Appendix A
List of Recipients

The following is a list of agencies, organizations, and persons to whom electronic copies of the Final Environmental Impact Statement (Final EIS) were sent. Copies of the Final EIS were sent to other interested businesses, individuals, and organizations as requested.

Federal Agencies

Advisory Council on Historic Preservation
National Park Service
Surface Transportation Board
United States Army Corps of Engineers
United States Department of Agriculture
United States Department of Commerce
United States Department of Energy
United States Department of Homeland Security, Federal Emergency Management Agency
United States Department of Housing and Urban Development
United States Department of the Interior, Office of Environmental Policy and Compliance
United States Environmental Protection Agency
United States Federal Aviation Administration
United States Federal Highway Administration
United States Federal Railroad Administration
United States Federal Transit Administration
United States Fish and Wildlife Service

United States Legislators

Honorable Al Franken, US Senator
Honorable Amy Klobuchar, US Senator
Honorable Erik Paulsen, US Representative (District 3)
Honorable Keith Ellison, US Representative (District 5)

Federal Agencies – Regional Offices

United States Army Corps of Engineers, St. Paul District
United States Department of Housing and Urban Development, Region V
United States Environmental Protection Agency, Region V
United States Federal Aviation Administration, Great Lakes Regional Office and Minneapolis Airports District Office
United States Federal Highway Administration, Minnesota Division
United States Federal Railroad Administration, Region IV
United States Federal Transit Administration, Region V

Tribes

Flandreau Santee Sioux
Lower Sioux Indian Community Council
Mille Lacs Band of Ojibwe
Prairie Island Indian Community
Santee Sioux Nation
Shakopee Mdewakanton Sioux Community
Sisseton-Wahpeton
Sisseton-Wahpeton Oyate
Spirit Lake Nation
Turtle Mountain
Upper Sioux Indian Community

State Agencies

Minnesota Board of Water and Soil Resources
Minnesota Department of Agriculture
Minnesota Department of Commerce
Minnesota Department of Health
Minnesota Department of Natural Resources
Minnesota Department of Public Safety
Minnesota Department of Transportation
Minnesota Environmental Quality Board
Minnesota Historical Society
Minnesota Indian Affairs Council
Minnesota Office of the State Archaeologist
Minnesota Pollution Control Agency
Minnesota State Historic Preservation Office

Governor and State Legislators

Honorable Mark Dayton, Governor, State of Minnesota

Honorable John A. Hoffman, Minnesota State Senator (District 36)
Honorable Chris A. Eaton, Minnesota State Senator (District 40)
Honorable Ann H. Rest, Minnesota State Senator (District 45)
Honorable Bobby Joe Champion, Minnesota State Senator (District 59)

Honorable Melissa Hortman, Minnesota State Representative (District 36B)
Honorable Michael V. Nelson, Minnesota State Representative (District 40A)
Honorable Lyndon Carlson, Sr., Minnesota State Representative (District 45A)
Honorable Mike Freiberg, Minnesota State Representative (District 45B)
Honorable Raymond Dehn, Minnesota State Representative (District 59B)

Local Elected Officials

Honorable Mike Opat, Hennepin County Commissioner (District 1)
Honorable Linda Higgins, Hennepin County Commissioner (District 2)
Honorable Marion Greene, Hennepin County Commissioner (District 3)
Honorable Peter McLaughlin, Hennepin County Commissioner (District 4)
Honorable Randy Johnson, Hennepin County Commissioner (District 5)
Honorable Jan Callison, Hennepin County Commissioner (District 6, Chair)
Honorable Jeff Johnson, Hennepin County Commissioner (District 7)

Honorable Jeffrey Lunde, Mayor, City of Brooklyn Park
Honorable Peter Crema, Council Member, City of Brooklyn Park (East District)
Honorable Rich Gates, Council Member, City of Brooklyn Park (Central District)
Honorable John Jordan, Council Member, City of Brooklyn Park (West District)
Honorable Bob Mata, Council Member, City of Brooklyn Park (West District)
Honorable Terry Parks, Council Member, City of Brooklyn Park (East District)
Honorable Mike Trepanier, Council Member, City of Brooklyn Park (Central District)

Honorable Jim Adams, Mayor, City of Crystal
Honorable Laura Libby, Council Member, City of Crystal (Section I, Wards 1 and 2)
Honorable Olga Parsons, Council Member, City of Crystal (Section II, Wards 1 and 2)
Honorable Elizabeth Dahl, Council Member, City of Crystal (Ward 1)
Honorable Jeff Kolb, Council Member, City of Crystal (Ward 2)
Honorable Casey Peak, Council Member, City of Crystal (Ward 3)
Honorable Julie Deshler, Council Member, City of Crystal (Ward 4)

Honorable Shep Harris, Mayor, City of Golden Valley
Honorable Joanie Clausen, Council Member, City of Golden Valley
Honorable Larry Fonest, Council Member, City of Golden Valley
Honorable Steve Schmidgall, Council Member, City of Golden Valley
Honorable Andy Snope, Council Member, City of Golden Valley

Honorable Mark Steffenson, Mayor, City of Maple Grove

Honorable Betsy Hodges, Mayor, City of Minneapolis
Honorable Kevin Reich, Council Member, City of Minneapolis (Ward 1)
Honorable Cam Gordon, Council Member, City of Minneapolis (Ward 2)
Honorable Jacob Frey, Council Member, City of Minneapolis (Ward 3)
Honorable Barbara Johnson, Council President, City of Minneapolis (Ward 4)
Honorable Blong Yang, Council Member, City of Minneapolis (Ward 5)
Honorable Abdi Warsame, Council Member, City of Minneapolis (Ward 6)
Honorable Lisa Goodman, Council Member, City of Minneapolis (Ward 7)
Honorable Elizabeth Glidden, Council Member, City of Minneapolis (Ward 8)
Honorable Alondra Cano, Council Member, City of Minneapolis (Ward 9)
Honorable Lisa Bender, Council Member, City of Minneapolis (Ward 10)
Honorable John Quincy, Council Member, City of Minneapolis (Ward 11)
Honorable Andrew Johnson, Council Member, City of Minneapolis (Ward 12)
Honorable Linea Palmisano, Council Member, City of Minneapolis (Ward 13)

Honorable Kathi Hemken, Mayor, City of New Hope

Honorable Duane Poppe, Mayor, City of Osseo

Honorable Regan Murphy, Mayor, City of Robbinsdale
Honorable Bill Blonigan, Council Member, City of Robbinsdale (Ward 1)
Honorable Dan Rogan, Council Member, City of Robbinsdale (Ward 2)
Honorable George Selman, Council Member, City of Robbinsdale (Ward 3)
Honorable Pat Backen, Council Member, City of Robbinsdale (Ward 4)

County Agencies

Hennepin County
Hennepin Conservation District
Hennepin County, Department of Energy and Environment
Hennepin County, Department of Housing, Transit, and Community Works
Hennepin County, Department of Policy, Planning and Land Management
Hennepin County, Department of Transportation
Hennepin County Regional Railroad Authority

Municipalities

City of Brooklyn Park
City of Crystal
City of Golden Valley
City of Maple Grove
City of Minneapolis
City of New Hope
City of Osseo
City of Robbinsdale

Local and Regional Agencies

Bassett Creek Watershed Management Commission
Maple Grove Transit
Metropolitan Airports Commission (MAC)
Metropolitan Council/Metro Transit
Minneapolis Heritage Preservation Commission
Minneapolis Park and Recreation Board
Minneapolis Regional Chamber of Commerce
Mississippi Watershed Management Organization
Shingle Creek and West Mississippi Watershed Management Commission
Three Rivers Park District

Libraries

Brookdale Library
Brooklyn Park Library
Golden Valley Library
Hennepin County Library – Minneapolis Central
Maple Grove Library
Metropolitan Council Library
Minnesota Department of Transportation Library
North Regional Library
Osseo Library
Rockford Road Library
Sumner Library
Legislative Reference Library

Other

BNSF Railway
Canadian Pacific Railway

BLRT Extension Project Committees

BLRT Extension project – Corridor Management Committee
BLRT Extension project – Business Advisory Committee
BLRT Extension project – Community Advisory Committee
BLRT Extension project – Technical Project Advisory Committee

Appendix B
List of Preparers

Public Agencies

Federal Transit Administration

Region V Office, Chicago, IL

Marisol Simón
Reginald Arkell, AICP
Kathryn Loster

Office of Environmental Programs, Washington, DC

Maya Sarna

Metropolitan Council – BLRT Extension Project Office

Name	Degree	Role
Dan Soler, PE	BS, Civil Engineering	Project Director
MarySue Abel, PE	MS, Civil Engineering	Deputy Project Director
Kathryn O'Brien	BS, Speech MUP, Urban Planning	Assistant Director, Environmental and Agreements
Robin Caufman	BS Environmental Studies MURP, Urban and Regional Planning	Assistant Director for Administration, Communication and Outreach
Sam O'Connell, AICP	BS, Geography	Manager, Public Involvement
Nick Landwer, PE	BS, Civil Engineering	Director, Transit Systems Design and Engineering
Alicia Vap	MUP, Urban Planning	Assistant Director, Land Use/ Stations/OMF
Jim Toulouse	BS, Civil & Environmental Engineering	Manager, Engineering
Kathryn Hansen	BS, Urban Land Economics MS, Real Estate Appraisal and Investment Analysis	Manager, TOD
Josh Haider	BS, Construction Management AAS, Construction Technology AAS, Architectural Drafting & Estimating Tech.	Manager, Project Controls
Judith Phillips	BA, Political Science MA, Organizational Communication	Manager, Project Offices
Caroline Miller	BA, Anthropology (Archaeology) MURP, Urban and Regional Planning	Environmental Specialist
Ella Rasp	BA, Urban Studies (Urban Infrastructure and Environment) – in progress	Environmental Intern

Minnesota Department of Transportation

Name	Degree	Role
Ryan Wilson	BS, Civil Engineering MS, Civil Engineering MURP, Urban and Regional Planning	Railroad Coordination Manager
Lee Williams	—	ROW/Permits Manager
James DeLuca	BS, Geology MS, Geology	Environmental Mitigation Specialist
Greg Mathis	BA, Geography MCRP, Community and Regional Planning	Cultural Resources Lead

Hennepin County

Name	Degree	Role
Brent Rusco	BS, Civil Engineering MA, Organizational Leadership	Senior Project Manager
Chad Ellos	BS, Civil Engineering	Project Manager

Final Environmental Impact Statement Consultants

Name	Degree	Contribution to Final EIS
HDR, Inc.		
Scott Reed, PG	BS, Geology MBA, Environmental Mgmt Concentration	Project Manager
Janet Kennison	BA, Environmental Studies MS, Environmental Management	Environmental Task Lead
Kimberly Slaughter	BA, Government/Pre-Law MS, Community and Region Planning	Quality Assurance Manager
Roben Armstrong	BS, Aviation Science MS, Transportation Planning and Management	Purpose and Need; Community and Social Analysis
Tim Burkhardt, AICP	BA, English MPH, Environmental Health	QC and Independent Technical Reviewer
Timothy Casey, INCE	BS, Biology	QC Reviewer
Jessica Dean, PE	BS, Civil Engineering	QC Reviewer
Michael DeRuyter	BS, Natural Resources	Wetlands; Biological Environment
Kelly Farrell	BS, Environmental Sciences/Studies (Natural Resources) BA, Visual and Performing Arts (Music) MBA, Business Administration	Section 4(f)
Steve Granson	BA, Accounting MS, Transportation Planning and Management	Economic Effects; Financial Considerations
Derek Green	BS, Zoology	QC Reviewer
Michael Justin, RPA	BS, Anthropology MS, Anthropology	QC Reviewer

Name	Degree	Contribution to Final EIS
Dax Kuhfuss, PE	BS, Civil Engineering	Independent Technical Reviewer
Cathy P. LaFata, AICP, CTP	BA, Psychology/Mathematics MA, Urban Planning, Transportation, and Environmental Planning	Environmental Justice; Section 6(f); Visual/Aesthetics
Edward J. Liebsch	BA, Earth Science MS, Meteorology	Air Quality
Agata Miszczyk	MGIS, Geographic Information Systems	GIS Technician
Thomas More, AICP	BA, Political Science MA, Urban and Regional Planning	QC Reviewer
Howard Newman, PE	BS Civil Engineering	QC Reviewer
Brandi Popenhagen, PE	BS, Civil Engineering	QC Reviewer
Jeanette Price	BS, Environmental Studies	Visual/Aesthetics
Shelley D. Richards, PE, ENV SP, STP	BS, Civil Engineering MS, Civil Engineering MBA, Business Administration	Draft EIS Comments/QC Reviewer
Hong Spores, CPG	BS, Geology MBA, Business Administration	Geology/Soils/Topography; Hazardous Materials Contamination
Carrie Ulrich	BS, Environmental Studies MS, English	Technical Editor
Ashley Ver Burg	BA, Environmental Studies	Executive Summary; Consultation and Coordination
Jennifer Walter	BA, Anthropology MA, Anthropology	GIS Manager
106 Group		
Jenny Bring	BA, Anthropology – Archaeology Emphasis	Cultural Resources Lead; QA/QC
Nicole Foss	BA, Anthropology MA, Anthropology (Historical Archaeology)	Cultural Resources
Nathan Moe	BA, Urban and Regional Studies	Cultural Resources GIS; Graphics
Kelly Wilder	BS, Ecology and Evolutionary Biology BA, New-Editorial Journalism JD, Law	Cultural Resources Editor
Cross-Spectrum Acoustics Inc.		
Scott Edwards, INCE Member	BSE, Acoustical Engineering and Music	Noise and Vibration
Lance Meister, INCE Member	BS, Civil Engineering	Noise and Vibration
SEH, Inc.		
Lisa Elliott	MA, Urban and Regional Planning	Joint Development
Chris Hiniker, AICP	BA, Geography	Independent Technical Reviewer
Jeffrey Olson, WDCP #1089	BS, Botany MS, Natural Resource Ecology	Wetlands; Aquatic Resources; Threatened and Endangered Species; Biological Environment

Name	Degree	Contribution to Final EIS
Robert Rogers, AICP	BA, Geography MA, Urban and Regional Planning	Section 4(f)
Stonebrooke Engineering Inc.		
Tim Arvidson, PE	BS, Civil Engineering	Utilities
Marc Briese, PE	BS, Civil Engineering MS, Infrastructure Systems Engineering	Vehicular Traffic
Ross Harris, AICP	BS, Community and Regional Planning MS, Business Management	Freight Rail Conditions; Bicyclists and Pedestrians; Parking; Aviation
Wally Marusenko, PE	BS, Civil Engineering MS, Civil Engineering	Utilities

Engineering Consultants

Name	Degree	Role
Kimley-Horn and Associates, Inc.		
Paul Danielson, PE	BS, Civil Engineering	Project Manager
Lisa Rasmussen, PE	BS, Civil Engineering	Civil Engineering Lead
JoNette Kuhnau, PE	BS, Civil Engineering MS, Civil Engineering	Traffic Engineering Lead
Tom Harrington, PLA	BS, Landscape Architecture	Architectural Design Lead
Derek Newbauer, PE	BS, Civil Engineering	Project Engineer
SRF Consulting Group, Inc.		
Lisa Goddard, PE, LEED AP	BS, Civil Engineering	Water Resources

Appendix D
Agency Coordination

The following is a list of agency coordination letters that have been transmitted since the Draft EIS was published in April 2014:

1. Metropolitan Council email to the Federal Aviation Administration seeking concurrence on proposed BLRT Extension project modifications in relation to its encroachment into the Crystal Airport Runway Protection Zone, November 20, 2015
2. Federal Aviation Administration letter to the Metropolitan Council concurring on the proposed BLRT Extension project modifications in relation to its encroachment into the Crystal Airport Runway Protection Zone, December 28, 2015
3. Minnesota Department of Natural Resources letter to the Metropolitan Council concurring on state-listed species that may be in the proposed BLRT Extension project area, February 9, 2016. This letter also includes a Blanding's turtle fact sheet and flyer
4. Federal Transit Administration letter to the US Fish and Wildlife Service seeking concurrence on Section 7 of the Endangered Species Act determinations, March, 7, 2016
5. Federal Transit Administration letter to the US Fish and Wildlife Service submitting the Northern Long-Eared Bat 4(d) Rule Streamlined Consultation Form, May 6, 2016
6. US Fish and Wildlife Service letter to the Federal Transit Administration concurring on Section 7 of the Endangered Species Act determinations, May 16, 2016
7. Federal Transit Administration letter to the US Environmental Protection Agency responding to their Draft EIS comments, June 16, 2016

Agency coordination with the Minnesota State Historic Preservation Office can be found in **Appendix H**.

Agency coordination with the US Army Corps of Engineers and local Wetland Conservation Act jurisdictions can be found in **Appendix I**.

Agency coordination with the Minnesota Department of Natural Resources, the US Department of the Interior, and the National Park Service regarding Section 6(f) can be found in **Appendix J**.

Agency coordination letters prior to 2015 can be found in the Bottineau Transitway Draft EIS at this website link:

metrocouncil.org/Transportation/Projects/Current-Projects/METRO-Blue-Line-Extension/Publications-And-Resources/Environmental/DEIS/BLLRT_DEIS_App-D_AgencyCoordination.aspx

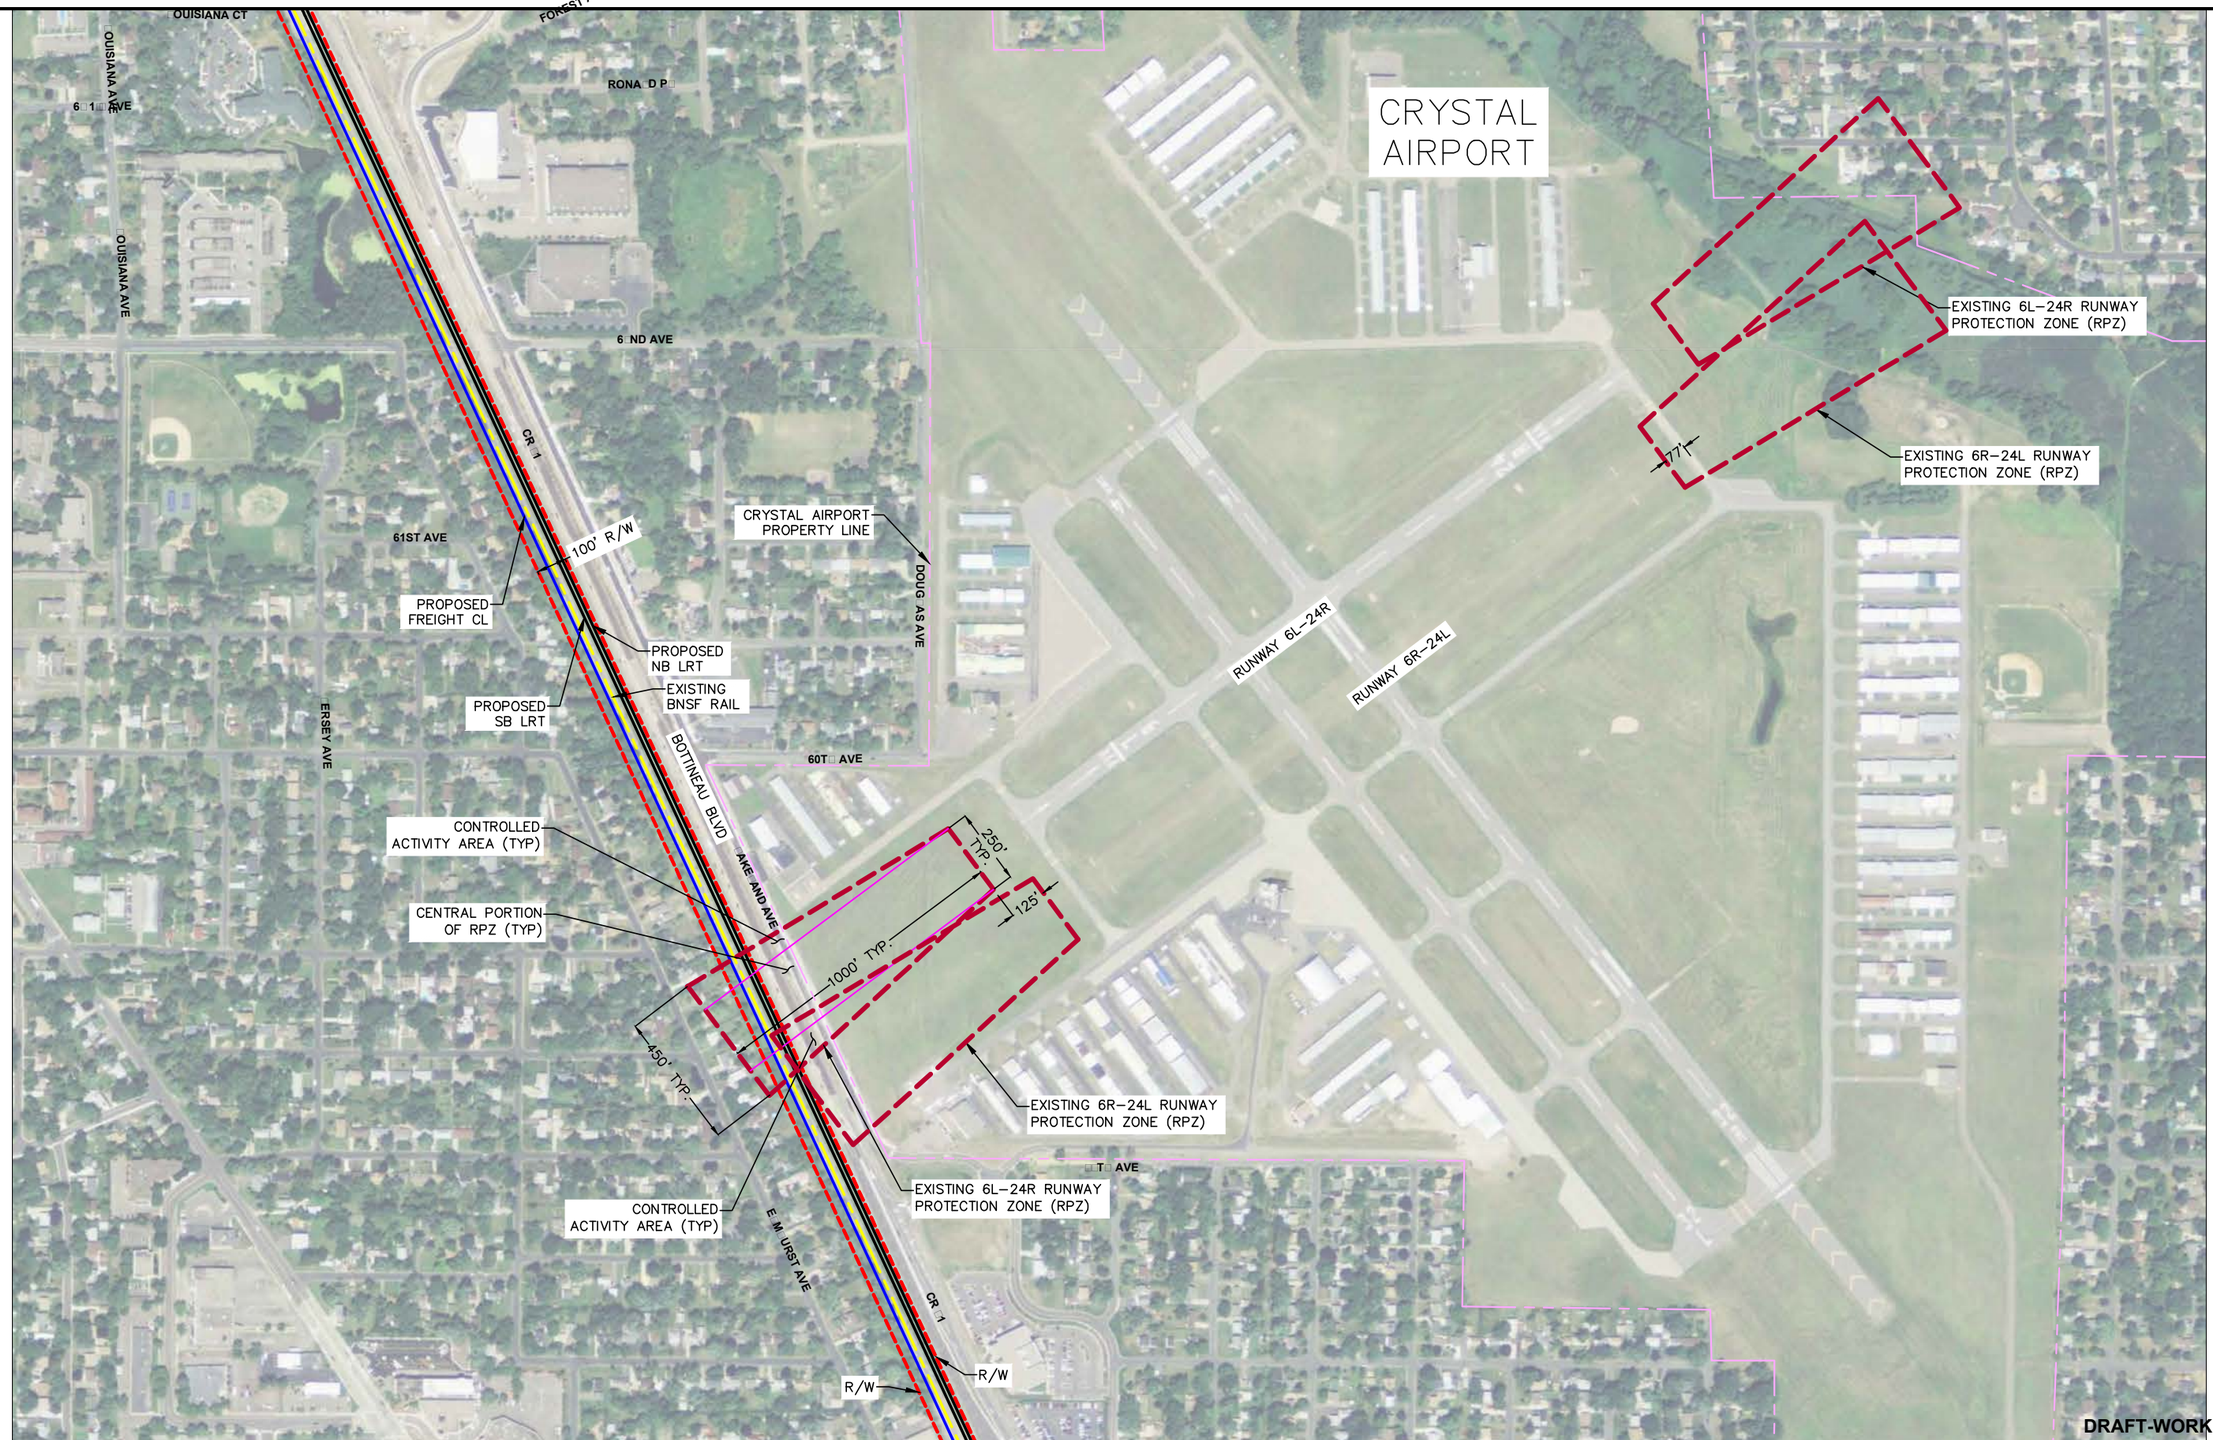
Cc: Bridget Rief; Abel, MarySue; Landwer, Nick; Reed, Scott; BPODMC
Subject: Blue Line Extension Project - RPZ Coordination

Gina, please find attached exhibits prepared by the Blue Line (formerly known as the Bottineau Transitway) Project Office that provide information on the Preferred Alternative for the Project, and, specifically, the Preferred Alternative relative to its encroachment into the Runway Protection Zone associated with Runway 6L-24R at the Crystal Airport.

As we discussed a week or so ago, the Project has changed slightly from its definition when the "FAA Great Lakes Region Runway Protection Zone Alternatives Analysis" was prepared for the Bottineau Transitway in February 2014. Namely, the alignment of the LRT tracks and associated overhead catenary system elements has shifted approximately 10-feet to the east, within the existing Burlington Northern Santa Fe (BNSF) railroad corridor. This shift resulted from coordination with the BNSF railway and is being made to provide sufficient separation from the LRT and the freight to minimize any potential for conflicts between these modes of rail operations.



Blue Line Project Office staff have reviewed the significance in this slight shift in guideway alignment in terms of its impact on the FAA approach surface as established for Runway 6L-24R. The assessment of our design team is that this shift to the east can be effected without breaking the plane of this approach surface – the calculation you will see on the typical section figure indicates that the overhead LRT elements are slightly more than 9-feet below the plane of the approach surface.

I look forward to your consideration of this information and to discussing with you how to best submit this in a more "official" transmittal as part of the process of bringing closure to the FAA Alternatives Analysis process, and for appropriate documentation in the forthcoming (June 2016) Blue Line Extension Project Final EIS and subsequent Record of Decision.

Please feel free to call or to e-mail and, as we discussed on the phone, please know that project office staff would be more than happy to sit down with you and other stakeholders in this matter to discuss any questions or concerns you may about the Blue Line Extension project.

Ms. O'Brien:

On November 20, 2015, the FAA Dakota-Minnesota Airports District Office (ADO) received an email stating the Blue Line Project, formerly known as the Bottineau Transitway Project, changed slightly from the alignment identified in the February 10, 2014, Crystal Airport Runway Protection Zone Alternatives Analysis (RPZ AA).

The FAA concurs with the November 20, 2015, proposed modifications to the February 10, 2014, RPZ AA. The ADO understands that this alignment and elevation information will be consistent with the Final EIS. Should the alignment or elevation change, please contact the ADO.

If you have any questions or would like to discuss this information further, please feel welcome to contact Gina Mitchell, Community Planner, at (612) 253-4641 or gina.mitchell@faa.gov.

Sincerely,

Lindsay Butler

Subject: RE: Blue Line Light Rail; seek concurrence on listed species

---

Hi Jeff,

I concur with your assessment, but would also add that the least darter and the pugnose shiner were documented in 2006 in Eagle Lake and have the potential to be present in Shingle Creek and perhaps other waterways crossed by the proposed project. As such, it is important that effective erosion and sediment control practices be implemented and maintained during construction and be incorporated into any stormwater management plan.

I've also attached the Blanding's Turtle Fact Sheet and Flyer for your reference.

Thank you,

Lisa Joyal

To: Joyal, Lisa (DNR)
Subject: Blue Line Light Rail; seek concurrence on listed species

