Employment in the Twin Cities Region, 2000-2006 Regional Jobs at New 2Q High; Center of Region Slower to Recover

Introduction

This report covers employment levels in the region during a period of national recession and recovery. Community-level job losses and gains are analyzed for second quarter 2000 through 2006, based on the Quarterly Census of Employment and Wages, a dataset maintained by Minnesota Department of Employment and Economic Development (DEED).

Summary

Regional employment fell off more than 2 percent during 2001 and 2002. It took until 2005 for employers to add jobs back to the region's previous peak. By its low point in 2002 the Minneapolis-St. Paul MSA's economy was off by more than 46,000 jobs (see Figure 1). Regional employment growth continued during 2006 and into 2007. As of March 2007, the Minneapolis-St. Paul area was above its previous peak by 2.1 percent, lagging the U.S. average, which was up 3.7 percent.

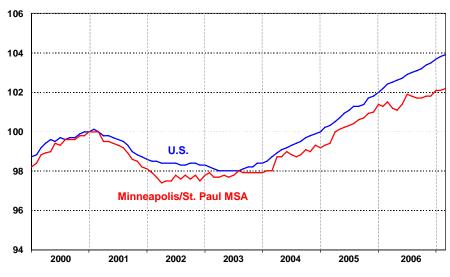

Among the 25 largest U.S. metro areas were some that experienced consistent growth throught the 2000-2006 period, some with mild declines and subsequent recovery, and some whose 2006 annual average employment still lagged the previous peak level. Minneapolis-St. Paul ranked in the middle for 2000-2006 growth (14th), and it ranked 16th in its 2005-06 growth rate.

Within the region, trends have been mixed—with some areas showing consistent growth and others slower to recover to previous employment levels. The remainder of this report analyzes local employment trends through second quarter of 2006. This data, from the Minn. Department of Employment and Economic Development, represents a near-complete census of employment. The count of approximately 1,620,400 jobs in the seven county Twin Cities region was 12,500 above the comparable 2000 figure, or a 0.8 percent gain.

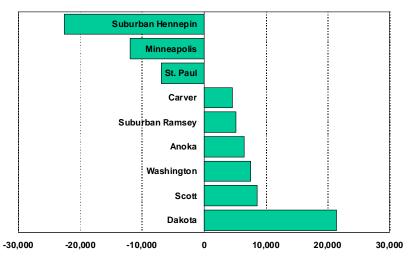

The central cities of Minneapolis and St. Paul suffered deeper cuts in their job base and have been slower to recover than the suburban balance of the region. By second quarter of 2006, both cities were on the rebound though their combined job total still lagged the 2000 figure by 4 percent, or close to 19,000 jobs. Suburban employment pushed past its previous peak level in 2004, and subsequent growth has put it nearly 3 percent above the 2000 figure (growth of over 31,000 jobs).

Suburban areas did not experience employment growth uniformly across the region. In suburban Hennepin County, gains in some communities were offset by losses in others, for a net shortfall of 22,600 jobs in 2006 compared to 2000 (4 percent). A substantial share of the decline (9,400 jobs) occurred in the airport area, with lingering weakness in the air travel industry. Employment in Dakota County has advanced consistently, even through the downturn, showing a net gain of about 21,500 jobs over the six-year period. Net gains in suburban Ramsey County and in the other four counties ranged from 4,600 to 8,600.

rc12!

Local employment levels do not necessarily rise in a linear fashion, even when the broader economy is in a period of expansion. A surge in new construction can lead to employment growth shortly after, or it can take some time for the new projects to be absorbed and for individual businesses to grow into surplus capacity. Firms vacating existing facilities can cause temporary shrinkage in local employment levels. Industry sectors experiencing a national or regional downturn can have a visible effect on employment levels in communities that have a concentration of businesses in those sectors.

The largest employment gains were seen in Maple Grove (10,629 jobs) and Eagan (6,927), though there were community-level increases of over 1000 jobs in each of the region's seven counties. Richfield's employment

base was boosted during this period with the relocation of Best Buy into new corporate headquarters. Some of the top-growth cities in Table 1 benefit from the availability of undeveloped land, while others are fully developed but are seeing infill and redevelopment. The pattern of 2000-2006 job gains and losses is mapped on Figure 3, page 4.

conley/312 3/14/07

Overall, employment in the developed suburbs was down by 3.3 percent from 2000, while the developing suburbs gained 13.2 percent. Rural centers are small towns with a historic role of providing basic community services to the surrounding population. As a group they showed an employment growth rate of 17.3 percent. However, these communities, along with the rest of the region's rural areas, accounted for less than 2 percent of the region's job base. Table 3 provides planning area employment subtotals. Figure 5 shows which communities are within each planning area.

^{*}For a small percentage of employment, Minn. DEED was able to identify location by county but not by specific community. In Table 3, these figures also include a small number of jobs located in communities that lie partially within the seven counties, but are not within the jurisdiction of the Metropolitan Council (Hanover, New Prague, Northfield, and Rockford).

Despite losses during the last economic downturn, the central cities and developed suburbs have close to three-quarters of the region's jobs—30 percent and 42 percent, respectively. (Figure 4). In terms of the availability of jobs relative to the amount of residential development, the developed suburbs are nearly as job-rich as the central cities. The region's overall job/household ratio is 1.45; that is, about 1½ jobs for every household. The developed suburbs as a group average 1.65. Developing suburbs average 1.2. Some are bedroom communities, some more balanced in their jobs/housing mix, and some quite strong on employment base. Figure 6 illustrates these patterns by community and Table 4 provides the planning area totals. (These data are based on the most current household estimates that are available--for 2005).

Other maps in this report are as follows:

- Figure 7 shows jobs by community in 2006.
- Figure 8 depicts gross employment density, calculated as the number of jobs per total acre in the community.
- Figure 9 shows the change in each community's employment for 2005-2006.

Table 5 provides employment counts for each year from 2000 to 2006, by community and county. Due to data confidentiality requirements, some local area data could not be disclosed by Minn. DEED. In these instances employment was estimated by Metropolitan Council. Values for 2000 for the cities of St. Paul and Maplewood have also been estimated to account for a data reporting change made after 2000. Therefore some statistics (with asterisk) are different than those published by Minnesota DEED.

Data source

Data used in this report come from the Quarterly Census of Employment and Wages Program (QCEW). All employer establishments covered under the Unemployment Insurance System are required to report wage and employment statistics quarterly to the Minnesota Department of Employment and Economic Development. The data therefore represent a near-complete census of employment (97 percent statewide). Self-employed people and some other workers are not covered; federal government establishments are picked up by the QCEW reporting system. Some data may differ from previously published figures due to revisions made by Minnesota DEED. The QCEW data are subject to revision for up to six calendar quarters.

The data presented in this report cover the second quarter of each year. Employment levels show seasonal variation throughout the year, but second quarter data are most likely to approximate the overall average employment level for the year. All of the quarterly data from Minnesota DEED, including industry detail and wages, can be accessed at www.deed.state.mn.us/lmi/tools/qcew.htm. For a more complete description of the data, see www.deed.state.mn.us/lmi/tools/qcew/about.htm. The U.S. Labor Department, Bureau of Labor Statistics, collects data from Minnesota and the other states and makes it available on its web site at www.bls.gov/cew/.
