### Appendix M. Regional Transit Standards

## **Transit Market Areas**

While several factors influence the propensity to use transit, the primary predictors of transit productivity are density of origination and destination. There are four categories of transit markets in the metropolitan area. Transit markets in the Twin Cities are identified using four primary criteria: 1) population density, 2) employment concentration and job density, 3) trip volumes and patterns, and 4) transit dependent segments of the population. Different types and levels of transit services should be used for each transit market area.

The region has four distinct market areas. Transit Market Area I has the highest density of population and employment, and is able to effectively support frequent regular route transit service. Because this is the most productive transit service area in the region, it should also be the area that receives a prioritized investment of transit resources.

Transit Market Area	Area Characteristics
Area I	Population Density = 15 or more persons/acre (or)
	Job Density = 50 or more jobs/acre <u>and</u> 10,000 more contiguous jobs
Area II	Population Density = 9 to 14.9 persons/acre augmented by contiguous High
	Transit Dependency areas
Area III	Population Density = 5 to 8.9 persons/acre (excluding isolated pockets)
	augmented by:
	(a) Contiguous areas with Job Density = $10$ to $49$ jobs/acre <u>and</u> 3,000 or more
	contiguous jobs
	Or
	(b) Contiguous areas with Major Travel destinations: 50 or more non-home
	bound trips/acre
Area IV	Population Density less than 5 persons/acre
Pockets	Areas meeting at least one of the following:
	1. Population Density = more than 5 persons/acre (isolated pockets only)
	2. Job Density = 10 to 49 jobs/acre and 3,000 or more contiguous jobs
	(isolated pockets only)
	3. Major Travel destinations: 50 or more non-home bound trips/acre (isolated
	pockets only)
	4. High Transit Dependency areas (isolated pockets only)

Transit Market Area II has high to moderate population and employment densities yielding a market area that is conducive to regular route operations and also other forms of transit service delivery.

The lower population and employment densities of Transit Market Areas III, IV, and Pocket areas increase the complexity and challenge of matching transit service to transit need. Due to the lower concentrated demand, it becomes more difficult to provide efficient transit service at reasonable costs in these areas. In the longer term to meet transit needs in suburban and rural settings, we need to promote the right type of land use and development densities that can sustain transit operations.

# **Transit Markets/Service Options**

The table below identifies transit strategies that appear to be most appropriate for the different transit markets that are in the metropolitan area. The service delivery strategies presented are only illustrative and not exhaustive. Detailed analysis of specific communities within the metropolitan area may generate other creative means of delivering effective transit services.

Transit	Suggested Service Type	Suggested Service Characteristics
Area I	Primary emphasis on big bus/regular route service complemented by paratransit service. Downtown area circulators possible.	Orientation – Focus on both CBD's Availability – Up to 24 hours/day and 7 days/week Access – Route spacing (.25 – .50 miles) with 8-10 bus stops per mile Frequency – Generally 5 – 15 minutes
Area II	Primary emphasis on big bus/regular route service complemented by paratransit service. Neighborhood circulators should tie in with limited stop regular route service.	Orientation – Link CBD's/suburban transit stations and centers Availability – Up to 20 hours/day and 7 days/week Access – Route spacing (0.5 – 1.0 miles) with 6-10 stops per mile Frequency – Generally 15 – 30 minutes
Area III	A mix of big and small bus/regular route and community circulator service complemented by paratransit service. Community circulators should tie into regular route regional service at a transfer point.	Orientation – Link CBD's/suburban transit stations and centers Availability – Up to 18 hours/day and Up to 7 days/week Access – Route spacing (0.5 – 1.5 miles) with 6-10 stops per mile Frequency – Generally 30 – 60 minutes
Area IV	Primary emphasis on: 1) small bus/dial-a- ride service providing county or rural circulation, and 2) community bus service tied to major park-and-ride facilities to create travel volumes.	Orientation – Suburb to suburb and central cities Availability – Peak-period express and midday circulators; weekday only Access – Express routes tied to major park-and-rides/circulators link to transit stations and centers Frequency – Advance registration for dial- a-ride services
Pockets	Primary emphasis on 1) small bus service providing community local or dial-a-ride circulation, and 2) commuter bus service may have localized service in addition to linking with major park-and-ride facilities to create travel volumes.	Orientation – Localized Availability – Varies by pocket; primarily weekday service Access – Door-to-door or modified circulation; express routes primarily tied to park-and-ride facilities Frequency – Up to 2 hours for circulator services. Advance registration for dial-a- ride

# **Transit Service Design Standards**

A consistent set of transit service design standards ensures regional coordination and consistency. Regional design standards are custom-tailored for each transit market area.

\* An allowable exception to standards may be CBD's and major traffic generators.

#### **Bus Stop Siting**

Regular Route	Near side stops are preferred in most areas. In CBD's and other high commercial density areas, where traffic movements
	are major impediments to smooth bus operations, far-side/mid-block stops are generally preferred. Individual stop sites
	must be evaluated for: 1) traffic conditions in area (i.e., right turns, merging, etc.); 2) curb availability (see stop dimensions
	table below); and 3) general suitability for stop (i.e., curb cuts, ADA considerations, obstructions, etc.).

Bus Stop Dimensions+	Mixed Use Stop	Small Bus Only Stop
Near-side Stop	100 ft.	75 ft.
Far-side Stop	120 ft.	90 ft.
Mid-Block Stop	150 ft.	110 ft.

+ Bus stops which have multiple buses stopping at the same time require more space.

Passenger Waiting Shelter Warrant	Central Cities	All Other Areas

# **Transit Performance Standards**

The primary performance standards to measure service are Subsidy per Passenger and Passengers per In-Service Hour. Performance standards are used to evaluate the relative productivity and efficiency of the services provided. To be responsible and dynamic, a transit system must consistently measure and adjust service in unproductive routes and address insufficient service in productive areas. The use of two regional performance standards provides better insight into the operational and financial performance of individual routes and services.

### Subsidy per Passenger

Subsidy or net cost is the difference between the total cost of providing service offset by revenue from passenger fares. Subsidy per passenger represents the net cost divided by the number of passengers using the service. This standard identifies services that are not operating within efficiency ranges and focuses corrective actions for those services. Subsidy thresholds are determined by calculating the non-weighted subsidy per passenger average within each service classification plus fixed percentage deviations from that average.

Threshold No.	Level of Subsity per Passenger Performance	Monitoring Goal	Possible Action
1	20 to 35% over peer average	For Quick Review	Minor Modifications
2	36 to 60% over peer average	For Intense Review	Major Changes
3	More than 60% over peer average	For Significant Change	Restructure/Eliminate

### Passengers per In-Service Hour

The passenger per in-service hour standard establishes a minimum threshold of performance for light rail transit, big bus fixed route service, small bus fixed route service and paratransit operations. Passengers per in-service hour represents the total passengers carried divided by the in-service time. This measure is most often calculated at the route level, but can also be measured less rigidly at a trip level.

Type of Service	Average Passengers per In-Service Hour	Minimum Passengers per In-Service Hour
Light Rail Transit	$\geq 70$	≥50
Big Bus Fixed Route – All Day	≥20	≥15
Big Bus Fixed Route – Peak Only	≥20	N/A
Small Bus Fixed Route	≥9	≥5
Small Bus Non-Fixed Route	≥3	≥2
Other/Rideshare/Shared Ride Taxi	≤2	N/A