Hello Lisa,

Per our Natural Heritage Licensing Agreement, we have completed a database search of element
~~~~~~

occurrences in the vicinity of the proposed Blue Line Light Rail. See attached figure (points and polygons), excel spreadsheet (attribute table), and general project location figure. We conclude that the only state-listed species that has a reasonable probability of being in the project area is the Blanding's Turtle (State Threatened). We also conclude that, with adherence to DNR guidelines concerning the minimization of impacts to to Blanding's Turtle, that potential impacts to the species would be negligible.

We are aware of three Federally-listed (or monitored) species that are have some probability of being in the project area;

- Northern Long-Eared Bat. We are in consultation with the USFWS concerning potential summer roosting habitat within the project area.
- Bald Eagle. De-listed (but still monitored). We will monitor nest locations prior to and during the construction phase of the project and consult with USFWS if there is an issue.
- Minnesota Dwarf Trout Lily. Population known from the Harriet Butler Wildflower Sanctuary - not impacted by the proposed Blue Line Project.

We seek your concurrence that our conclusions are reasonable.

Thank you!

Best Regards,

Jeffrey Olson

Environmental Review Fact Sheet Series

Endangered, Threatened, and Special Concern Species of Minnesota

Blanding's Turtle

(*Emydoidea blandingii*)

Minnesota Status:	Threatened	State Rank[1]:	S2
Federal Status:	none	Global Rank[1]:	G4

HABITAT USE

Blanding's turtles need both wetland and upland habitats to complete their life cycle. The types of wetlands used include ponds, marshes, shrub swamps, bogs, and ditches and streams with slow-moving water. In Minnesota, Blanding's turtles are primarily marsh and pond inhabitants. Calm, shallow water bodies (Type 1-3 wetlands) with mud bottoms and abundant aquatic vegetation (e.g., cattails, water lilies) are preferred, and extensive marshes bordering rivers provide excellent habitat. Small temporary wetlands (those that dry up in the late summer or fall) are frequently used in spring and summer -- these fishless pools are amphibian and invertebrate breeding habitat, which provides an important food source for Blanding's turtles. Also, the warmer water of these shallower areas probably aids in the development of eggs within the female turtle. Nesting occurs in open (grassy or brushy) sandy uplands, often some distance from water bodies. Frequently, nesting occurs in traditional nesting grounds on undeveloped land. Blanding's turtles have also been known to nest successfully on residential property (especially in low density housing situations), and to utilize disturbed areas such as farm fields, gardens, under power lines, and road shoulders (especially of dirt roads). Although Blanding's turtles may travel through woodlots during their seasonal movements, shady areas (including forests and lawns with shade trees) are not used for nesting. Wetlands with deeper water are needed in times of drought, and during the winter. Blanding's turtles overwinter in the muddy bottoms of deeper marshes and ponds, or other water bodies where they are protected from freezing.

LIFE HISTORY

Individuals emerge from overwintering and begin basking in late March or early April on warm, sunny days. The increase in body temperature which occurs during basking is necessary for egg development within the female turtle. Nesting in Minnesota typically occurs during June, and females are most active in late afternoon and at dusk. Nesting can occur as much as a mile from wetlands. The nest is dug by the female in an open sandy area and 6-15 eggs are laid. The female turtle returns to the marsh within 24 hours of laying eggs. After a development period of approximately two months, hatchlings leave the nest from mid-August through early-October. Nesting females and hatchlings are often at risk of being killed while crossing roads between wetlands and nesting areas. In addition to movements associated with nesting, all ages and both sexes move between wetlands from April through November. These movements peak in June and July and again in September and October as turtles move to and from overwintering sites. In late autumn (typically November), Blanding's turtles bury themselves in the substrate (the mud at the bottom) of deeper wetlands to overwinter.

IMPACTS / THREATS / CAUSES OF DECLINE

- loss of wetland habitat through drainage or flooding (converting wetlands into ponds or lakes)
- loss of upland habitat through development or conversion to agriculture
- human disturbance, including collection for the pet trade* and road kills during seasonal movements
- increase in predator populations (skunks, raccoons, etc.) which prey on nests and young

*It is illegal to possess this threatened species.

RECOMMENDATIONS FOR AVOIDING AND MINIMIZING IMPACTS

These recommendations apply to typical construction projects and general land use within Blanding's turtle habitat, and are provided to help local governments, developers, contractors, and homeowners minimize or avoid detrimental impacts to Blanding's turtle populations. **List 1** describes minimum measures which we recommend to prevent harm to Blanding's turtles during construction or other work within Blanding's turtle habitat. **List 2** contains recommendations which offer even greater protection for Blanding's turtles populations; this list should be used *in addition to the first list* in areas which are known to be of state-wide importance to Blanding's turtles (contact the DNR's Natural Heritage and Nongame Research Program if you wish to determine if your project or home is in one of these areas), or in any other area where greater protection for Blanding's turtles is desired.

List 1. Recommendations for all areas inhabited by Blanding's turtles.	**List 2. *Additional* recommendations for areas known to be of state-wide importance to Blanding's turtles.**
GENERAL	
A flyer with an illustration of a Blanding's turtle should be given to all contractors working in the area. Homeowners should also be informed of the presence of Blanding's turtles in the area.	Turtle crossing signs can be installed adjacent to road-crossing areas used by Blanding's turtles to increase public awareness and reduce road kills.
Turtles which are in imminent danger should be moved, by hand, out of harms way. Turtles which are not in imminent danger should be left undisturbed.	Workers in the area should be aware that Blanding's turtles nest in June, generally after 4pm, and should be advised to minimize disturbance if turtles are seen.
If a Blanding's turtle nests in your yard, do not disturb the nest.	If you would like to provide more protection for a Blanding's turtle nest on your property, see "Protecting Blanding's Turtle Nests" on page 3 of this fact sheet.
Silt fencing should be set up to keep turtles out of construction areas. It is critical that silt fencing be removed after the area has been revegetated.	Construction in potential nesting areas should be limited to the period between September 15 and June 1 (this is the time when activity of adults and hatchlings in upland areas is at a minimum).
WETLANDS	
Small, vegetated temporary wetlands (Types 2 & 3) should not be dredged, deepened, filled, or converted to storm water retention basins (these wetlands provide important habitat during spring and summer).	Shallow portions of wetlands should not be disturbed during prime basking time (mid morning to mid- afternoon in May and June). A wide buffer should be left along the shore to minimize human activity near wetlands (basking Blanding's turtles are more easily disturbed than other turtle species).
Wetlands should be protected from pollution; use of fertilizers and pesticides should be avoided, and run-off from lawns and streets should be controlled. Erosion should be prevented to keep sediment from reaching wetlands and lakes.	Wetlands should be protected from road, lawn, and other chemical run-off by a vegetated buffer strip at least 50' wide. This area should be left unmowed and in a natural condition.
ROADS	
Roads should be kept to minimum standards on widths and lanes (this reduces road kills by slowing traffic and reducing the distance turtles need to cross).	Tunnels should be considered in areas with concentrations of turtle crossings (more than 10 turtles per year per 100 meters of road), and in areas of lower density if the level of road use would make a safe crossing impossible for turtles. Contact your DNR Regional Nongame Specialist for further information on wildlife tunnels.
Roads should be ditched, not curbed or below grade. If curbs must be used, 4 inch high curbs at a 3:1 slope are preferred (Blanding's turtles have great difficulty climbing traditional curbs; curbs and below grade roads trap turtles on the road and can cause road kills).	Roads should be ditched, not curbed or below grade.

ROADS cont.	
Culverts between wetland areas, or between wetland areas and nesting areas, should be 36 inches or greater in diameter, and elliptical or flat-bottomed.	Road placement should avoid separating wetlands from adjacent upland nesting sites, or these roads should be fenced to prevent turtles from attempting to cross them (contact your DNR Nongame Specialist for details).
Wetland crossings should be bridged, or include raised roadways with culverts which are 36 in or greater in diameter and flat-bottomed or elliptical (raised roadways discourage turtles from leaving the wetland to bask on roads).	Road placement should avoid bisecting wetlands, or these roads should be fenced to prevent turtles from attempting to cross them (contact your DNR Nongame Specialist for details). This is especially important for roads with more than 2 lanes.
Culverts under roads crossing streams should be oversized (at least twice as wide as the normal width of open water) and flat-bottomed or elliptical.	Roads crossing streams should be bridged.
UTILITIES	
Utility access and maintenance roads should be kept to a minimum (this reduces road-kill potential).	
Because trenches can trap turtles, trenches should be checked for turtles prior to being backfilled and the sites should be returned to original grade.	
LANDSCAPING AND VEGETATION MANAGEMENT	
Terrain should be left with as much natural contour as possible.	As much natural landscape as possible should be preserved (installation of sod or wood chips, paving, and planting of trees within nesting habitat can make that habitat unusable to nesting Blanding's turtles).
Graded areas should be revegetated with native grasses and forbs (some non-natives form dense patches through which it is difficult for turtles to travel).	Open space should include some areas at higher elevations for nesting. These areas should be retained in native vegetation, and should be connected to wetlands by a wide corridor of native vegetation.
Vegetation management in infrequently mowed areas -- such as in ditches, along utility access roads, and under power lines -- should be done mechanically (chemicals should not be used). Work should occur fall through spring (after October 1st and before June 1st).	Ditches and utility access roads should not be mowed or managed through use of chemicals. If vegetation management is required, it should be done mechanically, as infrequently as possible, and fall through spring (mowing can kill turtles present during mowing, and makes it easier for predators to locate turtles crossing roads).

Protecting Blanding's Turtle Nests: Most predation on turtle nests occurs within 48 hours after the eggs are laid. After this time, the scent is gone from the nest and it is more difficult for predators to locate the nest. Nests more than a week old probably do not need additional protection, unless they are in a particularly vulnerable spot, such as a yard where pets may disturb the nest. Turtle nests can be protected from predators and other disturbance by covering them with a piece of wire fencing (such as chicken wire), secured to the ground with stakes or rocks. The piece of fencing should measure at least 2 ft. x 2 ft., and should be of medium sized mesh (openings should be about 2 in. x 2 in.). It is ***very important*** that the fencing be **removed before August 1st** so the young turtles can escape from the nest when they hatch!

CAUTION

BLANDING'S TURTLES

MAY BE ENCOUNTERED IN THIS AREA

The unique and rare Blanding's turtle has been found in this area. Blanding's turtles are state-listed as Threatened and are protected under Minnesota Statute 84.095, Protection of Threatened and Endangered Species. Please be careful of turtles on roads and in construction sites. For additional information on turtles, or to report a Blanding's turtle sighting, contact the DNR Nongame Specialist nearest you: Bemidji (218-308-2641); Grand Rapids (218-327-4518); New Ulm (507-359-6033); Rochester (507-206-2820); or St. Paul (651-259-5772).

DESCRIPTION: The Blanding's turtle is a medium to large turtle (5 to 10 inches) with a black or dark blue, dome-shaped shell with muted yellow spots and bars. The bottom of the shell is hinged across the front third, enabling the turtle to pull the front edge of the lower shell firmly against the top shell to provide additional protection when threatened. The head, legs, and tail are dark brown or blue-gray with small dots of light brown or yellow. A distinctive field mark is the bright yellow chin and neck.

BLANDING'S TURTLES DO NOT MAKE GOOD PETS
IT IS ILLEGAL TO KEEP THIS THREATENED SPECIES IN CAPTIVITY

SUMMARY OF RECOMMENDATIONS FOR AVOIDING AND MINIMIZING IMPACTS TO BLANDING'S TURTLE POPULATIONS

(see Blanding's Turtle Fact Sheet for full recommendations)

- This flyer should be given to all contractors working in the area. Homeowners should also be informed of the presence of Blanding's turtles in the area.
- Turtles that are in imminent danger should be moved, by hand, out of harm's way. Turtles that are not in imminent danger should be left undisturbed to continue their travel among wetlands and/or nest sites.
- If a Blanding's turtle nests in your yard, do not disturb the nest and do not allow pets near the nest.
- Silt fencing should be set up to keep turtles out of construction areas. It is critical that silt fencing be removed after the area has been revegetated.
- Small, vegetated temporary wetlands should not be dredged, deepened, or filled.
- All wetlands should be protected from pollution; use of fertilizers and pesticides should be avoided, and run-off from lawns and streets should be controlled. Erosion should be prevented to keep sediment from reaching wetlands and lakes.
- Roads should be kept to minimum standards on widths and lanes.
- Roads should be ditched, not curbed or below grade. If curbs must be used, 4" high curbs at a 3:1 slope are preferred.
- Culverts under roads crossing wetland areas, between wetland areas, or between wetland and nesting areas should be at least 36 in. diameter and flat-bottomed or elliptical.
- Culverts under roads crossing streams should be oversized (at least twice as wide as the normal width of open water) and flat-bottomed or elliptical.
- Utility access and maintenance roads should be kept to a minimum.
- Because trenches can trap turtles, trenches should be checked for turtles prior to being backfilled and the sites should be returned to original grade.
- Terrain should be left with as much natural contour as possible.
- Graded areas should be revegetated with native grasses and forbs.
- Vegetation management in infrequently mowed areas -- such as in ditches, along utility access roads, and under power lines -- should be done mechanically (chemicals should not be used). Work should occur fall through spring (after October 1st and before June 1st).

RE: METRO Blue Line Light Rail Extension Project – Consultation under Section 7 of the Endangered Species Act

Dear Mr. Horton:

The purpose of this letter is to advance informal consultation under Section 7 of the Endangered Species Act (ESA) between the Federal Transit Administration (FTA) and the U. S. Fish and Wildlife Service (USFWS) as it relates to the proposed Blue Line Light Rail Transit (BLRT) Extension project. The BLRT Extension project is a 13-mile light rail transit line that would be located in Hennepin County and extend westward along Trunk Highway (TH) 55 from Target Field Station to the BNSF Railway Monticello Subdivision at the eastern edge of Theodore Wirth Regional Park. It then would follow the BNSF corridor from TH 55 to just south of 73rd Avenue in Brooklyn Park. From that point it would cross eastward to West Broadway Avenue and extend north to a point just north of TH 610.

The Metropolitan Council has reviewed the USFWS publication "County Distribution of Federally Listed Threatened, Endangered, Proposed and Candidate Species." Accordingly, FTA has determined the following regarding these species in Hennepin County:

- **Northern long-eared bat** (*Myotis septentrionalis*). Federally Threatened. Based on review of the Natural Heritage Information System (NHIS) database, a known hibernacula is located along the Mississippi River near downtown Minneapolis; however the BLRT Extension will not be near the hibernacula. Based on NHIS database review and consultation with the USFWS, there are no known maternity colonies in all of Hennepin County. Based on USFWS documentation, forested areas throughout much of Minnesota provide potential summer roosting habitat for the Northern Long-Eared Bat (NLEB). Appropriate conclusions pertaining to impacts to the NLEB resulting from the BLRT Extension project are discussed below.

- **Higgins eye pearlymussel** (*Lampsilis higginsii*). Federally Threatened. This species occurs in the Mississippi River. The BLRT Extension project will not impact the Mississippi River, therefore the appropriate conclusion with respect to impacts to this mussel species is "No Effect".

- **Snuffbox mussel** (*Epioblasma triquetra*). Federally Endangered. This species occurs in the Mississippi River. The BLRT Extension project will not impact the Mississippi River, therefore the appropriate conclusion with respect to impacts to this mussel species is "No Effect".

The BLRT Extension project is now in the FTA New Starts Project Development process; current activities include preliminary design and completion of a Final Environmental Impact Statement (EIS). As part of the environmental review process and in compliance with Section 7 requirements, the FTA has assessed potential impacts to the NLEB as a result of the BLRT Extension project. Potential impacts to the NLEB take into account the ESA Final 4(d) Rule, published on January 14, 2016 and in effect as of February 16, 2016. The BLRT Extension project traverses a few larger forested areas that could be potential NLEB summer habitat.

This letter:

- Summarizes past consultation with the USFWS concerning the NLEB and the BLRT Extension project;
- Presents current information concerning impacts to forested areas within the project area;
- Proposes a project implementation strategy in compliance with the Final 4(d) NLEB Rule, specifically portions relevant to federal actions. As noted in the USFWS on-line guidance, "the [USFWS] has provided a framework to streamline Section 7 consultations when federal actions may affect the northern long-eared bat but not cause prohibited take." (See http://www.fws.gov/midwest/endangered/mammals/nleb/S7.html).
- Presents the assertion that implementation of the BLRT Extension project under this framework would lead to a decision regarding the NLEB of "May Affect, Incidental Take Not Prohibited", and requests concurrence with that decision;
- Presents information regarding proposed bald eagle nesting activity monitoring.

Past Consultation

On May 21, 2015 staff from the BLRT Extension project office (BPO) and the USFWS discussed (via teleconference call) the project, the recent listing of the NLEB as Federally Threatened, and the Interim 4(d) Rule established by the USFWS to help protect this species.

On November 19, 2015, BPO staff met with you at the USFWS Field Office to discuss the quantification of impacts to forested areas as it relates to summer roosting habitat for the NLEB. At this meeting, the parties discussed an early iteration of potential forest impacts. Table 1 (as follows) presents an updated quantification of forest impacts. Discussion also included scenarios under which seasonal clearing and grubbing restrictions would and would not be imposed within the BLRT Extension project area in compliance with the Interim 4(d) Rule, in place during late Fall 2015. These scenarios included no clearing restrictions for tree removal within smaller forested areas (less than 15 acres), and the possibility of conducting acoustic bat surveys in the spring and/or summer of 2016. However, with the adoption of the Final 4(d) Rule concerning NLEB and the absence of known maternity roost trees and hibernacula in or near the BLRT Extension project area, no acoustic bat surveys would be required and no seasonal clearing and grubbing restrictions would be imposed.

NLEB Summer Habitat Data Within/Near the Blue Line Light Rail Extension Project Area

BPO has compiled data on the extent of forested habitat in the vicinity of the BLRT Extension project area and potential impacts to forested habitat. These data are presented in the enclosed NLEB Map book and in Table 1.

GIS data on forest cover types within the project area were gathered from the Minnesota Land Cover Classification System (MLCCS). These data were overlain on modern aerial photography and MLCCS polygons were trimmed where it was clear that deforestation had occurred since the cover type GIS information had been acquired. Ten (10) large forest complexes within approximately ¼ mile of the proposed BLRT Extension project were identified and digitized. The size of the forest complexes ranged from approximately 7 acres to 62 acres. Other fragmented forest remnants outside of the forest complexes were identified throughout the project area as well. Table 1 summarizes the extent of and impacts to forested habitat (forest complexes and other forest remnants) in the vicinity of the project area.

Table 1: Forested Habitat Summary of Extent and Impacts Within the Project Area

Forest Complex Name	Extent (ac)	Impacts (ac) within existing linear transportation ROW	Impacts (ac) within 100 buffer outside of existing ROW	Impacts (ac) within ROW plus 100 foot buffer outside of ROW	Impacts (ac) outside of the 100 foot buffer	Total Forest Impacts (ac)
101st Avenue North	16.8	0.00	0.00	0.00	0.00	0.00
Target Corp #1	20.4	0.06	0.00	0.06	0.46	0.51
Target Corp #2	23.2	0.16	1.74	1.90	2.81	4.70
Shingle Creek	20.7	0.00	0.00	0.00	0.00	0.00
Grimes Pond	11.9	0.01	0.06	0.06	0.00	0.06
North Rice Pond – Mary Hills	57.5	2.59	0.70	3.29	0.01	3.30
St. Mary Margaret – MPRB	6.9	0.07	0.05	0.12	0.18	0.29
Theodore Wirth	62.1	2.80	2.40	5.20	3.49	8.69
Highway 55	24.7	0.31	0.07	0.38	0.00	0.38
Xerxes	24.9	0.00	0.00	0.00	0.00	0.00
Forest Complex Total	**269.1**	**5.99**	**5.01**	**10.99**	**6.94**	**17.93**
Individual Forest Remnant Total	**198.6**	**6.44**	**2.53**	**8.97**	**1.64**	**10.61**
Forest Complex and Individual Forest Remnant Total	**467.6**	**12.43**	**7.54**	**19.96**	**8.57**	**28.54**

In summary, the total extent of forest complexes in the vicinity of the BLRT Extension project area is approximately 269 acres. Of this total extent, about 18 acres would be impacted of which about 11 acres are within the right-of-way (ROW) and a 100-foot buffer outside of the ROW, and about 7 acres are outside of the 100-foot ROW buffer. Additionally, the total extent of small fragmented forested remnants in the vicinity of the BLRT alignment is about 199 acres. Of this total extent, approximately 11 acres of fragmented forest remnants would be impacted. Approximately 9 acres of impacts to forest fragments are within the ROW and 100-foot ROW buffer, and about 2 acres are outside of the 100-foot ROW buffer. These impacts are distributed over 77 individual small forest fragments.

Final 4(d) Rule for NLEB

On January 14, 2016 the USFWS published the Final 4(d) Rule for the NLEB. The Final 4(d) Rule is less restrictive than the Interim 4(d) Rule because it was determined that the overwhelming cause of the decline of the NLEB (and other bat species) is White Nose Syndrome. Habitat loss as a result of human activity was determined to be a considerably less important factor in the decline of bat populations. See USFWS Briefing at: http://www.fws.gov/Midwest/endangered/mammals/nleb/pdf/BriefingFinal4dRuleNLEB13Jan2016.pdf

The Final 4(d) Rule states that if tree clearing will occur at a distance of greater than ¼ mile of a hibernacula entrance or greater than 150 feet from a known maternity roost tree, then no seasonal restrictions on tree clearing would be imposed. See Question #7 in the "*Key to the Northern Long-Eared Bat 4(d) Rule for Federal Actions That May Affect Northern Long-Eared Bats*" (http://www.fws.gov/midwest/endangered/mammals/nleb/pdf/KeyFinal4dNLEB_FedAgencies17Feb2016.pdf). Also, tree clearing outside of the ¼ mile hibernacula buffer and outside of the 150-foot maternity roost tree buffer would lead to the appropriate conclusion of "May Affect, Incidental Take Not Prohibited".

Bald Eagle

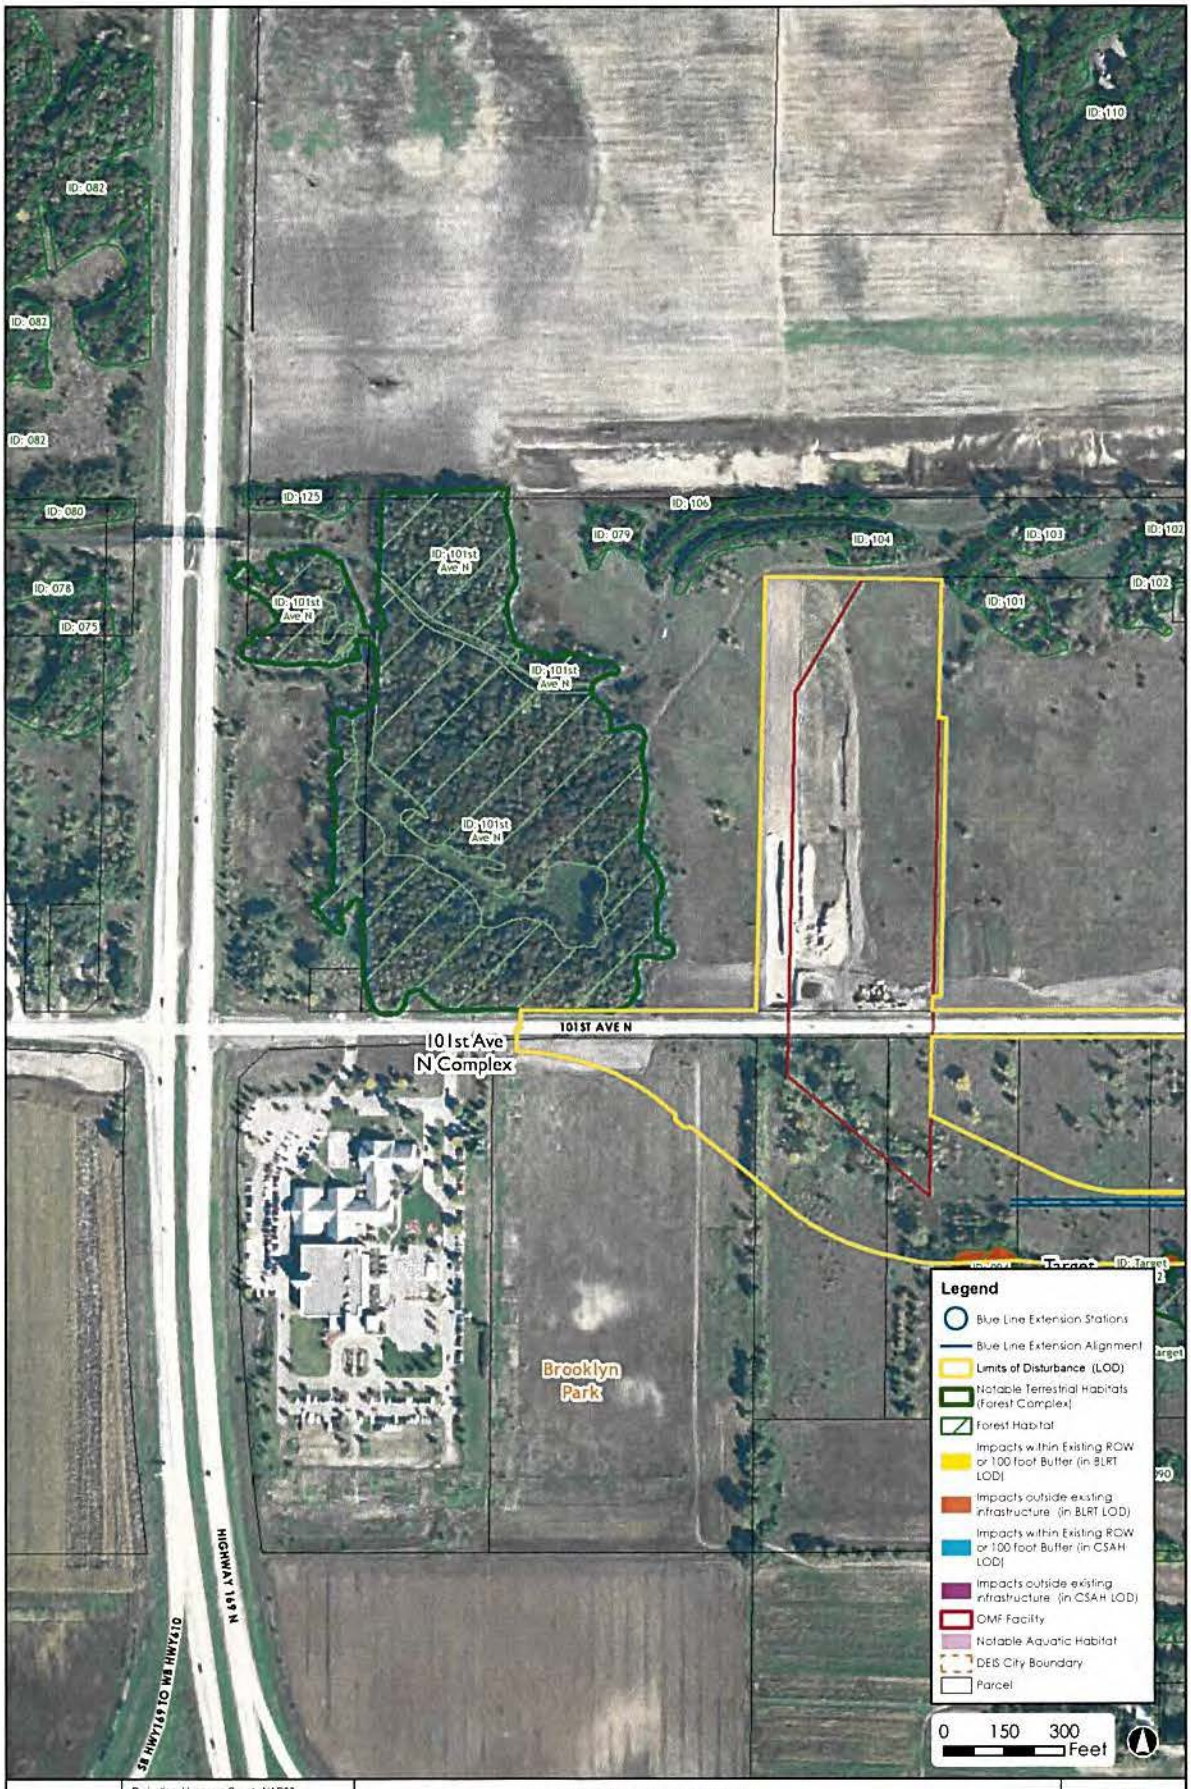
The FTA is aware that the bald eagle (*Haliaeetus leucocephalus*) has been documented to nest within approximately one mile of the BLRT Extension project area. Nest locations often change and nesting could occur within the project area prior to construction, during construction and in the post-construction phase. While the Bald Eagle has been de-listed from the Federal Endangered Species List and is outside of the scope of Section 7 Consultation, it is still afforded protections under the Bald and Golden Eagle Protection Act (BGEPA), the Migratory Bird Treaty Act (MBTA), and the Lacey Act. The Metropolitan Council will monitor potential nesting activity in the vicinity of the project area and will consult with the USFWS if it is evident that construction activities may disturb bald eagles or their nests.

Conclusions and Path Forward

Based on the aforementioned consultation with the USFWS, the FTA concludes the following:

1) There are no NLEB hibernacula within the BLRT Extension project area per consultation with USFWS and review of the NHIS database. Per NHIS database review and USFWS consultation, there is a known hibernacula along the Mississippi River in the City of Minneapolis; however, the BLRT Extension project will not impact this hibernacula.
2) There are no known NLEB maternity colonies within Hennepin County which includes the entire BLRT Extension project area per consultation with the USFWS and NHIS database review.
3) Based on the Final 4(d) Rule, FTA, in consultation with the USFWS, has determined that the appropriate finding under the ESA for the NLEB is: "May Affect, Incidental Take Not Prohibited".
4) Based on the Final 4(d) Rule and project site characteristics, FTA, in consultation with the USFWS, concludes that there would be no seasonal restrictions imposed on tree clearing throughout the entire BLRT Extension project area.
5) Based on the Final 4(d) Rule, FTA, in consultation with the USFWS, concludes that no acoustic bat surveys would be required throughout the BLRT Extension project area.

RE: METRO Blue Line Light Rail Extension Project – Consultation under Section 7 of the Endangered Species Act



The FTA requests USFWS concurrence on the determination of "May Affect, Incidental Take Not Prohibited" for the BLRT Extension project relative to the NLEB. Please contact Reggie Arkell, Community Planner, at (312) 886-3704 or reginald.arkell@dot.gov if you have any questions. Thank you.

Sincerely,

Marisol R. Simón

---

Andrew:

Pursuant to our conversation on 5/5/16, please see the attached *Northern Long-Eared Bat 4(d) Rule Streamlined Consultation Form* (NLEB Form) completed and signed by FTA. I understand from you that submission of this form by email is sufficient. This is follow-up documentation you had requested in relation to FTA's 3/7/16 Section 7 ESA consultation and concurrence request to USFWS concerning the Metro Blue Line Light Rail Transit Extension Project. FTA is requesting a response from USFWS at your earliest convenience on the information and conclusions/determinations provided in our 3/7/16 letter and the NLEB form. Thank you very much for your assistance.

Northern Long-Eared Bat 4(d) Rule Streamlined Consultation Form

Federal agencies should use this form for the optional streamlined consultation framework for the northern long-eared bat (NLEB). This framework allows federal agencies to rely upon the U.S. Fish and Wildlife Service's (USFWS) January 5, 2016, intra-Service Programmatic Biological Opinion (BO) on the final 4(d) rule for the NLEB for section 7(a)(2) compliance by: (1) notifying the USFWS that an action agency will use the streamlined framework; (2) describing the project with sufficient detail to support the required determination; and (3) enabling the USFWS to track effects and determine if reinitiation of consultation is required per 50 CFR 402.16.

This form is not necessary if an agency determines that a proposed action will have no effect to the NLEB or if the USFWS has concurred in writing with an agency's determination that a proposed action may affect, but is not likely to adversely affect the NLEB (i.e., the standard informal consultation process). Actions that may cause prohibited incidental take require separate formal consultation. Providing this information does not address section 7(a)(2) compliance for any other listed species.

Information to Determine 4(d) Rule Compliance:	**YES**	**NO**
1. Does the project occur wholly outside of the WNS Zone[1]?	☐	☒
2. Have you contacted the appropriate agency[2] to determine if your project is near known hibernacula or maternity roost trees?	☒	☐
3. Could the project disturb hibernating NLEBs in a known hibernaculum?	☐	☒
4. Could the project alter the entrance or interior environment of a known hibernaculum?	☐	☒
5. Does the project remove any trees within 0.25 miles of a known hibernaculum at any time of year?	☐	☒
6. Would the project cut or destroy known occupied maternity roost trees, or any other trees within a 150-foot radius from the maternity roost tree from June 1 through July 31.	☐	☒

You are eligible to use this form if you have answered yes to question #1 **or** yes to question #2 **and** no to questions 3, 4, 5 and 6. The remainder of the form will be used by the USFWS to track our assumptions in the BO.

Agency and Applicant[3] (Name, Email, Phone No.): *Marisol R. Simon, Regional Administrator, Federal Transit Administration Region 5; contact person – Reginald Arkell, Community Planner, reginald.arkell@dot.gov, (312) 886-3704*

Project Name: *METRO Blue Line Light Rail Transit Extension Project (BLRT Extension project)*

Project Location (include coordinates if known): *Western Minneapolis, Golden Valley, Robbinsdale, Crystal, and Brooklyn Park, MN*

Basic Project Description (provide narrative below or attach additional information): *The BLRT Extension project is a 13-mile light rail transit line that would be located in Hennepin county and extend westward along Trunk Highway (TH) 55 from Target Field Station to the BNSF Railway Monticello Subdivision at the eastern edge of Theodore Wirth Regional Park. It would then follow the BNSF*

Agency Determination:

By signing this form, the action agency determines that this project may affect the NLEB, but that any resulting incidental take of the NLEB is not prohibited by the final 4(d) rule.

If the USFWS does not respond within 30 days from submittal of this form, the action agency may presume that its determination is informed by the best available information and that its project responsibilities under 7(a)(2) with respect to the NLEB are fulfilled through the USFWS January 5, 2016, Programmatic BO. The action agency will update this determination annually for multi-year activities.

The action agency understands that the USFWS presumes that all activities are implemented as described herein. The action agency will promptly report any departures from the described activities to the appropriate USFWS Field Office. The action agency will provide the appropriate USFWS Field Office with the results of any surveys conducted for the NLEB. Involved parties will promptly notify the appropriate USFWS Field Office upon finding a dead, injured, or sick NLEB.

Signature: _____ Date Submitted: 5/5/2016

[4] Any activity that temporarily or permanently removes suitable forested habitat, including, but not limited to, tree removal from development, energy production and transmission, mining, agriculture, etc. (see page 48 of the BO).
[5] If the project removes less than 10 trees and the acreage is unknown, report the acreage as less than 0.1 acre.
[6] If the activity includes tree clearing in June and July, also include those acreage in April to October.

Mr. Arkell,

We have received your determination that this project will fall under the "may affect, but take not prohibited" determination of the Final 4(d) Rule. I have reviewed this project and the action area is greater than 0.25 acres from any known northern long-eared bat hibernacula and more than 150-feet from any known occupied maternity roost tree. This project meets the requirements under the Final 4(d) Rule and tree clearing may proceed without waiting the 30-days from the date submitted.

This project has also been reviewed in regards to Higgins eye pearlymussel and snuffbox and no impacts are anticipated. There are no known bald eagle nests within 660 feet of the proposed project, however, it an active nest is discovered within 660 feet from your work area or removal of an inactive nest is unavoidable, our office should be contacted. Thank you and let me know if you have any additional questions.

- Andrew

Re: USEPA Comments on the Draft Environmental Impact Statement (DEIS)
Bottineau Transitway, Hennepin County, Minnesota – CEQ No. 20140108

Dear Mr. Westlake:

Thank you for the U.S. Environmental Protection Agency's (EPA's) letter dated May 27, 2014, commenting on the Bottineau Transitway (now referred to as the Blue Line Light Rail Extension, or BLRT) Draft Environmental Impact Statement (Draft EIS), published in April 2014 by the Federal Transit Administration (FTA), the Metropolitan Council (Council), and the Hennepin County Regional Railroad Authority. Since publication of the Draft EIS, the Council has taken sole responsibility as the local Project sponsor and has been working with stakeholders and the FTA to prepare the Project's Final Environmental Impact Statement (Final EIS). The publication of the Final EIS is anticipated in July 2016. Although the FTA indicated in the project's Draft EIS its intent to publish a combined Final EIS/Record of Decision (ROD), the decision has subsequently been made to publish these documents separately.

This response letter is not intended to be the official response to your comments as required under 23 CFR Part 771.125 (a)(1) and under 23 CFR Part 774, but rather to provide USEPA context on how the Project has been defined as a Preferred Alternative for inclusion in the Final EIS. The FTA and the Council are available to meet to discuss USEPA's comments on the Draft EIS prior to publication of the Final EIS if you would like to discuss any issues in greater detail.

The letter is organized by the themes identified in EPA's letter of May 27, 2014 – a copy of which is attached for ease of reference. Under each theme, the EPA made recommendations, which are re-stated below along with a summary of the ways in which the issue will be addressed in the Final EIS and Record of Decision (ROD).

ALTERNATIVES

Recommendation: EPA recommends the FEIS identify how station location decisions will be made. These decisions should be documented based on how alternatives fulfill project purpose and need and their impacts.

FTA Response:

Decisions regarding the locations of stations for the proposed BLRT Extension project were made consistent with the Metropolitan Council's *Regional Transitway Guidelines* document (February 2012), which states that the identification of transitway station areas should be based on travel demand demonstrated through rigorous market analysis of existing and planned future conditions and articulates standards for station spacing and configuration based on transitway mode. This reference is included in Chapter 2 of the Final EIS with a link to the guidance document: http://www.metrocouncil.org/Transportation/Publications-And-Resources/RegionalTransitwayGuidelines-pdf.aspx.

EPA's recommendation was prefaced by the observation that two station locations, at Plymouth Avenue and at Golden Valley Road, were identified as part of the locally preferred alternative (LPA) alignment in the Draft EIS, but only one station was presumed for ultimate selection as part of the Preferred Alternative. Selecting one, or both, of these stations and identifying the basis for this decision in the Project's Final EIS was one of the key technical issues identified for resolution by the Met Council early in the Project Development phase.

Input received on resolving the issue of whether both a Golden Valley Road and a Plymouth Avenue station should be included in the Final EIS Preferred Alternative included comments received during the Draft EIS period. The City of Golden Valley, in their comment letter, pointed out the importance of the Golden Valley Road station to serve their residents, to provide a transit connection for existing bus routes on Golden Valley Road, and to serve nearby businesses, including the Kenny Courage Rehabilitation Institute located approximately 1/3-mile from the Golden Valley Road Station. The City of Minneapolis, in their Draft EIS comment letter, supported the construction of the Plymouth Avenue and Golden Valley Road stations, stating "both [are] necessary to adequately serve the corridor travelshed, including a significant portion of North Minneapolis."

Input received by the Council after publication of the Draft EIS further clarified the need for both stations to serve distinct travel markets. This input included a resolution passed by the Minneapolis Park and Recreation Board in November 2015 supporting the construction of both stations as well as an action by the Project's Corridor Management Committee to include the construction of both stations as part of the Project's scope and budget.

The Project's Final EIS will provide a through discussion of both the technical and public input process that led to decision-making regarding the decision to construct both the Plymouth Avenue and the Golden Valley Road stations. This information will include ridership estimates, constructability, design requirements, environmental impacts, any mitigation requirements, and stakeholder input.

> ***Recommendation:*** *We [EPA] recommend the FEIS identify how the OMF location decision will be made. We recommend selection of the alternative at CR 103 and 93rd Avenue because of its apparent fewer impacts.*

FTA Response:

The OMF location decision was made based on availability of sufficient property, design and operational requirements, environmental impact analyses, and stakeholder input. Summary-level discussion of this process is included in Chapter 2 of the Final EIS and the siting of the proposed Blue Line Extension project OMF is identified as Issue 12 of the project's issues resolution process (also described in Chapter 2 of the Final EIS). Since the publication of the Draft EIS, a private developer has acquired the proposed OMF site at CR 103 and 93rd Avenue and has started construction of a series of office/warehouse buildings; therefore, this site is no longer under consideration. The proposed OMF site at CR 103 and 101st Avenue will be the location identified as the Preferred Alternative in the Final EIS. The project design team has evaluated different layouts for the OMF facility that take into consideration park property, wetlands, long range development plans, and stakeholder input. The adverse effects associated with the CR 103 and 101st Avenue site, noted in the Draft EIS, have been avoided through a process of local stakeholder coordination and engineering solutions. Specifically, the Preferred Alternative OMF has been re-oriented in a north-south direction to avoid the potential permanent impacts to Three Rivers Park District property noted in the Draft EIS and to minimize wetland impacts. This location is also removed from any residents or other types of land uses potentially affected by noise or other activities associated with the OMF. Furthermore, the OMF siting accommodates the City of Brooklyn Park's plans for future development in this area and is consistent with these planned land uses and development.

> ***Recommendation:*** *We [EPA] recommend the FEIS acknowledge that Alternative B-C-D1 does not cause the least damage to the biological and natural resources of the physical environment.*

FTA Response:

The FTA concurs that Alternative B-C-D1 does not cause the least damage to the biological and natural resources of the physical environment. This will be acknowledged in the Project's Final EIS. In addition, an explanation of the selection of the locally preferred alternative, especially the potential for disproportionately high and adverse impacts on minority and low-income populations associated with the alternative not selected, will be provided in the Final EIS as well.

AIR QUALITY

> ***Recommendation:*** *Because MSATs [Mobile Source Air Toxics] can cause adverse health impact, especially to vulnerable populations such as children, the elderly, and those with existing respiratory health issues, EPA recommends the FEIS identify potential mitigation measures to decrease the exposure of these populations to MSATs emissions during construction and operation of the proposed project. Such measures may include, but should not be limited to, strategies to reduce diesel emissions, such as project construction contracts that require the use of equipment with clean diesel engines and the use of clean diesel fuels, and limits on the length of*

time equipment is allowed to idle when not in active use (EPA recommends idling not exceed 5 minutes).

FTA Response:

The current understanding of Mobile Source Air Toxics (MSATs) indicates that in general, MSATs will decline even if vehicle miles traveled increase. This is demonstrated in an FHWA analysis using the EPA's MOVES2012b model, where a 102% increase in VMT between 2010 and 2050 still allows an 83% reduction in priority MSATs. This reduction, even under a VMT growth scenario, is attributable to emission control technology and modern fuels[1]. The proposed BLRT project will result in a slight reduction of VMT in the project area, therefore an increase in MSATs from LRT operations is highly unlikely. A qualitative discussion of MSATs will be included in the Final EIS to document these findings.

Construction activities do indeed have the potential for temporary increases in MSAT emissions; the Final EIS will discuss mitigation measures to reduce such emissions during construction activities, including identifying potential equipment types and operational parameters to reduce MSAT emissions.

Recommendation: ***We [EPA] recommend that the FEIS identify and discuss any anticipated effects of climate change on the project and possible adaptation measures. For example, discuss any effects that predicted increase in the number and/or intensity of precipitation events associated with climate change may have on sizing bridge spans, culvert openings, and stormwater management measures in order to accommodate such events and ensure project longevity, public health, and safety.***

FTA Response:

The potential effects of climate change will be discussed in the Final EIS. The requirements of Executive Order 13690 (pertaining to infrastructure resiliency relative to extreme precipitation/flood events and the frequency of such events) is also included in the FEIS, and are being incorporated into the Project design. The necessary mitigation for water resource impacts associated with these designs will be disclosed in the Final EIS.

WATER RESOURCES – WETLANDS AND STREAMS

Recommendations: ***EPA recommends the FEIS include:***

- ***A specific discussion of how sequencing established by the Clean Water Act Section 404(b)(1) guidelines has been applied. This sequence is: avoidance first, then demonstrated impact minimization, then mitigation remaining unavoidable, minimized impacts;***
- ***A 404(b)(1) analysis; and,***

[1] FHWA Interim Guidance Update on Mobile Source Air Toxic Analysis in NEPA, December 6, 2012.

- ***A discussion on proposed mitigation for unavoidable, minimized wetland and stream impacts.***

FTA Response:

The United States Army Corps of Engineers (USACE) is a cooperating agency on the proposed BLRT Extension project, which is being advanced under the NEPA/404 Merger process. The NEPA/404 Merger process provides a series of concurrence points that can be considered formal documentation of the sequencing process in accordance with the 404(b)(1) guidelines. Specifically:

- Concurrence point 1 is agreement on the purpose and need for the proposed project. The USACE provided input to the FTA and the local project sponsor regarding the purpose and need, and agreed on the final purpose and need for the project as documented in their letter dated June 19, 2013.
- Concurrence point 2 is agreement on the alternatives to be evaluated in the NEPA document; the USACE reviewed the alternatives considered in the studies leading up to the Draft EIS, and agreed with the set of alternatives carried forward in the Draft EIS. This concurrence point was documented in the same June 19, 2013 USACE letter.
- Concurrence point 3 is the agreement on the Least Environmentally Damaging Practicable Alternative (LEDPA). The USACE reviewed the social, economic, and environmental impacts associated with the alternatives analyzed in the Draft EIS, and concluded that the locally preferred alternative (Draft EIS alternative B-C-D1) was the LEDPA when taking into account impacts to all resources. The USACE documented their agreement on concurrence point 3 in a letter dated October 1, 2013.
- Concurrent point 4 is the agreement on minimization and mitigation strategies. The Council submitted a Minnesota Interagency Water Resource Application (a joint Section 404/Minnesota Wetland Conservation Act (WCA) permit application) for the proposed BLRT Extension project on May 16, 2016. Section 5.5.1 of the application document provides a summary of the engineering measures taken to minimize wetland impacts, and Section 5.6 presents proposed wetland mitigation. The USACE reviewed the permit application and provided agreement on concurrence point 4 in a letter dated June 16, 2016.

A copy of the Minnesota Interagency Water Resource Application, including copies of the concurrence point letters from the USACE, will be included in the Final EIS appendices.

Recommendations:

- ***The FEIS should include wetland delineations, USACE jurisdictional determinations, and wetland and stream quality assessments. This information should encompass all areas of right-of-way (ROW, adjacent construction access and access road locations, staging areas, station locations, and park-and-ride lots) associated with the Preferred***

Alternative. This information will provide accurate baseline data on existing wetlands and water resources, and accurate quantification of potential impacts.

- ***To help inform decisions regarding the location of the OMF and choice between two station locations in Alignment D1, the FEIS should include potential aquatic resource impacts for all options, based on wetland delineations, and wetland and stream quality assessments.***
- ***Potential permanent and temporary wetlands and stream impacts noted on FEIS impact summary tables and impact narratives in the FEIS should be based on the delineations and assessments. The FEIS should address and discuss construction staging and access, and identify how wetlands adjacent to construction areas will be protected from incidental fill during construction. Restoration of all temporary wetland impacts should also be discussed.***
- ***The FEIS should discuss stream impacts associated with each alignment, station locations, and potential OMF locations. The FEIS should provide impact summary totals for the preferred alignments [i.e., linear footage of impact, stream impact location maps (including new or modified stream crossings or culvert work, with narrative discussion of impacts), and a description of stream impacts].***

FTA Response:

During the development of the Final EIS, wetland delineations were conducted along the entire proposed BLRT Extension project corridor, including all stations, park-and-ride locations, construction access areas, and the OMF. The delineations were reviewed and approved by USACE staff as well as state and local staff responsible for implementation of the Minnesota WCA. Jurisdictional determinations were made for the entire project; a total of about 4.16 acres of USACE-jurisdictional wetland impact and about 6.28 acres of WCA-jurisdictional wetland impact were identified.

The proposed BLRT Extension project includes stations at both the Plymouth Avenue and Golden Valley Road locations; the wetland delineation information indicated that the majority of wetland impacts in these locations was from the freight rail and light rail alignments and not the footprint of the stations. The difference in wetland impact between constructing one, the other, or both stations was negligible, and was not a determining factor in the selection of the stations.

The OMF was reoriented from what was shown in the Draft EIS and the footprint of the facility was reduced to avoid park property and minimize wetland impacts.

Chapter 5 of the Final EIS will include a summary of the anticipated temporary and permanent wetland and stream impacts, and will also include a discussion of minimization and mitigation requirements for permanent and temporary water resource impacts. A copy of the Minnesota Interagency Resource Application will be included in the final EIS appendices; this application

also includes a copy of the USACE letter approving concurrence point 4 (agreement on minimization/mitigation strategies). The Final EIS

> ***Recommendation:*** ***The FEIS should provide information on the location and number of proposed stream crossings or stream impacts (associated with culvert repair, extension, etc.), whether or not the waterbody is a 303(d)-listed waterbody or upstream of a 303(d)-listed waterbody, and describe how the project could potentially affect each listed waterbody with regard to specific listed impairments.***

FTA Response:

The Water Quality and Stormwater section of the Final EIS will disclose the number of stream crossings (two – Shingle Creek and Basset Creek). A discussion of impaired (303(d)-listed) waters will be included in the Water Quality and Stormwater section (see table below), along with short- and long-term mitigation measures to avoid impacts to receiving waters.

Table 5.9-2. Downstream Impaired Waters within 1 Mile of the BLRT Extension Project

Impaired Receiving Water	Impairments	Total Maximum Daily Load (TMDL) Status
Mississippi River	Mercury In fish tissue; fecal coliform; polychlorinated biphenyls (PCB) in fish tissue	*Upper Mississippi River Bacteria TMDL and Protection Plan* (2014)
Bassett Creek	Chloride; fecal coliform; fishes bioassessments	Included in the above TMDL plan
Crystal Lake	Nutrient/eutrophication biological indicators	*Crystal Lake Nutrient TMDL Implementation Plan* (2009)
Twin Lakes: Lower, Middle, and Upper	Mercury in fish tissue; nutrient/ eutrophication biological indicators; PCB in fish tissue; perfluorooctane sufonate (PFOS) in fish tissue	*Twin and Ryan Lakes Nutrient TMDL* (2007); plans are required for mercury, PCB, and PFOS
Shingle Creek	Aquatic macroinvertebrate bioassessments; chloride; dissolved oxygen	*Shingle and Bass Creeks Biota and Dissolved Oxygen TMDL Implementation Plan* (2012); *Shingle Creek Chloride TMDL Implementation Plan* (2007)

Recommendations:

- ***EPA recommends that FTA coordinate with the USACE, U.S. Fish and Wildlife Service (USFWS), EPA and Minnesota Department of Natural Resources (MnDNR) to determine if wetland mitigation for indirect impacts is expected and required. If mitigation for indirect impact, to include shading, is required, the FEIS should discuss this point.***

- ***The FEIS should discuss acreages of impact from both direct and indirect impacts, as well as proposed mitigation ratios for both direct and indirect wetland impacts.***
- ***The FEIS should discuss temporary wetland impacts, and how those wetland impacts will be restored. Monitoring of restored wetland areas to ensure full restoration is expected. Conceptual monitoring plans should be included in the FEIS.***
- ***To avoid confusion or misunderstanding of the information depicted on project figures, we also recommend that FEIS project figures/drawings include comprehensive legends.***

FTA Response:

- Coordination has taken place with the USACE, DNR, Minnesota Board of Water and Soil Resources, and local agencies responsible for implementing WCA regarding indirect impacts to wetlands. The USFWS was also consulted regarding the proposed BLRT Extension project; however, they did not express concerns regarding impacts to wetland resources.
- The Final EIS will discuss acreages of wetland impact. Two locations where shading from bridges over wetland areas could create indirect impacts were identified; however, the impacts were calculated conservatively using the footprint of the bridge deck rather than the cross-section of the bridge piers, and were reported as direct impacts. Mitigation has been calculated using direct impact ratios of 2 (mitigation):1 (impact) which is more conservative than indirect wetland impact mitigation ratios.
- Temporary wetland impacts are disclosed in the Minnesota Interagency Water Resource Application and will be summarized in the Final EIS. Restoration of temporary wetland impacts will be subject to monitoring to document restoration. It is anticipated that restored wetland areas will be monitored on the same schedule as on-site wetland mitigation areas.
- All figures in the Final EIS will include comprehensive legends..

THREATENED OR ENDANGERED SPECIES

Recommendation: EPA recommends that FTA continue to coordinate with USFWS and the MnDNR to determine if any of the proposed activities would or could detrimentally affect any Federally- or state-listed species, species proposed for listing, or their critical habitat. The FEIS should include updated correspondence from USFWS and MnDNR confirming whether the proposed project will, or will not, affect any Federally- or state-listed threatened or endangered species, including the northern long-eared bat and the Blanding's turtle.

FTA Response:

The Final EIS design and planning team has worked in close coordination with the USFWS and MnDNR concerning the potential for impacts to federal and state-listed species including the northern long-eared bat and Blanding's turtle. USFWS has concurred with FTA's determination that the proposed BLRT Extension project falls under the "may affect, incidental take not prohibited" determination of the Final 4(f) Rule for the northern long-eared bat; this concurrence is documented in an e-mail dated May 16, 2016. No other impacts to federal-listed species is anticipated. The Minnesota DNR concurred with the assessment of impacts to state-listed species in an e-mail on February 9, 2016.

> ***Recommendation: These [standards for avoiding impacts to bald eagle nesting sites and future eagle nest surveys] guidelines and surveys are commitments that should be reiterated and formalized in the FEIS/ROD.***

FTA Response:

Eagle nest locations are currently known, though nest locations do change from year to year. As noted in Section 5.8 of the Final EIS, appropriate and reasonable measures to avoid and minimize impacts to eagles, their nests and habitat will be taken and these measures will be documented in the Final EIS.

> ***Recommendation: [In reference to pre-construction surveys of bridge structures and forested areas within the construction limits for the presence of Migratory Bird Treaty Act species' nests] The FEIS should specify the agencies with which consultation will be undertaken, and specify the timeframes during which mitigation measures will be implemented. These surveys and mitigation measures should be commitments in the FEIS/ROD.***

FTA Response:

Bridges and structures have been surveyed for the presence of swallow's nests (afforded protections under the Migratory Bird Treaty Act) during the 2015 field season. Forested areas that will be impacted as a result of the proposed BLRT are disturbed from urban fragmentation and as a result, nests present within them likely have a high rate of nest parasitism from brown-headed cowbirds, an aggressive species. As noted in Section 5.8, appropriate and reasonable measures will be taken to avoid and minimize impacts to migratory nesting bird species. These measures and commitments, developed in consultation with the USFWS, will be described in the Final EIS and ROD.

> ***Recommendation: EPA recommends that FTA continue coordination efforts with USFWS and state wildlife agencies as appropriate to meet the conditions of the Fish and Wildlife Coordination Act. Correspondence to and received from coordinating agencies documenting FWCA coordination should be included in the FEIS/ROD.***

FTA Response:

FTA agrees and the requested correspondence documenting coordination efforts with US Fish and Wildlife and with the Minnesota Department of Natural Resources will be included in the Final EIS.

FLOODPLAINS

> **Recommendation: We [EPA] recommend the FEIS provide information on potential floodplain impacts (acres of impact plus acre-feet of impact), and potential floodplain mitigation information (including expected mitigation ratios, updates on status of coordination with permitting entities, and identification of potential mitigation sites that are not currently forested).**

FTA Response:
The Final EIS will include information regarding the extent of floodplain impacts based on more detailed design information than was available at the time of the Draft EIS publication. Section 5.2 of the Final EIS and/or Appendix F of the Final EIS supporting documentation will disclose the length of floodplain impact, whether the impact is linear or transverse, and the overall volume of floodplain impact by stream reach. Mitigation for floodplain impacts is being discussed with owners of the properties that lie within each stream reach. Mitigation will be in the form of compensatory flood storage, and will be provided at a one-to-one ratio. At this time, the mitigation site identified in the Draft EIS is a viable option. This option will be identified as floodplain mitigation in the Final EIS and is supported by the Minneapolis Park and Recreation Board (on whose property this site is partially located) as articulated in a resolution passed by the Board in November 2015. The site was damaged during a tornado in 2011; the opportunity exists to create compensatory flood storage, and introduce floodplain forest tree species to restore the forested nature of the area.

STORMWATER

> **Recommendation: All stormwater BMPs and detention area should be built and located outside of natural wetlands and streams. Existing natural wetlands should not be used as primary detention facilities, and any treated stormwater discharged to natural wetlands should not cause a change of existing wetland type and function (i.e., should not change an emergent wetland to an open water wetland, etc.). Sustainable stormwater technologies, including the use of pervious or porous pavement, should be utilized throughout the project.**

FTA Response:

Areas suitable for certain BMPs are somewhat limited in linear projects. In some cases, stormwater management may require BMPs (stormwater ponds, sediment forebays) to be placed at the perimeter of existing wetlands. Adjacent wetlands would then benefit from added hydrology which has been cleaned of sediments and pollutants in the BMP. Many wetlands in the project area are severely degraded as a result of a general lowering of the water table over

the past century. The team will strive to maintain the current functionality of wetlands, though addition of hydrology in some cases may enhance wetland functionality.

FORESTED IMPACTS

> **Recommendations: We [EPA] recommend the FEIS quantify acreage and number of upland trees to be removed by the project. EPA recommends further coordination with USFWS, MnDNR, and local municipalities regarding providing voluntary upland forested mitigation for these losses. The FEIS should include specific information on what forest mitigation is being offered (e.g., a summary of mitigation ratios, a summary of how mitigation will be offered). If applicable, the FEIS should clarify forest mitigation provided for bat habitat impacts versus forest mitigation provided for impacts to upland forest.**

FTA Response:

The FTA understands that the Council, as part of its preliminary design efforts, is conducting a detailed survey of existing trees that may be affected by project construction. This survey is anticipated to be complete in early fall 2016 (shortly after the publication of the Final EIS). This list will include the size and species of each tree greater than 6" diameter breast height (DBH) for trees within Minneapolis, Golden Valley, Robbinsdale, and Crystal; and greater than 4" DBH for trees within Brooklyn Park. FTA will document the process of coordinating with USFWS in the Project's Final EIS, including findings regarding potential impacts to the northern long-eared bat and its habitat. This coordination includes an inventory of existing forested complex areas and an assessment of Project impacts.

ADDITIONAL COMMENTS

> **Recommendations: We [EPA] recommend the FEIS include a vegetative management plan that addresses the identification and control of noxious weed/invasive species in and near the project ROW and associated facilities during project construction and operation. The plan should list the noxious weeds and exotic plants that occur in the resource area. In cases where noxious weeds are a threat, EPA recommends the document detail a strategy for prevention, early detection of invasion, and control procedures for each species.**

FTA Response:

The FTA takes the issues of noxious weeds and invasive plant species seriously. Through discussions with the Council, FTA understands that detailed noxious weed and invasive plant management strategies vary depending on the type of weed/plant to be controlled, the setting in which the weed/plan grows, and the construction and operating parameters of the light rail system. Rather than attempting to develop a detailed vegetative management plan at an early stage of design when little is known about construction staging, means and methods, and operational specifics; the Final EIS includes a commitment to develop a vegetation management plan including measures such as spot-spraying with appropriate herbicides and

cleaning equipment as it enters and exits the construction area along the proposed BLRT Extension Project. However, permanent eradication of invasive or noxious weeks in the study area would not be feasible. These measures are discussed in section 5.8.5.4 in the Final EIS.

> **Recommendation: EPA recommends project proponents consider using green building strategies for the Bottineau Transitway project.**

FTA Response:

To the extent feasible, the design of the BLRT project will incorporate green building strategies. These considerations will be more fully articulated as the Project proceeds into the Engineering phase of New Starts Project Development, which will occur at some point following FTA's issuance of a Project Record of Decision.

DEIS CORRECTIONS / ADDITIONS

> **Recommendation: In order to help avoid reader confusion, EPA recommends each of the above referenced terms [Locally Preferred Alternative or LPA, Preferred Alternative, Environmentally Preferred Alternative, Least Environmentally Damaging Preferred Alternative or LEDPA, and Least Environmentally Damaging Practicable Alternative or LEDPA] be defined in the FEIS Glossary of Terms and their associated acronyms included in the Acronyms section of the FEIS.**

FTA Response:

The Final EIS has been drafted to help avoid reader confusion, using clear and consistent terms for the proposed undertaking (the proposed BLRT Extension project), defining the Locally Preferred Alternative (LPA) and other technical terms. The Final EIS will include a glossary, and will provide a comprehensive list of acronyms used in the document. To the extent that the terms listed in the EPA's comment letter are confusing or synonymous, the FTA will strive to avoid using more than one term to explain or describe the same issue or item in the Final EIS.

> **Recommendation: EPA recommends the Acronym section of the FEIS identify the LEDPA acronym to mean "the least environmental damaging practicable alternative."**

FTA Response:

The FTA concurs that the acronym "LEDPA" means the "least environmentally damaging practicable alternative," and will document it as such in appropriate sections of the Final EIS.

We hope this additional information is useful and provides background information for how EPA's recommendations were responded to in the Project's forthcoming Final EIS, which is anticipated for publication later this summer.

Re: USEPA Comments on the Draft Environmental Impact Statement (DEIS)

F.2 BLRT Traffic Operations Technical Memorandum

This page intentionally left blank

To:	Nick Landwer, P.E. Director of Design and Engineering, Blue Line LRT Extension Project
From:	JoNette Kuhnau, P.E., PTOE Traffic Engineering Task Lead, Kimley-Horn and Associates, Inc.
Date:	November 12, 2015
Subject:	BLRT Traffic Operations Technical Memorandum

1.0 Introduction

The Blue Line Light Rail Transit Extension (BLRT) project is proposed to be a 13-mile LRT project with 10 or 11 new stations that will operate from downtown Minneapolis through Golden Valley, Robbinsdale, Crystal, and Brooklyn Park. The BLRT line will serve as an extension of the METRO Blue Line (Hiawatha Corridor) and will also connect to the METRO Green Line in downtown Minneapolis.

The traffic analysis presented in this memorandum is based on the project scope as presented to the Corridor Management Committee (CMC) through September 2015, and as shown in the BLRT Municipal Consent (MC) plans.

1.1 Purpose of Memorandum

This technical memorandum has been prepared in support of the BLRT project MC design and the Final Environmental Impact Statement (Final EIS). The objective of the traffic analysis is to define the scope of the project improvements and evaluate the potential traffic impacts of the project, including the following:

- Evaluate the project's impacts on traffic operations at existing and proposed intersections and at-grade rail crossings along or near the BLRT alignment.
- Identify proposed improvements to address operational issues identified in the traffic analysis.

The methodology, assumptions, and results of the analysis are presented in the following sections.

1.2 Study Areas

The location of the overall BLRT alignment is shown in **Figure 1**. The proposed BLRT guideway will be at-grade for most of its alignment and includes segments with the LRT operating in an exclusive guideway and semi-exclusive street-running operation. In the middle segments of the alignment, the LRT guideway operates adjacent to the BNSF Railway (BNSF) Monticello Subdivision, from approximately 73rd Avenue in Brooklyn Park to Trunk Highway (TH) 55 in Minneapolis. The locations of the intersections and at-grade crossings studied as part of the BLRT traffic analysis are shown in **Figures 2-6.** The analysis was broken into four segments based on the characteristics of the roadway and BLRT alignment, as shown in **Figure 1** and described below:

- Operations and Maintenance Facility (OMF) to TH 610 in Brooklyn Park – BLRT alignment side-running along County State Aid Highway (CSAH) 103 (West Broadway Avenue) and Oak Grove Parkway.

- TH 610 to CSAH 81 (Bottineau Boulevard)/73rd Avenue N intersection in Brooklyn Park – BLRT alignment generally center-running along CSAH 103 (West Broadway Avenue).
- CSAH 81 (Bottineau Boulevard)/73rd Avenue N intersection in Brooklyn Park to TH 55 (Olson Memorial Highway) in Minneapolis –BLRT alignment adjacent to the BNSF Monticello Subdivision freight rail alignment.
- TH 55 (Olson Memorial Highway) to Target Field Station in Minneapolis – BLRT alignment generally center-running along TH 55 (Olson Memorial Highway).

The alignment between 41st Avenue N in Robbinsdale and TH 55 (Olson Memorial Highway) in Minneapolis included only one intersection (Golden Valley Road/Theodore Wirth Parkway) in the traffic analysis because the BLRT alignment is generally grade separated from the roadway network through this area. The BLRT alignment crosses only one low-volume roadway (39 ½ Avenue N), and the crossing on 39 ½ Avenue N is a gated crossing with no nearby all-way stop or signalized intersections. The Golden Valley Road/Theodore Wirth Parkway intersection was included in the analysis based on the potential traffic impacts due to the proposed park-and-ride facility at the Golden Valley Road Station.

1.3 Data Collection

Multiple data elements were collected for each of the areas analyzed:

- 13-hour weekday counts at intersections including passenger vehicles, heavy vehicles, pedestrians, and bicycles
- Freight rail train lengths and crossing times
- On-site field survey to collect the following information:
  - Existing intersection geometry
  - Lane widths
  - Lane utilizations
  - Approximate peak hour queue lengths
  - Storage bay lengths to the nearest 10-ft increment
  - Approach speed limits
  - Traffic signal infrastructure, including emergency vehicle preemption
  - Relevant signage and pavement markings
- Timing and coordination plans for existing signalized intersections
- Bus routes, stops, and passenger loading/unloading

This data was used to assemble a comprehensive model of the existing conditions.

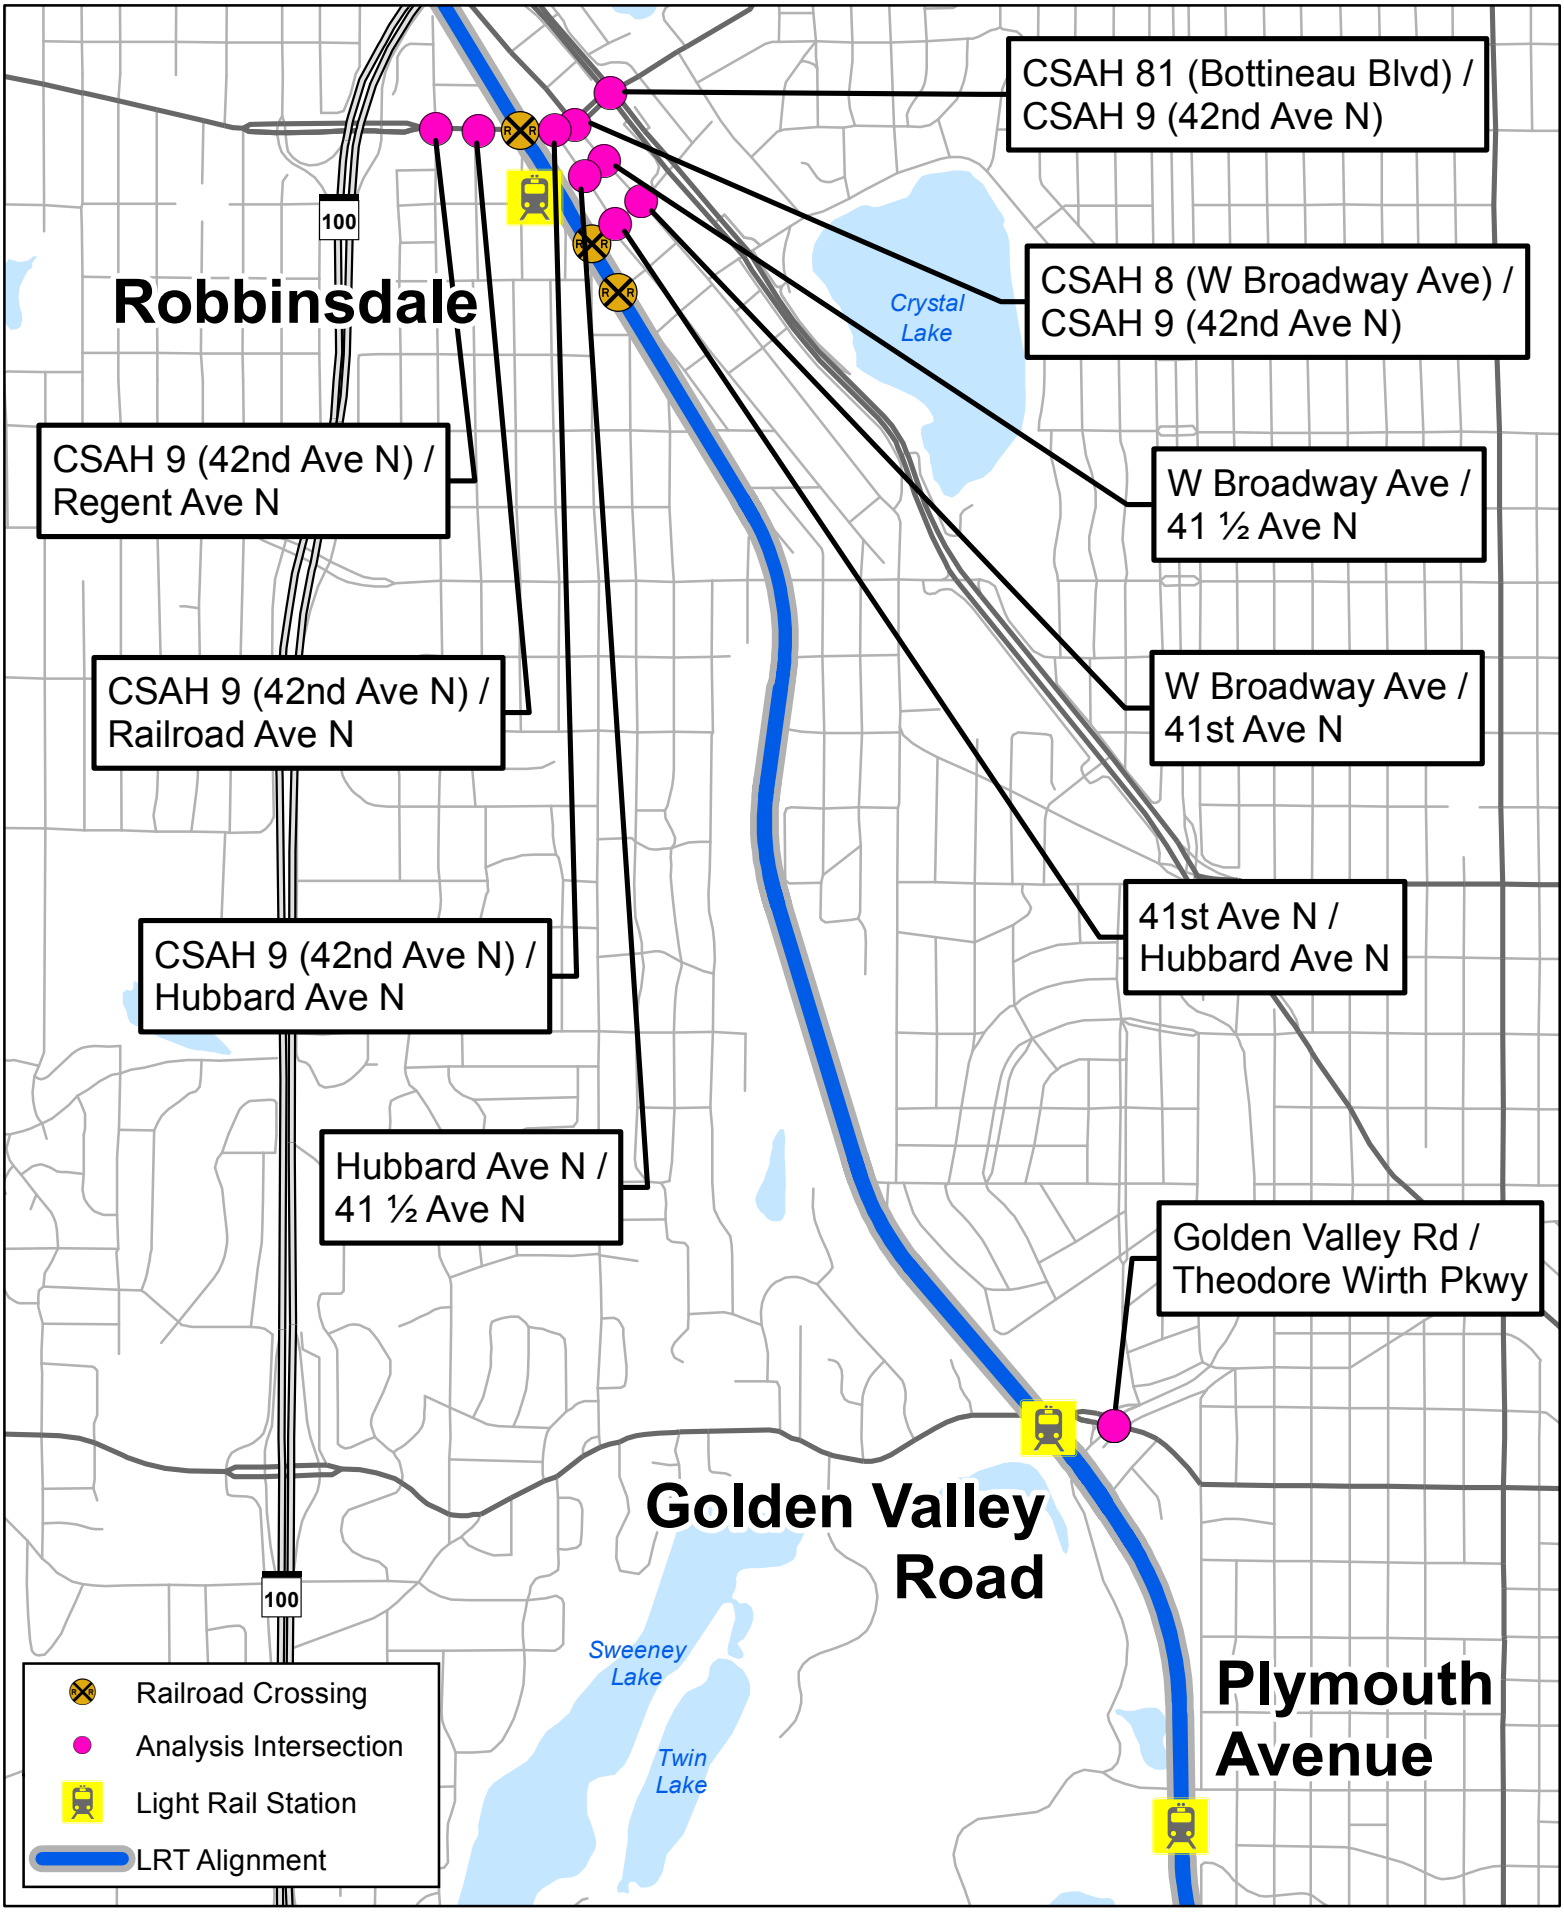

Figure 5. BLRT Traffic Analysis Intersections

0 0.2 0.4 Miles

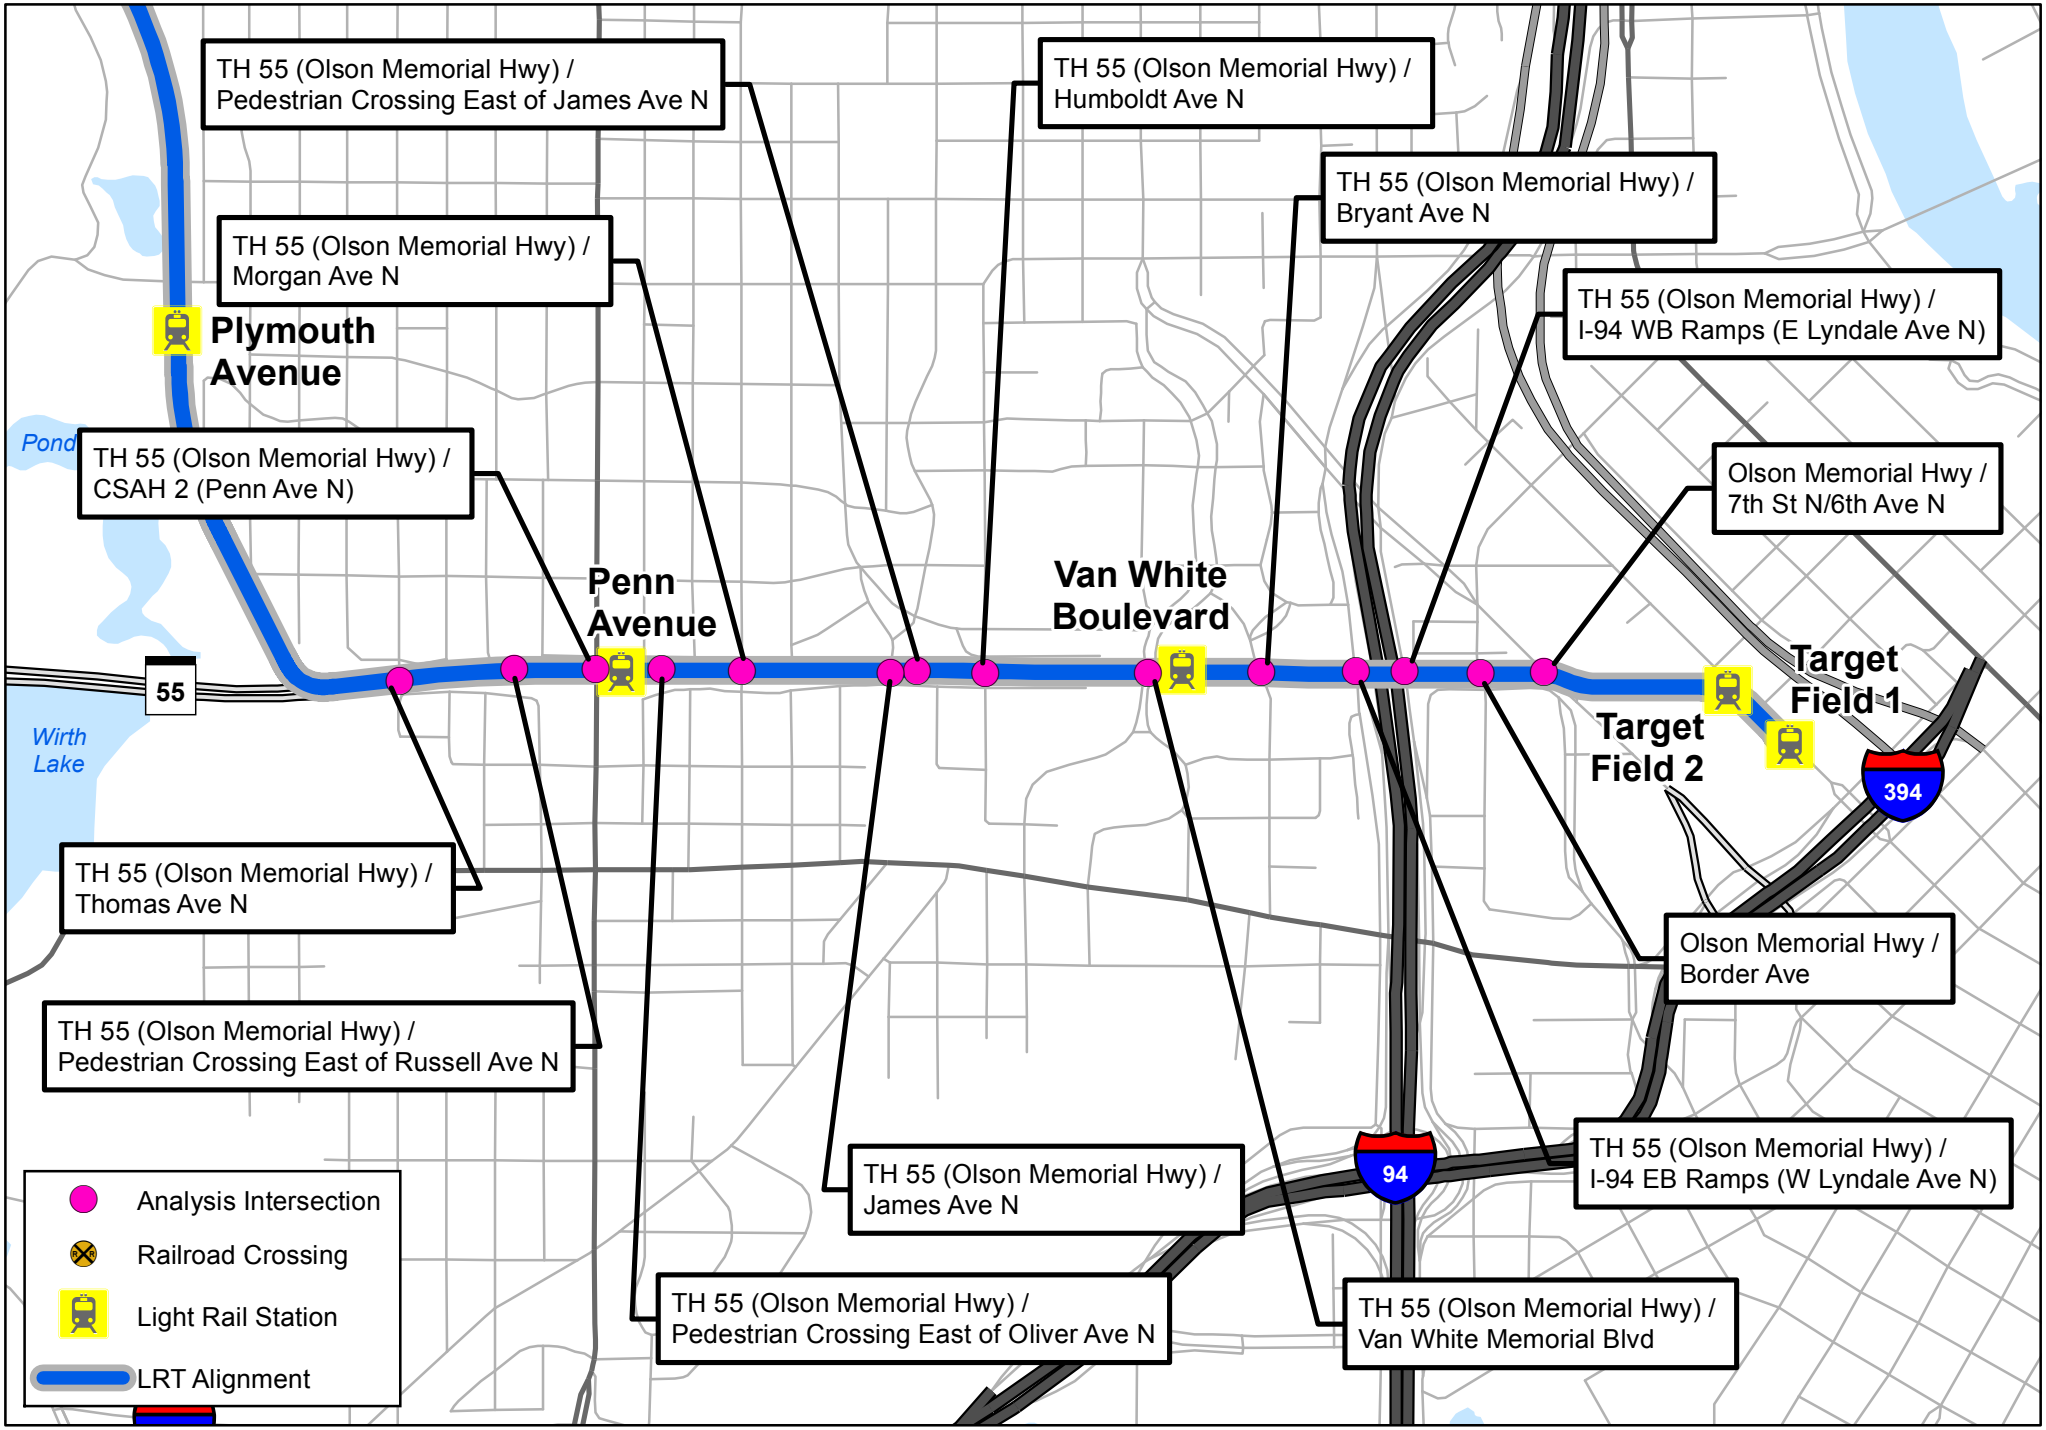

Figure 6. BLRT Traffic Analysis Intersections

2.0 Methodology

2.1 Key Intersections and At-Grade Crossings

To determine the impacts of the BLRT project on the local roadway network, a traffic operations analysis was conducted for signalized and unsignalized intersections within the vicinity of the new BLRT alignment or for intersections that would be expected to have increased traffic due to the BLRT stations, such as near park-and-ride facilities. The analysis area included signalized intersections with an LRT crossing in the intersection, the closest signalized or unsignalized intersections on both sides of an at-grade mid-block LRT crossing, and the intersections that provide access to a LRT station park-and-ride facility. At least two intersections were analyzed for each at-grade LRT crossing or park-and-ride facility. Additional intersections were analyzed based on their proximity to the crossing or park-and-ride facility and the potential for interaction with the crossing or park-and-ride facility. Grade separated crossings were not modeled because the LRT does not interact with pedestrian, bicycle, or vehicle traffic at these locations.

2.2 Forecast Traffic Volumes

The development of future year traffic forecasts for use in the simulation modeling was based on the preliminary 2040 socioeconomic data prepared by local communities and consistent with the Metropolitan Council's Thrive MSP 2040. This data was used as input to the Metropolitan Council's Regional Travel Demand Model. The outputs from the 2040 Regional Travel Demand Model were then compared to existing and historic traffic counts. This information, combined with the expected changes in land use and density, was utilized at a localized level to develop future year forecasts for each roadway segment within the project area. The traffic forecasting process is described in more detail in the *BLRT Traffic and Park-and-Ride Forecast Technical Memorandum* (2015).

2.3 Traffic Analysis Methodology

The approach to the traffic operations analysis is derived from the established methodologies documented in the 2010 *Highway Capacity Manual* (HCM). The HCM contains a series of analysis techniques for evaluating the operations of transportation facilities under specified conditions. The models for the BLRT analysis have been developed using VISSIM and Synchro/SimTraffic, software packages that implement the HCM methodologies. The inputs to the software include lane geometrics, traffic volumes, pedestrian/bicycle volumes, transit stations, freight and LRT alignments, freight and LRT volumes, intersection and grade crossing control devices, and signal phase and timing characteristics.

The outputs of the models are evaluated using the level of service thresholds as defined in the HCM, which are shown in **Table 2.1**. Based on standard practice in the traffic engineering industry, as well as guidance from the American Association of State Highway and Transportation Officials (AASHTO) and conformance with MnDOT practice, level of service D/E is considered to be the threshold of acceptable operations for an overall intersection in an urban or suburban area during peak hours.

The analysis periods included the highest hour of traffic volume during the weekday AM peak period (6:00-9:00 AM) and PM peak period (3:00-7:00 PM). The peak hour varied by intersection, but AM peak hours were generally identified as occurring between 7:00 AM and 8:30 AM and PM peak hours were generally identified as occurring between 4:30 PM and 5:45 PM.

Table 2.1. Intersection Level of Service Definitions

Level of Service	Signalized Intersection Delay (seconds per vehicle)	Unsignalized Intersection Delay (seconds per vehicle)
A	≤10	≤10
B	>10-20	>10-15
C	>20-35	>15-25
D	>35-55	>25-35
E	>55-80	>35-50
F	>80	>50

Source: Highway Capacity Manual 2010

2.4 Design Criteria and Assumptions

All full access intersections with the LRT guideway, where all vehicular movements are allowed across the guideway, were assumed to be signalized and/or controlled with automatic gates to provide safe movement of LRT and vehicles. All at-grade roadway/LRT crossings where LRT operates in the freight corridor were assumed to have automatic gates in accordance with the guidance and standards contained in the 2009 edition of the *Minnesota Manual on Uniform Traffic Control Devices* (MMUTCD). The operation of automatic gates was also based on the standards in the MUTCD, which includes:

- gate arms start lowering a minimum of 3 seconds after the flashing-light signals start to operate;
- gate arms shall reach the horizontal position at least 5 seconds before the arrival of the rail traffic;
- gate arms shall remain in the down position as long as the rail traffic occupies the grade crossing; and
- gate arms should ascend to the upright position in 12 seconds or less, once the rail traffic leaves the grade crossing.

For a typical LRT crossing, the time from the gates being activated until they return to the upright position is approximately 45 to 50 seconds.

Signalized intersections within 200 feet of an at-grade rail crossing were identified for interconnection to the rail crossing. At these locations, the signal is proposed to be preempted by the rail crossing, in order to provide for clearance of vehicle queues from the tracks prior to the gate arms being lowered.

2.5 Measures of Effectiveness

The measures of effectiveness used to evaluate the operations results and identify a project impact in need of improvement were based on intersection delay (level of service) and queuing.

The level of service (LOS) criteria used to identify a project impact and potential mitigation were as follows:

- Overall intersection LOS E or F in Build conditions, if No Build intersection LOS D or better
- Approach or movement LOS E or F in Build conditions, if the movement negatively impacts upstream operations and No Build approach or movement operated at LOS D or better

The criteria used to identify a queuing issue were as follows:

- 95th percentile queue length that exceeds storage length, and one of the following criteria is also met:
  - Average back-of-queue exceeds storage length
  - Movement operates at LOS E or LOS F
  - 95th percentile queue blocks upstream full-access intersection(s)
- 95th percentile queue length exceeds 500 feet on a stop-controlled approach

For locations where a queuing issue was identified, the need for mitigation was based on a comparison to the No Build conditions, the severity of the issue, the potential safety and operations implications at the study intersection, and the impact the queue had on the larger roadway network. Where the need for queue mitigation was identified based on these criteria, improvements were added to the Build modeling and have been incorporated into the BLRT project. These improvements are listed in Section 5.1, along with all improvements that have been identified to be built as part of the BLRT project.

3.0 Existing Conditions Analysis

The existing conditions models were developed to validate and calibrate the simulation models of the study areas, which were then used to model the future year conditions. The assumptions, methodology, and results of the existing conditions analysis are presented in the following sections.

3.1 Existing Conditions Assumptions

The existing conditions analysis was based on traffic volumes, roadway geometrics, rail crossing treatments, and signal operations as they existed in 2014 when the data collection was completed. The existing peak hour traffic volumes, which are based on the counts conducted in 2014, are provided in **Appendix A**. The geometrics and intersection control for the existing conditions are shown in the intersection layout tables provided in **Appendix B.**

The AM peak hour was calculated to be the highest volume hour between 7:00 AM and 8:30 AM and the PM peak hour was calculated to be the highest volume hour between 4:30 PM and 5:45 PM for all intersections, based on the turning movement data collected within the study area.

Existing information collected along the freight rail corridor shows that at most one train per day with less than 20 cars is expected on the BNSF Monticello Subdivision. The data collected in 2014 showed that trains typically travel through the corridor in the AM peak hour, between 7:30 and 8:00 AM. No freight trains have been observed during the PM peak hour.

3.2 Existing Conditions Traffic Modeling Results

The existing operations results are presented for each of the four modeling areas in the following sections.

3.2.1 OMF to TH 610

The results of the AM and PM peak hour analysis showed that all intersections currently operate at overall LOS D or better during the Existing peak hour scenarios. All intersections were modeled in VISSIM based on the proposed future at-grade LRT crossings. The overall intersection results are shown in **Table 3.1** below.

No queuing issues were identified in the Existing conditions.

The full table of existing conditions LOS and queuing analysis results can be found in **Appendix C.**

*Side street stop-controlled intersection

3.2.2 *TH 610 to CSAH 81 (Bottineau Boulevard)/73rd Avenue N*

The results of the AM and PM peak hour analysis showed that all intersections currently operate at overall LOS D or better during the Existing peak hour scenarios. All intersections were modeled in VISSIM based on the proposed future at-grade LRT crossings. The overall intersection results are shown in **Table 3.2** below.

Movements for which queuing issues were identified in one or more scenarios were as follows:

- CSAH 103 (West Broadway Avenue)/CSAH 30 (93rd Avenue N) – Eastbound left-turn

The queuing issue at CSAH 103 (West Broadway Avenue)/CSAH 30 (93rd Avenue N) is due to heavy demand for that movement in the PM peak and the single through lanes on the eastbound, westbound, and northbound approaches that limit the green time available for the eastbound left-turn movement.

The full table of existing conditions LOS and queuing analysis results can be found in **Appendix C.**

Table 3.2. TH 610 to CSAH 81/73rd Avenue N – Existing Conditions Results

3.2.3 CSAH 81 (Bottineau Boulevard)/73rd Avenue N to TH 55 (Olson Memorial Highway)

The location and control of the existing freight rail crossings on the BNSF Monticello Subdivision within the BLRT project area are summarized in **Table 3.3** below.

Table 3.3. Existing Conditions Rail Crossing Treatments

Crossing Location	Existing Crossing Control
73rd Ave N	Flashers; preemption of CSAH 81 (Bottineau Blvd)/73rd Ave N traffic signal
CSAH 8 (W Broadway Ave)/ 71st Ave N	Flashers and automatic gates; preemption of CSAH 81 (Bottineau Blvd)/CSAH 8 (W Broadway Ave)/ 71st Ave N traffic signal
I-94/I-694	Grade separated under I-94/I-694
63rd Ave N	Flashers and automatic gates; preemption of CSAH 81 (Bottineau Blvd)/63rd Ave N traffic signal
CSAH 10 (Bass Lake Rd)	Flashers and automatic gates; preemption of CSAH 81 (Bottineau Blvd)/CSAH 10 (Bass Lake Rd) traffic signal
Corvallis Ave N	Flashers
CSAH 8 (W Broadway Ave)	Flashers
45½ Ave N	Flashers
TH 100	Grade separated over TH 100
CSAH 9 (42nd Ave N)	Flashers
41st Ave N	Flashers and automatic gates
39½ Ave N	Flashers and automatic gates

The data collected along the BNSF Monticello Subdivision in 2014 showed that trains typically travel through the corridor in the AM peak hour, between 7:30 and 8:00 AM. No freight trains have been observed during the PM peak hour. Therefore, the AM peak hour analysis was conducted both with and without a freight event. The assumed freight event was approximately one minute in duration, which is consistent with the existing freight activity in the corridor. No freight events were analyzed for the PM peak hour.

The results of the AM and PM peak hour analysis showed that all intersections currently operate at overall LOS D or better during the Existing peak hour scenarios, including a 20-car freight event in the AM peak hour. The Golden Valley Road/Theodore Wirth Parkway intersection was modeled in Synchro/SimTraffic because it does not have any nearby at-grade crossings with freight rail or proposed crossings with light rail transit (LRT). All other intersections were modeled in VISSIM based on the existing freight crossings and proposed future at-grade LRT crossings. The overall intersection results are shown in **Table 3.4** below.

No queuing issues were identified in the Existing conditions.

The full table of existing conditions LOS and queuing analysis results can be found in **Appendix C**.

Table 3.4. CSAH 81/73rd Avenue N to TH 55 (Olson Memorial Highway) – Existing Conditions Results

** All-way stop-controlled intersection
[1] Left-turn movements limited to emergency vehicles and buses only.

3.2.4 TH 55 (Olson Memorial Highway) to Target Field Station

The results of the AM and PM peak hour analysis showed that all intersections currently operate at overall LOS D or better during the Existing peak hour scenarios, with the following exception:

- TH 55 (Olson Memorial Highway)/CSAH 2 (Penn Avenue N) in the PM peak

All intersections were modeled in VISSIM based on the proposed future at-grade LRT crossings. The overall intersection results are shown in **Table 3.5** on the following page.

The poor LOS at the TH 55 (Olson Memorial Highway)/CSAH 2 (Penn Avenue N) intersection is due to the high traffic volumes and the current split phasing of the northbound and southbound approaches, which leads to inefficiencies at the intersection.

Movements for which queuing issues were identified in one or more scenarios were as follows:

- TH 55 (Olson Memorial Highway)/Thomas Avenue N – Southbound approach
- TH 55 (Olson Memorial Highway)/CSAH 2 (Penn Avenue N) – Eastbound through and right-turn movements
- TH 55 (Olson Memorial Highway)/Morgan Avenue N – Southbound approach
- TH 55 (Olson Memorial Highway)/Humboldt Avenue N – Northbound approach
- TH 55 (Olson Memorial Highway)/Van White Memorial Boulevard – Northbound through and right-turn movements
- TH 55 (Olson Memorial Highway)/Bryant Avenue N – Northbound approach
- TH 55 (Olson Memorial Highway)/I-94 EB Ramps (W Lyndale Avenue N) – Southbound right-turn movement

The queuing issues on Thomas Avenue N, Morgan Avenue N, Humboldt Avenue N, Van White Memorial Boulevard, and Bryant Avenue N are all due to the location of the frontage road zero to 50 feet from the intersection with TH 55 (Olson Memorial Highway). This means that one to two vehicles queued at the stop bar would exceed the storage distance. However, these queues are not considered to be operational deficiencies because the approach volumes are generally low and do not cause operational or safety issues upstream.

The queues on TH 55 (Olson Memorial Highway) at CSAH 2 (Penn Avenue N) and on I-94 EB Ramps (W Lyndale Avenue N) at TH 55 (Olson Memorial Highway) are due to high volumes of traffic demand in peak hours. The queue on TH 55 (Olson Memorial Highway) at CSAH 2 (Penn Avenue N) has the potential to cause operational and safety issues due to the volume and speed of traffic on this approach. The queue on the southbound approach of TH 55 (Olson Memorial Highway)/I-94 EB Ramps (W Lyndale Avenue N) is a significant distance from the I-94 exit and in a lower-speed, signalized roadway segment (30 mph).

The full table of existing conditions LOS and queuing analysis results can be found in **Appendix C.**

Table 3.5. TH 55 (Olson Memorial Highway) to Target Field Station – Existing Conditions Results

Intersection	Overall Intersection Average Delay (seconds/vehicle) and LOS

*Side street stop-controlled intersection

3.3 Existing Conditions Traffic Modeling Summary

All intersections operate at overall LOS D or better in the AM and PM peak hour existing conditions, with the following exception:

- TH 55 (Olson Memorial Highway)/CSAH 2 (Penn Avenue N) in the PM peak

The poor LOS at the TH 55 (Olson Memorial Highway)/CSAH 2 (Penn Avenue N) intersection is due to the high traffic volumes and the current split phasing of the northbound and southbound approaches, which leads to inefficiencies at the intersection.

4.0 No Build Analysis

The No Build modeling was conducted to identify the expected traffic operations at the Opening Year of the BLRT project (2021) and for the forecast horizon year (2040). The assumptions, methodology, and results of the No Build conditions analysis are presented in the following sections.

4.1 No Build Conditions Assumptions

Opening Year and 2040 forecast peak hour volumes were based on the forecast No Build daily traffic volumes developed for key roadway segments within the study area, as described in Section 2.2. The Opening Year forecast daily traffic volumes were developed assuming a constant rate of growth between the Existing and 2040 conditions. The turning movement volumes for No Build AM and PM peak in the Opening Year and 2040 conditions are provided in **Appendix A**.

The No Build analysis was based on the future year No Build traffic volumes, existing roadway geometrics and rail crossing treatments, and existing signal operations. Geometric improvements assumed in the No Build analysis are shown in the intersection layouts provided in **Appendix B**, and were based on projects that were completed since 2014 or are currently programmed:

- CSAH 81 (Bottineau Boulevard) from TH 100 to Wilshire Boulevard restriped from a four-lane roadway to a six-lane roadway, completed in 2015 by Hennepin County.
- C-Line arterial bus rapid transit (BRT) construction on CSAH 2 (Penn Avenue N) and TH 55 (Olson Memorial Highway) currently planned for 2017 by the Metropolitan Council.
- CSAH 81 (Bottineau Boulevard) reconstruction from a four-lane to a six-lane roadway from 63rd Avenue N to CSAH 8 (West Broadway Avenue)/71st Avenue N, currently planned for 2016-2018 by Hennepin County.
- CSAH 81 (Bottineau Boulevard) reconstruction from a four-lane to a six-lane roadway from CSAH 8 (W Broadway Avenue)/71st Avenue N to TH 169, currently planned for 2019 by Hennepin County.
- CSAH 103 (West Broadway Avenue) reconstruction from a two-lane to a four-lane roadway from 78th Avenue N to CSAH 30 (93rd Avenue N) currently planned for 2018-2020 by Hennepin County.

Hennepin County and the City of Brooklyn Park have not yet determined if a new traffic signal will be constructed at the CSAH 103 (West Broadway Avenue)/Maplebrook Parkway intersection as part of the CSAH 103 (West Broadway Avenue) reconstruction project. Therefore, scenarios have been modeled with the intersection as an unsignalized right-in/right-out intersection or a signalized full-access intersection.

The City of Brooklyn Park has been studying a new interchange at TH 169/101st Avenue N and this project is currently in the preliminary design phase. However, the new interchange has not been programmed and is not shown in the Metropolitan Council *2040 Transportation Policy Plan* (TPP). Due to the significant impacts that this interchange will have on roadway capacity and traffic flow in the area north of TH 610 and to better capture the expected impacts of the BLRT project, 2040 scenarios have been analyzed both with and without the new interchange.

For other regional improvements that were assumed in the regional travel demand model and the forecasting process, refer to *BLRT Traffic and Park-and-Ride Forecast Technical Memorandum* (2015).

No improvements were assumed at any of the existing rail crossings. Signal timing was assumed to be optimized in the Opening Year (2021) and 2040 analysis. The signal timings were optimized as part of the VISSIM simulation models. The CSAH 103 (West Broadway Avenue), CSAH 81 (Bottineau Boulevard), and TH 55 (Olson Memorial Highway) corridors were all assumed to operate with coordinated and interconnected signals. Pedestrian crossings of TH 55 (Olson Memorial Highway) were assumed to be timed for one-stage crossings similar to the existing operations.

The geometrics and intersection control for the No Build conditions are shown in the intersection layout tables provided in **Appendix B.**

4.2 No Build Conditions Traffic Modeling Results

The same four modeling areas created for the Existing conditions modeling were used for the No Build analysis. The No Build operations results are presented by modeling area in the following sections.

4.2.1 OMF to TH 610

The results of the Opening Year AM and PM peak hour analysis showed that all intersections would be expected to operate at overall LOS D or better in the No Build scenarios. The results of the 2040 AM and PM peak hour analysis showed that all intersections, which are listed below, would be expected to operate at overall LOS E or F in the No Build scenarios.

- CSAH 103 (West Broadway Avenue)/101st Avenue N in the 2040 AM and PM peaks
- CSAH 103 (West Broadway Avenue)/Winnetka Avenue N in the 2040 AM and PM peaks
- CSAH 103 (West Broadway Avenue)/Oak Grove Parkway in the 2040 AM and PM peaks
- CSAH 103 (West Broadway Avenue)/TH 610 WB Ramps in the 2040 AM and PM peaks
- CSAH 103 (West Broadway Avenue)/TH 610 EB Ramps in the 2040 AM and PM peaks

All intersections were modeled in VISSIM based on the proposed future at-grade LRT crossings. The overall intersection results are shown in **Table 4.1** and **Table 4.2** below.

Movements for which queuing issues were identified in one or more of the 2040 scenarios were as follows:

- CSAH 103 (West Broadway Avenue)/Winnetka Avenue N – Northbound left-turn and through movements
- CSAH 103 (West Broadway Avenue)/Oak Grove Parkway – Northbound through movement; southbound left-turn and through movements; westbound left-turn and right-turn movements
- CSAH 103 (West Broadway Avenue)TH 610 WB Ramps – Northbound through movement; southbound left-turn movement; westbound left-turn and right-turn movements

The poor operations (delay and queuing) in the 2040 No Build scenarios are due to the intense development planned to occur in this area by 2040. Queues spill back between all intersections north of TH 610 and roadway capacity improvements would be needed to accommodate the forecast growth in traffic. However, there are not currently roadway improvement projects programmed in this area.

The full table of No Build conditions LOS and queuing analysis results can be found in **Appendix C**.

Table 4.1. OMF to TH 610 – Opening Year No Build Conditions Results

Intersection	Overall Intersection Average Delay (seconds/vehicle) and LOS	
	Opening Year AM No Build Scenario 01[1]	Opening Year PM No Build Scenario 01[1]
CSAH 103 (W Broadway Ave)/ 101st Ave N*	0.6 A	5.4 A
CSAH 103 (W Broadway Ave)/ Winnetka Ave N*	0.3 A	0.9 A
CSAH 103 (W Broadway Ave)/ Oak Grove Pkwy	20.6 C	27.9 C

* Side street stop-controlled intersection

[1] No Build Scenario 01 assumes no interchange at TH 169/101st Avenue N.

Table 4.2. OMF to TH 610 – 2040 No Build Conditions Results

Intersection	Overall Intersection Average Delay (seconds/vehicle) and LOS			
	2040 AM No Build Scenario 01[1]	2040 AM No Build Scenario 02[2]	2040 PM No Build Scenario 01[1]	2040 PM No Build Scenario 02[2]
CSAH 103 (W Broadway Ave)/ 101st Ave N*	73.5 F	72.1 F	193.9 F	156.2 F
CSAH 103 (W Broadway Ave)/ Winnetka Ave N*	133.8 F	125.8 F	162.1 F	149.5 F
CSAH 103 (W Broadway Ave)/ Oak Grove Pkwy	152.0 F	128.1 F	200+ F	200+ F
CSAH 103 (W Broadway Ave)/ TH 610 WB Ramps	200+ F	200+ F	200+ F	200+ F
CSAH 103 (W Broadway Ave)/ TH 610 EB Ramps	105.2 F	80.7 F	188.6 F	184.8 F

* Side street stop-controlled intersection

[1] No Build Scenario 01 assumes no interchange at TH 169/101st Avenue N.

[2] No Build Scenario 02 assumes a new full access interchange at TH 169/101st Avenue N.

4.2.2 TH 610 to CSAH 81 (Bottineau Boulevard)/73rd Avenue N

The results of the Opening Year and 2040 AM and PM peak hour analysis showed that all intersections would be expected to operate at overall LOS D or better during the No Build peak hour scenarios, with the following exception:

- CSAH 103 (West Broadway Avenue)/CSAH 109 (85th Avenue N) in the 2040 PM peak

The poor LOS at the CSAH 103 (West Broadway Avenue)/CSAH 109 (85th Avenue N) in the 2040 PM peak was due to increased southbound u-turn traffic in Scenario 1 with a right-in/right-out access at Maplebrook Parkway.

Several of the intersections along CSAH 103 (West Broadway Avenue) south of TH 610 had better operations in the No Build conditions than in the Existing conditions, due to the planned CSAH 103 (W Broadway Avenue) roadway reconstruction.

All intersections were modeled in VISSIM based on the proposed future at-grade LRT crossings. The overall intersection results are shown in **Table 4.3** and **Table 4.4** below.

Movements for which queuing issues were identified in one or more scenarios were as follows:

- CSAH 103 (West Broadway Avenue)/ CSAH 130 (Brooklyn Boulevard)/CSAH 152 – Eastbound left-turn movement

The eastbound left-turn queuing at CSAH 103 (West Broadway Avenue/CSAH 130 (Brooklyn Boulevard)/CSAH 152 occurs in the 2040 No Build PM peak was due to high vehicle traffic demand and protected-only phasing.

The full table of No Build conditions LOS and queuing analysis results can be found in **Appendix C.**

*Side street stop-controlled intersection

[1] Scenario 01 assumes right-in/right-out access with side street stop control at CSAH 103 (W Broadway Avenue)/Maplebrook Parkway.

[2] Scenario 02 assumes a full-access signalized intersection at CSAH 103 (W Broadway Avenue)/Maplebrook Parkway.

4.2.3 CSAH 81 (Bottineau Boulevard)/73rd Avenue N to TH 55 (Olson Memorial Highway)

The results of the Opening Year and 2040 AM and PM peak hour analysis showed that all intersections would be expected to operate at overall LOS D or better during the No Build peak hour scenarios, including a 20-car (approximately one minute) freight event in the AM peak hour, with the following exceptions:

- Golden Valley Road/Theodore Wirth Parkway in the 2040 PM Peak

The Golden Valley Road/Theodore Wirth Parkway intersection was modeled in Synchro/SimTraffic because it does not have any nearby at-grade crossings with freight rail or proposed crossings with LRT. All other intersections were modeled in VISSIM based on the existing freight crossings and proposed future at-grade LRT crossings. The overall intersection results are shown in **Table 4.5** and **Table 4.6** below.

Movements for which queuing issues were identified in one or more scenarios were as follows:

- Golden Valley Road/Theodore Wirth Parkway – Eastbound approach queues exceeded 500 feet

Many of the intersections along CSAH 81 (Bottineau Boulevard) had better operations in the No Build conditions than in the Existing conditions, due to the planned reconstruction projects from 63rd Avenue N to TH 169, planned to occur prior to Opening Year, and the six-lane restriping from TH 100 to Wilshire Boulevard that occurred in 2015.

The all-way stop control at the Golden Valley Road/Theodore Wirth Parkway would be expected to operate poorly in the 2040 PM peak due to the forecast growth in area traffic volumes and the inefficiency of the all-way stop control. There are no improvements currently planned or programmed for this intersection.

The full table of No Build conditions LOS and queuing analysis results can be found in **Appendix C.**

4.2.4 TH 55 (Olson Memorial Highway) to Target Field Station

The results of the Opening Year and 2040 AM and PM peak hour analysis showed that all intersections would be expected to operate at overall LOS D or better during the No Build peak hour scenarios, with the following exceptions:

- TH 55 (Olson Memorial Highway)/Thomas Avenue N in the 2040 AM and 2040 PM peaks
- TH 55 (Olson Memorial Highway)/CSAH 2 (Penn Avenue N) in the Opening Year PM, 2040 AM, and 2040 PM peaks
- TH 55 (Olson Memorial Highway)/Morgan Avenue N in the 2040 PM peak

All intersections were modeled in VISSIM based on the proposed future at-grade LRT crossings. The overall intersection results are shown in **Table 4.7** below.

Movements for which queuing issues were identified in one or more scenarios were as follows:

- TH 55 (Olson Memorial Highway)/Thomas Avenue N – Southbound approach
- TH 55 (Olson Memorial Highway)/CSAH 2 (Penn Avenue N) – Eastbound approach
- TH 55 (Olson Memorial Highway)/Morgan Avenue N – Southbound approach
- TH 55 (Olson Memorial Highway)/Humboldt Avenue N – Northbound approach
- TH 55 (Olson Memorial Highway)/Van White Memorial Boulevard – Northbound through and right-turn movements
- TH 55 (Olson Memorial Highway)/Bryant Avenue N – Northbound approach
- TH 55 (Olson Memorial Highway)/I-94 EB Ramps (W Lyndale Avenue N) – Southbound approach

The poor LOS at the TH 55 (Olson Memorial Highway)/Thomas Avenue N, TH 55 (Olson Memorial Highway)/CSAH 2 (Penn Avenue N), and TH 55 (Olson Memorial Highway)/Morgan Avenue N intersections is due to the high traffic volumes and capacity constraints at the TH 55 (Olson Memorial Highway)/CSAH 2 (Penn Avenue N) intersection, which result in queues that spill back and cause delays at the upstream intersections in each direction on TH 55 (Olson Memorial Highway).

The queuing issues on Thomas Avenue N, Morgan Avenue N, Humboldt Avenue N, Van White Memorial Boulevard, and Bryant Avenue N are all due to the location of the frontage road zero to 50 feet from the intersection with TH 55 (Olson Memorial Highway). One to two vehicles queued at the stop bar would exceed the storage distance for these approaches. These issues were also noted in the Existing conditions analysis.

The queues on TH 55 (Olson Memorial Highway) at CSAH 2 (Penn Avenue N) and on I-94 EB Ramps (W Lyndale Avenue N) at TH 55 (Olson Memorial Highway) are due to high volumes of traffic demand in peak hours. The queue on eastbound TH 55 (Olson Memorial Highway) has the potential to cause operational and safety issues due to the volume and speed of traffic on this approach. The queue on the southbound approach of TH 55 (Olson Memorial Highway)/I-94 EB Ramps (W Lyndale Avenue N) is due to the high volume of traffic, but is a significant distance from the I-94 exit and in a lower speed roadway segment (30 mph). These issues were also noted in the Existing conditions analysis.

The full table of No Build conditions LOS and queuing analysis results can be found in **Appendix C**.

Table 4.7. TH 55 (Olson Memorial Highway) to Target Field Station – Opening Year and 2040 No Build Conditions Results

*Side street stop-controlled intersection

4.3 No Build Conditions Traffic Modeling Summary

All intersections would be expected to operate at overall LOS D or better in the Opening Year and 2040 No Build AM and PM peak conditions, with the following exceptions:

- CSAH 103 (West Broadway Avenue)/101st Avenue N in the 2040 AM and PM peaks
- CSAH 103 (West Broadway Avenue)/Winnetka Avenue N in the 2040 AM and PM peaks
- CSAH 103 (West Broadway Avenue)/Oak Grove Parkway in the 2040 AM and PM peaks
- CSAH 103 (West Broadway Avenue)/TH 610 WB Ramps in the 2040 AM and PM peaks
- CSAH 103 (West Broadway Avenue)/TH 610 EB Ramps in the 2040 AM and PM peaks
- CSAH 103 (West Broadway Avenue)/CSAH 109 (85th Avenue N) in the 2040 PM peak scenario with no signal at Maplebrook Parkway
- Golden Valley Road/Theodore Wirth Parkway in the 2040 PM peak
- TH 55 (Olson Memorial Highway)/Thomas Avenue N in the 2040 AM and PM peaks

- TH 55 (Olson Memorial Highway)/CSAH 2 (Penn Avenue N) in the Opening Year PM, 2040 AM, and 2040 PM peaks
- TH 55 (Olson Memorial Highway)/Morgan Avenue N in the 2040 PM peak

The poor operations (delay and queuing) in the area north of TH 610 in the 2040 No Build scenarios is due to the intense development planned to occur in this area by 2040. However, there have been no roadway improvement projects programmed to improve the roadway network in this area, and therefore the intersections are expected to operate over capacity.

The all-way stop control at the Golden Valley Road/Theodore Wirth Parkway would be expected to operate poorly in the 2040 PM peak due to the forecast growth in area traffic volumes and the inefficiency of the existing all-way stop control.

The poor LOS at the TH 55 (Olson Memorial Highway)/Thomas Avenue N, TH 55 (Olson Memorial Highway)/CSAH 2 (Penn Avenue N), and TH 55 (Olson Memorial Highway)/Morgan Avenue N intersections is due to the high traffic volumes and capacity constraints at the TH 55 (Olson Memorial Highway)/CSAH 2 (Penn Avenue N) intersection, which results in queues that spill back and cause delays at the upstream intersections in each direction on TH 55 (Olson Memorial Highway).

Many of the intersections along CSAH 103 (West Broadway Avenue) and CSAH 81 (Bottineau Boulevard) had better operations in the No Build conditions than in the Existing conditions, due to the planned and already implemented corridor improvement projects.

5.0 Build Analysis

The Build modeling was conducted to identify the expected traffic operations at the Opening Year of the BLRT project (2021) and for the forecast horizon year (2040), with the LRT operating. The assumptions, methodology, and results of the Build conditions analysis are presented in the following sections.

5.1 Build Conditions Assumptions

Traffic volumes for the Build conditions were based on the same growth forecasts as the No Build conditions. At LRT stations, additional pedestrian volumes were incorporated into the modeling. Near park-and-ride facilities, additional vehicle traffic was added to the roadway network to account for traffic generated at these facilities. The modeled AM and PM peak hour Build turning movement volumes for the Opening Year (2021) and 2040 conditions are provided in **Appendix A.**

The location and size of park-and-ride facilities included in the traffic modeling are summarized in **Table 5.1**. The traffic analysis represents the total park-and-ride demand expected in 2040, as identified in the *BLRT Traffic and Park-and-Ride Forecast Technical Memorandum* (2015). The traffic analysis assumed the full 2040 demand for parking spaces in order to capture the full potential parking capacity of the site and produce a conservative analysis of the park-and-ride traffic impacts. The traffic analysis at the 63rd Avenue Station included an increased number of parking spaces, compared to what is currently proposed by the BLRT project, in order to model the expected traffic operations if the existing parking facility were to be expanded in the future to the site's full parking capacity.

Table 5.1. Park-and-Ride Facility Summary

Location	Number of Park-and-Ride Spaces Proposed	Number of Park-and-Ride Spaces Analyzed
Oak Grove Station	850	850
63rd Avenue Station	565	725
Bass Lake Road Station	170	170
Robbinsdale Station	550	550
Golden Valley Road Station	100	100

The control of each of the LRT crossings was identified based on the proximity to the freight rail alignment and adjacent signalized intersections. **Table 5.2** below displays the existing and proposed control of the freight and LRT crossings along the BLRT alignment.

Table 5.2. Build Conditions Rail Crossing Treatments

Crossing Location	Existing Freight Crossing Control	Proposed LRT and/or Freight Crossing Control
CSAH 103 (W Broadway Ave)/ Oak Grove Pkwy	N/A – no freight crossings	LRT controlled by traffic signal (non-revenue track)
CSAH 103 (W Broadway Ave)/ Main St		LRT controlled by traffic signal with transit signal priority
TH 610		LRT grade separated over TH 610
CSAH 103 (W Broadway Ave)/ 94th Ave N		LRT controlled by traffic signal with traffic signal priority
CSAH 103 (W Broadway Ave)/ CSAH 30 (93rd Ave N)		LRT controlled by traffic signal with traffic signal priority
CSAH 103 (W Broadway Ave)/ Setzler Pkwy		LRT controlled by traffic signal with traffic signal priority
CSAH 103 (W Broadway Ave)/ Maplebrook Pkwy[1]		LRT controlled by traffic signal with traffic signal priority
CSAH 103 (W Broadway Ave)/ CSAH 109 (85th Ave N)		LRT controlled by traffic signal with traffic signal priority
CSAH 103 (W Broadway Ave)/ College Park Dr		LRT controlled by traffic signal with traffic signal priority
CSAH 103 (W Broadway Ave)/ Candlewood Dr		LRT controlled by traffic signal with traffic signal priority
CSAH 103 (W Broadway Ave)/ CSAH 130 (Brooklyn Blvd)/ CSAH 152		LRT controlled by traffic signal with traffic signal priority
CSAH 130 (W Broadway Ave)/ 76th Ave N		LRT controlled by traffic signal with traffic signal priority
CSAH 130 (W Broadway Ave)/ 75th Ave N		LRT controlled by traffic signal with traffic signal priority

Crossing Location	Existing Freight Crossing Control	Proposed LRT and/or Freight Crossing Control
73rd Ave N	Flashers; preemption of CSAH 81 (Bottineau Blvd)/73rd Ave N traffic signal	Freight – flashers and automatic gates; preemption of CSAH 81 (Bottineau Blvd)/73rd Ave N traffic signal LRT – grade separated over CSAH 81 (Bottineau Blvd)
CSAH 8 (W Broadway Ave)/ 71st Ave N	Flashers and automatic gates; preemption of CSAH 81 (Bottineau Blvd)/CSAH 8 (W Broadway Ave)/ 71st Ave N traffic signal	Flashers and automatic gates; preemption of CSAH 81 (Bottineau Blvd)/CSAH 8 (W Broadway Ave)/ 71st Ave N traffic signal
I-94/I-694	Grade separated under I-94/I-694	Grade separated under I-94/I-694
63rd Ave N	Flashers and automatic gates; preemption of CSAH 81 (Bottineau Blvd)/63rd Ave N traffic signal	Flashers and automatic gates; preemption of CSAH 81 (Bottineau Blvd)/63rd Ave N traffic signal
CSAH 10 (Bass Lake Rd)	Flashers and automatic gates; preemption of CSAH 81 (Bottineau Blvd)/CSAH 10 (Bass Lake Rd) traffic signal	Flashers and automatic gates; preemption of CSAH 81 (Bottineau Blvd)/CSAH 10 (Bass Lake Rd) traffic signal
Corvallis Ave N	Flashers	Flashers and automatic gates
CSAH 8 (W Broadway Ave)	Flashers	Flashers and automatic gates
45½ Ave N	Flashers	Flashers and automatic gates
TH 100	Grade separated over TH 100	Grade separated over TH 100
CSAH 9 (42nd Ave N)	Flashers	Flashers and automatic gates
41st Ave N	Flashers and automatic gates	Flashers and automatic gates
39½ Ave N	Flashers and automatic gates	Flashers and automatic gates
TH 55 (Olson Memorial Hwy)/ Thomas Ave N	N/A – no freight crossings	LRT controlled by traffic signal with traffic signal priority
TH 55 (Olson Memorial Hwy)/ Pedestrian Crossing East of Russell Ave N		LRT controlled by traffic signal with traffic signal priority
TH 55 (Olson Memorial Hwy)/ CSAH 2 (Penn Ave N)		LRT controlled by traffic signal with traffic signal priority
TH 55 (Olson Memorial Hwy)/ Pedestrian Crossing East of Oliver Ave N		LRT controlled by traffic signal with traffic signal priority
TH 55 (Olson Memorial Hwy)/ Morgan Ave N		LRT controlled by traffic signal with traffic signal priority
TH 55 (Olson Memorial Hwy)/ Pedestrian Crosswalk East of James Ave N		LRT controlled by traffic signal with traffic signal priority
TH 55 (Olson Memorial Hwy)/ Humboldt Ave N		LRT controlled by traffic signal with traffic signal priority

Crossing Location	Existing Freight Crossing Control	Proposed LRT and/or Freight Crossing Control
TH 55 (Olson Memorial Hwy)/ Van White Memorial Blvd	N/A – no freight crossings	LRT controlled by traffic signal with traffic signal priority
TH 55 (Olson Memorial Hwy)/ Bryant Ave N		LRT controlled by traffic signal with traffic signal priority
TH 55 (Olson Memorial Hwy)/ I-94 EB Ramps (W Lyndale Ave N)		LRT controlled by traffic signal with traffic signal priority
TH 55 (Olson Memorial Hwy)/ I-94 WB Ramps (E Lyndale Ave N)		LRT controlled by traffic signal with traffic signal priority
Olson Memorial Hwy/ Border Ave		LRT controlled by traffic signal with traffic signal priority
Olson Memorial Hwy/ 7th St N/6th Ave N		LRT controlled by traffic signal with traffic signal priority

[1] LRT crossing only if intersection is signalized.

Several improvements were identified as part of the scope of the project in order to provide control of the LRT at intersections and to provide adequate infrastructure to accommodate buses, pedestrians, and park-and-ride traffic near stations. These project elements were incorporated into the Build conditions modeling and are shown in **Appendix B**. The significant infrastructure improvements and listed below:

- Reconstruct 101st Avenue N and Oak Grove Parkway to accommodate the needs of the BLRT OMF site.
- Reconstruct CSAH 103 (West Broadway Avenue) from TH 610 to north of Oak Grove Parkway to accommodate the desired location of the LRT alignment, station location, and park-and-ride parking structure.
- Install a new traffic signal at CSAH 103 (West Broadway Avenue)/Main Street to provide a second access point to the park-and-ride facility.
- Install a new traffic signal at CSAH 103 (West Broadway Avenue)/94th Avenue N to allow LRT to transition from side-running to center-running.
- Install a new traffic signal at CSAH 103 (West Broadway Avenue)/75th Avenue N to allow LRT to transition from side-running to center-running.
- Install a new traffic signal at 63rd Avenue N/Louisiana Avenue to provide for pedestrian crossings of 63rd Avenue N and facilitate traffic exiting the park-and-ride facility.
- Reconfigure the CSAH 8 (West Broadway Avenue)/Vera Cruz Avenue N intersection to a roundabout, to continue to provide full access to the surrounding neighborhood, along with additional gates and medians at the rail crossing.
- Install a new traffic signal at TH 55 (Olson Memorial Highway)/Thomas Avenue N to maintain neighborhood access.
- Install new traffic signals on TH 55 (Olson Memorial Highway) at the proposed pedestrian crossings east of Russell Avenue N, east of Oliver Avenue N, and east of James Avenue N to maintain neighborhood pedestrian access. These pedestrian signals are assumed to operate as two-stage crossings due to the u-shaped geometry of the walkway as it crosses the LRT guideway.

Several new intersections were added to the analysis north of TH 610 for the Build conditions. The Oak Grove Parkway/Xylon Avenue intersection will provide access to the OMF and is proposed to operate with stop control on Xylon Avenue. The CSAH 103 (West Broadway Avenue)/Main Street intersection will provide access to the Oak Grove Station park-and-ride facility and is proposed to operate with signalized control. Due to the roadway reconfiguration in this area, the CSAH 103 (West Broadway

Avenue)/101st Avenue N and CSAH 103 (West Broadway Avenue)/Winnetka Avenue N intersections would no longer exist, and therefore were not included in the Build analysis. The CSAH 103 (West Broadway Avenue)/Oak Grove Parkway intersection has a non-revenue LRT crossing, which would include LRT movements only in and out of the OMF site. These movements would be limited in volumes and would occur outside of the peak hour periods.

In addition, some improvements were also identified as part of the Build project in order to provide overall LOS D or better operations at all intersections in the Build conditions. These project improvements included:

- Modify left-turn phasing on CSAH 130 (Brooklyn Boulevard)/CSAH 152 at CSAH 103 (West Broadway Avenue) from protected-only to protected/permissive.
- Modify signal phasing at CSAH 81 (Bottineau Boulevard)/CSAH 10 (Bass Lake Road) to provide a right-turn overlap phase on eastbound CSAH 10 (Bass Lake Road).
- Restripe Wilshire Boulevard at CSAH 81 (Bottineau Boulevard) to provide dual eastbound left-turn lanes and modify signal timing to accommodate park-and-ride traffic.
- Restripe CSAH 8 (West Broadway Avenue) at CSAH 9 (42nd Avenue N) to provide northbound and southbound left-turn lanes and modify the traffic signal to provide northbound, southbound, and westbound protected/permissive left-turn phasing to accommodate park-and-ride traffic.
- Modify CSAH 2 (Penn Avenue N) lane geometrics at TH 55 (Olson Memorial Highway) to better accommodate vehicle traffic.
- Modify southbound W Lyndale Avenue N geometrics to better accommodate vehicle traffic flow.

Hennepin County and the City of Brooklyn Park have not yet determined if a new traffic signal will be constructed at the CSAH 103 (West Broadway Avenue)/Maplebrook Parkway intersection as part of the CSAH 103 (West Broadway Avenue) reconstruction project. Therefore, scenarios have been modeled with the intersection as an unsignalized right-in/right-out intersection or a signalized full-access intersection.

The City of Brooklyn Park has been studying a new interchange at TH 169/101st Avenue N and this project is currently in the preliminary design phase. However, the new interchange has not been programmed and is not shown in the Metropolitan Council *2040 Transportation Policy Plan* (TPP). Due to the significant impacts that this interchange will have on roadway capacity and traffic flow in the area north of TH 610 and to better capture the expected impacts of the BLRT project, 2040 scenarios have been analyzed both with and without the new interchange.

Signal timing was assumed to be optimized in the Opening Year (2021) and 2040 Build analysis. The signal timings were optimized as part of the VISSIM and Synchro simulation models. The CSAH 103 (West Broadway Avenue), CSAH 81 (Bottineau Boulevard), and TH 55 (Olson Memorial Highway) corridors were all assumed to operate with coordinated and interconnected signals. Pedestrian crossings of TH 55 (Olson Memorial Highway) were assumed to be timed for one-stage crossings similar to the existing operations, with the exception of the three new pedestrian signals as noted previously.

The geometrics and intersection control for the Build conditions are shown in the intersection layout tables provided in **Appendix B.**

5.2 Build Conditions Traffic Modeling Results

The same modeling areas created for the Existing and No Build conditions modeling were used for the Build analysis. The Build operations results are presented by modeling area in the following sections.

5.2.1 OMF to TH 610

The results of the Opening Year and 2040 AM and PM peak hour analysis showed that all intersections would be expected to operate at overall LOS D or better during the Build peak hour scenarios with the following exceptions:

- Oak Grove Parkway/Xylon Avenue in the 2040 AM peak in the scenario with an interchange at TH 169/101st Avenue N and in the 2040 PM peak for both scenarios
- CSAH 103 (West Broadway Avenue)/Oak Grove Parkway in the 2040 PM peak in the scenario with no interchange at TH 169/101st Avenue N
- CSAH 103 (West Broadway Avenue)/Main Street in the 2040 PM peak in the scenario with no interchange at TH 169/101st Avenue N

The Oak Grove Parkway/Xylon Avenue intersection was modeled in Synchro/SimTraffic because it does not have any nearby at-grade crossings with LRT. All other intersections were modeled in VISSIM based on the proposed future at-grade LRT crossings. The overall intersection results are shown in **Table 5.3** and **Table 5.4** below.

Movements for which queuing issues were identified in one or more scenarios were as follows:

- Oak Grove Parkway/Xylon Avenue – Northbound left-turn movement; southbound left-turn movement
- CSAH 103 (West Broadway Avenue)/Oak Grove Parkway – Eastbound right-turn movement; Westbound left-turn and right-turn movements (scenario with no interchange at TH 169/101st Avenue N))
- CSAH 103 (West Broadway Avenue)/Main Street – Eastbound through and right-turn movements (scenario with no interchange at TH 169/101st Avenue N))

All the intersections had better operations (delay and queuing) in the Build conditions than in the No Build conditions, due to the planned roadway construction completed as part of the BLRT project.

A future traffic signal is expected to be needed at the Oak Grove Parkway/Xylon Avenue intersection to accommodate future traffic volumes. The traffic signal is recommended to be constructed (by others) at the same time as the TH 169/101st Avenue N interchange or as development traffic warrants. The signal is not needed for the BLRT project or for LRT operations, and therefore is not proposed to be constructed as part of the BLRT project.

The poor operations (delay and queuing) at the CSAH 103 (West Broadway Avenue/Oak Grove Parkway and CSAH 103 (West Broadway Avenue)/Main Street intersections in the 2040 Build PM peak scenario without the TH 169/101st Avenue N interchange was due to the high traffic volumes, generated by future development, that all access the TH 610 interchange. The planned future interchange at TH 169/101st Avenue N would distribute this traffic demand between two interchanges and result in all intersections operating at overall LOS D or better during the peak periods. The operations issues noted in the Build conditions also occur in the No Build conditions to a greater degree, therefore no mitigation has been proposed.

The full table of Build conditions LOS and queuing analysis results can be found in **Appendix C**.

Table 5.3. OMF to TH 610 – Opening Year Build Conditions Results

Intersection	Overall Intersection Average Delay (seconds/vehicle) and LOS	
	Opening Year AM Build Scenario 01[1]	Opening Year PM Build Scenario 01[1]
Oak Grove Pkwy/Xylon Ave*	1.8 A	1.6 A
CSAH 103 (W Broadway Ave)/ Oak Grove Pkwy	27.6 C	38.0 D
CSAH 103 (W Broadway Ave)/ Main St	18.7 B	12.5 B
CSAH 103 (W Broadway Ave)/ TH 610 WB Ramps	18.5 B	21.6 C
CSAH 103 (W Broadway Ave)/ TH 610 EB Ramps	16.7 B	16.0 B

* Side street stop-controlled intersection
[1] Build Scenario 01 assumes no interchange at TH 169/101st Avenue N.

Table 5.4. OMF to TH 610 – 2040 Build Conditions Results

Intersection	Overall Intersection Average Delay (seconds/vehicle) and LOS			
	2040 AM Build Scenario 01[1]	2040 AM Build Scenario 02[2]	2040 PM Build Scenario 01[1]	2040 PM Build Scenario 02[2]
Oak Grove Pkwy/Xylon Ave*	22.0 C	85.7 F	74.9 E	91.5 F
CSAH 103 (W Broadway Ave)/ Oak Grove Pkwy	41.9 D	40.6 D	95.9 F	47.2 D
CSAH 103 (W Broadway Ave)/ Main St	41.2 D	38.7 C	62.6 E	34.5 C
CSAH 103 (W Broadway Ave)/ TH 610 WB Ramps	32.3 C	22.5 C	38.8 D	26.3 C
CSAH 103 (W Broadway Ave)/ TH 610 EB Ramps	24.3 C	21.0 C	28.2 C	26.1 C

* Side street stop-controlled intersection
[1] Build Scenario 01 assumes no interchange at TH 169/101st Avenue N.
[2] Build Scenario 02 assumes a new full access interchange at TH 169/101st Avenue N.

5.2.2 TH 610 to CSAH 81 (Bottineau Boulevard)/73rd Avenue N

The results of the Opening Year and 2040 AM and PM peak hour analysis showed that all intersections would be expected to operate at overall LOS D or better during the Build peak hour scenarios. All intersections were modeled in VISSIM based on the proposed future at-grade LRT crossings. The overall intersection results are shown in **Table 5.5** and **Table 5.6** below.

Movements for which queuing issues were identified in one or more scenarios were as follows:

- CSAH 103 (West Broadway Avenue)/Shopping Center Access – Eastbound right-turn movement
- CSAH 103 (West Broadway Avenue)/CSAH 130 (Brooklyn Boulevard)/CSAH 152 – Southbound left-turn movement

The two queuing issues identified are related, and are due to vehicle traffic demands and access control along CSAH 103 (West Broadway Avenue) in the 2040 Build PM peak. The conversion of the CSAH 103 (West Broadway Avenue)/Shopping Center Access to right-in/right-out in the Build conditions is expected to result in increased u-turn movements at the CSAH 103 (West Broadway Avenue)/CSAH 130 (Brooklyn Boulevard)/CSAH 152 intersection. The southbound left-turn lane at the CSAH 103 (West Broadway Avenue)/CSAH 130 (Brooklyn Boulevard)/CSAH 152 intersection will need to be designed with sufficient storage to accommodate these movements and limit or avoid impacts to the CSAH 103 (West Broadway Avenue)/Shopping Center Access intersection.

The full table of Build conditions LOS and queuing analysis results can be found in **Appendix C**.

*Side street stop-controlled intersection

[1] Scenario 01 assumes right-in/right-out access with side street stop control at CSAH 103 (West Broadway Avenue)/Maplebrook Parkway.

[2] Scenario 02 assumes a full-access signalized intersection at CSAH 103 (West Broadway Avenue)/Maplebrook Parkway.

5.2.3 CSAH 81 (Bottineau Boulevard)/73rd Avenue N to TH 55 (Olson Memorial Highway)

The results of the Opening Year and 2040 AM and PM peak hour analysis showed that all intersections would be expected to operate at overall LOS D or better during the Build peak hour scenarios, including a 20-car freight event in the AM peak hour, with the following exceptions:

- Golden Valley Road/Theodore Wirth Parkway in the 2040 PM peak

The Golden Valley Road/Theodore Wirth Parkway intersection was modeled in Synchro/SimTraffic because it does not have any nearby at-grade crossings with freight rail or proposed crossings with LRT. All other intersections were modeled in VISSIM based on the existing freight crossings and proposed future at-grade LRT crossings. The overall intersection results are shown in **Table 5.7** and **Table 5.8** below.

Movements for which queuing issues were identified in one or more scenarios were as follows:

- CSAH 81 (Bottineau Boulevard)/Wilshire Boulevard – Eastbound left-turn movement
- Golden Valley Road/Theodore Wirth Parkway – Eastbound approach queue exceeded 500 feet

Many of the intersections along CSAH 81 (Bottineau Boulevard) had better operations in the Build conditions than in the Existing conditions, due to the planned reconstruction projects from 63rd Avenue N to TH 169, planned to occur before Opening Year, and the six-lane restriping from TH 100 to Wilshire Boulevard, which occurred in 2015.

The storage distance on Wilshire Boulevard between CSAH 81 (Bottineau Boulevard) and Lakeland Avenue N is limited to approximately 45 feet due to the location of the frontage road (Lakeland Avenue N). As a result, during the PM peak in the Build conditions, vehicles exiting the park-and-ride cause the eastbound left-turn queue to exceed this limited storage. Lakeland Avenue N is a dead end street north and south of Wilshire Boulevard and has very low traffic volumes, so the queues are not a concern relative to traffic operations or safety. However, to address concerns for access to the properties along Lakeland Avenue, the capacity of the eastbound left-turn movement is proposed to be improved through a combination of signal timing and lane restriping.

The all-way stop control at the Golden Valley Road/Theodore Wirth Parkway would be expected to operate poorly in the 2040 PM peak due to the forecast growth in area traffic volumes and the inefficiency of the existing all-way stop control. The operations issues noted in the Build conditions also occur in the No Build conditions to the same degree, and the park-and-ride would be expected to contribute two percent or less of the 2040 peak hour volumes. Therefore, no mitigation has been proposed for this intersection.

The full table of Build conditions LOS and queuing analysis results can be found in **Appendix C**.

5.2.4 TH 55 (Olson Memorial Highway) to Target Field Station

The results of the Opening Year and 2040 AM and PM peak hour analysis showed that all intersections would be expected to operate at overall LOS D or better during the Build peak hour scenarios, with the following exceptions:

- TH 55 (Olson Memorial Highway)/Thomas Avenue N in the 2040 AM peak
- Olson Memorial Highway)/7th Street N/6th Avenue N in the 2040 PM peak

All intersections were modeled in VISSIM based on the proposed future at-grade LRT crossings. The overall intersection results are shown in **Table 5.9** below.

Movements for which queuing issues were identified in one or more scenarios were as follows:

- TH 55 (Olson Memorial Highway)/Thomas Avenue N – Southbound approach
- TH 55 (Olson Memorial Highway)/CSAH 2 (Penn Avenue N) – Southbound left-turn movement
- TH 55 (Olson Memorial Highway)/Morgan Avenue N – Southbound approach
- TH 55 (Olson Memorial Highway)/Humboldt Avenue N – Northbound approach
- TH 55 (Olson Memorial Highway)/Van White Memorial Boulevard – Northbound through and right-turn movements
- TH 55 (Olson Memorial Highway)/Bryant Avenue N – Northbound approach
- TH 55 (Olson Memorial Highway)/I-94 EB Ramps (W Lyndale Avenue N) – Southbound approach

The poor LOS at the TH 55 (Olson Memorial Highway)/Thomas Avenue N intersections is due to the high traffic volumes at the TH 55 (Olson Memorial Highway)/CSAH 2 (Penn Avenue N) intersection. During the AM peak when eastbound traffic volumes are heaviest, queues can spill back on TH 55 (Olson Memorial Highway) and impact the upstream intersection at TH 55 (Olson Memorial Highway)/Thomas Avenue N. The queues and delays on TH 55 (Olson Memorial Highway) are less severe in the Build conditions than in the No Build conditions due to intersection and signal timing improvements associated with the BLRT project, therefore no additional improvements are proposed.

The LOS E operations at the Olson Memorial Highway/7th Street N/6th Avenue N intersection in the 2040 PM peak is due to growth in traffic volumes at the intersection, the LRT alignment through the intersection that results in complex traffic signal phasing, and the roadway geometrics at the intersection. The intersection has many competing needs: C-Line arterial BRT stations; bus access to the adjacent Metro Transit Heywood Garage; pedestrian access to the adjacent Target Field Station; City of Minneapolis planned future protected bikeway on 7th Street N; and buildings immediately adjacent to the right-of-way in two quadrants. During the design development process, several roadway improvements including additional left-turn and through lanes were identified and modeled, and these roadway improvements would maintain LOS D or better operations at the intersection in 2040 peak hours in the Build conditions. However, these roadway improvements would result in longer crossings for pedestrians and bicyclists, were perceived to make the intersection less friendly for transit users, and would reduce the available space for the planned protected bikeway on 7th Street N. The BLRT project stakeholders, including the City of Minneapolis, Metro Transit, and Hennepin County, evaluated the competing needs of all modes at the intersection and recommended that roadway capacity improvements not be implemented at the intersection due to the negative impacts on other modes. Therefore roadway improvements are not proposed to maintain LOS D or better operations at this intersection in the 2040 Build PM peak conditions.

The southbound left-turn queue at TH 55 (Olson Memorial Highway)/CSAH 2 (Penn Avenue N) occurs in the 2040 Build PM peak only and is due to the relatively short 100-foot turn lane. The length of the turn lane was limited to 100 feet in order to minimize impacts to on-street parking and adjacent boulevard space. The queue would be accommodated within the taper distance of the turn lane, and therefore this is not considered to be an issue that is in need of further improvements.

The queuing issues on Thomas Avenue N, Morgan Avenue N, Humboldt Avenue N, Van White Memorial Boulevard, and Bryant Avenue N are all due to the location of the frontage road zero to 50 feet from the intersection with TH 55 (Olson Memorial Highway). One to two vehicles queued at the stop bar would exceed the storage distance for these approaches. These issues were also noted in the Existing and No Build conditions analysis and occur on low volume approaches. Therefore, no mitigation is proposed to address these queues.

The queue on the southbound approach of the TH 55 (Olson Memorial Highway)/I-94 EB Ramps (W Lyndale Avenue N) intersection is due to the high volume of traffic, but is a significant distance from the I-94 exit and in a lower speed roadway segment (30 mph). This issue was noted in the Existing and No Build conditions analysis also, and does not change significantly in the Build conditions. Therefore no additional improvements are proposed.

The full table of Build conditions LOS and queuing analysis results can be found in **Appendix C**.

Table 5.9. TH 55 (Olson Memorial Highway) to Target Field Station – Opening Year and 2040 Build Conditions Results

Intersection	Overall Intersection Average Delay (seconds/vehicle) and LOS			
	Opening Year AM Build	2040 AM Build	Opening Year PM Build	2040 PM Build

*Side street stop-controlled intersection

5.3 Build Conditions Traffic Modeling Summary

Several improvements were identified as part of the scope of the project in order to provide control of the LRT at intersections and to provide adequate infrastructure to accommodate buses, pedestrians, and park-and-ride traffic near stations. These project elements were incorporated into the Build conditions modeling and included:

- Reconstruct 101st Avenue N and Oak Grove Parkway to accommodate the needs of the BLRT OMF site.
- Reconstruct CSAH 103 (West Broadway Avenue) from TH 610 to north of Oak Grove Parkway to accommodate the desired location of the LRT alignment, station location, and park-and-ride parking structure.
- Install a new traffic signal at CSAH 103 (West Broadway Avenue)/Main Street to provide a second access point to the park-and-ride facility.
- Install a new traffic signal at CSAH 103 (West Broadway Avenue)/94th Avenue N to allow LRT to transition from side-running to center-running.
- Install a new traffic signal at CSAH 103 (West Broadway Avenue)/75th Avenue N to allow LRT to transition from side-running to center-running.
- Install a new traffic signal at 63rd Avenue N/Louisiana Avenue to provide for pedestrian crossings of 63rd Avenue N and facilitate traffic exiting the park-and-ride facility.
- Reconfigure the CSAH 8 (West Broadway Avenue)/Vera Cruz Avenue N intersection to a roundabout, to continue to provide full access to the surrounding neighborhood, along with additional gates and medians at the rail crossing.
- Install a new traffic signal at TH 55 (Olson Memorial Highway)/Thomas Avenue N to maintain neighborhood access.
- Install new traffic signals on TH 55 (Olson Memorial Highway) at the proposed pedestrian crossings east of Russell Avenue N, east of Oliver Avenue N, and east of James Avenue N to maintain neighborhood pedestrian access. These pedestrian signals are assumed to operate as two-stage crossings due to the u-shaped geometry of the walkway as it crosses the LRT guideway.

In addition, some improvements were also identified as part of the Build project in order to provide overall LOS D or better operations or to manage park-and-ride queuing at all intersections in the Build conditions. These project improvements included:

- Modify left-turn phasing on CSAH 130 (Brooklyn Boulevard)/CSAH 152 at CSAH 103 (West Broadway Avenue) from protected-only to protected/permissive.
- Modify signal phasing at CSAH 81 (Bottineau Boulevard)/CSAH 10 (Bass Lake Road) to provide a right-turn overlap phase on eastbound CSAH 10 (Bass Lake Road).
- Restripe Wilshire Boulevard at CSAH 81 (Bottineau Boulevard) to provide dual eastbound left-turn lanes and modify signal timing to accommodate park-and-ride traffic.
- Restripe CSAH 8 (West Broadway Avenue) at CSAH 9 (42nd Avenue N) to provide northbound and southbound left-turn lanes and modify the traffic signal to provide northbound, southbound, and westbound protected/permissive left-turn phasing to accommodate park-and-ride traffic.
- Modify CSAH 2 (Penn Avenue N) lane geometrics at TH 55 (Olson Memorial Highway) to better accommodate vehicle traffic.
- Modify southbound W Lyndale Avenue N geometrics to better accommodate vehicle traffic flow.

Signal timings in the Build conditions were optimized as part of the VISSIM simulation models. The CSAH 103 (West Broadway Avenue), CSAH 81 (Bottineau Boulevard), and TH 55 (Olson Memorial Highway) corridors were all assumed to operate with coordinated and interconnected signals. Pedestrian crossings of TH 55 (Olson Memorial Highway) were assumed to be timed for one-stage crossings similar to the existing operations, with the exception of the three new pedestrian signals as noted previously.

With these improvements, all intersections would be expected to operate at overall LOS D or better in the Opening Year and 2040 Build AM and PM peak conditions, with the following exceptions:

- Oak Grove Parkway/Xylon Avenue in the 2040 AM and PM peak
- CSAH 103 (West Broadway Avenue)/Oak Grove Parkway in the 2040 PM peak in the scenario with no interchange at TH 169/101st Avenue N
- CSAH 103 (West Broadway Avenue)/Main Street in the 2040 PM peak in the scenario with no interchange at TH 169/101st Avenue N
- Golden Valley Road/Theodore Wirth Parkway in 2040 PM peak
- TH 55 (Olson Memorial Highway)/Thomas Avenue N in the 2040 AM peak
- Olson Memorial Highway)/7th Street N/6th Avenue N in the 2040 PM peak

A future traffic signal is expected to be needed at the Oak Grove Parkway/Xylon Avenue intersection to accommodate 2040 development-generated traffic volumes. The traffic signal is recommended to be constructed (by others) at the same time as the TH 169/101st Avenue N interchange or as development traffic warrants.

The poor operations (delay and queuing) at the CSAH 103 (West Broadway Avenue/Oak Grove Parkway and CSAH 103 (West Broadway Avenue)/Main Street intersections in the 2040 Build PM peak scenarios without the TH 169/101st Avenue N interchange are due to the high development-generated traffic volumes all accessing the TH 610 interchange. The planned future interchange at TH 169/101st Avenue N would distribute this traffic demand between two interchanges and result in all intersections operating at overall LOS D or better during the peak periods. The operations issues noted in the Build conditions also occurred in the No Build conditions to a greater degree, therefore no mitigation has been proposed as part of the BLRT project.

The all-way stop control at the Golden Valley Road/Theodore Wirth Parkway would be expected to operate poorly in the 2040 PM peak due to the forecast growth in area traffic volumes and the inefficiency of the existing all-way stop control. The operations issues noted in the Build conditions also occur in the No Build conditions to the same degree, and the park-and-ride would be expected to contribute two percent or less of the 2040 peak hour volumes. Therefore, no mitigation has been proposed for this intersection.

The poor LOS at the TH 55 (Olson Memorial Highway)/Thomas Avenue N intersections is due to the high eastbound traffic volumes in the AM peak. The operations in the 2040 Build conditions are expected to be better than in the 2040 No Build conditions due to the improvements associated with the BLRT project, therefore no additional improvements are proposed.

The LOS E operations at the Olson Memorial Highway/7th Street N/6th Avenue N intersection in the 2040 PM peak is due to growth in traffic volumes at the intersection, the LRT alignment through the intersection that results in changes to the traffic signal phasing, and the roadway geometrics at the intersection. The BLRT stakeholders, in evaluating the competing needs of all modes at the intersection, recommended that roadway capacity improvements not be implemented at the intersection due to the corresponding negative impacts on other modes, including pedestrians, bicyclists, and buses.

Overall, there are fewer failing intersections in the Build conditions than in the No Build conditions due to the improvements made as part of the BLRT project. In addition, all the intersections with LOS E or F were due to an issue that also existed in the No Build conditions, or stakeholders determined that the traffic mitigation measures would have significant negative impacts on other modes. Therefore, no traffic mitigation measures, other than those described above, are proposed for the BLRT project.

Appendix A: Peak Hour Traffic Volumes

Analysis Notes:

No Build01/Build01: Assumes no interchange at Hwy 169 and 101st Ave N

No Build02/Build02: Assumes a full access interchange at Hwy 169 and 101st Ave N

Storage Length for through lanes is measured to the nearest upstream full access public intersection, unless otherwise noted.

Analysis Notes:

No Build01/Build01: Right-in/Right-out at CSAH 103 (W Broadway Ave)/Maplebrook Parkway

No Build02/Build02: Full-access signalized intersection at CSAH 103 (W Broadway Ave)/Maplebrook Parkway

Storage Length for through lanes is measured to the nearest upstream full access public intersection, unless otherwise noted.

Storage Length

Analysis Notes:

Storage Length for through lanes is measured to the nearest upstream full access public intersection, unless otherwise noted.

[1] All left turns and NB and SB through movements are restricted to emergency vehicles and buses.

	WB	-											-	-	-	-
CSAH 103 (W Broadway Ave) / CSAH 130 (Brooklyn Blvd/CSAH 152)	NB	-											-	-	-	-
	EB	Left-Turn	AM										Yes	Average back of queue does not exceed storage length, but movement operates at LOS E or worse.	No	Issue occurs in No Build scenarios only. Protected/permissive left-turn phasins is proposed in the Build scenarios, which reduces the queue.
			PM						X	X						
	SB	Left-Turn/ U-Turn	AM										Yes	Movement operates at LOS E or worse and the average back of queue exceeds the storage length.	No	Issue occurs as a result of the eastbound left-turns at the CSAH 103 (W Broadway Ave)/Shopping Center intersection being redirected to this intersection as a result of the intersection becoming a right-in/right-out in the Build scenarios. These vehicles may choose to exit the shopping center using the access on Brooklyn Boulevard, which would reduce the number of vehicles making this movement. The southbound left-turn/U-turn turn bay length will be designed to reduce the amount of time the queue spills back into the through lanes.

Visual Quality Technical Report

June 2016

Blue Line Extension Project Technical Report

METROPOLITAN COUNCIL

This page intentionally left blank

Executive Summary

This Visual Quality Technical Report has been prepared in support of the Final Environmental Impact Statement (Final EIS) for the proposed METRO Blue Line Light Rail Transit (BLRT) Extension project. The proposed BLRT Extension project is located in Hennepin County, Minnesota, extending approximately 13 miles from downtown Minneapolis to the northwest serving north Minneapolis and the suburbs of Golden Valley, Robbinsdale, Crystal, and Brooklyn Park. The light rail transit (LRT) is anticipated to serve a broader area to the northwest, including the communities of New Hope, Brooklyn Center, Maple Grove, Osseo, Champlin, and Dayton.

The purpose of the proposed BLRT Extension project is to provide transit service which will satisfy the long-term regional mobility and accessibility needs for businesses and the traveling public. The proposed BLRT Extension project is needed to effectively address long-term regional transit mobility and local accessibility needs while providing efficient, travel-time competitive transit service that supports economic development goals and objectives of local, regional, and statewide plans.

The methodology used to evaluate aesthetics and visual quality impacts of the proposed BLRT Extension project is based on the federal guidelines provided in the Federal Highway Administration (FHWA) Guidelines for the Visual Impact Assessment of Highway Projects (FHWA, 2015), which outlines the four phases used to assess visual impacts: establishment; inventory; analysis; and mitigation.

For the purposes of this visual and aesthetics resource analysis, the proposed BLRT Extension project corridor was divided into four landscape units (Minneapolis, Golden Valley, Robbinsdale/ Crystal, and Brooklyn Park). Potential aesthetic impacts resulting from implementation of the proposed BLRT Extension project were determined based on direct field observation from multiple vantage points; evaluation of existing visual character; and review of BLRT Extension project plans and features. Visual impact assessment was based on direct field observation from multiple vantage points, including from neighboring properties and roadways; evaluation of existing visual character; and review of proposed BLRT Extension project plans and features. Visual impact assessment was also based on photographic documentation of several key views of the proposed BLRT Extension project corridor.

This resulting aesthetics and visual resources analysis focuses on proposed BLRT Extension project features that would have direct impacts on the proposed BLRT Extension project corridor by changing the character of the existing visual quality of the landscape. The analysis concluded that the proposed BLRT Extension project would not result in a substantial change to the visual character of the corridor as a whole, and neutral effects on visual quality are anticipated to result from project implementation along most segments. However, adverse effects on visual quality would occur in some areas, such as where the existing vegetated center median of Olson Memorial Highway (Trunk Highway 55) would be modified or removed. Additionally, adverse effects on visual quality would occur in areas where recreational and residential uses are located along or in the vicinity of the proposed BLRT Extension project corridor. At locations where adverse visual effects are anticipated, transitway elements added to the rail corridor may be visually screened or softened using landscaping where adequate space permits, and in general, the loss of vegetation

would be replaced with vegetation of a similar type where feasible. Where new physical features of the transitway are introduced, strategies to screen or soften the view would be implemented.

Neutral impacts are anticipated as a result of station and traction power substation (TPSS) construction. Stations would be designed to be aesthetically attractive and to complement their surroundings. Additionally, TPSSs would be designed to be compatible with their surroundings, and may incorporate landscaping and/or other built features such as walls or fencing to minimize visual intrusion as appropriate. However, it is anticipated that station features would also include passenger information displays, lighting, and security systems, which could alter the visual quality and character of the view for sensitive view groups. Coordination with stakeholders would continue throughout the proposed BLRT Extension project design process for stations and also to address the siting of TPSSs to maintain neutral visual impacts. This process many include development of additional visual screening as required. To further minimize visual quality impacts of TPSS siting, the siting would be customized for each location based on the context of each facility in relation to adjacent properties and resources.

1 Introduction

1.1 Project Background

This Visual Quality Technical Report has been prepared in support of the Final Environmental Impact Statement (Final EIS) for the proposed METRO Blue Line Light Rail Transit (BLRT) Extension project. The purpose of the proposed BLRT Extension project is to provide transit service which will satisfy the long-term regional mobility and accessibility needs for businesses and the traveling public. The proposed BLRT Extension project is needed to effectively address long-term regional transit mobility and local accessibility needs while providing efficient, travel-time competitive transit service that supports economic development goals and objectives of local, regional, and statewide plans.

The Draft Environmental Impact Statement (Draft EIS) was completed in 2014 (March). In support of the Draft EIS, the *Bottineau Transitway Technical Report: Visual Quality* (September 2012) was prepared to analyze the project alternatives under consideration in the Draft EIS. The objective of this Final EIS Visual Quality Technical Report is to evaluate the proposed BLRT Extension project's potential effects on visual quality within the study area for the proposed BLRT Extension project, including:

- The effect of the proposed BLRT Extension project on the character of the natural visual features of the study area;
- The effect of the proposed BLRT Extension project on the character of the built visual features of the study area; and
- The effect of the proposed BLRT Extension project as visually perceived by the affected population in the study area.

1.2 Definition of Terms

1.2.1 Visual Features

The term *visual features* refers to the components of the natural, built, or project environments that are capable of being seen, as described in further detail below.

- **Natural Visual Features** include the land, water, vegetation, and animals that compose the natural environment. Although natural features may have been altered or imported by people, features which are primarily geological or biological in origin are considered natural.
- **Built Visual Features** include the buildings, structures, and artifacts that compose the surrounding built environment, also known as the cultural environment. These are features which were constructed by people.
- **Project Visual Features** include the geometrics, structures, and fixtures that compose the project environment. These are the constructed features which would be placed in the environment as part of the proposed BLRT Extension project.

1.2.2 Visual Quality

The term *visual quality* refers to what viewers like and dislike about the visual features that compose a particular scene. Visual quality is inherently subjective—different viewers may evaluate visual features differently. In general, people respond favorably to scenes that create a sense of perceived harmony, order, and coherence.

Based on the developed urban and suburban context of the proposed BLRT Extension project study area, specific features were identified as *higher-quality visual features* when they exemplified one of the following characteristics:

- A remnant natural feature exemplary of pre-settlement conditions;
- A visually distinct natural or built feature that stands out from the surroundings and which contributes physically and symbolically in a positive way to the overall community's visual quality; or
- A natural or built feature that is an integral component of the broader physical pattern of the community and is generally regarded positively.

1.2.3 Affected Population

The term *affected population* is defined as the viewers who occupy land adjacent to the proposed BLRT Extension project—in either the long or short terms. These people can be characterized by their association with a specific adjacent land-use, including residential, commercial, industrial, agricultural, recreational, and institutional parcels. An example of a long-term viewer would be a homeowner with property along the transitway. An example of a short-term viewer would be a runner using a trail in a park adjacent to the transitway.

1.2.4 General Visual Context

The term *general visual context* is the appearance of the nearby surroundings from the vantage point of a person from ground level; i.e., as one would perceive it from a car, train, bus, bicycle, or on foot. The proposed BLRT Extension project passes through developed urban and suburban areas with a wide range of development patterns. In **Section 4.2 – Landscape Units and Viewshed**, a brief description of the general visual context of each area is provided as a basis for understanding the identified effects on specific visual features.

2 Assessment Methodology

The methodology used to evaluate aesthetics and visual quality impacts is based on the Federal Highway Administration's (FHWA) *Guidelines for the Visual Impact Assessment of Highway Projects* (January 2015), which outlines the four phases used to assess visual impacts. The four phases are establishment, inventory, analysis, and mitigation, as described in detail below.

- **Establishment:** The primary purpose of the establishment phase is to define the study area. The establishment phase is documented in **Chapter 3 – Proposed BLRT Extension Project Location and Description**, which defines the proposed BLRT Extension project's visual character, and **Chapter 4 – Existing Conditions**, which defines the proposed BLRT Extension project's study area, including viewsheds and landscape units.
- **Inventory:** The purpose of the inventory phase is to examine visual quality, or the relationship between viewers and their environment. The inventory phase is documented in **Chapter 4 – Existing Conditions**, which describes the affected environment and visual quality of the study area.
- **Analysis:** The purpose of the analysis phase is to evaluate impacts on visual quality. The analysis phase is documented in **Chapter 5 – Visual Impact Assessment**, which assesses the changes to visual quality as a result of the proposed BLRT Extension project implementation, including a review of project features as seen from several key views.
- **Mitigation:** The purpose of the mitigation phase is to define the mitigation and enhancement efforts to be included in proposed BLRT Extension project design. The mitigation phase is documented in **Chapter 6 – Conclusions and Recommendations**, which outlines the mitigation measures to be implemented during proposed BLRT Extension project construction and operation.

2.1 Visual Character and Quality

The visual impacts of a proposed project are determined by assessing the visual resource changes that would occur as the result of the project and by predicting viewer response to those changes. Visual resource change is the sum of the change in visual character and the change in visual quality. This change can be determined by assessing the compatibility of the proposed project with the visual character of the existing landscape, and then comparing the visual quality of the existing resources with projected visual quality after implementation of the proposed project.

Visual character is descriptive and non-evaluative, which means it is based on defined attributes that are neither good nor bad themselves. A change in visual character cannot be described as having good or bad attributes until it is compared with the viewer response to that change. Both natural and artificial landscape features contribute to the visual character of an area or view.

Visual quality is the value viewers place on the existing visual character of the affected environment based on their visual preferences. FHWA outlines the following three aspects of visual perception, which determine the visual quality of a particular scene.

- When viewing the components of a scene's natural environment, viewers inherently evaluate the natural harmony of the existing scene, determining if the composition is harmonious or inharmonious.
- When viewing the components of the cultural environment, viewers evaluate the scene's cultural order, determining if the composition is orderly or disorderly.
- When viewing the project environment, viewers evaluate the coherence of the project components, determining if the project's composition is coherent or incoherent.

According to FHWA guidelines, people typically perceive the landscape from or to a linear transportation feature as a composition, and the more the composition meets their visual preferences and expectations, the more they like it. The more they like it, the more memorable, or vivid, it becomes. Therefore, it is useful to evaluate whether the new composition will be as vivid as the existing one, and whether the improvements have enhanced or detracted from the original scene.

2.1.1 Viewer Groups

The population affected by the proposed project is referred to as viewers. Viewer response is composed of two elements: viewer sensitivity and viewer exposure. These elements combine to form a method of predicting how a viewer might react to visual changes brought about by a project. Viewer sensitivity is defined both as the viewers' concern for scenic quality and the viewers' response to change in the visual resources that make up the view. Viewer exposure is typically assessed by measuring the number of viewers exposed to the resource change, the type of viewer activity, the duration of the view, the speed at which the viewer moves, and the position of the viewer.

Low viewer sensitivity results when there are few viewers who experience a defined view, or when they may be less focused on the view, such as a freeway commuter on the freeway. Low viewer sensitivity is also related to viewer expectations resulting from what viewers are used to seeing along the corridor. For example, because a portion of the proposed BLRT Extension project corridor has historically been a rail corridor, viewers are accustomed to seeing rail as a dominant visual feature in the landscape in those areas. High viewer sensitivity results when there are many viewers who have a view of frequent or long duration. High viewer sensitivity is also related to familiarity with a view, such as when viewing a resource from a residence, a recreational site, or a commute route. For example, recreational and residential viewers tend to have extended viewing periods and may be more concerned about changes in views.

The study area for the proposed BLRT Extension project includes several types of viewer groups, such as light rail transit (LRT) users, roadway users, pedestrians, residents, workers, and recreational users, as described in further detail below.

- **LRT users:** LRT users include both occasional and frequent (e.g., commuters) passengers on rail lines utilizing the proposed BLRT Extension project corridor. Single views for LRT users are typically of short duration. LRT users who frequently travel a route generally possess low to moderate visual sensitivity to their surroundings, as the passing landscape becomes familiar. Also, LRT users may be less focused on the passing views and more focused on activities such as reading or use of electronic devices.
- **Roadway Users:** Roadway users include both routine (e.g., commuters) and occasional (e.g., recreational) travelers through the proposed BLRT Extension project corridor. Roadway users travel at varying speeds due to differences in the mode of transportation used (vehicles, bicycles, etc.), topography of the route, the traveler's familiarity with the route, and roadway and weather conditions. Single views for roadway users are typically of short duration. Roadway users are generally assumed to have moderate levels of sensitivity due to the typically short-term exposure to changes. Roadway users who frequently travel a route generally possess low to moderate visual sensitivity to their surroundings, as the passing landscape becomes familiar. Also, roadway users may be less focused on the passing views and more focused on roadway conditions.
- **Parkway Users:** The study area for the proposed BLRT Extension project also includes a unique category of roadway users: Grand Rounds Users, which are a combination of the routine (e.g., commuters) and occasional (e.g., recreational) travelers described above. The Grand Rounds National Scenic Byway, a linked series of park areas in Minneapolis, is part of the Federal Highway Administration's National Scenic Byways Program,[1] According to the Minneapolis Park and Recreation Board, Grand Rounds users are not truly "roadway users" because the Grand Rounds was developed and is managed as a pleasure-driving loop with a focus on scenic attributes; speeds are slower and the intended experience is park-like, and not transportation-focused. Yet these users are also not just "recreational users" because they are not seeking the same natural experience.
- **Pedestrians:** Pedestrians include individuals who are traveling on foot along or in the vicinity of the proposed BLRT Extension project corridor. Pedestrians may include individuals traveling to and from residences, schools, places of employment, retail centers, transportation facilities, etc. Pedestrians are generally assumed to have higher levels of viewer sensitivity due to the typically long-term exposure to changes in the environment.
- **Residents:** Residents include individuals whose homes are located along or in the vicinity of the proposed BLRT Extension project corridor. Residential viewers are generally assumed to have higher levels of viewer sensitivity due to a concern for their home environment and typically long-term exposure to changes in that environment. Residents may have moderately high viewer sensitivity because they are likely to place a high value on their local visual resources and to be more sensitive to changes in views.

[1] The US Department of Transportation, Federal Highway Administration oversees the National Scenic Byways Program, which helps recognize, preserve and enhance selected roads throughout the US National Scenic Byways are recognized based on one or more archaeological, cultural, historic, natural, recreational, and/or scenic qualities. The Grand Rounds National Scenic Byway is eligible for the National Register of Historic Places.

- **Business Owners:** Business owners include individuals whose business and/or work activities are located along or in the vicinity of the proposed BLRT Extension project corridor. Business owners are generally assumed to have lower levels of viewer sensitivity to a work environment. Viewer sensitivity is moderate among business owners, as they are typically less focused on the visual resources surrounding their business, and therefore are less sensitive to changes in views. However, depending on the nature of the business, some business owners may place a higher value on the visual resources surrounding their business, especially if the business is focused on the use or enjoyment of a natural or peaceful setting.
- **Workers:** Workers include individuals whose place of employment or work activities are located along or in the vicinity of the proposed BLRT Extension project corridor. Workers are generally assumed to have lower levels of viewer sensitivity to a work environment, as they are typically less focused on the visual resources surrounding their workplace, and therefore are less sensitive to changes in views.
- **Recreational Users:** The proposed BLRT Extension project corridor passes through or near several park and trail areas, and recreational users in these areas may include walkers/joggers, bikers, and nature viewers. Recreational viewers are generally assumed to have higher levels of viewer sensitivity due to a particularly focused interest in scenic quality. Viewer sensitivity is moderately high among recreational users because they are more likely to place a high value on the natural environment and to be more sensitive to changes in views.

2.1.2 Levels of Visual Impact

According to FHWA guidelines, impacts are defined as either changes to the environment, measured by the compatibility of the impact, or changes to viewers, measured by sensitivity to the impact. Together, the compatibility and sensitivity determine the degree of the impact, which is defined as a beneficial, adverse, or neutral change to visual quality. For example, a project may benefit visual quality by enhancing visual resources and/or views and improving the experience of visual quality. Similarly, a project may adversely affect visual quality by degrading visual resources or obstructing or altering desired views.

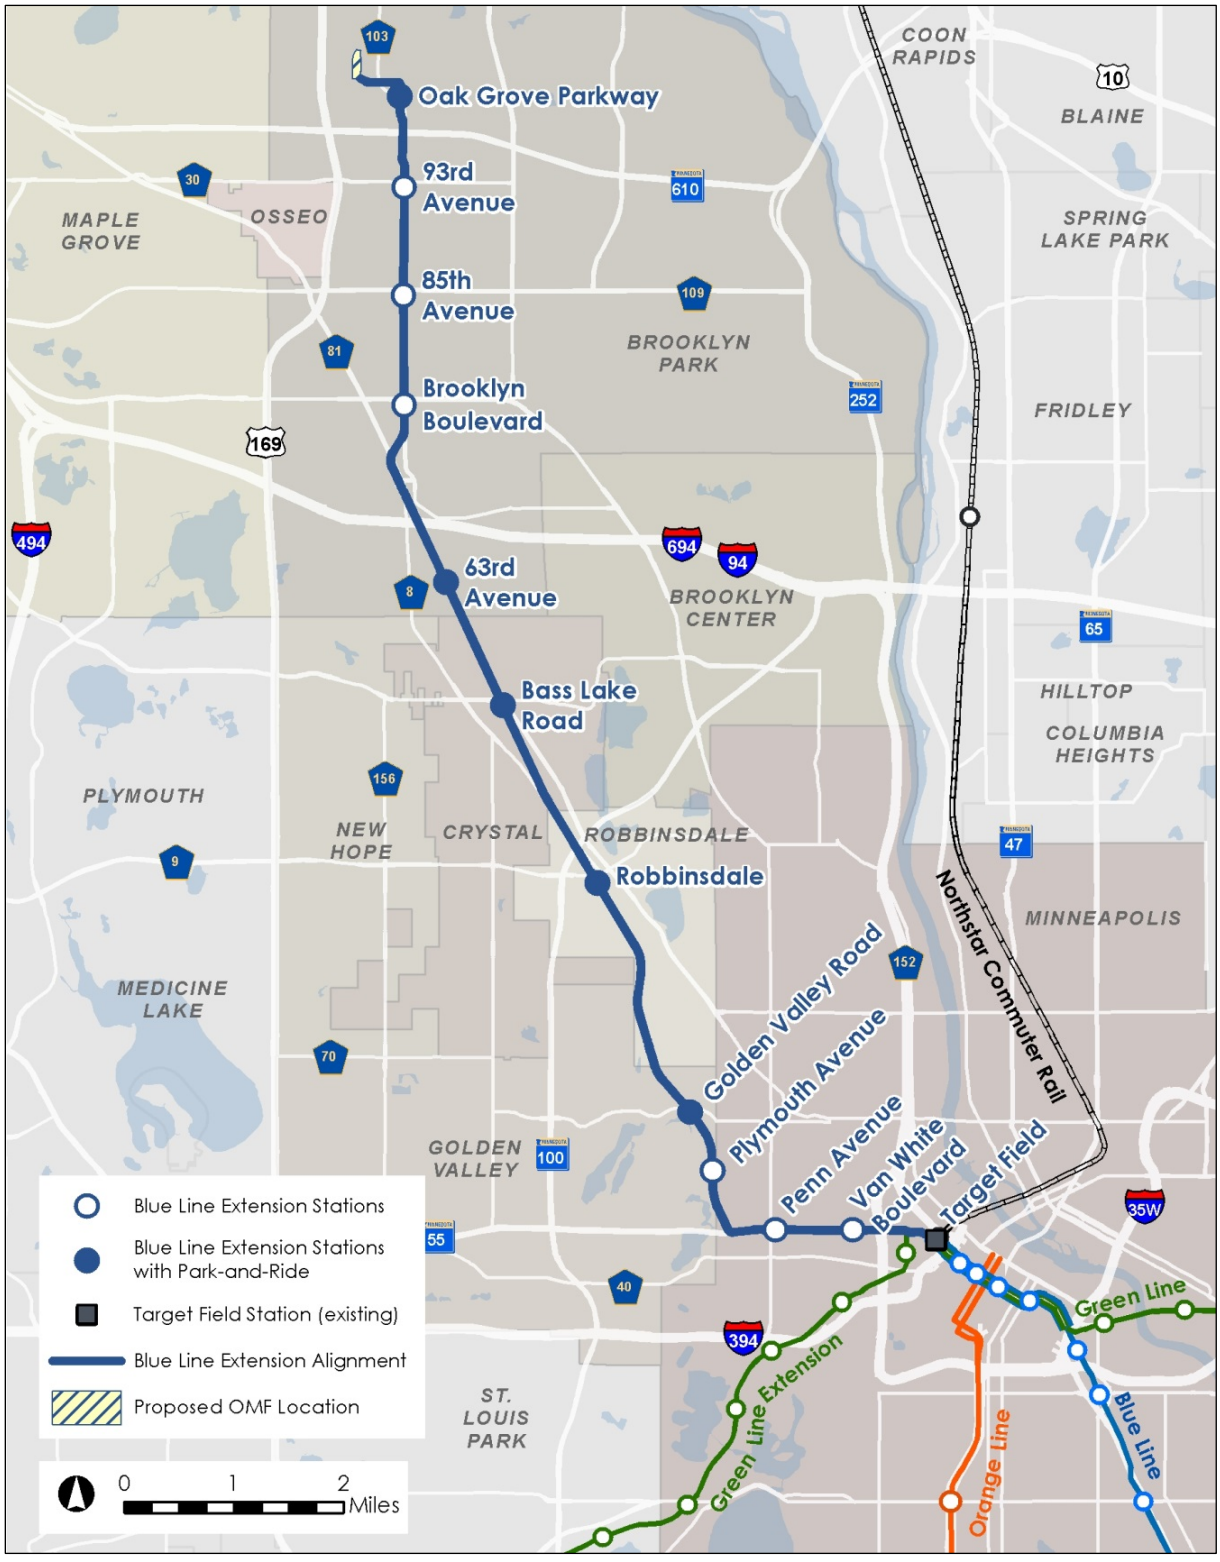
2.1.3 Assessing Visual Change

The visual impacts of the proposed BLRT Extension project were determined by evaluating the changes to existing visual resources that would occur as a result of the proposed BLRT Extension project implementation, and assessing the anticipated viewer response to those changes. Aesthetic impacts resulting from the proposed BLRT Extension project implementation were determined based on direct field observation from multiple vantage points, including from neighboring properties and roadways; evaluation of existing visual character; and review of proposed BLRT Extension project plans and features. Visual impact assessment was also based on photographic documentation of several key views of the proposed BLRT Extension project corridor. Key views are described in future detail below in **Chapter 5 – Visual Impact Assessment**. Key views represent specific locations within a landscape unit from which the proposed BLRT Extension project would be visible. Within the landscape unit, key views are used to characterize the existing visual conditions and to represent examples of visual character and visual quality. They are also used to determine impacts by demonstrating how the proposed BLRT Extension project would change views within the landscape unit.

3 Proposed BLRT Extension Project Location and Description

3.1 Proposed BLRT Extension Project Location

The proposed BLRT Extension project is located in Hennepin County, Minnesota, extending approximately 13 miles from downtown Minneapolis to the northwest, serving north Minneapolis and the suburbs of Golden Valley, Robbinsdale, Crystal, and Brooklyn Park. **Figure 1** illustrates the proposed BLRT Extension project area. Key transportation facilities within the proposed BLRT Extension project area include Interstate Highway 94 (I-94), Olson Memorial Highway (Trunk Highway [TH] 55), TH 100, TH 610, Bottineau Boulevard (County Road 81), West Broadway Avenue (County State-Aid Highway [CSAH] 103), the BNSF Railway (BNSF) corridor, the Canadian Pacific Railway (CP) corridor, and Crystal Airport.



3.2 Proposed BLRT Extension Project Setting

The character of the area surrounding the proposed BLRT Extension project transitions from downtown Minneapolis to a moderately dense urban setting in north Minneapolis and then to a less dense suburban setting starting in the cities of Golden Valley, Robbinsdale, and Crystal, and extending through the City of Brooklyn Park at the north end of the corridor. The proposed BLRT Extension project area includes a variety of land use patterns that have been influenced by the transportation-oriented history of the corridor. Low-density, auto-oriented land uses have heavily influenced existing development patterns in the corridor, which primarily reflect highway-oriented regulations and traditional suburban development forms. Additionally, the presence of the existing railway lines influenced the development patterns and settings in much of the proposed BLRT Extension project corridor (e.g., development set back from the railroad right-of-way).

Much of the proposed BLRT Extension project area, in particular the Golden Valley area, includes substantial park setting along the proposed BLRT Extension project corridor. These areas are primarily located to the west of downtown Minneapolis, between the intersection of Olson Memorial Highway with Theodore Wirth Regional Park and continuing through Golden Valley.

Existing development in north Minneapolis and Robbinsdale reflects the history of West Broadway Avenue as a commercial streetcar corridor, with strips of auto-oriented commercial activity developed more recently. Residential neighborhoods are located along the proposed BLRT Extension project in the cities of Minneapolis, Golden Valley, Robbinsdale, Crystal, and Brooklyn Park. In Brooklyn Park south of 73rd Avenue and in northern Crystal, development adjacent to the proposed BLRT Extension project includes highway-oriented commercial activity and the Crystal Airport. In the City of Brooklyn Park north of 73rd Avenue, development adjacent to West Broadway Avenue includes mixed commercial and retail, commercial office/corporate campus (Target North Campus), residential, and institutional use (North Hennepin Community College and Hennepin County Library under construction). Several activity centers are located along the corridor, including downtown Minneapolis, Theodore Wirth Regional Park, downtown Robbinsdale, the Crystal Shopping Center, the City of Brooklyn Park commercial strip, and North Hennepin Community College. In addition, large commercial developments with substantial employment concentrations are anticipated by 2040 in the City of Brooklyn Park (surrounding the Target North Campus north of TH 610).

Figure 1. Proposed BLRT Extension Project

3.3 Proposed BLRT Extension Project Description

The proposed BLRT Extension project corridor begins at the Target Field Station in downtown Minneapolis and follows Olson Memorial Highway to just west of Thomas Avenue where it enters the BNSF rail corridor. Adjacent to the freight rail tracks, it continues in the rail corridor through the cities of Golden Valley, Robbinsdale, Crystal, and enters the City of Brooklyn Park. In portions of the Golden Valley area, the existing freight rail tracks would be relocated. As a result, in some areas, the new freight rail tracks would be closer to the corridor's parks. The corridor then crosses Bottineau Boulevard at 73rd Avenue to West Broadway Avenue and terminates just north of TH 610 near the Target North Campus.

The proposed BLRT Extension project includes seven new LRT bridges: a 350-foot-long crossing of the Hennepin Energy Recovery Center (HERC) driveway, a 700-foot-long crossing of the ponds immediately north of Golden Valley Road, a 1,250-foot-long crossing of Grimes Pond in Robbinsdale, a 375-foot-long bridge over TH 100, a 1,250-foot-long bridge over the CP rail tracks, a 925-foot-long bridge over the 73rd Avenue/Bottineau Boulevard intersection, and a 300-foot-long bridge over TH 610.

In addition, five roadway bridges would be reconstructed: a 375-foot-long Olson Memorial Highway bridge over the BNSF rail corridor, a 375-foot-long Plymouth Avenue bridge, a 120-foot-long Theodore Wirth Parkway bridge, a 215-foot-long Golden Valley Road bridge, and a 110-foot-long 36th Street bridge. Three additional bridges would require modifications to accommodate LRT: the Olson Memorial Highway bridge over I-94 in the City of Minneapolis, the eastbound Olson Memorial Highway bridge over the BNSF rail corridor, and the Interstate Highway 694 (I-694) bridge over the BNSF rail corridor in the City of Brooklyn Park.

The general elements of the proposed transitway system are the stations, the Operations and Maintenance Facility (OMF), the traction power substations (TPSSs), fare collection, trackway, vehicles, train control, operating frequencies, and noise walls proposed to mitigate noise impacts. These features are summarized below.

- **Stations** – The proposed BLRT Extension project includes 11 new stations at Van White Boulevard, Penn Avenue, Plymouth Avenue, Golden Valley Road, Robbinsdale Road, Bass Lake Road, 63rd Avenue, Brooklyn Boulevard, 85th Avenue, 93rd Avenue, and Oak Grove Parkway. The Golden Valley Road and Plymouth Avenue stations include vertical circulation (elevator) to allow passengers to access the station platforms. The 63rd Avenue Station includes a pedestrian overpass of the rail lines to provide better rider access between the parking ramp and the LRT platform. It is anticipated that station features would also include passenger information displays, lighting, and security systems.
- **Operations and Maintenance Facility** – The OMF site would be located at the north end of the proposed BLRT Extension project corridor in Brooklyn Park. The OMF site was selected based on its proximity to the end of the line, adequate space for the special trackwork required between the mainline track and the facility, and adequate property for the facility (about 10.8 acres). The OMF site would be occupied by a storage and maintenance building that is about 163,000 square feet (SF), surface parking for employees and visitors, trackwork, and

open space. The facility would include areas to store, service, and maintain up to 30 light rail vehicles (LRVs), vehicle washing and cleaning equipment, and office space to accommodate staff who would report for work at this facility. The facility would be equipped to perform daily cleaning and repair activities on the LRVs as they enter and leave revenue service. Scheduled service and maintenance inspections also would be performed in this facility. It is anticipated that OMF features would also include lighting and security systems.

- **Traction Power Substations** –A total of 17 potential TPSS locations have been identified along the proposed BLRT Extension project corridor. The TPSS locations are represented by areas with a 300-foot diameter. These areas would be refined through more-detailed engineering to minimize impacts to surrounding properties and resources and to balance safety, reliability, cost, and operational efficiencies. TPSS sites, once located, would be about 4,000 SF and able to accommodate a single-story building about 40 feet by 20 feet. Access to the building must also be accommodated. It is anticipated that most TPSS sites would be located within existing transportation right-of-way.
- **Fare-Collection System** – A self-service, proof-of-payment fare-collection system was assumed for the proposed BLRT Extension project, consistent with that used on the other regional transitways today. A proof-of-payment fare-collection system minimizes the right-of-way needed for each station.
- **Trackway** – LRVs would operate on standard-gauge rail. The proposed system would be double-tracked throughout to provide separate tracks for northbound and southbound trains. Crossovers to allow trains to cross from the northbound to the southbound tracks would be provided at regular intervals for special operations or emergencies. Typically, the trackway in the BNSF rail corridor would be ballasted track separate from the freight rail track. Alignments in streets would be either ballasted or embedded depending on the location and the context of the street.
- **Vehicles** – The conceptual engineering to support the Final EIS assumes the following LRV characteristics:
  - Articulated train cars could operate in either directional and could be operated as a single-unit or multi-unit train.
  - Cars would be designed for use with an overhead catenary system.
  - Each car would have 66 seats and capacity for 160 passengers (sitting and standing).
  - Two- to three-car trains would operate at speeds up to 55 miles per hour (mph).
  - Cars would be fully compatible with Americans with Disabilities Act (ADA) standards.
- **Train Control** – An operator would occupy each train and would have control over acceleration and braking as well as operating the passenger doors. Automated systems would inform the operator of various train and transitway operating conditions and would manage traffic signal priority, activation of crossing gates, and track switch operations.
- **Operating Frequencies** – The Final EIS assumes that trains would operate at 10-minute frequencies for weekday operations.

- **Noise Walls** – The proposed BLRT Extension project would also include the construction of noise walls in locations where such features have been determined feasible to mitigate for noise impacts. The proposed noise walls are located primarily in the more dense residential sections of the cities of Robbinsdale and Crystal. Noise wall design details would be refined during final project design activities, but it is anticipated that noise walls may be a maximum of 8 feet tall.

4 Existing Conditions

4.1 Study Area

The study area is defined as the right-of-way for the proposed BLRT Extension project corridor and the adjacent properties with a visual connection to the transitway, which include residential, commercial, and park properties. In select instances, the extent of analysis was expanded to account for specific features that were visible by field observation along the proposed transitway as a result of topography, physical scale, architectural distinction, or other considerations.

The study area includes a diverse array of development patterns, parks and natural areas, railroads, highways, and local roadways. A summary of the general visual context and a listing of identified higher-quality and unique visual features are provided below.

4.2 Landscape Units and Viewshed

A landscape unit is a portion of the regional landscape. These units are commonly used to divide long linear projects into logical geographic entities for assessment purposes. Landscape units generally are made up of areas with similar visual characteristics, although smaller locations within each landscape unit may differ from the overall unit's character. For the purposes of this visual quality analysis, the study area is divided into four landscape units: Minneapolis, Golden Valley, Robbinsdale/Crystal, and Brooklyn Park. The limits of the four landscape units are shown in **Figure 2**, and are described in detail below, in the discussion of each landscape unit.

A viewshed is a subset of a landscape unit; this subset is comprised of all the surface areas visible from an observer's viewpoint. The limits of a viewshed are defined as the visual limits of the views located from the proposed BLRT Extension project. The viewshed also includes the locations of viewers likely to be affected by visual changes resulting from the addition of proposed BLRT Extension project features. The study area for the proposed BLRT Extension project includes the areas that could potentially have views of the proposed BLRT Extension project features and the areas which LRT users could potentially view as they travel through the landscape.

4.2.1 Minneapolis Landscape Unit

The Minneapolis Landscape Unit is bound by Target Field to the east, and by the Minneapolis/ Golden Valley city limits to the west (see **Figure 2**).

Figure 2. Landscape Units

4.2.1.1 General Visual Context

The Minneapolis Landscape Unit runs along Olson Memorial Highway between downtown Minneapolis and the Golden Valley city limits. In the vicinity of Target Field in downtown Minneapolis, 7th Street branches into one-way outbound 7th Street and one-way inbound 10th Street. Northeast of the Target Field Station at 5th Avenue, 6th Avenue realigns to the street grid of the North Loop section of downtown. The taller buildings of downtown Minneapolis are visible in the near distance. Between Target Field and I-94, industrial and civic buildings line the route, and there is little greenery. The intersection of Olson Memorial Highway, 6th Avenue, and 7th Street is a skewed configuration and a visually challenging area to navigate. Along Olson Memorial Highway between I-94 and the bridge over the BNSF rail corridor, homes in the adjacent residential neighborhoods generally face inward to the local streets and do not face Olson Memorial Highway directly. Some multi-family residential buildings ranging from two to six stories do have some units facing the highway. On the south side of Olson Memorial Highway, Harrison Park includes ball fields and a community center building. Additionally, several civic buildings and spaces have prominent locations.

As part of the *Minneapolis Near Northside Master Plan* (May 2000), Olson Memorial Highway was envisioned as a "gateway" corridor, in that it passes through the center of the Master Plan area and is being redesigned to create a formalized green gateway to downtown Minneapolis. The redesigned roadway would also contribute to a safer, enhanced pedestrian environment. The plan also acknowledged the redesign would permit future implementation of LRT within the median island. Since the plan's adoption, a number of improvements have been implemented, including new boulevard and median tree plantings to complement the mature trees along the south frontage road.

4.2.1.2 Higher-Quality Visual Features

Section 1.1.1.2 – Visual Quality outlines the characteristics that a feature would exemplify in order to be considered a "higher-quality visual feature." Based on the developed urban and suburban context of the study area, the following features of the Minneapolis Landscape Unit were identified as higher-quality visual features:

- Ford Building
  - Located at the northeast corner of the intersection of 5th Street and 5th Avenue, the recently redeveloped historic ten-story building has a brick façade with large window openings and a recently renovated primary entrance oriented towards the parking lot off 5th Avenue.
- HERC site landscaping
  - Located at the southeast corner of 6th Avenue and 7th Street, this landscaped area stands out because there is very little other vegetation in the vicinity.
- Metro Transit headquarters
  - Located at the corner of 6th Avenue and 7th Street, the five-story modern building has a brick, metal, and glass façade.

- Boulevard and median trees along Olson Memorial Highway west of I-94
  - Linear rows of trees frame the roadway corridor. They are a mixture of mature and newly planted trees, which reinforces the city's desired "gateway" character for the roadway.
- Sumner Library
  - Located at the northwest corner of Olson Memorial Highway and Van White Memorial Boulevard, the historic two-story building, on the National Register of Historic Places, has prominent gabled roof peaks and a brick façade that faces Olson Memorial Highway.
- Seed Academy and Wayman African Methodist Episcopal (AME) Church
  - Located on the north side of Olson Memorial Highway east of Humboldt Avenue, the historic, multi-purpose building has a two-story brick façade with a mosaic appearance.
- Zion Baptist Church
  - Located on the north side of Olson Memorial Highway just west of Logan Avenue, the building is a modern three-story brick and glass structure.
- Floyd B. Olson Memorial Statue
  - Located on the south side of the Olson Memorial Highway just east of the Penn Avenue intersection, a small plaza surrounds an approximately 10-foot-tall historic figural stone sculpture of Floyd B. Olson, Minnesota's 22nd Governor from 1931 to 1936.
- Harrison Neighborhood gateway sculptures
  - Located on the south side of Olson Memorial Highway at the Penn Avenue intersection, these artistic gateway features are approximately ten feet tall and are topped with figural sculptures of children and colorful symbols.

4.2.2 Golden Valley Landscape Unit

The Golden Valley Landscape Unit is generally bound by the Minneapolis/Golden Valley city limits to the east, and by the Golden Valley/Robbinsdale city limits to the north; however, this landscape unit also includes the southern portion of the City of Robbinsdale (see **Figure 2**).

4.2.2.1 General Visual Context

The Golden Valley Landscape Unit runs along the edge of the Minneapolis and Golden Valley city limits, in the eastern 50 feet of the total 100-foot-wide BNSF right-of-way alongside the BNSF tracks. At the Olson Memorial Highway bridges over the BNSF right-of-way, the transitway would shift away from the center median of Olson Memorial Highway and turn north under westbound Olson Memorial Highway and continue northward along the Golden Valley and Minneapolis city limits. Through 36th Avenue, the transitway would be depressed in relation to the surroundings with wooded embankments on both sides. Adjacent land uses primarily include residential neighborhoods and public parkland.

While some of the residential areas are secluded from the rail corridor by wider vegetative buffers, others are in closer proximity or have less vegetative buffer such as along the eastern edge on Indiana Avenue, Kewanee Way, parts of Xerxes Avenue, and the area near the transition to/from

Olson Memorial Highway. Along the western edge of the rail corridor, a linear natural area is comprised of a series of parks that are a natural retreat from the surrounding urban and suburban development including Sochacki Park,[2] South Halifax Park, Glenview Terrace/Valley View Park, and Theodore Wirth Regional Park and Golf Course. Each is described in more detail below. Within Theodore Wirth Regional Park, Bassett Creek meanders through a patchwork of forested areas at the edge of the golf course as it heads south toward Bassett Lake and Olson Memorial Highway.

The railroad right-of-way is also a primary utility corridor. A power substation is located adjacent to the BNSF right-of-way near 34th Avenue. Power lines run along the east or west, or in some areas both, sides of the railroad corridor along the entire length of this landscape unit. The presence of the railroad and utilities through this generally green area environment indicates the natural area has been previously disturbed. However, much of the green area is an intentionally designed landscape by Theodore Wirth, as referenced in the Theodore Wirth Regional Park Cultural Landscape Study prepared by The 106 Group in 2015.

4.2.2.2 Higher-Quality Visual Features

Based on the developed urban and suburban context of the study area, the following features of the Golden Valley Landscape Unit were identified as higher-quality visual features:

- Plymouth Avenue bridge over Bassett Creek and the BNSF rail corridor
  - This bridge was designed with tall slender arching piers, an architectural railing, and decorative lighting. It serves as a gateway feature approaching Theodore Wirth Regional Park on Plymouth Avenue from the east and affords a good vantage point down to the creek from the sidewalk.
- Theodore Wirth Regional Park and Golf Course
  - At 759 acres, Theodore Wirth Regional Park is the largest park in the City of Minneapolis parks system and provides a diverse assortment of recreational opportunities. The park includes two golf courses, Wirth Lake, Birch Pond, and other amenities. Wirth Lake, located in a portion of the park to the south of Olson Memorial Highway, includes a beach area, a boardwalk across the northern portion of the lake, and also offers a variety of water recreation activities. The golf course comprises most of the park area adjacent to the proposed transitway. It is a mixture of open spaces for the tees, fairways, and greens bordered by densely wooded areas. The terrain is varied, ranging from flat in some areas to steeply sloped in others. The wooded area between the BNSF rail corridor and Theodore Wirth Parkway between Golden Valley Road and Plymouth Avenue forms a visual buffer from the active use areas of the park.

[2] In this technical report, the term *Sochacki Park* refers to the park resource managed jointly by the cities of Golden Valley and Robbinsdale, and the Three Rivers Park District. Sochacki Park consists of the former Sochacki Park located in the City of Robbinsdale, and the former Rice Lake Park and former Mary Hills Nature Area located in the City of Golden Valley.

- Bassett Creek and Bassett Lake
  - Bassett Creek flows along the eastern edge of Theodore Wirth Regional Park within the park boundaries, and is partially set within a vegetated area with a mixture of open spaces for the tees. It follows a meandering route that borders several golf holes. In some locations, views of the creek from the course are wide open, and in others the creek is secluded in dense vegetation. Connected with the creek, Bassett Lake is a wider body of water located within Theodore Wirth Regional Park on the north side of Olson Memorial Highway.
- Theodore Wirth Parkway
  - Theodore Wirth Parkway passes through Theodore Wirth Regional Park and crosses over the BNSF right-of-way near Golden Valley Road. It is part of the Grand Rounds National Scenic Byway, which was created for the purpose of scenic pleasure driving. The Grand Rounds was, and is envisioned, designed, and maintained as a facility with high visual quality. This feature is also described in the Theodore Wirth Regional Park Cultural Landscape Study noted above.
- Sochacki Park and South Halifax Park
  - These parks, although under different municipal jurisdictions, are adjacent to each other along the west side of the BNSF right-of-way. They are all densely wooded with a network of paved and unpaved trails.
- Glenview Terrace/Valley View Park
  - Glenview Terrace/Valley View Park is located east of the BNSF rail corridor north of Theodore Wirth Parkway. Near the railroad, it is densely wooded. Moving further east, it transitions to mowed lawn and has tennis courts and a playground.

4.2.3 Robbinsdale/Crystal Landscape Unit

The Robbinsdale/Crystal Landscape Unit is bound by the Golden Valley/Robbinsdale city limits to the south, and by the Crystal/Brooklyn Park city limits to the north (see **Figure 2**).

4.2.3.1 General Visual Context

In the Robbinsdale/Crystal Landscape Unit, the transitway would generally follow the BNSF rail corridor. In some locations, the route would parallel a primary roadway. In other locations, it would be more secluded, running behind commercial and residential areas. South of 36th Avenue, the transitway would pass by Walter Sochacki Park, park situated outside the west embankment of the BNSF right-of-way. Near 36th Avenue, the railroad right-of-way is depressed with steep side slopes to allow clearance under the 36th Avenue bridge. In the segment between 36th Avenue and Noble Avenue, the transitway would be aligned at a skew from the neighborhood street grid, so vantage points would vary. At the edges of the railroad right-of-way, continuous chain link fencing restricts access.

Between Noble/41st Avenue and 42nd Avenue, the transitway would pass along the west edge of downtown Robbinsdale's commercial area. Downtown Robbinsdale is an area primarily comprised of single-story storefront buildings and an enhanced streetscape with brick pavers, decorative

lighting, and other features. Along the edges of the railroad right-of-way, rows of tree cover provide some visual buffer for adjacent residential properties and continuous chain link fencing restricts access. Several neighborhood-scale parks are located adjacent to the transitway in this landscape unit, including Becker Park, Triangle Park, and Lee Park. These parks are characterized by mowed lawn with some tree cover at the edges. Moving north, the transitway would cross over TH 100 and run adjacent to West Broadway Avenue, a lower speed two-lane county roadway. Between TH 100 and 47th Avenue, a handful of mature trees are in a grass median between the railroad and West Broadway Avenue.

The development pattern in this area is comprised of single-story commercial buildings oriented towards Bottineau Boulevard. The transitway would parallel Bottineau Boulevard, a multi-lane divided-median county highway. Along the edges of the railroad right-of-way, rows of tree cover provide some visual buffer for adjacent residential properties. The railroad right-of-way is also a primary utility corridor and includes overhead utility lines and poles.

4.2.3.2 Higher-Quality Visual Features

Based on the developed urban and suburban context of the study area, the following features of the Robbinsdale/Crystal Landscape Unit were identified as higher-quality visual features:

- Sacred Heart Catholic Church
  - Located at the intersection of Hubbard Avenue and 40th Avenue, the prominent church spire rises vertically above all other buildings in the vicinity. Constructed of limestone, the building conveys a strong presence that visually anchors the southern end of downtown Robbinsdale.
- Historic Robbinsdale Public Library
  - Located south of 42nd Avenue and west of the BNSF right-of-way, a single-story library building, on the National Register of Historic Places, houses the Robbinsdale Historical Society and is residential in scale.
- West Broadway Avenue and BNSF railroad bridges over TH 100
  - The West Broadway Avenue and BNSF railroad bridges over TH 100 were designed and constructed in accordance with the Minnesota Department of Transportation's (MnDOT) TH 100 aesthetic design guidelines developed for bridges and other features throughout the corridor.
- Green boulevard on west side of West Broadway Avenue between 47th Avenue and TH 100
  - Mature trees in informal groupings are dispersed throughout a lawn area separating the roadway and railroad.
- Bottineau Boulevard Bridge over CP rail corridor
  - As part of the Bottineau Boulevard Roadway Reconstruction, a new bridge with aesthetic treatments and long approaches supported by retaining walls was constructed.

- City of Crystal gateway area
  - As part of the Bottineau Boulevard Roadway Reconstruction, an architectural gateway monument, landscaping, and decorative lighting were installed at the southwest corner of Bottineau Boulevard and Bass Lake Road to call attention to the entrance to the City of Crystal's primary commercial area to the west. Street trees, landscaping, and decorative lighting extend in both directions along both Bass Lake Road and Bottineau Boulevard.

4.2.4 Brooklyn Park Landscape Unit

The Brooklyn Park Landscape Unit: The landscape unit is bound by the Crystal/Brooklyn Park city limits to the south, and by the OMF to the north (see **Figure 2**).

4.2.4.1 General Visual Context

At the southern end of the Brooklyn Park Landscape Unit, the route would pass under I-94; the development pattern in that vicinity is comprised of single-story commercial buildings oriented towards Bottineau Boulevard.

South of TH 610, the adjacent land use transitions from agricultural to a mix of single-story commercial and light-industrial buildings and single-family residential neighborhoods. The commercial areas have front yards characterized by mowed lawn, trees, and stormwater treatment ponds. The homes face away from West Broadway Avenue, and fences and landscaping visually separate backyards from the roadway. North Hennepin Community College, located in the southeast corner of the West Broadway Avenue and 85th Avenue intersection is comprised of one and two-story buildings organized around a central green space. The perimeter of the campus is dominated by surface parking lots, with two ball fields and a mowed lawn located south of the college.

North of TH 610 up to 101st Avenue, open field agricultural land is the predominant land use with some remnant woodland and grassland areas. The recently constructed Target North Campus with its multi-story buildings is located along Oak Grove Parkway east of West Broadway Avenue and has landscaped grounds characterized by mowed lawn and trees. Future redevelopment with higher-intensity land use is envisioned for the area, which would likely bring a more suburban development pattern with new streets, buildings, parking, and landscaping.

4.2.4.2 Higher-Quality Visual Features

Based on the developed urban and suburban context of the study area, the following features of the Brooklyn Park Landscape Unit were identified as higher-quality visual features:

- I-94 bridge over the BNSF rail corridor and Bottineau Boulevard
  - The I-94 bridge was designed and constructed with aesthetic enhancements that are unique to this bridge and not a consistent theme throughout the I-94 corridor.
- Shingle Creek
  - Views of Shingle Creek where it crosses West Broadway Avenue north of Candlewood Drive soften the predominantly built appearance of the area. East of West Broadway Avenue, the creek is located in a residential area, and has a natural meandering shape edged by tree cover. To the west, the creek is located in a commercial area, has been straightened and there is little tree cover.
- West Broadway Avenue Bridge over TH 610
  - The West Broadway Avenue bridge over TH 610 was designed and constructed in accordance with MnDOT's TH 610 aesthetic design guidelines developed for bridges and other features throughout the corridor.
- Rush Creek Regional Trail
  - The Rush Creek Regional Trail is approximately 10 miles of paved trail linking Elm Creek Park Reserve to Coon Rapids Dam Regional Park. The trail is popular for its wider-than-average trail corridor, which allows the trail alignment to weave gradually, incorporating significant variety in the landscape. The trail is located adjacent to large mowed turf in some areas, and wooded and dense vegetation in other areas.

5 Visual Impact Assessment

5.1 Introduction

As described in **Section 2.1.3** – **Assessing Visual Change**, the visual impacts of the proposed BLRT Extension project were determined by evaluating the changes to existing visual resources that would occur as a result of the proposed BLRT Extension project implementation, and assessing the anticipated viewer response to those changes. Visual impact assessment was based on direct field observation from multiple vantage points, including from neighboring properties and roadways; evaluation of existing visual character; and review of proposed BLRT Extension project plans and features. Visual impact assessment was also based on photographic documentation of several key views of the proposed BLRT Extension project corridor.

5.2 Key Views

Visual impact assessment included an evaluation of photographic documentation of several key views of the proposed BLRT Extension project corridor. Key views were selected at critical viewpoints, along commonly traveled routes, or at other likely observation points to document the existing conditions of the study area. For some locations, both an existing condition photograph and a simulated condition drawing are provided. Simulation vantage points were selected to provide representative public views from which the proposed BLRT Extension project components that would be most visible to the various types of sensitive receptors that are anticipated to be located within the landscape units identified for the proposed BLRT Extension project. These locations are noted as key view point (KVP) followed by a figure number.

Analysis of aesthetic impacts resulting from the proposed BLRT Extension project implementation included an evaluation of both the photographic documentation of key views of the proposed BLRT Extension project, as well as the simulation condition drawings which illustrate the proposed BLRT Extension project components from 23 KVP locations. For some KVP locations, more than one view was provided (for example, KVP-7 and KVP-7a), resulting in a total of 27 simulations. KVP locations were selected based on the sensitivity of the resource (e.g., to support the historic resources Section 106 consultation process) or locations of key vertical features of the proposed BLRT Extension project that could potentially change the visual character or views of an affected area.

Each of the 20 KVPs is included on a location map, which consists of a series of aerial photographs depicting the location and direction of each KVP. Each KVP is then represented with a "before the proposed BLRT Extension project" existing condition photograph and a computer-generated sketch-up simulation of the conceptual "after the proposed BLRT Extension project" condition. The computer-generated sketch-up simulations were prepared using digital photographs and computer modeling procedures to represent the visual changes that would result from implementation of the proposed BLRT Extension project. The KVP location maps and photographs are provided in **Appendix A** of this report.

Additional key views were evaluated at three of the locations proposed for noise walls. These locations are noted as noise wall (NW) followed by a figure number. Each of the three NWs is

included on a location map, which consists of an aerial photograph depicting the location and direction of each NW. The NW location map and photographs are provided in **Appendix A** of this report.

5.3 Visual Impact Assessment

The following sections describe the anticipated changes in visual quality and character, within each landscape unit and for each KVP or NW where applicable, as a result of the proposed BLRT Extension project implementation. As described above in **Section 4.2 – Landscape Units and Viewshed**, the proposed BLRT Extension project would pass through four landscape units, for which 23 KVPs were analyzed. It is important to note when assessing KVPs, that seasonal changes and weather patterns typical of the proposed BLRT Extension project area would produce variations to vegetation and ground cover. In order to represent an accurate long-term view of the proposed BLRT Extension project area, in addition to representation of new proposed BLRT Extension project features, visual simulations for the proposed BLRT Extension project represented a simulation of established vegetation. Thus, in the short term, proposed BLRT Extension project features may be more visible when vegetation is young, and, in the long term, proposed BLRT Extension project features may be less visible when vegetation is mature. Therefore, depending upon the timeframe of the view, both seasonal and vegetation variations could result in altered views than those represented in each existing condition and simulated photograph.

5.3.1 No-Build Alternative

The No-Build Alternative reflects existing and committed improvements to the regional transit network for the horizon year of 2040, not including the proposed BLRT Extension project. The No-Build Alternative is based on the Metropolitan Council's (Council) *Thrive MSP 2040 Transportation Policy Plan* (*2040 TPP*). Under the No-Build Alternative, there would be no alteration of the visual quality and character of the proposed BLRT Extension project corridor. Therefore, there would be no visual effects and no mitigation would be required.

5.3.2 BLRT Extension Project Operational Impacts

Overview

Anticipated visual effects during operation of the proposed BLRT Extension project would generally be consistent with existing, similar features, and the proposed BLRT Extension project would not substantially obstruct proposed BLRT Extension project area views or substantially alter the existing visual character of the proposed BLRT Extension project corridor. Additional discussion of operational impacts on the higher-quality visual features identified in **Section 4.2** and other prominent visual features of each of the four landscape units is provided below. A summary of KVP and NW analysis (photographic and simulation analysis) by landscape unit is provided below in **Table 5-1**. A summary of impacts resulting from the addition of primary proposed BLRT Extension project features, as well as impacts on existing higher-quality visual features is provided below in **Table 5-2**.

Table 1. Summary of Photographic Documentation

Landscape Unit	Designation and Description of View	Degree of Visual Change in Quality and Character	Level of Visual Sensitivity
Minneapolis	OMH 1 (view to the west toward Penn Avenue, from center Olson Memorial Highway median)	Altered	Moderate
	KVP 1 (view to the east toward the Olson Memorial Highway bridge over the BNSF rail corridor, from the Wirth Lake Boardwalk)	Not substantially altered	High
	KVP 2 (view to the east-southeast toward the Olson Memorial Highway bridge over the BNSF rail corridor, from the Wirth Park Trail)	Altered	High
Golden Valley	KVP 3 (view to the northwest toward the existing BNSF tracks and proposed LRT tracks, from Farwell Avenue and Xerxes Avenue North)	Not substantially altered	Moderately high
	KVP 4a (view to the west toward the proposed Plymouth Avenue Station and bridge, from Plymouth Avenue North and Washburn Avenue North)	Altered	Moderately high
	KVP 4b (view to the south toward the existing BNSF tracks and proposed LRT tracks, from the Plymouth Avenue North bridge)	Altered	Moderate
	KVP 4c (view to the north toward the proposed Plymouth Avenue Station, from the Plymouth Avenue bridge)	Substantially altered	Moderate
	KVP 5 (view to the southeast toward the proposed Plymouth Avenue Station and bridge, from the Theodore Wirth Regional Park Chalet)	Altered	High
	KVP 6a (view to the north toward the proposed Golden Valley Road Station, from the Theodore Wirth Regional Park Golf Course)	Not substantially altered	High
	KVP 6b (view to the northeast toward Bassett Creek and the proposed Golden Valley Road Station, from the Theodore Wirth Regional Park Golf Course)	Altered	High
	KVP 7 (view to the west toward the proposed Golden Valley Road Station, from Theodore Wirth Parkway near the intersection of Zenith Avenue)	Not substantially altered	Moderately high
	KVP 8 (view to the west toward the proposed Golden Valley Road Station, from Golden Valley Road and Theodore Wirth Parkway)	Altered	High
	KVP 8a (view to the west toward the proposed Golden Valley Road Station, from Theodore Wirth Parkway at Golden Valley Road)	Altered	Moderately high

Table 1. Summary of Photographic Documentation

Landscape Unit	Designation and Description of View	Degree of Visual Change in Quality and Character	Level of Visual Sensitivity
Robbinsdale/ Crystal	KVP 9 (view to the northwest toward downtown Robbinsdale, from 41st Avenue and Hubbard Avenue)	Not substantially altered	Moderate
	KVP 10 (view to the north toward the proposed Robbinsdale Station, from 41st Avenue)	Not substantially altered	Moderate
	KVP 11 (view to the east toward the proposed Robbinsdale Station, from 42nd Avenue)	Not substantially altered	Moderate
	KVP 12 (view to the southeast toward the proposed wall and fence, from the adjacent residential alley)	Altered	Moderately high
	KVP 21 (view to the southeast toward the proposed Bass Lake Road station and pedestrian bridge, from Bottineau Boulevard)	Altered for visual quality; not substantially altered for visual character	Moderate
	KVP 22 (view to the northwest toward the proposed Bass Lake Road station and pedestrian bridge, from the southeast quadrant of the Bass Lake Road/Bottineau Boulevard intersection)	Altered for visual quality; not substantially altered for visual character	Moderate
	KVP 23 (view to the northeast toward the proposed Bass Lake Road pedestrian bridge, from the southwest quadrant of the Bass Lake Road/Bottineau Boulevard intersection)	Altered for visual quality; not substantially altered for visual character	Moderate
Brooklyn Park	KVP 13 (view to the south toward the proposed 63rd Avenue Station, from the trail adjacent to Bottineau Boulevard)	Altered for visual quality; not substantially altered for visual character	Moderate
	KVP 14 (view to the southeast toward the proposed 63rd Avenue Station, from the adjacent neighborhood west of 63rd Avenue)	Altered	Moderately high
	KVP 15 (view to the north toward the proposed 73rd Avenue/Bottineau Boulevard bridge, from Bottineau Boulevard 81 at 71st Avenue)	Altered for visual quality; not substantially altered for visual character	Moderate
	KVP 16 (view to the northeast toward the proposed 73rd Avenue/Bottineau Boulevard bridge, from 71st Avenue)	Not substantially altered	Moderate
	KVP 17 (view to the north toward the proposed 73rd Avenue/Bottineau Boulevard bridge, from the southeast corner of Bottineau Boulevard and 71st Avenue)	Altered for visual quality; not substantially altered for visual character	Moderate

Table 1. Summary of Photographic Documentation

Landscape Unit	Designation and Description of View	Degree of Visual Change in Quality and Character	Level of Visual Sensitivity
	KVP 18 (view to the south toward the proposed 73rd Avenue/Bottineau Boulevard bridge, from Bottineau Boulevard at 73rd Avenue)	Altered for visual quality; not substantially altered for visual character	Moderate
	KVP 19 (view to the east toward the proposed OMF, from 101st Avenue)	Substantially altered	Moderate
	KVP 20 (view to the southwest toward the proposed OMF, from Rush Creek Regional Trail)	Substantially altered	Moderately high

For each view described in the table, **Appendix A** includes a "before BLRT Extension project" existing condition photograph and a computer-generated sketch-up simulation of the conceptual "after BLRT Extension project" condition.

Table 2. Summary of Impacts from Primary Project Visual Features and to Higher-Quality Visual Features

Landscape Unit	Description of View, Higher-Quality Visual Feature, or Primary Project Visual Feature	Photographic Documentation[1]	Level of Impact
Minneapolis	OMH 1 (view to the west toward Penn Avenue, from center Olson Memorial Highway median)	OMH 1	Adverse
	KVP 1 (view to the east toward the Olson Memorial Highway bridge over the BNSF rail corridor, from the Wirth Lake Boardwalk)	KVP 1	Neutral
	KVP 2 (view to the east-southeast toward the Olson Memorial Highway bridge over the BNSF rail corridor, from the Wirth Park Trail)	KVP 2	Adverse
	Ford Building	Not applicable	Neutral
	HERC Landscaping	Not applicable	Neutral
	Metro Transit Headquarters	Not applicable	Neutral
	Boulevard and median trees along Olson Memorial Highway west of I-94	See photographic documentation of OMH 1 above	Adverse
	Sumner Library	Not applicable	Neutral
	Seed Academy and Wayman AME Church	Not applicable	Neutral
	Zion Baptist Church	Not applicable	Neutral
	Floyd B. Olson Memorial	Not applicable	Neutral
	Harrison Neighborhood gateway sculptures	Not applicable	Neutral
Golden Valley	KVP 3 (view to the northwest toward the existing BNSF tracks and proposed LRT tracks, from Farwell Avenue and Xerxes Avenue North)	KVP 3	Neutral
	KVP 4a (view to the west toward the proposed Plymouth Avenue Station and bridge, from Plymouth Avenue North and Washburn Avenue North)	KVP 4a	Adverse
	KVP 4b (view to the south toward the existing BNSF tracks and proposed LRT tracks, from the Plymouth Avenue North bridge)	KVP 4b	Adverse
	KVP 4c (view to the north toward the proposed Plymouth Avenue Station, from the Plymouth Avenue bridge)	KVP 4c	Adverse
	KVP 5 (view to the southeast toward the proposed Plymouth Avenue Station and bridge, from the Theodore Wirth Regional Park Chalet)	KVP 5	Adverse
	KVP 6a (view to the north toward the proposed Golden Valley Road Station, from the Theodore Wirth Regional Park Golf Course)	KVP 6a	Neutral

Table 2. Summary of Impacts from Primary Project Visual Features and to Higher-Quality Visual Features

Landscape Unit	Description of View, Higher-Quality Visual Feature, or Primary Project Visual Feature	Photographic Documentation[1]	Level of Impact
	KVP 6b (view to the northeast toward Bassett Creek and the proposed Golden Valley Road Station, from the Theodore Wirth Regional Park Golf Course)	KVP 6b	Adverse
	KVP 7 (view to the west toward the proposed Golden Valley Road Station, from Theodore Wirth Parkway near the intersection of Zenith Avenue)	KVP 7	Neutral
	KVP 8 (view to the west toward the proposed Golden Valley Road Station, from Golden Valley Road and Theodore Wirth Parkway)	KVP 8	Adverse
	KVP 8a (view to the west toward the proposed Golden Valley Road Station, from Theodore Wirth Parkway at Golden Valley Road)	KVP 8a	Adverse
	NW 1a (view to the northwest toward the proposed noise barrier on the east side of the alignment roughly across from the extent of Sochacki Park (the former Mary Hills Nature Area portion)	NW 1a	Potentially adverse
	NW 1b (view to the southeast toward the proposed noise barrier on the east side of the alignment roughly across from the extent of Sochacki Park (the former Mary Hills Nature Area portion)	NW 1b	Potentially adverse
	Plymouth Avenue bridge over Bassett Creek and BNSF rail corridor	See photographic documentation of KVPs 4a, 4b, 4c, and 5 above.	Neutral
	Theodore Wirth Regional Park and Golf Course	See photographic documentation of KVPs 5, 6a, and 6b above.	Adverse
	Bassett Creek and Bassett Creek Lagoons	Not applicable	Adverse
	Theodore Wirth Parkway	See photographic documentation of KVPs 7, 8, and 8a above.	Neutral
	Glenview Terrace/Valley View Park	Not applicable	Neutral
	Sochacki Park and South Halifax Park	Not applicable	Adverse

Table 2. Summary of Impacts from Primary Project Visual Features and to Higher-Quality Visual Features

Landscape Unit	Description of View, Higher-Quality Visual Feature, or Primary Project Visual Feature	Photographic Documentation[1]	Level of Impact
Robbinsdale/ Crystal	KVP 9 (view to the northwest toward downtown Robbinsdale, from 41st Avenue and Hubbard Avenue)	KVP 9	Neutral
	KVP 10 (view to the north toward the proposed Robbinsdale Station, from 41st Avenue)	KVP 10	Neutral
	KVP 11 (view to the east toward the proposed Robbinsdale Station, from 42nd Avenue)	KVP 11	Adverse
	KVP 12 (view to the southeast toward the proposed wall and fence, from the adjacent residential alley)	KVP 12	Adverse
	KVP 21 (view to the southeast toward the proposed Bass Lake Road Station and pedestrian bridge, from Bottineau Boulevard)	KVP 21	Adverse
	KVP 22 (view to the northwest toward the proposed Bass Lake Road Station and pedestrian bridge, from the southeast quadrant of the Bass Lake Road/Bottineau Boulevard intersection)	KVP 22	Adverse
	KVP 23 (view to the northeast toward the proposed Bass Lake Road pedestrian bridge, from the southwest quadrant of the Bass Lake Road/Bottineau Boulevard intersection)	KVP 23	Adverse
	NW 2a (view to the northwest toward the proposed noise barrier from 36th Avenue to 41st Avenue on the east side, and from 36th Avenue to the southern border of Lee Park on the west side)	NW 2a	Neutral (east) or potentially adverse (west)
	NW 2b (view to the southeast toward the proposed noise barrier from 36th Avenue to 41st Avenue on the east side)	NW 2b	Neutral
	NW 3a (view to the northwest toward the proposed noise barrier from West Broadway Avenue to Corvallis Avenue on the east side)	NW 3a	Neutral
	NW 3b (view to the southeast toward the proposed noise barrier toward from West Broadway Avenue to Corvallis Avenue on the east side)	NW 3b	Neutral
	Bass Lake Road pedestrian overpass	See photographic documentation of KVPs 21, 22, and 23 above.	Adverse
	Sacred Heart Catholic Church	Not applicable	Neutral
	Historic Robbinsdale Public Library	Not applicable	Neutral

Table 2. Summary of Impacts from Primary Project Visual Features and to Higher-Quality Visual Features

Landscape Unit	Description of View, Higher-Quality Visual Feature, or Primary Project Visual Feature	Photographic Documentation[1]	Level of Impact
	West Broadway Avenue and BNSF rail bridges over TH 100	Not applicable	Neutral
	Green boulevard on west side of West Broadway Avenue between 47th Avenue and TH 100	Not applicable	Adverse
	Bottineau Boulevard bridge over CP rail corridor	Not applicable	Neutral
	City of Crystal gateway area	Not applicable	Neutral
	Residential neighborhood between Bass Lake Road and 63rd Avenue	See **Appendix A**	Adverse
Brooklyn Park	KVP 13 (view to the south toward the proposed 63rd Avenue Station, from the trail adjacent to Bottineau Boulevard)	KVP 13	Adverse
	KVP 14 (view to the southeast toward the proposed 63rd Avenue Station, from the adjacent neighborhood west of 63rd Avenue)	KVP 14	Adverse
	KVP 15 (view to the north toward the proposed 73rd Avenue/Bottineau Boulevard bridge, from Bottineau Boulevard 81 at 71st Avenue)	KVP 15	Adverse
	KVP 16 (view to the northeast toward the proposed 73rd Avenue/Bottineau Boulevard bridge, from 71st Avenue)	KVP 16	Neutral
	KVP 17 (view to the north toward the proposed 73rd Avenue/Bottineau Boulevard bridge, from the southeast corner of Bottineau Boulevard and 71st Avenue)	KVP 17	Adverse
	KVP 18 (view to the south toward the proposed 73rd Avenue/Bottineau Boulevard bridge, from Bottineau Boulevard at 73rd Avenue)	KVP 18	Adverse
	KVP 19 (view to the east toward the proposed OMF, from 101st Avenue)	KVP 19	Adverse
	KVP 20 (view to the southwest toward the proposed OMF, from Rush Creek Regional Trail)	KVP 20	Adverse
	63rd Avenue park-and-ride	See photographic documentation of KVPs 13 and 14 above.	Adverse
	73rd Avenue/Bottineau Boulevard bridge	See photographic documentation of KVPs 15, 16, 17, and 18 above.	Adverse
	OMF	See photographic documentation of KVPs 19 and 20 above.	Adverse

Table 2. Summary of Impacts from Primary Project Visual Features and to Higher-Quality Visual Features

	I-694 bridge over BNSF rail corridor and Bottineau Boulevard	Not applicable	Neutral
	Shingle Creek	Not applicable	Neutral
	West Broadway Avenue bridge over TH 610	Not applicable	Neutral
	Rush Creek Regional Trail	Not applicable	Adverse

[1] A summary of photographic documentation locations is presented in **Table 4.5-1** of the Final EIS for locations where a current condition photograph and a simulation exist. These photographs, simulations, and other photographic documentation can be found in **Appendix F – Visual Quality Technical Report** of the Final EIS.

"Not applicable" indicates that photographic documentation was not developed for that particular feature.

Minneapolis Landscape Unit

Primary Proposed BLRT Extension Project Visual Features

Stations

The following proposed BLRT Extension project stations are proposed within the Minneapolis Landscape Unit.

- Van White Boulevard
- Penn Avenue

Bridges and Structures

The following proposed BLRT Extension project bridges and structures are proposed within the Minneapolis Landscape Unit.

- New bridge crossing HERC driveway
- Modified Olson Memorial Highway bridge over I-94
- Reconstructed Olson Memorial Highway bridge over the BNSF rail corridor (see description of KVPs 1 and 2 below)

Photographic Documentation

The Minneapolis Landscape Unit includes KVPs 1 and 2, as described in detail below. KVP location maps and photographs are provided in **Appendix A** of this report. A separate location map is provided in **Appendix A** for the Olson Memorial Highway photograph and sketch-up, designated as OMH 1.

- **OMH 1** (view to the west toward Penn Avenue, from center Olson Memorial Highway median) represents the changes to the viewshed as seen by roadway users and pedestrians. Views at this location would typically be of both short and long duration, depending on the viewer group, and viewers would have a moderate sensitivity based on its status as a heavily traveled corridor. In the simulated view from OMH 1, median trees have been removed for the transitway alignment. However, though these trees would be removed from the corridor, some would be relocated to other park properties. Tree relocation would depend on the condition and age of the tree, and other factors. The proposed BLRT Extension project would alter the visual quality and character at this location; however, trees at the highway edges remain and continue to support the "gateway" appearance of the corridor.
- **KVP 1** (view to the east toward the Olson Memorial Highway bridge over the BNSF rail corridor, from the Wirth Lake Boardwalk) represents the changes to the viewshed as seen by recreational users. Views at this location would typically be of long duration, and viewers would have a high sensitivity based on the recreational nature of land uses at this location. In the simulated view from KVP 1, the new proposed BLRT Extension project features that would be most visible are the reconstructed Olson Memorial Highway bridge over the BNSF rail corridor, the overhead catenary system, and passing LRVs. However, these features could be difficult for viewers to see based on the distance and the surrounding vegetation. The proposed BLRT

Extension project would not substantially alter the visual quality or character at this location and would not obstruct views. The proposed BLRT Extension project would not preclude continued recreational use at this location.

- **KVP 2** (view to the east-southeast toward the Olson Memorial Highway bridge over the BNSF rail corridor, from the Wirth Park Trail) represents the changes to the viewshed as seen by recreational users. Views at this location would typically be of long duration, and viewers would have a high sensitivity based on the recreational nature of land uses at this location. In the simulated view from KVP 2, the new proposed BLRT Extension project features that would be most visible are the new track, the overhead catenary system, and passing LRVs. These new features would be of similar elevation to the existing BNSF rail corridor and may be difficult for viewers to see based on the surrounding vegetation, though it is important to note that seasonal changes in vegetation may result in increased visibility of the new features. These new features would be noticeable but would appear as a consistent linear feature alongside the existing BNSF tracks. However, existing Xcel Energy transmission poles are proposed to be relocated from the east, behind existing screening, to the west, closer to the adjacent park. Therefore, based on the increased frequency in passing vehicles, the additional overhead wires, and the relocation of the existing Xcel Energy power lines, the proposed BLRT Extension project would alter the visual quality and character at this location, but would not preclude continued recreational use.

Summary of Visual Impacts

In the Minneapolis Landscape Unit, the transitway would run along Olson Memorial Highway, a highway that currently accommodates a relatively high amount of traffic. Although Olson Memorial Highway is envisioned as a "gateway" corridor to downtown Minneapolis, the *Minneapolis Near Northside Master Plan* envisioned that LRT could be accommodated within the median without sacrificing the overall desired character of the corridor. The construction of the transitway within the existing median would alter its existing green character, which is considered a "higher-quality visual feature," resulting in adverse impacts on visual quality in that location. Impacts on "higher-quality visual features" are described in further detail below. Considering the existing industrial character of the visual context east of I-94 approaching downtown, it is anticipated that neutral visual effects would occur in that area.

Neutral impacts are anticipated as a result of station and TPSS construction, as these features would be designed to complement their surroundings, with variations in design that are consistent with the context of each station and TPSS location. TPSS features are introduced in **Section 3.3 – Proposed BLRT Extension Project Description**, which includes the size and siting considerations. Coordination with stakeholders, including the Minneapolis Park and Recreation Board, would continue throughout the proposed BLRT Extension project design process to address the siting of TPSSs and to maintain neutral visual impacts, including additional visual screening as required. However, it is anticipated that station features would also include passenger information displays, lighting, and security systems, which could alter the visual quality and character of the view for sensitive viewer groups.

Impacts on the resources identified in **Section 4 – Existing Conditions** as "higher-quality visual features" are described in detail below. Visual impacts to these resources as a result of the

proposed BLRT Extension project implementation would generally be neutral. However, where visual impacts would be adverse, implementation of Mitigation Measure 1 (Minimize Operational Night Lighting) and Mitigation Measure 2 (Visual Screening of proposed BLRT Extension project Facilities), outlined below in **Section 6.2**, would help to further reduce the impacts of operation of the proposed BLRT Extension project on sensitive viewer groups in the proposed BLRT Extension project area.

- **Ford Building:** Visual impacts to the Ford Building would be neutral because the Hiawatha LRT alignment already passes the building along 5th Street.
- **HERC site landscaping:** Visual impacts to the HERC site landscaping would be neutral. The transitway would run parallel to 6th Avenue in a widened right-of-way which would require partial removal of planter wall, trees, and the lawn area at the southeast corner of 6th Avenue and 7th Street.
- **Metro Transit headquarters:** Visual impacts to the Metro Transit's building would be neutral since it is already located along a busy highway and serves as a transit vehicle service and storage site.
- **Boulevard and median trees along Olson Memorial Highway west of I-94:** Visual impacts to the Olson Memorial Highway center median would be adverse, as trees would need to be removed for the transitway alignment. After the transitway is constructed in the center median, there would not be adequate space for new trees alongside it. However, as noted above, trees at the highway edges would remain and continue to support the "gateway" appearance of the corridor. Additionally, some trees would be relocated to other park properties, depending on the condition and age of the tree, and other factors.
- **Sumner Library:** Visual impacts to the library would be neutral since it is already located along a highly used roadway.
- **Seed Academy and Wayman AME Church:** Visual impacts to the school and church would be neutral since the use of church sanctuaries is typically inward-focused and because the site is already located along a highly used roadway.
- **Zion Baptist Church:** Visual impacts to church would be neutral since it is visually buffered by the north frontage road along Olson Memorial Highway. Use of church sanctuaries is typically inward-focused, and it is already located along a highly used roadway.
- **Floyd B. Olson Memorial Statue:** Visual impacts to the memorial would be neutral since the transitway turns onto Olson Memorial Highway and does not conflict with its siting.
- **Harrison Neighborhood gateway sculptures:** Visual impacts to the sculptures would be neutral since the transitway turns onto Olson Memorial Highway and does not conflict with their siting.

Golden Valley Landscape Unit

Primary Proposed BLRT Extension Project Visual Features

Stations

The following proposed BLRT Extension project stations are proposed within the Golden Valley Landscape Unit.

- Plymouth Avenue (see description of KVP 4a and 5 below)
- Golden Valley Road (includes park-and-ride; see description of KVPs 6a, 6b, 8, and 8a below)

Bridges and Structures

The following proposed BLRT Extension project bridges and structures are proposed within the Golden Valley Landscape Unit.

- Reconstructed Plymouth Avenue bridge (see description of KVPs 4a and 4b below)
- Reconstructed Theodore Wirth Parkway bridge (see description of KVPs 7 and 8a below)
- Reconstructed Golden Valley Road bridge (see description of KVPs 7 and 8a below)
- New bridge crossing Golden Valley Road ponds
- New bridge crossing Grimes Pond
- Reconstructed 36th Avenue bridge
- Noise walls on the east side of the Plymouth Avenue Station, the east side of the alignment roughly across from the southern extent of Sochacki Park (the former Mary Hills Nature Area – see description of NW 1a and NW 1b below), and the east side of the alignment from just north of South Halifax Park to 36th Avenue North, with a gap at the Xcel Energy substation. Photographs of proposed noise wall locations are provided in **Appendix A**.

Photographic Documentation

The Golden Valley Landscape Unit includes KVPs 3 through 8a, as described in detail below. KVP location maps and photographs are provided in **Appendix A** of this report. The Golden Valley Landscape Unit also includes NW 1a, and NW 1b. Photographs of proposed noise wall locations are provided in **Appendix A** of this report.

- **KVP 3** (view to the northwest toward the existing BNSF tracks and proposed LRT tracks, from Farwell Avenue and Xerxes Avenue North) represents the changes to the viewshed as seen by roadway users, pedestrians, and residents. Views at this location would typically be of both short and long duration, depending on the viewer group, and viewers would have a moderately high sensitivity based on the residential nature of land uses at this location. In the simulated view from KVP 3, the new proposed BLRT Extension project features that would be most visible are the overhead catenary system. These new features would also be of similar elevation to the existing BNSF rail corridor, and may be difficult for viewers to see based on the surrounding vegetation. Additionally, the overhead catenary system would be a consistent feature alongside existing overhead power lines. The proposed BLRT Extension project would not substantially alter the visual quality or character at this location.

- **KVP 4a** (view to the west toward the proposed Plymouth Avenue Station and bridge, from Plymouth Avenue North and Washburn Avenue North) represents the changes to the viewshed as seen by roadway users, pedestrians, and residents. Views at this location would typically be of both short and long duration, depending on the viewer group, and viewers would have a moderately high sensitivity based on the residential nature of land uses at this location. In the simulated view from KVP 4a, the vertical circulation structure adjacent to the Plymouth Avenue Station would be highly visible. These new features would be noticeable, but would be partially shielded by the existing bridge structure and vegetation. The proposed BLRT Extension project would alter the visual quality and character at this location.
- **KVP 4b** (view to the south toward the existing BNSF tracks and proposed LRT tracks, from the Plymouth Avenue North bridge) represents the changes to the viewshed as seen by roadway users and pedestrians. Views at this location would typically be of both short and long duration, depending on the viewer group, and viewers would have a moderate sensitivity based on the transportation-related nature of land uses at this location. In the simulated view from KVP 4b, the new proposed BLRT Extension project features that would be most visible would be the new track, overhead catenary system, and passing LRVs. Although the new features would noticeable, they would appear as a consistent linear feature alongside the existing BNSF tracks. However, with the addition of multiple overhead lines to the corridor, and the relocation of existing power lines from the east to the west, adjacent to the park, the view toward the green space of the park would be altered. Further, as stated above, the Plymouth Avenue Bridge has an important role in setting the visual character for the park itself. Although the altered viewshed would be at a lower elevation than the viewer, the proposed BLRT Extension project would alter the visual quality and character at this location.
- **KVP 4c** (view to the north toward the proposed Plymouth Avenue Station, from the Plymouth Avenue bridge) represents the changes to the viewshed as seen by roadway users and pedestrians. Views at this location would typically be of both short and long duration, depending on the viewer group, and viewers would have a moderate sensitivity based on the transportation-related nature of land uses at this location. In the simulated view from KVP 4c, the new proposed BLRT Extension project features that would be most visible would be the new track, overhead catenary system, and passing LRVs. Although the new features would noticeable, they would appear as a consistent linear feature alongside the existing BNSF tracks. In addition, the station and the vertical circulation structure adjacent to the station would be highly visible, substantially altering the visual quality and character at this location.
- **KVP 5** (view to the southeast toward the proposed Plymouth Avenue Station and bridge, from the Theodore Wirth Regional Park Chalet) represents the changes to the viewshed as seen by recreational users. Views at this location would typically be of long duration, and viewers would have a high sensitivity based on the recreational nature of land uses at this location. In the simulated view from KVP 5, the new proposed BLRT Extension project features that would be most visible would be the overhead catenary system and portions of the new Plymouth Avenue Station. These new features would be noticeable, but may be difficult for viewers to see based on the surrounding vegetation. However, as described above, seasonal changes and weather patterns typical of the proposed BLRT Extension project area would produce variations to

vegetation and ground cover. The proposed BLRT Extension project would alter the visual quality and character at this location, but would not preclude continued recreational use.

- **KVP 6a** (view to the north toward the proposed Golden Valley Road Station, from the Theodore Wirth Regional Park Golf Course) represents the changes to the viewshed as seen by recreational users. Views at this location would typically be of long duration, and viewers would have a high sensitivity based on the recreational nature of land uses at this location. In the simulated view from KVP 6a, the new proposed BLRT Extension project features may be noticeable, but may be difficult for viewers to see based on the surrounding vegetation. The proposed BLRT Extension project would not substantially alter the visual quality or character at this location. The proposed BLRT Extension project would not preclude continued recreational use at this location.
- **KVP 6b** (view to the northeast toward Bassett Creek and the proposed Golden Valley Road Station, from the Theodore Wirth Regional Park Golf Course) represents the changes to the viewshed as seen by recreational users. Views at this location would typically be of long duration, and viewers would have a high sensitivity based on the recreational nature of land uses at this location. In the simulated view from KVP 6b, the new proposed BLRT Extension project features that would be most visible would be the overhead catenary system and passing LRVs. These new features would be noticeable, but may be difficult for viewers to see based on the surrounding vegetation. However, as described above, seasonal changes and weather patterns typical of the proposed BLRT Extension project area would produce variations to vegetation and ground cover. The proposed BLRT Extension project would alter the visual quality and character at this location, but would not preclude continued recreational use.
- **KVP 7** (view to the west toward the proposed Golden Valley Road Station, from Theodore Wirth Parkway near the intersection of Zenith Avenue) represents the changes to the viewshed as seen by roadway users and pedestrians. Views at this location would typically be of both short and long duration, depending on the viewer group, and viewers would have a moderately high sensitivity based on the presence of sensitive land uses (residential, church, etc.) at this location. Additionally, viewer sensitivity at this location would also be due to the presence of the Grand Rounds, which offers opportunities for scenic pleasure driving, as described above. In the simulated view from KVP 7, the new Golden Valley Road Station and park-and-ride would generally not be visible based on the lower elevation of the station, the terraced design of the parking lot, and the existing vegetation. The proposed BLRT Extension project would not substantially alter the visual quality or character at this location.
- **KVP 8** (view to the west toward the proposed Golden Valley Road Station, from Golden Valley Road and Theodore Wirth Parkway) represents the changes to the viewshed as seen by roadway users and pedestrians. Views at this location would typically be of both short and long duration, depending on the viewer group, and viewers would have a high sensitivity based on the presence of sensitive land uses (residential, church, etc.) at this location, as well as the presence of the Grand Rounds. In the simulated view from KVP 8, the pedestrian access and upper levels of the terraced parking lot would be visible. The proposed BLRT Extension project would alter the visual quality and character at this location.

- **KVP 8a** (view to the west toward the proposed Golden Valley Road Station, from Theodore Wirth Parkway at Golden Valley Road) represents the changes to the viewshed as seen by roadway users, pedestrians, and recreational users, which at this location would include bicyclists on the Grand Rounds trail and nature enthusiasts accessing the existing park triangle. Views at this location would typically be of both short and long duration, depending on the viewer group, and viewers would have a moderately high sensitivity based on the presence of sensitive land uses (residential, church, etc.) at this location. In the simulated view from KVP 8a, the pedestrian access and upper levels of the terraced parking lot would be visible. The proposed BLRT Extension project would alter the visual quality and character at this location.
- **NW 1a** (view to the northwest toward the proposed noise wall on the east side of the alignment roughly across from the southern extent of Sochacki Park) represents the location of a proposed noise wall, which would be located adjacent to the Kewanee Way residences. For this segment of the proposed noise wall, existing residences are located on both the west and east sides of Kewanee Way. While the addition of the noise wall would mainly be for the purpose of sound insulation, a noise wall at this location would also provide visual screening and privacy from the existing rail and proposed LRT alignment for the existing residences. However, the addition of the noise wall at this location would result in a potentially adverse visual effect by precluding views across the alignment toward the southern extent of Sochacki Park. The proposed BLRT Extension project would alter the visual quality and character at this location, especially for residents, pedestrians, and roadway users.
- **NW 1b** (view to the southeast toward the proposed noise wall on the east side of the alignment roughly across from the southern extent of Sochacki Park) represents the location of a proposed noise wall, which would be located adjacent to the Kewanee Way residences. For this segment of the proposed noise wall, existing residences are located along the east side of Kewanee Way. While the addition of the noise wall would mainly be for the purpose of sound insulation, a noise wall at this location would also provide visual screening and privacy from the existing rail and proposed LRT alignment for the existing residences. However, the addition of the noise wall at this location would result in a potentially adverse visual effect by precluding views across the alignment toward the southern extent of Sochacki Park. The proposed BLRT Extension project would alter the visual quality and character at this location, especially for residents, pedestrians, and roadway users.

Summary of Visual Impacts

In the Golden Valley Landscape Unit, the corridor utilizes the existing BNSF right-of-way between 34th Avenue and Olson Memorial Highway. The transitway would closely parallel the existing railway and, as such, would be an addition to an existing transportation corridor. Thus the addition of LRT to this corridor would be compatible with the existing land use. The implementation of LRT would bring an increased frequency of vehicles passing through the area. Impacts on visual quality would range from neutral to adverse because in some locations, the tracks would be in a depressed cut section and shielded by the topography and vegetation. However, in other instances, residential and park areas on both the east and west sides of the corridor, which are considered "higher-quality visual features" as described below, have an increased visual connection based on close

proximity and varying degrees of openness of existing vegetation. Both temporary and permanent impacts on the vegetation along the BNSF right-of-way may alter the views and amount of screening of adjacent neighborhoods and parks. At locations where adverse visual effects are anticipated, transitway elements added to the rail corridor may be visually screened or softened using landscaping where adequate space permits.

Neutral impacts are anticipated as a result of station and TPSS construction, as these features would be designed to complement their surroundings, with variations in design that are consistent with the context of each station and TPSS location. TPSS features are introduced in **Section 3.3 – Proposed BLRT Extension Project Description**, which includes the size and siting considerations. However, it is anticipated that station features would also include passenger information displays, lighting, and security systems, which could alter the visual quality and character of the view for sensitive view groups. Coordination with stakeholders, including the Minneapolis Park and Recreation Board, would continue throughout the proposed BLRT Extension project design process to address the siting of TPSSs and to maintain neutral visual impacts, including additional visual screening as required.

Impacts on the resources identified above in **Section 4 – Existing Conditions** as "higher-quality visual features" are described in detail below. Visual impacts to these resources as a result of proposed BLRT Extension project implementation would generally be neutral. However, where visual impact would be adverse, implementation of Mitigation Measure 1 (Minimize Operational Night Lighting) and Mitigation Measure 2 (Visual Screening of proposed BLRT Extension project Facilities), outlined below in **Section 6.2**, would help to reduce the impacts of operation of the proposed BLRT Extension project on sensitive viewer groups in the proposed BLRT Extension project area.

- **Plymouth Avenue bridge over Bassett Creek and BNSF rail corridor:** The bridge would be reconstructed to make space for the transitway. Reconstructed features would include a new deck and piers. However, the bridge would be reconstructed in a manner such that the key visual elements would remain essentially the same as the existing elements, with the exception of the pier spacing. In order to accommodate the new LRT tracks, an area below the bridge would be altered from a paved slope to a clear opening with infill walls added to two of the existing arched piers for crash protection and to retain grade. This modification would only be visible from the pedestrian trail west of the BNSF track and would be unnoticeable from Plymouth Avenue above. Therefore, visual impacts to the bridge would be neutral.
- **Theodore Wirth Regional Park and Golf Course:** Visual impacts to Theodore Wirth Regional Park and Golf Course would be adverse, since views to the BNSF right-of-way may be opened up by grading and vegetation thinning for the transitway. The additional features, including the catenary wires, support poles, tracks, TPSS, and light rail vehicles, would add visual intrusions to the perceived "natural" character of the park, beyond the existing railroad and overhead utilities.
- **Bassett Creek and Bassett Lake:** Visual impacts to Bassett Creek and Bassett Lake would be adverse. The additional features of the transitway, as listed above in the description of impacts

on Theodore Wirth Regional Park, would add visual intrusions to the perceived "natural" character of the parks beyond the existing railroad and overhead utilities.

- **Theodore Wirth Parkway:** Visual impacts to Theodore Wirth Parkway would be neutral since it passes over the transitway on a bridge for only a short distance. Some views to the BNSF right-of-way may be opened up in the approaches by grading and vegetation thinning for the transitway, but would be peripheral to the immediate scenery adjacent to the Parkway.
- **Glenview Terrace/Valley View Park:** Visual impacts to Glenview Terrace/Valley View Park would be neutral. As noted above, a new bridge would cross the Golden Valley Road Ponds at the western border of the park. The presence of wetlands in the BNSF right-of-way adjacent to the park would prevent cutting into side slopes and minimize removal of trees. The active uses of the park are well-buffered by a wooded area.
- **Sochacki Park and South Halifax Park:** Visual impacts to these parks would be adverse. The additional features of the transitway, as listed above in the description of impacts on Theodore Wirth Regional Park, would add visual intrusions to the perceived "natural" character of these parks beyond the existing railroad and overhead utilities. Also, as noted above, a new bridge would cross Grimes Pond adjacent to the existing BNSF embankment, which would remain as is and continue to be utilized for freight. Refer to **Chapter 8 – Amended Draft Section 4(f) and 6(f) Evaluation** for further discussion of impacts to Sochacki Park, along with associated mitigation commitments to reduce impacts on these parks.

Robbinsdale/Crystal Landscape Unit

Primary Proposed BLRT Extension Project Visual Features

Stations

The following proposed BLRT Extension project stations are proposed within the Robbinsdale/ Crystal Landscape Unit.

- Robbinsdale (includes park-and-ride; see description of KVPs 10, and 11 below)
- Bass Lake Road (includes park-and-ride)

Bridges and Structures

The following proposed BLRT Extension project bridges and structures are proposed within the Robbinsdale/Crystal Landscape Unit.

- New bridge over TH 100
- New bridge over the CP rail corridor
- New pedestrian bridge at Bass Lake Road (see description of KVPs 21, 22, and 23 below)
- Noise walls from 36th Avenue to 41st Avenue, from 45½ Avenue to West Broadway Avenue, and from West Broadway Avenue to Corvallis Avenue on the east side (see description of NW 2a, NW 2b, NW 3a, and NW 3b below). Noise walls from 36th Avenue to the southern border of Lee Park, from the northern border of Lee Park to near 41st/Noble Avenue, and along

the Robbinsdale Station area on the west side (see description of NW 2a and NW 2b below). Photographs of proposed noise wall locations are provided in **Appendix A** of this report.

Photographic Documentation

The Robbinsdale/Crystal Landscape Unit includes KVPs 9 through 12 and KVP 21 through 23, as described below. KVP location maps and photographs are provided in **Appendix A** of this report. The Robbinsdale/Crystal Landscape Unit also includes NW 2a, NW 2b, NW 3a, and NW 3b. Photographs of proposed noise wall locations are provided in **Appendix A** of this report.

- **KVP 9** (view to the northwest toward downtown Robbinsdale, from 41st Avenue and Hubbard Avenue) represents the changes to the viewshed as seen by roadway users, pedestrians, business owners, and workers. Views at this location would typically be of both short and long duration, depending on the viewer group, and viewers would have a moderate sensitivity based on the varied land uses (residential, church, retail, commercial, transportation, etc.) at this location. In the simulated view from KVP 9, the new proposed BLRT Extension project features that would be most visible would be the overhead catenary system and passing LRVs. These new features would be noticeable, but may be partially shielded by existing structures. The proposed BLRT Extension project would not substantially alter the visual quality or character at this location.
- **KVP 10** (view to the north toward the proposed Robbinsdale Station, from 41st Avenue) represents the changes to the viewshed as seen by roadway users, pedestrians, business owners, and workers. Views at this location would typically be of both short and long duration, depending on the viewer group, and viewers would have a moderate sensitivity based on the varied land uses (residential, church, retail, commercial, transportation, etc.) at this location. In the simulated view from KVP 10, the new proposed BLRT Extension project features that would be most visible would be the new track, overhead catenary system, and passing LRVs. These new features would also be of similar elevation to the existing BNSF rail corridor, and although the new features would noticeable, they would appear as a consistent linear feature alongside the existing BNSF tracks. Additionally, the new Robbinsdale Station and park-and-ride structure would be highly visible; however, based on the presence of other prominent visual features, would not substantially alter the visual quality or character at this location.
- **KVP 11** (view to the east toward the proposed Robbinsdale Station, from 42nd Avenue) represents the changes to the viewshed as seen by roadway users, pedestrians, business owners, and workers. Views at this location would typically be of both short and long duration, depending on the viewer group, and viewers would have a moderate sensitivity based on the varied land uses (residential, retail, commercial, transportation, etc.) at this location. In the simulated view from KVP 11, the new proposed BLRT Extension project features that would be most visible would be the new track, overhead catenary system, and passing LRVs. These new features would also be of similar elevation to the existing BNSF rail corridor, and although the new features would noticeable, they would appear as a consistent linear feature alongside the existing BNSF tracks. Additionally, the new Robbinsdale Station and park-and-ride structure would be highly visible; however, based on the presence of other prominent visual features, would not substantially alter the visual quality or character at this location.

- **KVP 12** (view to the southeast toward the proposed wall and fence, from the adjacent residential alley) represents the changes to the viewshed as seen by roadway users, pedestrians, and residents. Views at this location would typically be of both short and long duration, depending on the viewer group, and viewers would have a moderately high sensitivity based on the residential nature of land uses at this location. In the simulated view from KVP 12, the new proposed BLRT Extension project features that would be most visible would be the new wall and fence, which would be associated with the new bridge over TH 100. These new features would be highly visible; however, an existing BNSF bridge is located adjacent to the proposed bridge. Viewer groups at this location are partially shielded from views of BNSF operations by existing vegetation, which would be replaced by the proposed wall and fence. The new proposed BLRT Extension project features would alter the visual quality and character at this location.
- **KVP 21** (view to the southeast toward the proposed Bass Lake Road station and pedestrian bridge, from Bottineau Boulevard) represents the changes to the viewshed as seen by roadway users and pedestrians. Views at this location would typically be of both short and long duration, depending on the viewer group, and viewers would have a moderate sensitivity based on the transportation-related nature of land uses at this location. In the simulated view from KVP 21, the new proposed BLRT Extension project features that would be most visible would be the new station and pedestrian bridge, which would be highly visible and would alter the visual quality at this location. However, the new station and pedestrian overpass would not substantially alter the visual character based on its location adjacent to an existing and highly used roadway.
- **KVP 22** (view to the northwest toward the proposed Bass Lake Road station and pedestrian bridge, from the southeast quadrant of the Bass Lake Road/Bottineau Boulevard intersection) represents the changes to the viewshed as seen by roadway users and pedestrians. Views at this location would typically be of both short and long duration, depending on the viewer group, and viewers would have a moderate sensitivity based on the transportation-related nature of land uses at this location. In the simulated view from KVP 22, the new proposed BLRT Extension project features that would be most visible would be the new station and pedestrian bridge, which would be highly visible and would alter the visual quality at this location. However, the new station and pedestrian overpass would not substantially alter the visual character based on its location adjacent to an existing and highly used roadway.
- **KVP 23** (view to the northeast toward the proposed Bass Lake Road pedestrian bridge, from the southwest quadrant of the Bass Lake Road/Bottineau Boulevard intersection) represents the changes to the viewshed as seen by roadway users and pedestrians. Views at this location would typically be of both short and long duration, depending on the viewer group, and viewers would have a moderate sensitivity based on the transportation-related nature of land uses at this location. In the simulated view from KVP 23, the new proposed BLRT Extension project features that would be most visible would be the new pedestrian bridge, which would be highly visible and would alter the visual quality at this location. However, the new pedestrian overpass would not substantially alter the visual character based on its location adjacent to an existing and highly used roadway.

- **NW 2a** (view to the northwest toward the proposed noise walls from 36th Avenue to 41st Avenue on the east side, and from 36th Avenue to the southern border of Lee Park on the west side) represents the location of a proposed noise wall, which would be located adjacent to the June Avenue North residences on the west side and the Indiana Avenue North residences on the east side. While the addition of the noise wall would mainly be for the purpose of sound insulation, a noise wall at this location would also provide visual screening and privacy from the existing rail and proposed LRT alignment for the existing residences, especially those on June Avenue North, which have less of a vegetation buffer than those on Indiana Avenue North. The addition of the noise wall at this location would result in a potentially adverse visual effect for June Avenue North residences by precluding views across the alignment toward the existing vegetation buffer, but would result in a neutral visual effect for Indiana Avenue North residences due to the presence of the existing vegetation buffer. The proposed BLRT Extension project would alter the visual quality and character at this location, especially for residents and pedestrians.
- **NW 2b** (view to the southeast toward the proposed noise walls from 36th Avenue to 41st Avenue on the east side) represents the location of a proposed noise wall, which would be located adjacent to the Indiana Avenue North residences. While the addition of the noise wall would mainly be for the purpose of sound insulation, a noise wall at this location would also provide visual screening and privacy from the existing rail and proposed LRT alignment for the existing residences. The addition of the noise wall at this location would result in a neutral visual effect for Indiana Avenue North residences due to the presence of an existing vegetation buffer. The proposed BLRT Extension project would alter the visual quality and character at this location, especially for residents and pedestrians.
- **NW 3a** (view to the northwest toward the proposed noise wall from West Broadway Avenue to Corvallis Avenue on the east side) represents the location of a proposed noise wall, which would be located adjacent to the Welcome Avenue North and Fairview Avenue North residences. While the addition of the noise wall would mainly be for the purpose of sound insulation, a noise wall at this location would also provide visual screening and privacy from the existing rail and proposed LRT alignment for the existing residences. The addition of the noise wall at this location would result in a neutral visual effect for Welcome Avenue North and Fairview Avenue North residences due to the presence of an existing vegetation buffer. The proposed BLRT Extension project would alter the visual quality and character at this location, especially for residents and pedestrians.
- **NW 3b** (view to the southeast toward the proposed noise wall toward from West Broadway Avenue to Corvallis Avenue on the east side) represents the location of a proposed noise wall, which would be located adjacent to West Broadway Avenue. While the addition of the noise wall would mainly be for the purpose of sound insulation for the residential area to the east of West Broadway Avenue, a noise wall at this location would also provide visual screening and privacy from the existing rail and proposed LRT alignment for the existing residences. The addition of the noise wall at this location would result in a neutral visual effect due to the presence of West Broadway Avenue, which provides a buffer between the residential area and the existing rail and proposed LRT alignment. The proposed BLRT Extension project would

alter the visual quality and character at this location, especially for residents, pedestrians, and roadway users.

Summary of Visual Impacts

In the Robbinsdale/Crystal Landscape Unit, the corridor utilizes the existing BNSF right-of-way. Impacts on visual quality would generally be neutral because the transitway would closely parallel the existing railroad and, as such, would be a modification to an existing dedicated rail corridor rather than the introduction of a new rail corridor. The implementation of LRT would bring an increased frequency of vehicles passing through the area, and the effects to visual quality would generally be neutral. At locations where adverse visual effects are anticipated, including where sensitive receptors are located adjacent to the corridor, as described in further detail below, transitway elements added to the rail corridor may be visually screened or softened using landscaping where adequate space permits.

Where sensitive receptors are located adjacent to the corridor, visual intrusions would result from the increased frequency of vehicles passing through the area, the introduction of new sources of light from LRT vehicles and stations, and the altered viewshed for residents viewing the LRT corridor and vehicles. In addition, the ability for LRT users to view the residential land uses from passing LRT vehicles could also constitute a visual intrusion. For example, in the City of Crystal between the proposed Bass Lake Road Station and the proposed 63rd Avenue Station, many existing residences already have a partial or full view of the existing rail corridor. Existing vegetation provides visual screening of the existing BNSF rail corridor, and would also provide visual screening of the proposed LRT vehicles. However, in order to construct the proposed LRT alignment, vegetation removal, such as tree clearing, is proposed for portions of the BNSF right-of-way. Therefore, visual intrusions for sensitive receptors at these locations would also result from the removal of vegetation, and impacts on visual quality would be adverse.

To help visualize the proposed changes, especially in areas of thick vegetation and thin (or no) vegetation, **Appendix A** includes "before BLRT Extension project" existing condition photographs and computer-generated sketch-up simulation of the conceptual "after BLRT Extension project" conditions. For those areas located outside of the BNSF right-of-way, coordination with the city of Crystal has been initiated, and would continue throughout the proposed BLRT Extension project design process, to address the need for revegetation and/or landscaping and other aesthetic treatments to soften or offset the visual effects of tree clearing. Further, where visual impacts would be adverse, implementation of Mitigation Measure 1 (Minimize Operational Night Lighting) and Mitigation Measure 2 (Visual Screening of Proposed BLRT Extension Project Facilities), outlined below in **Section 6.2**, would help to further reduce the impacts of operation of the proposed BLRT Extension project on sensitive viewer groups in the proposed BLRT Extension project area.

For the majority of the LRT alignment, the trackway would generally be level with adjacent land uses. However, at some locations, such as the new bridges over the CP rail corridor and TPH 100, the trackway would be elevated and would result in similar visual intrusions to adjacent sensitive receptors (residential land uses) as described above. However, where visual impacts would be adverse, implementation of Mitigation Measure 1 (Minimize Operational Night Lighting) and

Mitigation Measure 2 (Visual Screening of Proposed BLRT Extension Project Facilities), outlined below in **Section 6.2**, would help to further reduce the impacts of operation of the proposed BLRT Extension project on sensitive viewer groups in the proposed BLRT Extension project area.

Neutral impacts are anticipated as a result of station and TPSS construction, as these features would be designed to complement their surroundings, with variations in design that are consistent with the context of each station and TPSS location. TPSS features are introduced in **Section 3.3 – Proposed BLRT Extension Project Description**, which includes the size and siting considerations. Coordination with stakeholders would continue throughout the proposed BLRT Extension project design process to address the siting of TPSSs and to maintain neutral visual impacts, including additional visual screening as required. However, it is anticipated that station features would also include passenger information displays, lighting, and security systems, which could alter the visual quality and character of the view for sensitive viewer groups.

Some proposed BLRT Extension project features within the Robbinsdale/Crystal landscape unit would result in adverse effects to visual quality, as described below. Where visual impacts would be adverse, implementation of Mitigation Measure 1 (Minimize Operational Night Lighting) and Mitigation Measure 2 (Visual Screening of Proposed BLRT Extension Project Facilities), outlined below in **Section 6.2**, would help to further reduce the impacts of operation of the BLRT Extension project on sensitive viewer groups in the proposed BLRT Extension project area.

- **Bass Lake Road pedestrian overpass:** The new grade separated pedestrian crossing at Bass Lake Road would be a prominent visual feature, altering the viewshed at this location and resulting in adverse effects to visual quality. However, the new structure would not be out of character with the varied land uses (retail, commercial, transportation, etc.) at this location.

Impacts on the resources identified above in **Section 4 – Existing Conditions** as "higher-quality visual features" are described in detail below. Visual impacts to these resources as a result of the proposed BLRT Extension project implementation would generally be neutral. However, where visual impacts would be adverse, implementation of Mitigation Measure 1 (Minimize Operational Night Lighting) and Mitigation Measure 2 (Visual Screening of Proposed BLRT Extension Project Facilities), outlined below in **Section 6.2**, would help to further reduce the impacts of operation of the proposed BLRT Extension project on sensitive viewer groups in the proposed BLRT Extension project area.

- **Sacred Heart Catholic Church:** Visual impacts on the church would be neutral since the transitway infrastructure would run within the existing BNSF right-of-way and would not alter views of the building.
- **Historic Robbinsdale Public Library:** Visual impacts on the library would be neutral since the transitway infrastructure would run within the existing BNSF right-of-way and would not alter views of the building.
- **West Broadway Avenue and BNSF Railroad bridges over TH 100:** The reconstructed BNSF railroad bridge would be in the same location but widened to accommodate the transitway, and it would be designed to be consistent with the TH 100 aesthetic guidelines. Visual effects would be neutral.

- **Green boulevard on west side of West Broadway Avenue between 47th Avenue and TH 100:** The construction of the transitway would require the removal of some mature trees and reduce the width of the green space separating the roadway and railroad. Visual effects would be adverse.
- **Bottineau Boulevard Bridge over CP rail corridor:** Visual impacts on the bridge would be neutral. It would not be physically impacted, and since the new bridge for the transitway over the railroad would be separated visually by commercial development, there would be minimal visual influence between them.
- **City of Crystal gateway area:** Visual impacts on the gateway area would be neutral. The gateway sign and landscaping are near the intersection corner and would not be in conflict with the station location.

Brooklyn Park Landscape Unit

Primary Proposed BLRT Extension Project Visual Features

Stations

The following proposed BLRT Extension project stations are proposed within the Brooklyn Park Landscape Unit.

- 63rd Avenue (includes park-and-ride; see description of KVPs 13 and 14 below)
- Brooklyn Boulevard
- 85th Avenue
- 93rd Avenue
- Oak Grove Parkway (includes park-and-ride)

Bridges and Structures

The following proposed BLRT Extension project bridges and structures are proposed within the Brooklyn Park Landscape Unit.

- New pedestrian overpass at 63rd Avenue Station connected to parking garage (see description of KVPs 13 and 14 below)
- New bridge over 73rd Avenue/Bottineau Boulevard intersection (see description of KVPs 15, 16, 17, and 18 below)
- Modified I-694 bridge over the BNSF rail corridor
- New bridge over TH 610
- New OMF (see description of KVPs 19 and 20 below)

Photographic Documentation

Photographic Documentation

The Brooklyn Park Landscape Unit includes KVPs 13 through 20, as described below. KVP location maps and photographs are provided in **Appendix A** of this report.

- **KVP 13** (view to the south toward the proposed 63rd Avenue Station, from the trail adjacent to Bottineau Boulevard) represents the changes to the viewshed as seen by roadway users and pedestrians. Views at this location would typically be of both short and long duration, depending on the viewer group, and viewers would have a moderate sensitivity based on the transportation-related nature of land uses at this location. In the simulated view from KVP 13, the new proposed BLRT Extension project features that would be most visible would be the new track, overhead catenary system, and passing LRVs. These new features would also be of similar elevation to the existing BNSF rail corridor, and although the new features would be noticeable, they would appear as a consistent linear feature alongside the existing BNSF tracks. Additionally, the new 63rd Avenue Station and park-and-ride with pedestrian overpass structure would be highly visible and would alter the visual quality at this location. However, the new station and park-and-ride would not substantially alter the visual character based on its location adjacent to an existing and highly used roadway.
- **KVP 14** (view to the southeast toward the proposed 63rd Avenue Station, from the adjacent neighborhood west of 63rd Avenue) represents the changes to the viewshed as seen by roadway users, pedestrians, and residents. Views at this location would typically be of both short and long duration, depending on the viewer group, and viewers would have a moderately high sensitivity based on the residential nature of land uses at this location. In the simulated view from KVP 14, the new proposed BLRT Extension project feature that would be most visible would be the 63rd Avenue park-and-ride structure. Although partially shielded by existing residential structures and vegetation, this new feature would be highly visible, and would alter the visual quality and character at this location.
- **KVP 15** (view to the north toward the proposed 73rd Avenue/Bottineau Boulevard Bridge, from Bottineau Boulevard at 71st Avenue) represents the changes to the viewshed as seen by roadway users and pedestrians. Views at this location would typically be of both short and long duration, depending on the viewer group, and viewers would have a moderate sensitivity based on the transportation-related nature of land uses at this location. In the simulated view from KVP 15, the new proposed BLRT Extension project features that would be most visible would be the new 73rd Avenue/Bottineau Boulevard bridge. This new feature would be highly visible and would alter the visual quality at this location. However, the new bridge would not substantially alter the visual character based on its location over an existing and highly used roadway.
- **KVP 16** (view to the northeast toward the proposed 73rd Avenue/Bottineau Boulevard Bridge, from 71st Avenue) represents the changes to the viewshed as seen by roadway users and pedestrians. Views at this location would typically be of both short and long duration, depending on the viewer group, and viewers would have a moderate sensitivity based on the transportation-related nature of land uses at this location. In the simulated view from KVP 16,

the new proposed BLRT Extension project features that would be most visible would be the new track, overhead catenary system, and passing LRVs. Although the new features would noticeable, they would appear as a consistent linear feature alongside the existing BNSF tracks. The new proposed BLRT Extension project features would not substantially alter the visual quality and character at this location.

- **KVP 17** (view to the north toward the proposed 73rd Avenue/Bottineau Boulevard Bridge, from the southeast corner of Bottineau Boulevard and 71st Avenue) represents the changes to the viewshed as seen by roadway users and pedestrians. Views at this location would typically be of both short and long duration, depending on the viewer group, and viewers would have a moderate sensitivity based on the transportation-related nature of land uses at this location. In the simulated view from KVP 17, the new proposed BLRT Extension project features that would be most visible would be the new track, overhead catenary system, and passing LRVs. Additionally, the new 73rd Avenue/Bottineau Boulevard bridge would be a prominent visual feature at this location. These new features would be highly visible and would alter the visual quality at this location. However, the new bridge would not substantially alter the visual character based on its location over an existing and highly used roadway.
- **KVP 18** (view to the south toward the proposed 73rd Avenue/Bottineau Boulevard Bridge, from Bottineau Boulevard at 73rd Avenue) represents the changes to the viewshed as seen by roadway users and pedestrians. Views at this location would typically be of both short and long duration, depending on the viewer group, and viewers would have a moderate sensitivity based on the transportation-related nature of land uses at this location. In the simulated view from KVP 18, the new proposed BLRT Extension project features that would be most visible would be the new track, overhead catenary system, and passing LRVs. Additionally, the new 73rd Avenue/Bottineau Boulevard bridge would be a prominent visual feature at this location. These new features would be highly visible, and would alter the visual quality at this location. However, the new bridge would not substantially alter the visual character based on its location over an existing and highly used roadway.
- **KVP 19** (view to the east toward the proposed OMF, from 101st Avenue) represents the changes to the viewshed as seen by roadway users and pedestrians. Views at this location would typically be of both short and long duration, depending on the viewer group, and viewers would have a moderate sensitivity based on the rural and transportation-related nature of land uses at this location. In the simulated view from KVP 19, the new proposed BLRT Extension project features that would be most visible would be the new OMF, which would be a prominent visual feature altering the viewshed at this location. The new facility would introduce a large structure to an otherwise minimally developed area, resulting in a substantial alteration of the visual quality and character, as well as a partial obstruction of long distance views.
- **KVP 20** (view to the southwest toward the proposed OMF, from Rush Creek Regional Trail) represents the changes to the viewshed as seen by recreational users. Views at this location would typically be of long duration, and viewers would have a moderately high sensitivity based on the recreational nature of land uses at this location. In the simulated view from KVP 20, which would be a prominent visual feature altering the viewshed at this location. The new

facility would introduce a large structure to an otherwise minimally developed area, resulting in a substantial alteration of the visual quality and character, as well as a partial obstruction of views. However, the proposed BLRT Extension project would not preclude continued recreational use at this location.

Summary of Visual Impacts

In the Brooklyn Park Landscape Unit, the corridor utilizes the existing right-of-way of West Broadway Avenue. For much of the corridor, the transitway would be located in the center of the roadway and would have neutral effects to visual quality.

For the majority of the LRT alignment, the trackway would generally be level with adjacent land uses. However, at some locations, such as the new bridge over 73rd Avenue/Bottineau Boulevard intersection, the trackway would be elevated resulting in potential visual intrusions to adjacent sensitive receptors (residential land uses). Visual intrusions for sensitive receptors at these locations would result from both the altered viewshed for residents viewing the LRT corridor and vehicles, and the ability for LRT users to view the residential land uses from passing LRT vehicles. However, where visual impacts would be adverse, implementation of Mitigation Measure 1 (Minimize Operational Night Lighting) and Mitigation Measure 2 (Visual Screening of Proposed BLRT Extension Project Facilities), outlined below in **Section 6.2**, would help to further reduce the impacts of operation of the proposed BLRT Extension project on sensitive viewer groups in the proposed BLRT Extension project area.

Neutral impacts are anticipated as a result of station and TPSS construction, as these features would be designed to complement their surroundings, with variations in design that are consistent with the context of each station and TPSS location. TPSS features are introduced in **Section 3.3 – Proposed BLRT Extension Project Description**, which includes the size and siting considerations. However, it is anticipated that station features would also include passenger information displays, lighting, and security systems, which could alter the visual quality and character of the view for sensitive viewer groups. Coordination with stakeholders would continue throughout the proposed BLRT Extension project design process for proposed stations and also to address the siting of TPSSs to maintain neutral visual impacts. This process may include the development of additional visual screening as required.

Some proposed BLRT Extension project features within the Brooklyn Park landscape unit would result in adverse effects to visual quality, as described below. Where visual impacts would be adverse, implementation of Mitigation Measure 1 (Minimize Operational Night Lighting) and Mitigation Measure 2 (Visual Screening of Proposed BLRT Extension Project Facilities), outlined below in **Section 6.2**, would help to further reduce the impacts of operation of the proposed BLRT Extension project on sensitive viewer groups in the proposed BLRT Extension project area.

- **63rd Avenue Park-and-ride/Pedestrian Bridge and Overpass:** The new 63rd Avenue park-and-ride and overpass would be prominent visual features, altering the viewshed at this location and resulting in adverse effects to visual quality. However, the new structure would not be out of character with the varied land uses (retail, commercial, transportation, etc.) at this location.

- **73rd Avenue/Bottineau Bridge:** While the proposed BLRT Extension project was designed to minimize impacts on land uses/private property, the new 73rd Avenue/Bottineau bridge would result in the acquisition of commercial property to the south of the Brooklyn Boulevard Station. The new bridge would be a prominent visual feature, altering the viewshed at this location and resulting in adverse effects to visual quality. However, the new bridge would not be out of character with the varied land uses (retail, commercial, transportation, etc.) at this location.
- **OMF:** The new OMF would be a prominent visual feature, altering the viewshed at this location. The new facility would introduce a large structure to an otherwise minimally developed area. Further, the new OMF would alter views for recreational users, and would result in adverse effects to visual quality. However, the new OMF and related proposed BLRT Extension project elements, including landscaping and visual screening, would be designed in coordination with the city of Brooklyn Park and the Three Rivers Park District, and in accordance with local zoning ordinances.

Impacts on the resources identified above in **Section 4 – Existing Conditions** as "higher-quality visual features" are described in detail below. Visual impacts to these resources as a result of proposed BLRT Extension project implementation would generally be neutral. Where visual impacts would be adverse, implementation of Mitigation Measure 1 (Minimize Operational Night Lighting) and Mitigation Measure 2 (Visual Screening of proposed BLRT Extension project Facilities), outlined below in **Section 6.2**, would help to further reduce the impacts of operation of the proposed BLRT Extension project on sensitive viewer groups in the proposed BLRT Extension project area.

- **I-694 bridge over the BNSF rail corridor and Bottineau Boulevard:** Since only minor modifications to the piers of the I-694 bridge are required, visual impacts on this resource would be neutral.
- **Shingle Creek:** Visual impacts on Shingle Creek would be neutral. The only transitway features in the vicinity would be the tracks and catenary in the center median of the roadway, and they would not visually interrupt clear views to the creek.
- **West Broadway Avenue Bridge over TH 610:** Visual effects on the bridge would be neutral. The new transitway bridge that would parallel the West Broadway Avenue Bridge over TH 610 would block views of the West Broadway Avenue bridge, and the transitway bridge would be designed to be consistent with the TH 610 aesthetic guidelines.
- **Rush Creek Regional Trail:** Visual effects on the trail would be adverse. As described above, the new OMF would be a prominent visual feature, introducing a large structure to an otherwise minimally developed area. The presence of the OMF would alter views for recreational users of this existing trail.

5.3.2.2 Construction Impacts

Anticipated visual effects during construction of the proposed BLRT Extension project would be similar to the appearance of typical roadway projects including the temporary presence of heavy equipment, traffic control measures, and construction activities. Areas where construction activities for proposed BLRT Extension project features would be particularly noticeable to sensitive viewer groups include:

- The reconstruction of the Olson Memorial Highway Bridge over I-94 to create adequate width for the transitway would be highly visible to travelers along I-94 and Olson Memorial Highway.
- Users of Theodore Wirth Regional Park, Sochacki Park and South Halifax Park would likely perceive construction activity as undesirable and not consistent with their anticipated recreational experience. The reconstruction of the westbound Olson Memorial Highway bridge over the BNSF rail corridor and depressed transitway with retaining walls curving onto Olson Memorial Highway would be highly visible to travelers along Olson Memorial Highway. Additionally, there may be temporary grading for the construction of retaining walls or other features that would affect slopes and vegetation.
- The reconstruction of the BNSF bridge over TH 100 to create adequate width for the transitway would be highly visible to travelers along northbound TH 100. Where the transitway passes along residential neighborhoods, the construction activity would likely be perceived as more visually disruptive to these typically peaceful residential settings.
- The construction of the new bridge for the transitway over TH 610 would be highly visible to travelers along eastbound TH 610.

In general, the potential short-term impacts that would occur during proposed BLRT Extension project construction would be associated with construction staging areas; concrete and form installation; removal of some of the existing vegetation; lights and glare from construction areas; and generation of dust and debris in the proposed BLRT Extension project area, as described in further detail below.

Temporary construction activities are anticipated to include partial or complete road and lane closures, vehicle and pedestrian detours, construction material deliveries, and transport of construction equipment. In general, construction staging areas would be located adjacent to the existing BNSF rail corridor and proposed BLRT Extension project corridor, where the presence of construction equipment and earthmoving activities are not anticipated to be visually intrusive and would be compatible with the surrounding landscape. Where the transitway passes along recreation areas and residential neighborhoods, construction activities, such as grading, vegetation removal, and lighting of work areas, would likely be perceived as visually disruptive to those typically more peaceful residential settings.

Construction impacts would be temporary, and construction staging areas would be restored to pre-project conditions after construction is completed. At locations where higher visual effects are anticipated, the loss of existing vegetation on side slopes for grading or access purposes would be replaced to the extent feasible. Implementation of Mitigation Measure 3 (Minimize Visual Disruption from Construction Activities), outlined below in **Section 6.2**, would help to further

reduce the impacts of construction of the proposed BLRT Extension project on sensitive viewer groups in the proposed BLRT Extension project area.

6 Conclusions and Recommendations

6.1 Overview of Evaluation Results

The proposed BLRT Extension project implementation would not result in a substantial change to the visual character of the corridor as a whole. Neutral visual effects are anticipated to result from the proposed BLRT Extension project implementation along most segments. However, adverse visual effects would occur in some areas, such as where partial residential acquisitions would be required and where the existing vegetated center median of Olson Memorial Highway would be modified or removed. Additionally, adverse visual effects to visual quality would occur in areas where recreational and residential uses are located along or in the vicinity of the proposed BLRT Extension project corridor.

At locations where adverse visual effects are anticipated, transitway elements added to the rail corridor may be visually screened or softened using landscaping where adequate space permits, and the loss of existing vegetation on side slopes for grading or access purposes would be replaced to the extent feasible. Several local plans address aesthetic and visual resources in the proposed BLRT Extension project area, and applicable policies include the establishment of design and landscape guidelines. The Minneapolis Park and Recreation Board, the Three Rivers Park District, the Sochacki Park Joint Powers Board, and the affected communities would be involved in the selection of landscape treatments that would be consistent with applicable local policies and that would be compatible with the character of the parks and surrounding neighborhoods. In general, lost vegetation for disturbed areas outside of the BNSF right-of-way would be replaced with vegetation of a similar type where feasible, and where new physical features of the transitway are introduced, efforts would be made to screen or soften the view.

Neutral impacts are anticipated as a result of station and TPSS construction. Stations would be designed to be aesthetically attractive and to complement their surroundings. However, it is anticipated that station features would also include passenger information displays, lighting, and security systems. Coordination with stakeholders would continue throughout the proposed BLRT Extension project design process for proposed stations. Additionally, TPSS facilities would be designed to complement their surroundings, and would incorporate landscaping features to minimize visual intrusion as appropriate. To further minimize visual quality impacts of TPSS siting, the siting would be customized for each location based on the context of each facility in relation to adjacent properties and resources. Coordination with stakeholders would continue throughout the proposed BLRT Extension project design process for proposed TPSSs.

6.2 Mitigation Measures

Implementation of Mitigation Measures 1 through 3, outlined below, would help to further reduce the impacts of operation and construction of the proposed BLRT Extension project on sensitive viewer groups in the proposed BLRT Extension project area.

6.2.1 Operational Mitigation Measures

Mitigation Measure 1: Minimize Operational Night Lighting

To minimize impacts on sensitive receptors resulting from nighttime operational lighting, to the extent feasible and consistent with safety and security, all permanent exterior lighting would be designed and installed so that (a) the lighting does not cause excessive reflected glare and (b) illumination of the proposed BLRT Extension project and its immediate vicinity is minimized.

Mitigation Measure 2: Visual Screening of Proposed BLRT Extension Project Facilities

To the extent feasible, proposed BLRT Extension project facilities have been sited to avoid locations in proximity to residences, parks, or other sensitive visual receptors. Where avoidance is not feasible, or where higher visual or privacy effects are anticipated to result from the introduction of new physical features of the transitway, such as where the vertical distance of the LRT alignment is higher than adjacent residences, efforts would be made to screen or soften the view using landscaping or walls where adequate space permits. Landscape treatments would be selected for consistency with applicable local policies, consideration for agency maintenance budgets and manpower, and for compatibility with the character of the parks and surrounding neighborhoods.

The Council has prepared design guidelines for key structures throughout the proposed light rail alignment, focusing on bridges and retaining walls. Those guidelines are included within the *Visual Quality Guidelines for Key Structures* (Council, 2015). These guidelines were developed by the Council, reflecting various coordinating efforts with affected local jurisdictions. The guidelines have been used by the Council in the advancement of the proposed BLRT Extension project's design and development. The guidelines have and will help to ensure a consistent aesthetic element for key structures throughout the proposed BLRT Extension project alignment, while allowing for some flexibility in wall treatments.

6.2.2 Construction Period Mitigation Measures

Mitigation Measure 3: Minimize Visual Disruption from Construction Activities

Follow the Council's design guidelines to address construction impacts where appropriate and practical; these include:

- Locate staging areas in places where their visibility will be minimal and provide temporary construction screens or barriers to limit views into them from nearby residential areas, community facilities, recreational areas and trails, or other public open spaces from which they will be seen by visually sensitive viewers
- Use construction methods that minimize the need to remove vegetation to accommodate construction activities
- Shield light sources used in nighttime construction to reduce lighting impacts for residential areas
- Restore areas disturbed during construction

F.4 Economic Impacts of Bottineau LRT

This page intentionally left blank

Internal Memorandum

DATE: December 21, 2015

TO: Caroline Miller, MetroTransit
Kathryn O'Brien, MetroTransit

FROM: Todd Graham, Regional Policy and Research (602-1322)

SUBJECT: Economic impacts of Bottineau LRT

This memo describes a Bottineau LRT economic impact analysis, prepared to inform the project's EIS. A baseline and an alternative build scenario are specified in Metropolitan Council's REMI-PI economic model. This model returns the following impacts representing our expectations for Bottineau LRT.

During the construction phase, 2018-20:

- Minnesota employment (jobs) will expand **+3,762 more *jobXyears*** for the 2018-20 period.
- Personal income for the 3-year period will be **+$349 million higher** than in the base case. (All figures expressed in constant 2015 $)
- Workers employed will come from both the metro region and Greater Minnesota: $223 million (58%) of the personal income gained will situate in the metro region, $125 million (32%) in Greater Minnesota, and $38 million (10%) will be earned by workers from out-of-state.
- Gross domestic product for the state (GSP), representing the size of the Minnesota economy, will be **+$593 million higher** than in the base case.
- Of that **$593 million** of additional economic activity, 93% will be situated at businesses in the metro region; 7% in Greater Minnesota.

Over the long-term:

- The economic impact of Bottineau LRT will be small initially, but will grow as accessibility gains and mode shifts bring benefits to the metro industries.
- Minnesota employment (jobs) will be **+279 jobs higher** in 2030 than in the base case.
- Annual personal income will be **+$30 million higher** in 2030 than in the base case.
- Gross domestic product for the state (GSP) will be **+$118 million higher** in 2030 than in the base case.
- The cumulative additional GSP grows from **$593 million** for 2018-2020 to **$1.197 Billion** for 2018-2030 to **$3.012 Billion** for 2018-2040. It takes 15 years of accessibility gains and mode shift benefits for the project to "pay for itself" through economic returns.

Economic impact analysis. Metropolitan Council uses a REMI-PI model for economic impact analyses. For the Bottineau LRT project, I have prepared a scenario to represent the Bottineau LRT project as a major infrastructure investment, which may generate spillover economic activity. In the short-term, 2018-20, the construction phase provides an economic stimulus to the regional economy.

In the long-term, beyond 2020, the Bottineau LRT marginally improves transit accessibility for commuting workers who use the expanded transit system, and also marginally mitigates car ownership and associated costs.

METROPOLITAN COUNCIL

In this scenario, I assume:

- The new LRT improves labor accessibility, specifically for transit-dependent residents who are newly connected to worksite locations because of Bottineau LRT service. Overall regional labor accessibility improves +0.03% in the first year of service, rising to +0.04% in the second year, and beyond.
- Additionally, there will be a small fraction of new frequent riders who are motivated to reduce their car ownership. After five years, the new LRT will reduce regional car ownership by -1,200 and car-ownership costs by $10 million per year.
- Household expense for transit will increase. Given the transportation forecast of 12,100 net new daily trips, the corresponding transit costs are higher by $6.1 million per year.
- The Bottineau LRT has no effect on roadways drive times and congestion, and no benefit to freight movement. While Bottineau LRT will mitigate 200,000 regional vehicle miles traveled (VMT) per day, a separate transportation model analysis find that drive times do not improve as a result.

For comparison with the build scenario, the *base case* is the economic growth path found in Metropolitan Council's long-range forecast to 2040.

Data inputs. Data inputs needed to construct the build scenario are drawn from the project's environmental impact statement:

- $1.293 Billion of transitway capital investment during 2018-20, including.
    - $860 million for construction.
    - $433 million for administration, design, engineering, and other professional services.
- $748 million in local and state taxes collected *in Minnesota* to fund the construction phase.
    - In economic modeling, taxes are a debit against disposable personal income, and can slow economic growth. Still, in the case of Bottineau LRT, an equal-sized investment comes from a national revenue pool – this is external investment.
    - For expediency, the build scenario assumes that the timing of local and state tax revenues coincides with the spending of same.
- Following the conclusion of the construction phase, Bottineau LRT will have permanent employment of 145 jobs for operations and maintenance.
    - For this modeling, I specify a fixed public sector budget scenario in which the operation and maintenance of Bottineau LRT is a fiscal substitute for other public spending and employment that would have occurred in a *no-build* scenario.
    - Infrastructure maintenance for Bottineau LRT is assumed to be 1% of the initial cost and is credited as annual expenditure to maintain the nonresidential capital stock. (The infrastructure maintenance estimate does not include operations.)

Not considered in the scenario. The modeling accounts for the local, metro and state taxes raised and directed to the Bottineau LRT project. Other factors and costs expected during the construction phase have *not* been introduced to the model.

- $136 million budgeted for LRT-vehicles is *not* considered as a stimulus factor. The LRT-vehicles are manufactured out of state; thus their manufacture induces no additional economic activity here.
- $67 million for purchase of right of way does not by itself generate economic activity, and so is also *not* considered as a stimulus factor.

- While the FEIS acknowledges disruptions to business (noise, disrupted access to local streets), those costs have not been quantified, and have not been introduced to the model.

Short-term economic impact results. Short-term impacts, now to 2020, are substantially positive during the construction phase – and this is mainly a windfall gain from the external (federal government) investment in the region.

Table 1. Net effects of construction (short-term) activity

External investment (US FTA investment)	$748,000,000
2018-20 Economic Impact	
• Output	$1,135,000,000
• Gross State Product	$593,000,000
• Personal Income	$349,000,000
• Employment (jobs x years)	3,762
Impact compared to external investment	
• Output	1.517 x external invest.
• Gross State Product	0.792 x external invest.
• Personal Income	0.467 x external invest.
• Employment (jobs x years)	5.03 per $1 million

Source: Metropolitan Council analysis.

In response to the direct stimulus of the construction phase:

- ***Metro region.*** Cumulative employment located in the metro region during 2018-20 will be +3,275 more *jobXyears* in the build scenario than the base case. The construction and professional services industries will account for the largest share of this new employment.
- The REMI-PI model estimates that Bottineau LRT project itself accounts for 4,850 construction industry *jobXyears*. The construction resources needed to accomplish Bottineau LRT are diverted during this period to an extent that some other projects and some industries lose employment temporarily.
- Cumulative personal income for the metro region during 2018-20 will be +$223 million larger (constant 2015 $) in the build scenario than the base case.
- Cumulative gross domestic product for the metro (GMP) will be larger by +$556 million (constant 2015 $) for the three-year period 2018-20.

- ***Greater Minnesota.*** Cumulative employment located in the rest of Minnesota during 2018-20 will be +487 more *jobXyears* in the build scenario than the base case. This is all indirect and induced economic growth.
- Cumulative personal income for the rest of Minnesota during 2018-20 will be +$125 million larger (constant 2015 $) in the build scenario than the base case; most of this personal income gain are paycheck earnings from worksites in the metro region, brought back by commuters to home locations in Greater Minnesota.
- Cumulative gross domestic product for the rest of Minnesota will be larger by +$37 million (constant 2015 $) for the three-year period 2018-20; this amount only accounts production situated in Greater Minnesota.

- ***Minnesota, statewide.*** Cumulative employment for the state during 2018-20 will be +3,762 more *jobXyears* in the build scenario than the base case.
- Cumulative personal income for the state during 2018-20 will be +$349 million larger (constant 2015 $) in the build scenario than the base case.
- Workers employed will come from both the metro region and Greater Minnesota: $223 million (58%) of the personal income gained will situate in the metro region, $125 million (32%) in Greater Minnesota, and $38 million (10%) will be earned by workers from out-of-state.
- Cumulative gross domestic product for the state (GSP) will be larger by +$593 million (constant 2015 $) for the three-year period 2018-20. Of that $593 million of additional economic activity, 94% will be situated at businesses in the metro region; 6% in Greater Minnesota.

Long-term economic impact results. Following the conclusion of the construction phase, *after* 2020, the indirect and induced impacts of the construction itself will quickly taper off.

Residents will enjoy improved accessibility to workplaces and other destinations. Overall labor accessibility (the metro region average number of workers within commute distance of workplaces) improves slightly. Some transit-dependent workers are enabled to reach workplaces they could not have reached prior. At higher levels of labor accessibility improvement, the region's industries are more successful in finding and hiring workers who best fit industries' talent needs.

Long-term economic impact derives from these marginal accessibility gains and also car ownership mitigation. These adjustments to the economy should mature 5-7 years after the start of Bottineau LRT operation.

Table 2. Long-term net impacts of Bottineau LRT

	2018-20	2021-30	2031-40
	3 years	10 years	10 years
• Gross State Product	$593,000,000	$603,000,000	$1,815,000,000
o Construction	$636,000,000	-$115,000,000	$33,000,000
o Professional and technical services	$52,000,000	$155,000,000	$210,000,000
o All other private sector	-$95,000,000	$477,000,000	$1,422,000,000
o Transit and ground passenger transportation	0	$75,000,000	$80,000,000
o All other government	0	$11,000,000	$70,000,000
• Personal Income	$349,000,000	$114,000,000	$561,000,000
• Employment (jobs x years)	3,762	751	5,260

Source: Metropolitan Council analysis.

- ***Minnesota employment.*** In the 10th year of Bottineau LRT operation (2030), state total employment will be +279 jobs higher than the base case.
    - Throughout the forecast period, the transit industry itself is the largest employment gainer, with 145 directly created jobs in the metro region. Initially, during 2021-27, transit's gain is balanced by slight losses in other industries.

    - Beyond that, as industries absorb the benefit of the improved labor accessibility, the long-term employment gains are broad-based, spread among all industry sectors.
- ***Annual personal income.*** Closely related to employment, annual personal income in 2030 will be +$30 million higher (constant 2015 $) than the base case.
- ***Gross domestic product for the state (GSP).*** The most complete measure of the economy's expansion due to Bottineau LRT is gross domestic product. Gross domestic product is a summarization of "final goods and services" production, removing duplication of intermediate inputs and supplies. Gross domestic product in 2030 will be +$118 million higher (constant 2015 $) than the base case.
    - Summarizing all of the economic gains, the cumulative additional GSP grows from $593 million for 2018-2020 to $1.197 Billion for 2018-2030 to $3.012 Billion for 2018-2040.
    - In the first years of operation, all of the economic impacts from accessibility improvements and car ownership mitigation will be situated in the metro region. Gradually, the metro's economic growth spills over. For the entire period 2018-2040, 96% of the additional economic activity is situated at businesses in the metro region; 4% in Greater Minnesota.

An Excel spreadsheet accompanying this memo provides a time-series of results for each year, 2018 to 2044.

Assumptions details. Projections of the economic return from labor accessibility gain are based on average economic returns observed historically and in other regions – data available to the REMI-PI model. The eventual Twin Cities results for the forecast period could be higher or lower than the historically-based, average, generic case.

Beyond the construction phase economic stimulus, Bottineau LRT's economic impact depends on what it does for the greater transportation system, providing residents expanded transit. These outcomes are introduced to the REMI-PI model as factors affecting economic performance.

From a separate transportation modeling analysis, SRF Consulting forecasts that Bottineau LRT will prompt 12,100 net new trips by transit. Most of that new transit use will be for work commutes (5,800 net new home-based work trips). For economic modeling purposes, these trips only constitute a labor accessibility gain if they connect workers to workplaces that the workers could not reach prior, but for the new LRT service.

Additionally, SRF Consulting forecasts that Bottineau LRT will prompt a reduction of 200,000 daily vehicle miles traveled, due to travel mode shift; equivalent to -0.2% of daily VMT in the region. However, there will be no improvement in average roadway speeds, and no measureable improvement to overall accessibility *on roadways*.

For economic modeling, the build scenario assumes a +0.03% regionwide labor accessibility improvement in the first full year of service, with the improvement growing to +0.04% in the second year, and beyond. I arrive at this estimated improvement by considering the transit accessibility improvement for the workforce most certain to benefit:

- From analysis of Census data, an estimated 0.08% of the metro workforce is both transit-dependent (no vehicles) *and* living in the immediate area of Bottineau LRT stations.
- Within these station areas, SRF Consulting finds that transit accessibility will improve by 47%.
- The multiplicative product of these two variables is 0.04%.

The assumption of accessibility gains is an exogenous input to the REMI-PI model, not a prediction of the model. (REMI-PI is not a transportation model designed to project accessibility and transportation network outcomes.) This and all of the exogenous inputs and have leverage on the economic model results. The economic impact of Bottineau LRT is most sensitive to the extent of regional labor accessibility improvement. Attentive to this, the specific assumption – a +0.03% to 0.04% improvement in regionwide labor accessibility improvement – is deliberately conservative.

The regional economy may benefit in another way as well: There will be new frequent transit riders who are motivated to reduce their car ownership. For this analysis, after five years the new LRT will reduce total regional car ownership by -0.05% (or -1,200 vehicles) and associated car-ownership costs by $10 million per year. This mitigated spending by households outweighs the increased spending on transit fares (12,100 net new trips / 2 trips per day X $85 monthly pass X 12 months = $6.1 million per year), and the balance allows other uses or savings. Long-term economic benefits result.

F.5 Preliminary Floodplain Impacts and Mitigation Strategies

This page intentionally left blank

To:	Nick Landwer, P.E. Director of Design and Engineering, Blue Line LRT Extension Project
From:	Lisa Goddard, PE, LEED AP Water Resources Sub-Task Lead, SRF Consulting Group Erin Hunker, PE, CFM Water Resources Lead Engineer, SRF Consulting Group
Date:	January 6, 2016
Subject:	Preliminary Floodplain Impacts and Mitigation Strategies

1.0 Introduction

1.1 Project Location

The METRO Blue Line LRT Extension (BLRT) project will extend light rail passenger service from the Target Field Station in Minneapolis to Oak Grove Parkway/101st Avenue N in Brooklyn Park. The project corridor is approximately 13 miles and runs through the cities of Minneapolis, Golden Valley, Robbinsdale, Crystal, and Brooklyn Park. The project has been divided into six segments corresponding with municipal boundaries where possible, which have been labeled according to city. The portion within Brooklyn Park has been further divided into two segments: Brooklyn Park 1, which is the northernmost segment, and Brooklyn Park 2.

Roughly eight miles of the proposed project will be constructed within the existing BNSF Railway corridor. However, most of the Minneapolis segment is located within the median of TH 55 (Olson Memorial Highway), and portions of the two Brooklyn Park segments are within the median of CSAH 103 (West Broadway Avenue). The proposed project also includes the construction and/or reconstruction of affected roadways, construction of station platforms, several park-and-ride facilities, and an operations and maintenance facility (OMF).

Hennepin County is in the preliminary design phase of a portion of CSAH 103 (West Broadway Avenue) that coincides with a portion of the Brooklyn Park 1 segment. A separate environmental assessment worksheet (EAW) and preliminary stormwater design have been completed for the Hennepin County project, which incorporates the floodplain and wetland impacts and stormwater treatment best management practices (BMPs) required to treat runoff from the BLRT Extension project. These have been documented in the EAW and in supporting technical memoranda.

1.2 Purpose

This *Floodplain Technical Memorandum* has been prepared in support of the BLRT Extension project Final Environmental Impact Statement (Final EIS). The objective of this memorandum is to evaluate the BLRT Extension project's potential impacts to floodplains within the study area and to identify potential mitigation measures. This includes the following:

- Identify regulatory requirements that will set forth mitigation standards that are specific to floodplain management.
- Identify potential mitigation areas that would be used to compensate for the floodplain impacts along the BLRT Extension project corridor.

This report contains qualitative and quantitative design recommendations for the BLRT Extension project corridor that will be used by the consultant team preparing the Final EIS and will provide information on how the project would meet the various regulatory requirements.

1.3 Data Collection

The Federal Emergency Management Agency (FEMA) Flood Insurance Study (FIS) and the Flood Insurance Rate Maps (FIRMS) for Hennepin County (panel numbers 27053C0182E, 27053C0201E, 27053C0203E, 27053C0212E, 27053C0214E, and 27053C0352E) dated September 4, 2004, were used to identify floodplains and floodways within the BLRT Extension project corridor. The floodplains within the project area are associated with Bassett Creek, Grimes Avenue Pond, North Rice Pond, Shingle Creek, and the Century Channel Ponds. Note that the latter two water bodies fall within the purview of the CSAH 103 (West Broadway Avenue) EAW.

All floodplain elevations were adjusted from National Geodetic Vertical Datum 1929 (NGVD 29) to North American Vertical Datum 1988 (NAVD 88) by adding 0.20 feet to the NGVD 29 elevations. FEMA 100-year floodplain and floodway GIS shapefiles were downloaded from the DNR floodplain/floodway file transfer site and used to determine the impacts of the BLRT Extension project. The floodplain and floodway areas are shown on **Figures 1 to 12** in Appendix A. The DNR shapefiles had the following discrepancies:

- Century Channel Ponds 7 and 8 (DNR Wetland #559W) and a portion of the Shingle Creek floodplain had been omitted from the digitized GIS shapefile. These floodplain shapes were added by Engineering Services Consultant (ESC) team, based on the LiDAR contours below the adjusted 100-year floodplain elevations listed in FIS 27053CV001A. These areas are shown on **Figures 9 and 10** in Appendix A.
- The City of Brooklyn Park is in the process of applying for a Letter of Map Revision (LOMR) from FEMA for a portion of the Shingle Creek floodplain on the west side of CSAH 103 (West Broadway Avenue), adjacent to the creek crossing. It is assumed that the LOMR will be approved, and the annotated DFIRM and hydraulic modeling prepared for the LOMR was used to determine the floodplain impacts at this location. The GIS shapefiles will be updated to reflect the LOMR once it has been approved.
- The floodplain boundary for Pond 5, which is located in the northeast quadrant of 93rd Avenue N and CSAH 103 (West Broadway Avenue), has also changed. The 610 Commerce Site was recently constructed at this location, and it is unknown at this time if the floodplain elevation has been altered. Based upon discussions with City Staff, a LOMR was not submitted for the impact to the floodplain of Pond 5, but based on aerial imagery, it is clear that the boundary shown on the FIRM is no longer accurate due to locations of buildings and parking lots.

2.0 Regulatory Environment

Regulatory and permitting authority for floodplain impacts falls to the Local Government Unit (LGU), which is typically the municipality. Watershed management organizations (WMOs) also regulate floodplain impacts to waters within their jurisdictional authority. In addition to the LGUs and WMOs, FEMA and the DNR play a role in floodplain management and impacts to water resources within the study area. These include:

- Federal Emergency Management Agency (FEMA)
- Minnesota Department of Natural Resources (MnDNR)
- Mississippi Watershed Management Organization (MWMO)
- Bassett Creek Watershed Management Commission (BCWMC)
- Shingle Creek and West Mississippi Watershed Management Commissions (SCWMC and WMWMC, or SCWM WMC when referred to in reference to their joint watershed management plan)
- City of Minneapolis

- City of Golden Valley
- City of Robbinsdale
- City of Crystal
- City of Brooklyn Park

2.1 Federal Emergency Management Agency

FEMA, under the National Flood Insurance Program (NFIP) has the authority to regulate floodplains and floodways. Executive Order (EO) 11988 requires all federal agencies to evaluate and, to the extent possible, avoid adverse impacts to floodplain areas which may result in action they administer, regulate, or fund. EO 11988 specifically requires floodplain impacts to be considered in the preparation of environmental documents. This document identifies that the following four areas must be adequately addressed in the Final EIS:

1) No significant potential for interruption of a transportation facility which is needed for emergency vehicles or provides a community's only evacuation route.
2) No significant impact on natural or beneficial floodplain values.
3) No significant increased risk of flooding will result.
4) Will the project support and/or result in incompatible floodplain development?

These four areas are addressed in the 'Floodplain Impacts and Mitigation' section of this memo.

Executive Order 13690, *Establishing a Federal Flood Risk Management Standard and a Process for Further Soliciting and Considering Stakeholder Input*, was implemented on January 30, 2015. The EO 13690 amends EO 11988 and states that the floodplain shall be:

1) The elevation and flood hazard area that result from using a climate-informed science approach that uses the best-available, actionable hydrologic and hydraulic data and methods that integrate current and future changes in flooding based on climate science. This approach will also include an emphasis on whether the action is a critical action as one of the factors to be considered when conducting the analysis.
    a. This could mean using flow rates based on the new precipitation intensity-duration-frequency curves, called Atlas 14, or using flows based on regression equations using more recent stream gage data. However, according to the FAQ section of the National Oceanic Atmospheric Administration (NOAA) website (http://www.nws.noaa.gov/oh/hdsc/FAQ.html#1.5), Atlas 14 volumes are "based on the assumption of stationary climate." It appears that the project's use of Atlas 14 precipitation frequencies would not qualify as a climate-informed science approach based on NOAA guidance.
2) The elevation and flood hazard area that result from using the freeboard value, reached by adding an additional two feet to the base flood elevation for non-critical actions and by adding an additional three feet to the base flood elevation for critical actions. The term 'critical action' shall mean any activity for which even a slight chance of flooding would be too great.
3) The area subject to flooding by the 0.2 percent (500-year) annual chance flood.
4) The elevation and flood hazard area that results from using any other method identified in an update to the Federal Flood Risk Management Standard (FFRMS).

The ESC team and the Final EIS team met with the Federal Transit Authority to discuss which of the above options would be most appropriate for the BLRT extension project to use. Based on that meeting, as well as a conversation with the Metropolitan Planning Organization, the BLRT Extension project is using Option 2, Noncritical Action (100-year elevation plus two feet of freeboard) to determine the elevation of the roadway profile, which will ensure the intent for resilient infrastructure in EO 13690 is met.

Rivers and streams for which FEMA has prepared detailed engineering studies may have designated floodways. The floodway is the area of the floodplain that must remain free from obstruction so that the 100-year flood can be conveyed downstream. Placing fill or buildings in the floodway may block the flow of water and increase flood elevations. Such activities in the floodway are generally restricted and require mitigation in the form of compensatory storage volume to offset the lost floodway storage. Similarly, activities in the floodplain that reduce flood storage capacity are also restricted and would require compensatory storage volume. A project in a floodway must be reviewed to determine if the project will increase flood heights. An engineering analysis must be conducted before a permit can be issued. The community's permit file must have a record of the results of this analysis, which is in the form of a No-Rise Certification. The No-Rise certification must be supported by technical data and signed by a registered professional engineer.

2.2 Minnesota Department of Natural Resources

On behalf of FEMA, the MnDNR, and the local government units (i.e., the cities and watershed management organizations) also regulate activities that may impact floodplains, including activities such as construction, excavation, or deposition of materials over, or under waters that may affect flood stage, floodplain, or floodway boundaries.

The MnDNR has developed regulatory standards for floodplain development within the State. Local government units must, at a minimum, adopt these standards. The requirement for allowing fill within the flood fringe is that it generally cannot:

- Increase the 100-year flood elevation more than ½ foot above the preexisting, natural unobstructed condition, or
- Increase the 100-year flood elevation if the filling would negatively impact existing floodplain development (even if the increase would be less than ½ foot)

The floodplain requirements of each community and WMO located along the project corridor meet or exceed the guidance provide by the MnDNR.

2.3 Local Government Units

The project is located within the Bassett Creek Water Management Commission, Mississippi Watershed Management Organization, the Shingle Creek and West Mississippi Water Management Commission; and within the Cities of Minneapolis, Golden Valley, Crystal, Robbinsdale, and Brooklyn Park. Each of these cities and WMOs has rules and ordinances that address floodplain impacts and mitigation. Please see the Regulatory Matrix in Appendix B for more details on the floodplain regulations that pertain to this project.

2.3.1 Mississippi Watershed Management Organization

The MWMO manages waters within its boundaries through its Watershed Management Plan that was amended in 2011. This plan complies with the water resource protection requirements under Minnesota Statutes 103A through 103G in conformance with Minnesota Rules Chapters 8410 and 8420. The communities within the boundaries include parts of Lauderdale, Minneapolis, St. Anthony, and St. Paul, as well as property owned by the Minneapolis Park and Recreation Board (MPRB).

The MWMO does not issue permits or provide approval letters for construction projects, but works with the member communities to ensure the implementation of its standards. MWMO's floodplain standards are that public roadways shall not flood when adjacent to stormwater storage basins or subsurface stormwater management BMPs designed to store the 100-year event.

2.3.2 Bassett Creek Water Management Commission

The BCWMC manages waters within its boundaries through its 2015 – 2025 Watershed Management Plan. This Plan complies with the water resource protection requirements under Minnesota Statutes 103A through 103G in conformance with Minnesota Rules Chapters 8410 and 8420. The BCWMC is governed by a Joint Powers Agreement that is held between the watershed organization and the member communities that are located within the boundaries of the WMO. The member municipalities include Crystal, Golden Valley, Medicine Lake, Minneapolis, Minnetonka, New Hope, Plymouth, Robbinsdale, and St. Louis Park.

The BCWMC's rules address floodplain alteration within the watershed. The rules prohibit new structures or improvements in the floodplain, which would be subject to damage by the 100-year flood, including basements, public utilities, and streets. Where streets, utilities, and structures currently exist below the 100-year floodplain, BCWMC encourage member cities to remove these features as development/redevelopment allows. Projects within the floodplain must maintain no net loss to floodplain storage and no increase in flood level at any point along the trunk system. The BCWMC defines the trunk system as including the Bassett Creek Main Stem (including the East Channel), Grimes Pond, North Rice Pond, South Rice Pond, and inundations areas in Mary Hills Nature Area and Theodore Wirth Regional Park (TWRP). The BCWMC rules prohibit expansion of existing non-conforming land uses within the floodplain unless fully flood-proofed.

2.3.3 Shingle Creek and West Mississippi Watershed Management Commissions

The SCWMC and WMWMC are two separate WMOs; however, they plan and conduct business jointly, managing waters within its boundaries. Each is governed by a Joint Powers Agreement that is held between the watershed organization and the communities/members that are located within the boundaries of the WMOs. The communities within the boundaries include parts of Brooklyn Center, Brooklyn Park, Crystal, Maple Grove, Minneapolis, New Hope, Osseo, Plymouth, Robbinsdale, and Champlin.

The SCWM WMC manages waters through its Third Generation Watershed Management Plan, which was adopted in 2013. This Plan complies with the water resource protection requirements under Minnesota Statutes 103A through 103G in conformance with Minnesota Rules Chapters 8410 and 8420.

The SCWM WMC's rules address floodplain alteration within the watershed. No person or political subdivision shall alter or fill land below the 100-year critical flood elevation of any public waters, public waters wetland, or other wetland without first obtaining an approved project review from the Commission. Floodplain alteration or filling shall not cause a net decrease in flood storage capacity below the projected 100-year critical flood elevation unless it is shown that the proposed alteration or filling, together with the alteration or filling of all other land on the affected reach of the waterbody to the same degree of encroachment as proposed by the applicant, will not cause high water or aggravate flooding on other land and will not unduly restrict flood flows. The SCWM WMC also requires compensatory storage for floodplain fill.

The SCWM WMC also requires approval of a project review of any new or improved crossing of Shingle Creek. The crossings shall retain adequate hydraulic capacity based on the hydraulic model of the creek, not adversely affect water quality, represent the "minimal impact" solution to a specific need with respect to all reasonable alternatives, and allow for future erosion, scour, and sedimentation maintenance considerations.

2.3.4 City of Minneapolis

The City of Minneapolis' Floodplain Overlay District Ordinance (Chapter 551) includes regulations for managing land uses in the mapped floodplain. The ordinance states that linear projects within the floodplain shall be designed to minimize the increases in flood elevations and shall be compatible with local comprehensive floodplain development plans. Protection to the regulatory flood protection elevation (RFPE) shall be provided where failure or interruption of public facilities would result in danger to public health or safety where facilities are essential to

orderly functioning of the area. Conditional uses in the Floodway District are allowed provided such uses shall have a low flood damage potential, shall not cause an increase in the stage of the regional flood, or cause an increase in flood damages in the reach(es) affected.

2.3.5 City of Golden Valley

The City of Golden Valley's Floodplain Management Zoning Overlay District Ordinance (Section 11.60) states that linear projects may be located in the floodplain provided they are designed to minimize increases in flood elevation and are compatible with the BCWMC Management Plan. These uses can cause no increase in stage to the 100-year flood within the floodway and cannot increase the floodplain elevation by more than ½ foot in a designated Zone A or AE where a floodway has not been designated. Protection to the RFPE shall be provided where failure or interruption of these public facilities would endanger the public health or safety or where such facilities are essential to the orderly functioning of the area.

2.3.6 City of Robbinsdale

The City of Robbinsdale's Floodplain Management District Ordinance (Section 530.01) states that no structure, fill (including for roads and levees), deposit, obstruction, storage of materials or equipment, or other uses may be allowed as a conditional use in the floodway that will cause any increase in the stage of the 100-year regional flood or cause an increase in flood damages in the reach(es) affected. Floodplain development shall not adversely affect the hydraulic capacity of the channel and adjoining floodplain of any tributary watercourse or drainage system where a floodway or other encroachment limit has not been specified on the Official Zoning Map.

2.3.7 City of Crystal

The City of Crystal's Floodplain Overlay Ordinance (Chapter 515.61) states that no structure, fill (including for roads and levees), deposit, obstruction, storage of materials or equipment, or other uses may be allowed as a conditional use in the floodway that will cause any increase in the stage of the 100-year regional flood or cause an increase in flood damages in the reach(es) affected. Floodplain development shall not adversely affect the hydraulic capacity of the channel and adjoining floodplain of any tributary watercourse or drainage system where a floodway or other encroachment limit has not been specified on the Official Zoning Map.

2.3.8 City of Brooklyn Park

The City of Brooklyn Park has adopted zoning regulations to manage land uses in the mapped floodplain. These regulations include the minimum federal and state regulations, which are enforced in the 1-percent chance (100-year) floodplain that is mapped on the Flood Insurance Rate Map (FIRM) for Brooklyn Park. The Brooklyn Park ordinance requires that no fill, excavation, or storage of materials or equipment that obstruct flows or increase flood elevations will be permitted within the flood fringe or floodway.

3.0 Floodplain Impacts and Mitigation

There are several floodplains within the project area that will be impacted by the construction of the BLRT Extension project. Floodplain impacts were estimated based on a conceptual (10 percent) design of the project corridor. The floodplain impacts may be revised as the design for the project progresses, but they are not expected to increase. The following sections include a summary of the impacts and identify potential on-site floodplain storage mitigation areas that have been preliminarily evaluated for the project. **Table 1, Floodplain Impacts by Water Body**, provides a summary of the floodplain impacts throughout the corridor.

Table 1. Floodplain Impacts by Water Body

Water Body	Type of Encroachment	Length (ft)	Volume of Floodplain Impact (cy)
Bassett Creek	Longitudinal	5,310 (1)	16,800
Grimes and North Rice Ponds	Transverse	1,200 (2)	200
Shingle Creek	Transverse	(3)	(3)
Setzler Pond	Transverse	(3)	(3)
DNR Wetland #559W	Transverse	(3)	(3)

(1) Impacts listed are on the east and west sides of the BLRT guideways.
(2) Impacts listed include the bridge piers and the south abutment.
(3) See West Broadway EAW for detailed floodplain fill impacts (see www.hennepin.us/westbroadway for a link to the EAW).

3.1 Bassett Creek

3.1.1 Affected Environment

The Bassett Creek Main Stem is located on the west side of the BNSF Railway and BLRT corridor through TWRP from south of TH 55 (Olson Memorial Highway) to Bassett Creek Drive, within portions of the Minneapolis and Golden Valley segments. The East Channel of Bassett Creek is located on the east side of the existing BNSF Railway corridor, and is connected by existing culverts that cross the existing Canadian Pacific (CP) and BNSF Railway corridors. There is also a flood control structure located on Bassett Creek on the north side of TH 55 (Olson Memorial Highway). This structure is not expected to be impacted by the project. See **Figures 2 and 3** for the location.

The ESC team received the FEMA-approved HEC-2 models for Bassett Creek from the MnDNR, and from Ferris Chamberlain, who did the last updates to the modeling for the United States Army Corps of Engineers (USACE) in the late 1990s. The model sets were identical, and are the basis of the 100-year floodplain and floodway boundaries shown on the FIRMs for Bassett Creek, which are the regulated boundaries for the creek. The creek's large floodplain includes both a conveyance element as well as a large storage element due to the flood control structure. As such, the floodway extents in TWRP were "administratively determined" by the Bassett Creek Flood Control Commission, the MnDNR, the City of Golden Valley, and FEMA as part of a management "envelope" to limit development within areas necessary for flood control.

The ESC team converted the models into HEC-RAS to create duplicate-effective models, which will be corrected to match existing conditions once all the survey data has been collected. The proposed conditions model will be refined as the project design progresses.

3.1.2 Proposed Conditions

As part of the BLRT Extension project, the existing BNSF track will be shifted to the western 50 feet of the existing 100 foot rail corridor. This will result in impacts to the Bassett Creek floodplain. An access road will be constructed on the west side of the proposed BNSF track from TH 55 (Olson Memorial Highway) to Theodore Wirth Parkway. Due to poor soils and wetlands, the access road has been eliminated from Theodore Wirth Parkway to the northern end of the Golden Valley segment. Westbound TH 55 (Olson Memorial Highway) will be realigned to the north to accommodate the BLRT guideway, extending into the area adjacent to the East Channel Bassett Creek. A retaining wall is proposed to limit the amount of fill placed into the area near the upstream end of the culvert crossing the highway.

The preliminary floodplain strategy has been to include impacts and mitigation for the access road, which is generally where potential expansion of the BNSF Railway would occur. The existing culverts that convey the East Channel Bassett Creek under the BNSF Railway corridor will be reconstructed to accommodate the freight and LRT tracks. The existing culvert that conveys the East Channel Bassett Creek will be studied for capacity to determine if it needs to be reconstructed. The cross-sections from the HEC-RAS models have been compared against LiDAR data for the area and are very similar. The ESC team conducted a sensitivity analysis in the HEC-RAS models by incorporating the potential floodplain fill from the proposed project. The sensitivity analysis resulted in no increase to the 100-year water surface elevation. This is understandable given the large size of the floodplain relative to the project impacts, and that the floodplain elevation is controlled by both the flood control structure at TH 55 (Olson Memorial Highway) and the overflow provided by a low point in TH 55 (Olson Memorial Highway).

The total proposed floodplain fill within the Bassett Creek floodplain, is 16,800 cubic yards. These include impacts to the Main Stem and East Channel Bassett Creek between TH 55 (Olson Memorial Highway) and Bassett Creek Drive. A floodplain mitigation area has been identified within TWRP, between Bassett Creek Main Stem and the BLRT and BNSF Railway corridor. The City of Minneapolis owns an easement over the mitigation area, as well as other areas within TWRP. The mitigation would include excavation of adjacent ground below the 100-year floodplain elevation to provide compensatory floodplain storage for the fill placed within the floodplain. The mitigation site will be designed in collaboration with MPRB and the City of Minneapolis. See **Figure 2** for the location of the potential floodplain mitigation area.

3.2 Grimes and North Rice Ponds

3.2.1 Affected Environment

Grimes and North Rice Ponds are located within the BCWMC north of Golden Valley Road in the City of Robbinsdale. The existing BNSF Railway corridor transects the Grimes and North Rice Ponds, which discharge to Bassett Creek Main Stem. The BNSF track is located on embankment between the two ponds, and is located above the 100-year floodplain elevation. The floodplain boundary shown on the FIRM includes portions of residential properties and roadways on the north side of Grimes Pond. The City Engineer confirmed that these areas are within the 100-year floodplain.

3.2.2 Proposed Conditions

The BLRT Extension project will result in widening of the existing corridor. The BLRT guideway will be constructed on a new bridge due to poor soils, and in order to reduce floodplain impacts. The BNSF track will remain on the current embankment. There will be minor floodplain fill at the south end of the bridge and from the bridge piers.

3.3 Shingle Creek

3.3.1 Affected Environment

The 100-year floodplain and floodway associated with Shingle Creek crosses the BLRT Extension project at the existing culvert crossing at CSAH 103 (West Broadway Avenue). The mapped floodplain is wider on the upstream (west) and downstream (east) ends of the crossing than it is immediately at the crossing. As mentioned previously, the City of Brooklyn Park is in the process of obtaining a LOMR approval for this area, which reduces the floodplain extents on the upstream side of the culvert to account for fill that was placed within the property directly adjacent to CSAH 103 (West Broadway Avenue) on the south side of Shingle Creek and a floodplain mitigation area that was constructed on the opposite side of the Creek from the impacted property.

3.3.2 Proposed Conditions

As part of a separate project, Hennepin County will be reconstructing CSAH 103 (West Broadway Avenue) from approximately Candlewood Drive N to approximate northbound station 2651+15. The BLRT corridor will be located within the median of the CSAH 103 (West Broadway Avenue) corridor. A separate Environmental Assessment Worksheet (EAW) has been prepared for the CSAH 103 (West Broadway Avenue) project, and includes information on the floodplain impacts within that project area. There are no floodplain impacts to Shingle Creek associated with the BLRT Extension project. See the CSAH 103 (West Broadway Avenue) EAW for more information on the impacts and mitigation associated with that project.

3.4 Century Channel Ponds

3.4.1 Affected Environment

The Century Channel Ponds include Setzler Pond, DNR Wetland #559W, and Pond 5. Historically, these basins were part of Century Channel, which now consists of a series of wetlands, ponds, and culverts also known as Edinbrook Channel that discharge to Mattson Brook east of CSAH 103 (West Broadway Avenue), and ultimately to the Mississippi River. The Century Channel Ponds were added to the Hennepin County FIS and FIRM through a LOMR in the early 2000s. Setzler Pond is located in the northwest quadrant of the intersection of 89th Avenue N and CSAH 103 (West Broadway Avenue). DNR Wetland #559W is located between 92nd Avenue N and Setzler Parkway, and is bisected by CSAH 103 (West Broadway Avenue). Pond 5 of the Century Channel Ponds is located in the northeast quadrant of CSAH 30 (93rd Avenue N) and CSAH 103 (West Broadway Avenue).

3.4.2 Proposed Conditions

There are no floodplain impacts to Setzler Pond or DNR Wetland #559W associated with the BLRT Extension project. See the CSAH 103 (West Broadway Avenue) EAW for more information on the impacts and mitigation impacts associated with that project. The Pond 5 floodplain was recently impacted by development, and it is unknown at this time if the floodplain elevation or boundary has been altered.

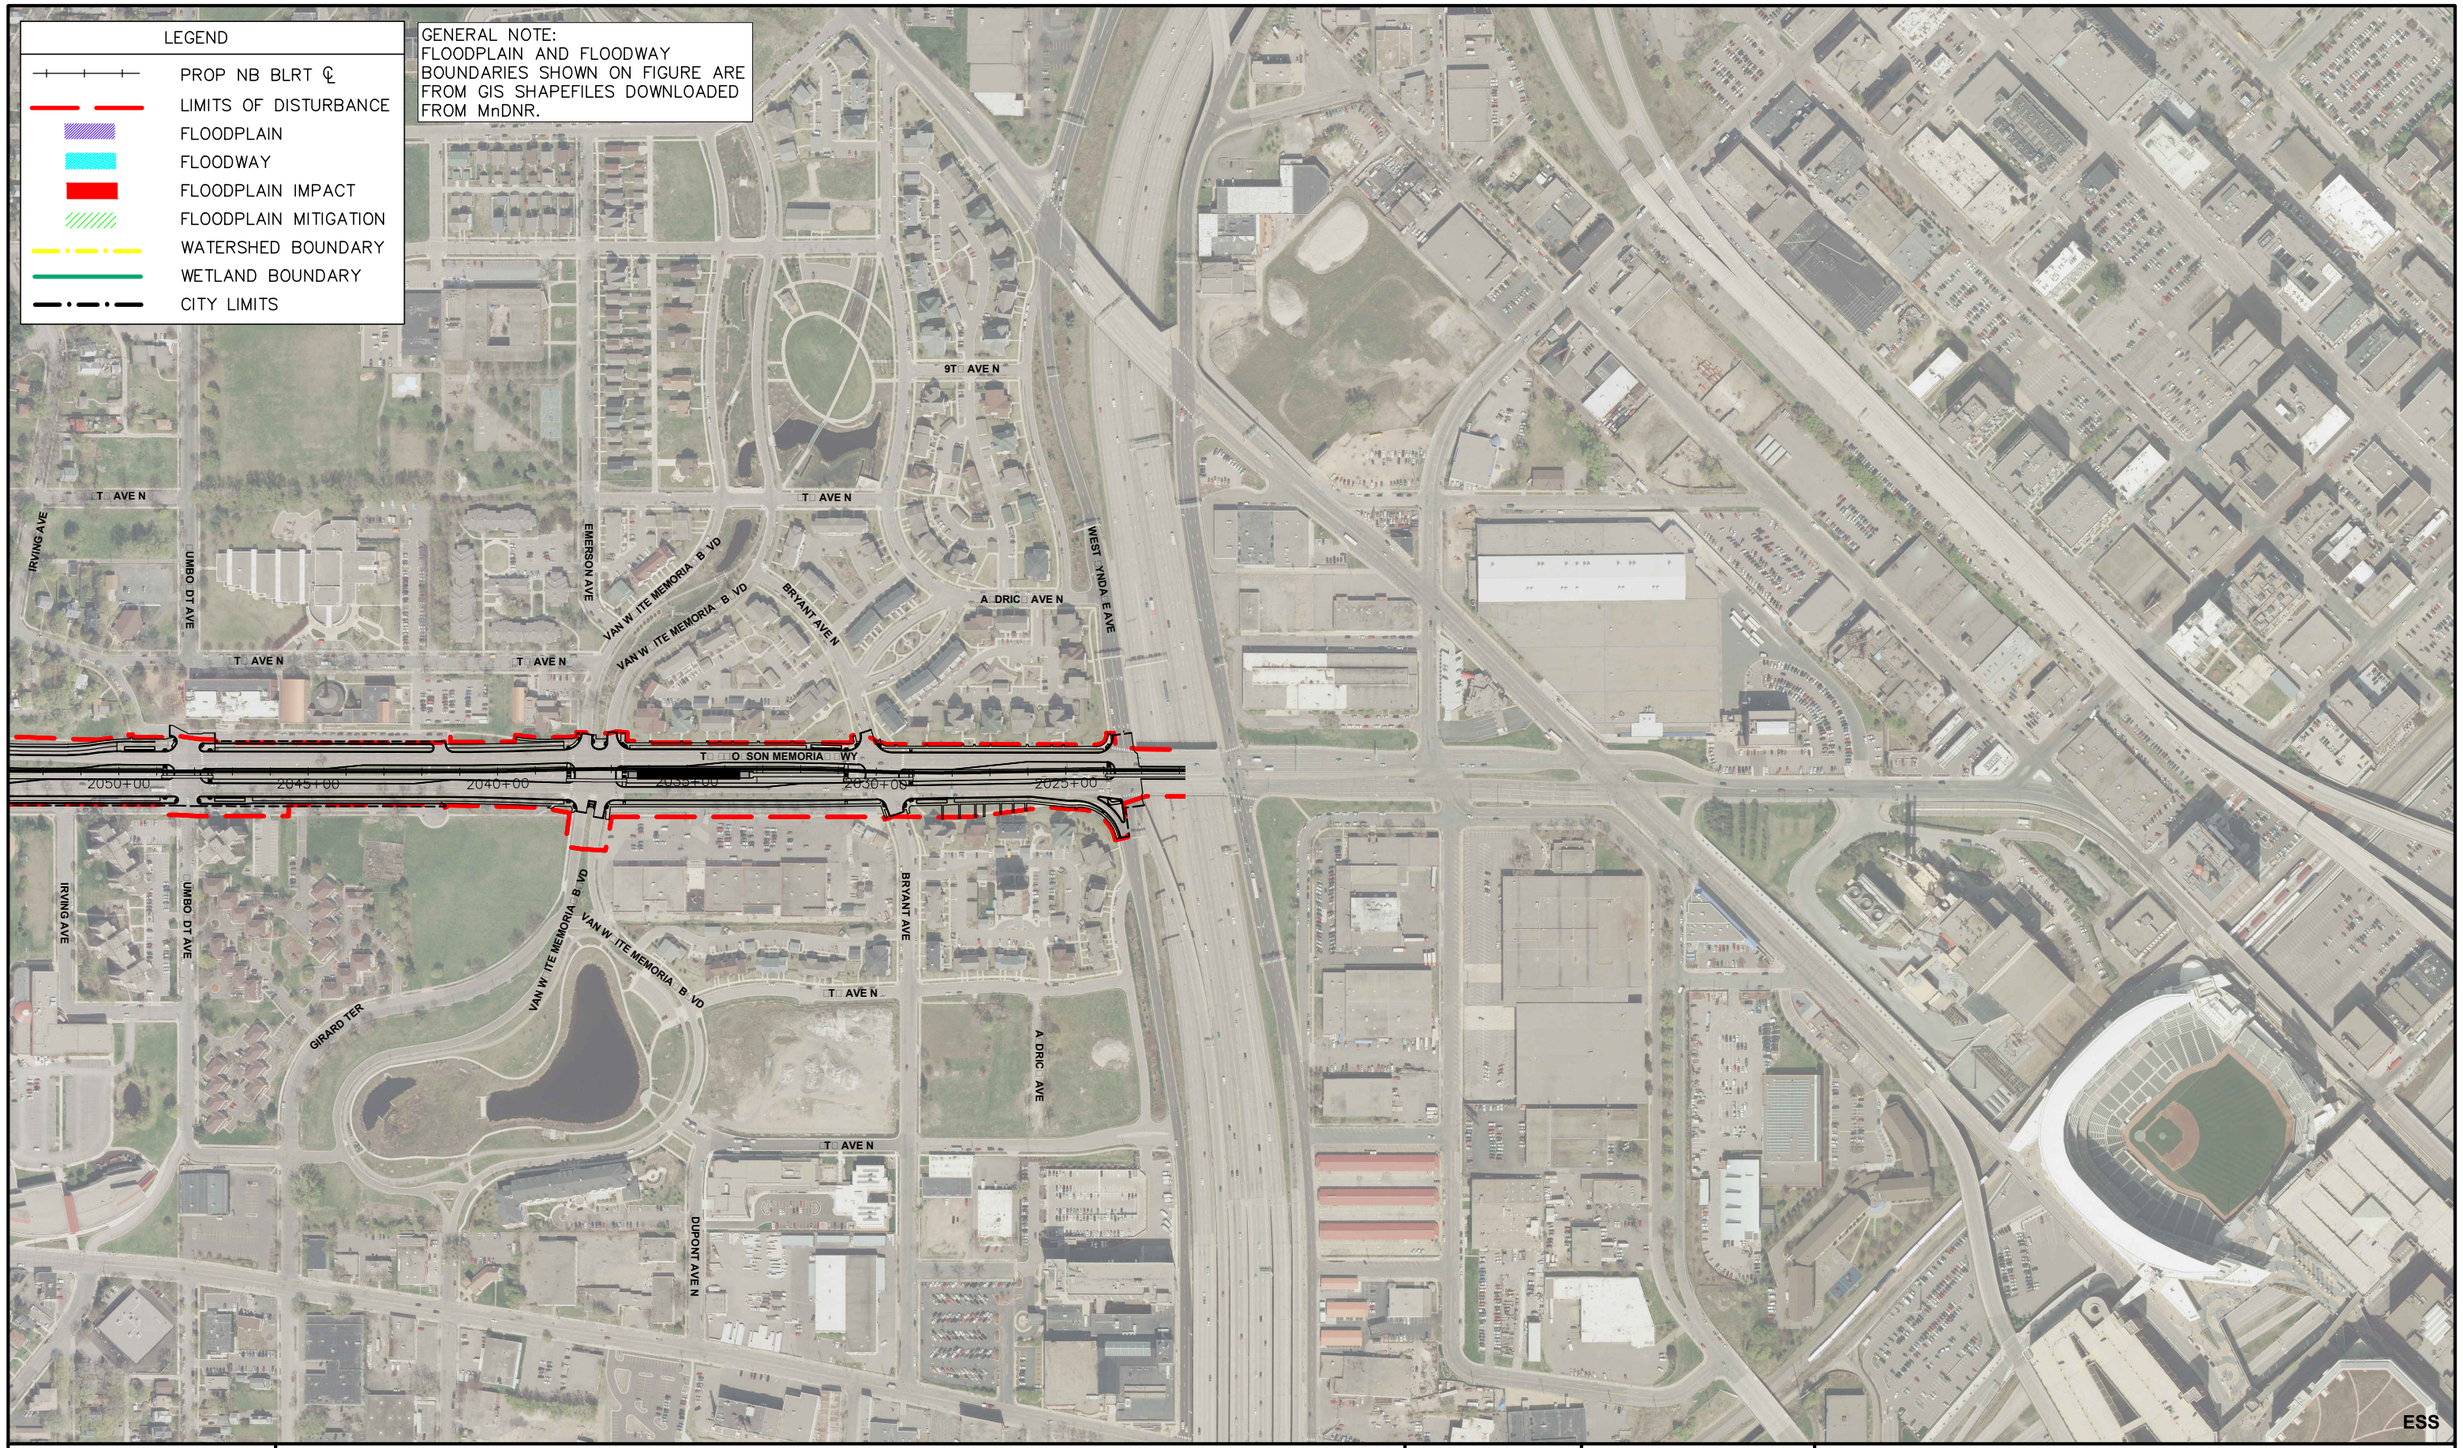
3.5 Impact Analysis

This project will not result in any significant floodplain impacts for the following reasons:

1) No significant interruption of termination of a transportation facility which is needed for emergency vehicles or provides a community's only evacuation route.
    a. All major roadways, including TH 55 (Olson Memorial Highway) and CSAH 103 (West Broadway Avenue), and BLRT guideway grades will be designed to be two feet above the 100-year floodplain elevation, in order to be in compliance with EO 13690.
2) No significant adverse impact on natural and beneficial floodplain values should result from this project.
    a. No fisheries impacts are anticipated. Construction operations in the creeks will not occur during fish spawning and migration periods.
    b. The wetland impacts and mitigation are discussed in a separate wetland technical memorandum.
    c. No threatened or endangered plants or animals have been identified in the floodplains.
    d. Appropriate turf establishment and erosion control measures will be used.
3) No significant increased risk of flooding will result.
    a. No significant change in 100-year water surface elevations is anticipated as a result of the BLRT Extension project. Hydraulic analysis indicates that the proposed fill within the Bassett Creek floodplain will not result in an increase to the 100-year floodplain elevation, and a 'No-Rise Certificate' will be completed, which states that there will be no rise in the floodplain elevation.
4) This project should not result in any incompatible floodplain development.

a. The LGUs and WMOs located throughout the corridor have floodplain ordinances that regulate floodplain development. The ordinances conform to the MnDNR Floodplain Management guidelines. No new access to a floodplain area is being created by the BLRT Extension project.

4.0 Conclusion



The *Floodplain Technical Memorandum* has been prepared in support of the Final EIS for the BLRT Extension project. The memorandum includes a summary of the regulatory environment for floodplain management within the project area, a summary of the proposed floodplain impacts from the project, and identifies potential floodplain mitigation areas within the project corridor. **Figures 1 through 12** in Appendix A show the locations of the floodplains, proposed impacts, and potential mitigation sites. The information in the memorandum will be used by the consultant team preparing the Final EIS and will provide information on how the project would meet various regulatory requirements.

APPENDIX B. SUMMARY OF REGULATORY CRITERIA

Blue Line LRT Extension
Water Resources - Regulatory Matrix - DRAFT
2/5/2015
Revised 10/5/2015

RFPE = Regulatory Flood Protection Elevation [2]

Requirements Summary								
Organization	**Applies to**	**Rainfall Data**	**Rate Control**	**Water Quality (1)**	**Volume Control**	**Floodplain/Flood Control Requirements**	**Plan Review Process**	**Comments**
MWMO MWMO Watershed Management Plan 2011-2021, dated May 10, 2011	Segment M	TP-40 or "subsequent revisions"	Match pre-development rates for 2-, 10-, and 100-year; may be restricted to less than pre-development rates when the capacity of the downstream conveyance system is limited	Remove 90% TSS from 95th percentile daily rainfall total (1.17 in. over 24 hrs) over entire project area, or Alternate Compliance which involves payments and/or credits and is summarized in MWMO standards document	Includes statement: placeholder for future volume standard by ~ 2013	Public Roadway Condition - roadway shall not flood when adjacent to stormwater storage basin or subsurface stormwater managmeent BMP designed to store the 100-year event. Freeboard requirement set by road authority. Alternative - minimum freeboard requirement above the 100-year HWL may be calculated as the height determined by adding depth of volume of runoff received by BMP from two-year event over the BMP.	The MWMO works with the member communities to ensure the implementation of its standards. The MWMO recommends members adopt its ordinance-ready MWMO Standards language into their local ordinances.	Note in the Standards Section that the MWMO will be working with agencies and its member organizations over the next 2.5 years to review or determine new water quality and volume standards.
BCWMC BCWMC 2015-2025 Watershed Management Plan, dated September 2015	Segment GV and Segment R	Atlas 14	Match existing rates for 2-, 10-, and 100-year events	Meet MIDS performance goals FOR LINEAR PROJECTS: Retention of whichever is greater: - 0.55 in from new or fully reconstructed areas or -1.1 in from the net increase in impervious areas If the MIDS performance goal is not feasible and/or is not allowed for a proposed project, then the project must implement the MIDS flexible treatment options, as shown in the MIDS Design Sequence Flow Chart	Meet MIDS performance goals FOR LINEAR PROJECTS: Retention of whichever is greater: - 0.55 in from new or fully reconstructed areas or -1.1 in from the net increase in impervious areas If the MIDS performance goal is not feasible and/or is not allowed for a proposed project, then the project must implement the MIDS flexible treatment options, as shown in the MIDS Design Sequence Flow Chart	Prohibits new structures or improvements in the floodplain, which would be subject to damage by the 100-year flood, including basements, public utilities, and streets. Where streets, utilities, and structures currently exist below the 100-year floodplain, BCWMC encourages member cities to remove these features as development/redevelopment allows. Projects within the floodplain must maintain no net loss to floodplain storage and no increase in flood level at any point along the trunk system. Prohibits expansion of existing non-conforming land uses within floodplain unless fully flood-proofed. OLD REQUIREMENTS DOC: Filling will generally not be allowed within the floodplain. Proposals to fill within the established floodplain must obtain BCWMC approval and must provide compensating storage and/or channel improvement so that the flood level shall not be increased at any point along the trunk system due to the fill	BCWMC reviews development/redevelopment proposals after project receives preliminary review by municipality indicating general compliance with existing local water management plan. Complex projects may require additional review time. All submittals involving floodplains, Bassett Creek trunk system, appropriations, variances, underground wet vaults or other alternative BMPs are presented at the BCWMC meetings.	Requirements for Improvements and Development Proposals' document has not been updated to match the revised standards in the 2015 Draft plan.

Requirements Summary								
Organization	**Applies to**	**Rainfall Data**	**Rate Control**	**Water Quality (1)**	**Volume Control**	**Floodplain/Flood Control Requirements**	**Plan Review Process**	**Comments**
SCWMC SCWMC Rules and Standards, dated April 2013	Segment C, Segment BP2, and Segment BP1	Atlas 14	Match existing rates for 2-, 10-, and 100-year events	Remove 60% of P and 85% of TSS Use NURP ponds or infiltrate all site runoff from 1.3-inch event NURP pond dead storage requirement is runoff from 2.5-inch storm event over the contributing drainage area Linear projects that create one acre or more of new impervious surface must meet all Commission requirements for the **net new impervious surface.**	1-inch of runoff from impervious surfaces. Linear projects that create one acre or more of new impervious surface must meet all Commission requirements for the **net new impervious surface.**	Floodplain alteration/filling shall not cause a net decrease in flood storage capacity below the 100-year critical flood elevation unless it is shown that the proposed alteration or filling, together with the alteration or filling of all other land on the affected reach to the same degree of encroachment will not cause high water or aggravate flooding on other land and will not unduly restrict flood flows.	The Commission reviews proposed land development and redevelopment projects affecting water resources. Projects are reviewed in accordance with the management standards and policies of the SCWMC and recommendations are made to the member City in which the project is located. It is the City's responsibility to enforce the Commission's recommendations. Linear projects that create one acre or more of new impervious surface must meet all Commission requirements for the **net new impervious surface**. Projects impacting wetlands where Commission is LGU must be reviewed regardless of size. Plans for developemtn within the 100-year floodplain as defined by the FIS must be reviewed.	
MPCA (via NPDES permit issued 8/1/2013) As of 2/5/2015, the impaired and special waters within 1 mile of corridor include: Shingle Creek Upper Twin Lake Middle Twin Lake Lower Twin Lake Crystal Lake Bassett Creek Mississippi River	All segments	N/A	N/A	Water quality volume of 1-inch of runoff from new impervious surfaces must be retained on site. If infiltration is prohibited,must use other methods of volume reduction and the water quality volume (or remainder if some volume reduction is achieved) must be treated by a wet sedimentation basin, filtration system, regional ponding or equivalent methods prior to discharge of stormwater to surface waters. If use wet sedimentation pond to provide treatment, dead storage requirement is 1800 cubic feet per acre of surface area drained.	Retain on site 1-inch of runoff from new impervious surfaces. If infiltration is prohibited, must use other methods of volume reduction and the water quality volume (or remainder if some volume reduction is achieved) must be treated by a wet sedimentation basin, filtration system, regional ponding or equivalent methods prior to discharge of stormwater to surface waters. NOTE: infiltration BMPs are prohibited when soil infiltration rates are > 8.3 in/hr unless the soil is amended to slow it down. See permit for other conditions that prohibit infiltration.	N/A	SWPPP must be submitted to MPCA for review if the project size is 50 acres or more and will discharge to special or impaired waters. Application and SWPPP must be submitted at least 30 days before the start of the construction activity.	The General Permit used to develop this matrix expires on 8/1/2018. It will be necessary to verify how any proposed changes in the permit would apply to this project.
Minnesota B3 Guidelines	OMF and park-and-ride buildings in all segments		Match runoff rates for the native soil and vegetation conditions for 2- and 10-year, 24 hr design storms	Remove 80% of post development TSS Remove 60% of post development TP	Retain 1.1 inches from all new or redeveloped impervious	N/A	N/A	Minimize the negative impacts of the project, both on and off site, by maintaining a more natural hydrologic cycle through infiltration, evapotranspiration, and reuse.

Requirements Summary								
Organization	**Applies to**	**Rainfall Data**	**Rate Control**	**Water Quality (1)**	**Volume Control**	**Floodplain/Flood Control Requirements**	**Plan Review Process**	**Comments**
City of Minneapolis Email from Jeremy Strehlo, dated 1/23/15 Minneapolis Floodplain Overlay District Ordinance (Chapter 551.540) Minneapolis Erosion and Sediment Control and Drainage Ordinance (Chapter 52) Minneapolis Stormwater Ordinance (Chapter 54)	Segment M		Maintain discharge rates at or below the existing rates. May be restricted to less than existing rates when the capacity of the downstream conveyance system is limited	Remove 70% TSS	N/A	Linear projects within the floodplain shall be designed to minimize increases in flood elevations and shall be compatible with local comprehensive floodplain development plans. Protection to the RFPE shall be provided where failure or interruption of public facilities would result in danger to public health or safety where facilities are essential to orderly functioning of the area. Conditional uses in Floodway District allowed provided such uses shall have a low flood damage potential, shall not cause an increase in the stage of the regional flood or cause an increase in flood damages in the reach(es) affected.	Must submit application and obtain approval for Storm Water Management Plan from the city engineer. Requirements are included in Chapter 54.70 of City Code.	
City of Golden Valley	Segment GV		Must meet BCWMC standards.	Must meet BCWMC standards.	Must meet BCWMC standards.	Linear projects may be located in the floodplain provided they are designed to minimize increases in flood elevation and are compatible with the BCWMC Management Plan. These uses can cause no increase in stage to the 100-year flood within the floodway and cannot increase the floodplain elevation by more than 1/2 foot in a designated Zone A or AE where a floodway has not been designated. Protection to the RFPE shall be provided where failure or interruption of these public facilities would endanger the public health or safety or where such facilities are essential to the orderly functioning of the area.	See BCWMC plan review process for information on stormwater management review. Floodplain alteration permit will be submitted to the City, which will then submit the information to the DNR Commisssioner and BCWMC for review.	

Requirements Summary								
Organization	**Applies to**	**Rainfall Data**	**Rate Control**	**Water Quality (1)**	**Volume Control**	**Floodplain/Flood Control Requirements**	**Plan Review Process**	**Comments**
City of Robbinsdale Robbinsdale 2030 Comprehensive Plan - Appendix IIIA Storm Water Management Plan	Segment R		Must meet SCWMC and BCWMC standards.	Must meet SCWMC and BCWMC standards.	Must meet SCWMC and BCWMC standards.	No structure, fill (including for roads and levees),…, or other uses may be allowed as a conditional use in the **floodway** that will cause any increase in the stage of the 100-year regional flood or cause an increase in flood damages in the reach(es) affected. Floodplain developments shall not adversely affect the hydraulic capacity of the channel and adjoining floodplain of any tributary watercourse or drainage system where a floodway or other encroachment limit has not been specified on the Official Zoning Map.	See SCWMC and BCWMC plan review process for stormwater management. Floodplain Alteration - must submit application for review to the City's Zoning Administrator and obtain all necessary State and Federal permits.	
City of Crystal 2009 Local Surface Water Management Plan and Land Use and Planning Ordinance	Segment C		Existing rates for 2-, 10-, and 100-year events; accelerated channel erosion will not occur as a result of the proposed land disturbing or development activity.	Detention facilities should have permanent pond surface area = to 2% of impervious area draining to pond, or 1% of entire area draining to pond, whichever is greater; Or as an alternative, the volume of permanent pool shall be equal to or greater than the runoff from a 2.0-inch rainfall for the fully developed site. Sequencing of preferred treatment options: infiltration, flow attenuation by using open space, stormwater retention, stormwater detention	LSWMP includes text that the City's ordinances need to be revised to include volume control standard that is in line with most restrictive between SCWMC and MPCA as it relates to discharge to impaired waters.	No structure, fill (including for roads and levees),…, or other uses may be allowed as a conditional use in the **floodway** that will cause any increase in the stage of the 100-year regional flood or cause an increase in flood damages in the reach(es) affected. Floodplain developments shall not adversely affect the hydraulic capacity of the channel and adjoining floodplain of any tributary watercourse or drainage system where a floodway or other encroachment limit has not been specified on the Official Zoning Map.	SCWMC and BCWMC review projects that fall within the watershed review authority. Crystal forwards development plans to the applicable watershed when received at the City.	
City of Brooklyn Park Email from Kevin Larson (City), dated 2/4/14 Flood Hazard Area Overlay Ordinance (152.510)	Segment BP1 and Segment BP2		Must meet SCWMC standards.	Must meet SCWMC standards.	Must meet SCWMC standards.	Railroad tracks, roads, and bridges must be elevated above the regulatory flood protection elevation where failure of facilities would result in danger to public healthy/safety or where facilities are essential to orderly function of area. None of these uses shall increase flood elevations. No fill, excavation, or storage of materials or equipment that obstruct flows or increase flood elevations will be permitted.	Must submit application to City Manager. SCWMC will review projects that fall within watershed review authority.	

(1) Wet stormwater pond design should follow the guidelines in the MPCA Stormwater Manual for dead storage depth, side slopes, and benches.
(2) Refers to an elevation 1 foot (minimum) above the 100-year flood plus any stage increase due to the designation of flood fringe areas. In Minnesota, the floodplain management ordinances (local regulations) require that the elevation of the surface of the lowest floor of a dwelling be at or above the regulatory flood protection elevation. Local regulations will also require the top of the access road elevations to be within 2 feet of the flood protection elevation.
All regulatory entities will have requirements for erosion and sediment control and at a minimum will refer back to the NPDES requirements.

Wetlands Technical Report

May 2016

Blue Line Extension Project Technical Report

METROPOLITAN COUNCIL

This page intentionally left blank

Executive Summary

This technical report summarizes Water Resources within the proposed METRO Blue Line Light Rail (BLRT) Extension project area. The intent of this technical report is to support and augment the Final Environmental Impact Statement (Final EIS) being prepared for this project. Wetlands, floodplains and other aquatic resources within the proposed BLRT Extension project area were examined during 2015 with field work and published data sources. Impacts to wetlands and aquatic resources, described in this technical report, were established based on the limits of disturbance for the proposed BLRT Extension project. Floodplains and floodways are described in the *Floodplain Technical Memorandum* (January 2016). Some delineated basins within the proposed BLRT Extension project area are clearly natural wetlands; whereas, others have been excavated in uplands for the purpose of stormwater management.

Some wetlands are regulated by the Wetland Conservation Act (WCA) and others are not. Some wetlands are regulated by the US Army Corps of Engineers (USACE), and others, such as "non–Waters of the United States (non-WOUS)" and isolated basins are not regulated by USACE. Impacts to wetland basins requiring mitigation per WCA are 6.2815 acres. Impacts to wetland basins requiring USACE mitigation are 4.1623 acres. Required mitigation for wetland impacts will be a combination of on-site wetland mitigation and credit purchases from suitable private wetland mitigation banks. Jurisdiction of delineated basins per WCA and USACE has been established based on agency review and concurrence with conclusions in the *Technical Memorandum: Jurisdictional Issues Associated with Delineated Basins; Blue Line Extension LRT*.

1 Introduction

This technical report supplements the Final Environmental Impact Statement (Final EIS) associated with the proposed METRO Blue Line Light Rail (BLRT) Extension project.

Figure 1 on page 23 shows a general location map. **Figure 2** beginning on page 25 shows a 24-page mapbook of water resources throughout the proposed BLRT Extension project area including aerial imagery, delineated wetland boundaries, updated National Wetland Inventory (NWI), Public Waters Inventory, municipal and watershed boundaries, and floodplains and floodways. **Figure 3** beginning on page 49 shows a 24-page mapbook that focuses on water resources, mapped hydric soils and LiDAR 2-foot contours.

1.1 Project Limits

The proposed BLRT Extension project connects Brooklyn Park north of 101st Avenue North southward along West Broadway Avenue (County State-Aid Highway 103) to approximately 74th Avenue North, then southwest adjacent to existing BNSF Railway (BNSF) freight rail tracks to Olson Memorial Highway (Trunk Highway [TH] 55), then eastward along Olson Memorial Highway to the Target Field Station in downtown Minneapolis.

The area that lies roughly between 94th Avenue North and Candlewood Drive North is part of the separate West Broadway Avenue Reconstruction project. A description of water resources within this area is provided in the Environmental Assessment Worksheet (EAW) and associated technical memoranda for the West Broadway Avenue Reconstruction project.

1.2 Report Purpose

The purpose of this technical report is to summarize water resources within the proposed BLRT Extension project area and describe their regulatory context and potential impacts to them and mitigation for their impacts. Existing and proposed stormwater management within the proposed BLRT Extension project area is described in a separate *Stormwater Technical Memorandum* (January 2016). A description of floodplains and floodways and proposed impacts to and mitigation for them is described in a separate *Preliminary Floodplain Impacts and Mitigation Strategies Technical Memorandum* (January 2016), or *Floodplain Technical Memorandum*.

1.3 Data Collection

Various geo-referenced data were collected to inform the assessment of water resources within the proposed BLRT Extension project area. These data sources include aerial imagery, the updated NWI, the Hennepin County Soil Survey, Public Waters Inventory maps, floodplain and floodway maps, LiDAR two-foot contour maps, parcel maps, and municipal and watershed boundary maps.

Additional data were collected in the field and locations were recorded in field notes and with global positioning system (GPS) units capable of sub-foot accuracy. These data were added to geographic information systems (GIS) files and depicted in figures associated with this technical report.

2 Wetlands, Streams and Other Aquatic Resources

2.1 Regulatory Context

Wetlands and other aquatic resources in the proposed BLRT Extension project area are regulated by several agencies at the local, state, and federal levels including the US Army Corps of Engineers (USACE) and the US Environmental Protection Agency (EPA) at the federal level; the Minnesota Board of Water and Soil Resources (BWSR) and the Minnesota Pollution Control Agency (MPCA) at the state level; and the Minnesota Wetland Conservation Act (WCA) Local Governmental Unit (LGU) at the local level. Any proposed work below the ordinary high water (OHW) elevation in public waters, public waters wetlands, or unnumbered public watercourses is regulated by the Minnesota Department of Natural Resources (DNR).

2.1.1 Federal Regulation

Wetlands are defined in federal Executive Order 11990 as follows:

> Those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas.

USACE regulates wetlands per the Clean Water Act. According to the USACE Wetlands Delineation Manual (USACE, 1987) and the Regional Supplement to the Corps of Engineers Wetlands Delineation Manual: Midwest Region (USACE, 2012) one positive indicator (except in certain situations) from each of three elements must be present in order to make a positive wetland determination, which are as follows:

- Greater than 50 percent dominance of hydrophytic plant species.
- Presence of hydric soil.
- The area is either permanently or periodically inundated, or soil is saturated to the surface during the growing season of the dominant vegetation.

USACE regulates those areas that meet the definition of wetlands. Those wetland basins that are isolated hydrologically on the landscape, i.e., those with no inlets or outlets, are not typically regulated by USACE. However, if a Preliminary Jurisdictional Determination is requested, then USACE will assume jurisdiction regardless of hydrologic connection.

2.1.2 State Regulation

BWSR is the lead state agency that administers the WCA. WCA LGUs are delegated by the WCA to issue Notices of Decision regarding concurrence on delineated wetland boundaries and types, and approvals for wetland replacement plans. The WCA LGU has jurisdiction over portions of wetlands that lie above the OHW level.

DNR has jurisdiction over public waters and public waters wetlands. The upper elevation limit of public waters and public waters wetlands is the OHW mark. In some cases, the elevation of the OHW has been calculated with hydraulic modeling. In other cases, the OHW is estimated through examination of evidence of hydrology and vegetation. Sometimes the bankfull streambank elevation serves as the demarcation of DNR jurisdiction.

Minnesota public waters and public waters wetlands are defined by Minnesota Statute 103G.005 as follows:

- **Public waters** are all waterbasins and watercourses that meet the criteria set forth in Minnesota Statutes, Section 103G.005, subd. 15 that are identified on Public Waters Inventory maps authorized by Minnesota Statutes, Section 103G.201.
- **Public waters wetlands** are all types 3, 4, and 5 wetlands as defined in US Fish and Wildlife Service (USFWS) Circular No. 39 (1971 edition), not included within the definition of public waters, that are 10 or more acres in size in unincorporated areas or 2.5 acres or more in incorporated areas.

2.1.3 Local Regulation

Relevant WCA LGUs in the proposed BLRT Extension project area include:

- City of Golden Valley
- Shingle Creek Watershed Management Commission
- City of Crystal
- Bassett Creek Watershed Management Commission
- City of Minneapolis

For purposes of the proposed BLRT Extension project, the WCA LGUs listed above retain their approval authority; however, in order to simplify the approval process, the WCA approvals are being processed by two representatives of the WCA LGUs. One representative will process approvals on behalf of the relevant WCA LGUs for water resources north of 36th Avenue North in the City of Robbinsdale and the other representative will process approvals on behalf of relevant WCA LGUs for water resources south of 36th Avenue North in the City of Robbinsdale and east to the Target Field Station.

2.2 Affected Environment

2.2.1 Wetlands

Forty-four basins were delineated within the proposed BLRT Extension project area. Additional basins, delineated within the West Broadway Avenue Reconstruction project limits, are not described in this document. The four 4 proposed BLRT Extension project area basins are depicted in **Figures 2 and 3**. Some of the delineated basins are natural wetlands whereas others are excavated in uplands for the purpose of stormwater management. Delineated basins are described in narrative below and summarized in **Table 1** on page 8.

2.2.1.1 Wetlands Numbers 1 to 13

These hydrologically isolated basins all are located north of TH 610 and have been mapped by the updated NWI variously as PEM1A, PEM1C, and PFO1A. Wetland Numbers 4, 9, 10, and 12 were not mapped by the updated NWI. These basins are fully or partially underlain by hydric soils and have been hydrologically modified as a result of dwindling ground water over the past several decades. Most of these basins are dominated by invasive plant species such as reed canary grass.

2.2.1.2 Wetland Number 51

Wetland Number 51 is located just north of Oak Grove Parkway in the City of Brooklyn Park on the Target Corporation campus. The updated NWI has mapped Wetland Number 51 as PEM1A. The majority of this basin is mapped as being underlain with hydric soil. This basin was excavated in 2004 to provide a wetland mitigation bank to compensate for wetland impacts that resulted from construction of the Target Corporation campus. Perpetual conservation easements have been recorded for Wetland Number 51. A wetland delineation conducted in W51 revealed that only the southern portion of this area meets the criteria of wetlands. Several feet of soil were removed from this basin in order to allow portions of it to function as a restored wetland.

2.2.1.3 Wetland Number 52

Wetland Number 52 is located on the south side of 101st Avenue North within the area associated with the Operations and Maintenance Facility (OMF). Wetland Number 52 was not mapped by the NWI; however, it is mapped in what is predominantly hydric soil. Wetland Number 52 appears to be a natural isolated basin.

2.2.1.4 Wetlands Numbers 14 to 17

These basins are located north of and south of TH 610 and have been excavated for stormwater management. Wetlands Numbers 14 and 15 were excavated in an area that is underlain by hydric soils. Wetlands Numbers 16 and 17 were excavated in non-hydric soils. The updated NWI mapped Wetland Number 14 as PEM1A though it was found based on field data to be a PUBGx, and Wetland Number 16 as PUBGx/PEM1C. The updated NWI did not map Wetlands 15 and 17 but they were both found to be PSS1A.

2.2.1.5 Wetlands Numbers 18 to 25 and 43

These wetlands are described in the Wetland Delineation Report for the West Broadway Avenue Reconstruction project and are not included in this report.

2.2.1.6 Wetland Number 26

Wetland Number 26 is a small isolated roadside ditch located approximately 500 feet north of Brooklyn Boulevard on the west side of West Broadway Avenue. This ditch was not mapped by the updated NWI and it is not underlain by mapped hydric soils. Wetland Number 26 was field verified to be a PEM1A. It was excavated in uplands for the purpose of stormwater management associated with the parking lots to the west.

2.2.1.7 Wetlands Numbers 27 to 30

Wetlands Numbers 27 to 30 are used for stormwater management and are located between Interstate 94 and Highway 100. Wetland Number 27 is mapped by the updated NWI as PEM1C and is not underlain by hydric soils. Wetland Number 28 is mapped by the NWI as PABGx/PEM1C (field verified to be PFO1A) and is underlain by hydric soils. Wetland Number 29 is mapped by the NWI as PEM1C (and field verified as such) and is underlain by hydric soils. Wetland Number 30 is mapped by the NWI as PUBG/PEM1A (and field verified as such) and is not underlain by hydric soils.

2.2.1.8 Wetland Number 31 (an extension of Wetland Number 32)

Wetland Number 31 is a long linear ditch that extends along the west side of the existing BNSF tracks in the City of Robbinsdale, roughly between Lowry Avenue North and 35th Avenue North. The updated NWI has mapped this basin as PSS1A/PABG/PEM1A (field verified as PSS1A) and it is not underlain by mapped hydric soils. This railroad ditch was created long ago and the plant communities that have developed over time have matured into a functioning mosaic of wetland types.

2.2.1.9 Wetlands Numbers 32, 33, and 45

This wetland complex is located within the City of Robbinsdale along the west side (Wetlands Numbers 32 and 45) and the east side (Wetland Number 33) of the BNSF tracks. The updated NWI has mapped this complex as PUBG/PFO1A/PSS1C/PEM1C/PEM1F/PABG. These wetlands were field verified to be PFO1A, PUBGx, and PFO1A, respectively. The southern tip of Wetland Numbers 32 and 45 is underlain with mapped hydric soil; however, the middle and northern portion of this complex is not mapped with hydric soils. Wetland Number 33 is not underlain with mapped hydric soils. Wetland Number 32 lies partly within Walter Sochacki Park. Wetland Number 33 is also known as Grimes Pond and is in part within South Halifax Park.

2.2.1.10 Wetland Number 34

Wetland Number 34 is located approximately 350 feet west of the BNSF tracks partly within the City of Robbinsdale and partly within the City of Golden Valley. The updated NWI has mapped Wetland 34 as PABG, PEM1F, PEM1A, and PFO1A. Field data revealed that the mosaic of wetland

types present in this large complex is similar to what is mapped by the updated NWI. Most of this wetland is underlain with mapped hydric soils. Wetland Number 34, also known as South Rice Pond, lies within Walter Sochacki Park.

2.2.1.11 Wetlands Numbers 35 and 36

Wetlands Numbers 35 and 36 are located within the City of Robbinsdale, roughly between 26th Avenue North and 29th Avenue North, on the west side (Wetland 35) and east side (Wetland 36) of the BNSF tracks. Wetland Number 35 is mapped by the updated NWI as PEM1F (field verified as PFO1A) and Wetland Number 36 is mapped as PSS1A (field verified as the same). Neither wetland is mapped as being underlain by hydric soils. Wetlands Numbers 35 and 36 were excavated as ditches for stormwater management.

2.2.1.12 Wetland Number 37

Wetland Number 37 is a linear ditch along the west side of the BNSF tracks and the east side Kewanee Way in the City of Golden Valley. The updated NWI has not mapped this ditch as a wetland and the soil survey has not mapped hydric soils here. Field data verified this wetland to be a PEM1A. Wetland Number 37 was excavated in uplands for stormwater management.

2.2.1.13 Wetland Numbers 38 and 39

Wetlands Numbers 38 and 39 are located in the City of Golden Valley just north of Golden Valley Road on the west side (Wetland Number 38) and east side (Wetland Number 39) of the BNSF tracks. The updated NWI has mapped these basins as PUBG, PABG and PFO1A. Field verifications confirmed both basins to be PUBGx. The soil survey has not mapped hydric soils in these basins. Wetland 38 lies within Sochacki Park: Mary Hills Management Unit. Wetland Number 39 lies partly within Minneapolis Park and Recreation Board land.

2.2.1.14 Wetlands Numbers 40 and 50

Wetlands 40 and 50 are parts of a linear ditch along the east side of the existing BNSF tracks, near 16th Avenue North, in the City of Golden Valley. The updated NWI mapped Wetland Number 40 as PFO1A and did not map Wetland Number 50. The soil survey did not map hydric soils in this ditch. Wetlands Numbers 40 and 50 were excavated in uplands for stormwater management.

2.2.1.15 Wetland Number 41

Wetland 41 is a linear ditch located along the east side of the BNSF tracks, just north of Plymouth Avenue North, in the City of Golden Valley. Wetland 41 was not mapped as wetland by the updated NWI. This wetland was field verified to be a PEM1A. The soil survey did not map hydric soils within Wetland 41. Wetland 41 was excavated in uplands for stormwater management.

2.2.1.16 Wetlands Numbers 42 and 49

Wetlands Numbers 42 and 49 are both part of a linear ditches that are located along the east side (Wetland Number 42) and the west side (Wetland Number 49) of the existing BNSF tracks, partly within the City of Golden Valley and partly within the City of Minneapolis. These ditches are located

near the intersection of Xerxes Avenue North and Oak Park Avenue North. Wetland Number 42 was not mapped by the updated NWI though it was field verified to be PSS1A. Wetland Number 49 is mapped by the NWI as PABGx and PFO1A and field verified to be PFO1A. The soil survey did not map hydric soils within these ditches. These ditches were excavated in uplands for stormwater management.

2.2.1.17 Wetland Number 44

Wetland Number 44 is located along the east side of the BNSF tracks between 33rd Avenue North and 35th Avenue North in the City of Robbinsdale, just downslope from the Xcel Indiana substation. Wetland Number 44 is a linear railroad ditch. The updated NWI mapped Wetland Number 44 as PABG (field verified to be PUBGx) and the soil survey did not map hydric soils here.

2.2.1.18 Wetlands Numbers 46 and 47

Wetlands Numbers 46 and 47 are located along the west side of the BNSF tracks, north and south of Plymouth Avenue North, in the City of Golden Valley. This wetland complex is adjacent to Bassett Creek and associated backwaters. The updated NWI has mapped this complex as PFO1A, PEM1A, PEM1C and riverine. These basins were field verified to be mostly PFO1A. The soil survey has not mapped hydric soils within this complex.

2.2.1.19 Wetland Number 48

Wetland Number48 is located on the east and west sides of the existing BNSF tracks, just north of Olson Memorial Highway, in the City of Minneapolis. Wetland Number 48 is an old channel of Bassett Creek. Wetland Number 48 is mapped by the updated NWI as riverine (R2UBG or R2UBGx) and field verified as such. The soil survey has mapped Wetland Number 48 as non-hydric. Wetland Number 48, now used for stormwater management, enters a large culvert which flows south under Olson Memorial Highway.

2.2.1.20 Pond East of Wetland Number 30

The Pond East of Wetland Number 30 is located in the City of Robbinsdale. This pond appears to have been constructed in uplands for the purpose of stormwater management and is not underlain by mapped hydric soils. The updated NWI has mapped this pond as PUBG.

Table 1. Summary of Delineated Basins within and near the Proposed BLRT Extension Project

Wetland ID	Updated NWI Mapping	Hydric Soil Mapping	Field Verified Cowardin Class.	Eggers & Reed Class.[1]	Circ. 39 Class.[2]	Sheet Number (see Figure 2)	Notes

[1] Wetland types based on *Wetland Plants and Plant Communities of Minnesota and Wisconsin* by Eggers and Reed (USACE St. Paul District).
[2] Wetland types classified based on US Fish and Wildlife Circular 39.

2.2.2 Streams and Other Aquatic Resources

Bassett Creek and associated backwaters flow through and near a large portion of the proposed BLRT Extension project from North Rice Pond south to Olson Memorial Highway. The headwaters of Bassett Creek is Medicine Lake in Plymouth, and its confluence with the Mississippi River is in the City of Minneapolis. Along its entire length, Bassett Creek is currently listed on the MPCA 303(d) List of Impaired Waters. Aquatic recreation is impaired as a result of high fecal coliform. Aquatic life is impaired as a result of high chloride and stressors affecting the fish community in Bassett Creek.

Table 2 summarizes those areas within the proposed BLRT Extension project area that are designated as DNR public waters, public waters wetlands, or public watercourses.

Table 2. Summary of DNR Public Waters, Public Waters Wetlands, and Public Watercourses within the Proposed BLRT Extension Project Area

Public Waters ID[1]	Wetland Basin ID	Notes
644W	Wetlands 32 and 33	North Rice Pond and Grimes Pond
651P	Wetland 46	Backwaters of Bassett Creek near Plymouth Avenue
36P	Wetland 48	Backwaters of Bassett Creek near Olson Memorial Highway
Bassett Creek	Adjacent to Wetland 46	Channel of Bassett Creek

Source: DNR Public Waters Inventory

[1] "W" indicates DNR public waters wetlands; "P" indicates public waters; unnumbered waterbodies indicate public watercourses.

2.2.3 Notable Aquatic Habitats within the Proposed BLRT Extension Project Area

Table 3 summarizes characteristics and locations of four notable aquatic habitats within and near the proposed BLRT Extension project; the North and South Rice Ponds Complex, Grimes Pond, Golden Valley Ponds Complex, and the Theodore Wirth Regional Park Complex (Bassett Creek and associated backwaters). In the context of this technical report, the term *notable* is used in a general sense and signifies larger wetlands with a variety of wetland habitats and functions.

Table 3. Notable Aquatic Habitats within and near the Proposed BLRT Extension Project Area

Aquatic Habitat	Location	Total Size (ac)	Wildlife Associations
North and South Rice Ponds	Cities of Robbinsdale and Golden Valley on west side of existing BNSF tracks	24.72	Habitat for frogs and toads, turtles, snakes, potential habitat for common rough fish species
Grimes Pond	City of Robbinsdale on the east side of existing BNSF tracks	7.41	Habitat for frogs and toads, turtles, snakes, potential habitat for common rough fish species
Golden Valley Road Ponds	North side of Golden Valley Road on both sides of the existing BNSF tracks	5.08	Habitat for frogs and toads, turtles, snakes, potential habitat for common rough fish species
Theodore Wirth Regional Park (Bassett Creek and backwater)	North and south of the Plymouth Avenue Bridge on the west side of the existing BNSF tracks	11.85	Habitat for frogs and toads, turtles, snakes, potential habitat for common rough fish species

2.3 Environmental Consequences

2.3.1 Wetland Impacts within the Proposed BLRT Extension Project Area

Wetlands were delineated along the proposed BLRT Extension project and associated facilities during the spring and summer of 2015. The wetlands inventoried along with potential impacts by wetland type are summarized in **Table 4**. **Table 4** also describes a portion of the delineated basins as being currently used as stormwater ponds and others as being natural wetland basins. The jurisdictional status of all delineated basins in the proposed BLRT Extension project area with respect to WCA and USACE has been established based on agency review and concurrence with conclusions in the *Technical Memorandum: Jurisdictional Issues Associated with Delineated Basins; Blue Line Extension LRT*. **Table 5** summarizes wetland impacts data per delineated basin. Impact areas are shown in **Figure 2** beginning on page 25.

Standard erosion control best management practices (BMPs) would be used for work within adjacent wetland and aquatic resources where necessary, minimizing impacts to the waterbodies down slope and to aquatic wildlife.

Table 4. Disturbance or Fill in Delineated Basins for the Proposed BLRT Extension Project by Wetland Type

Wetland Type (Circular 39)[1]	Wetland Type (Eggers and Reed)[2]	Total Impacts (acres)	Impacts Requiring Mitigation for WCA (acres)	Impacts Requiring Mitigation for USACE (acres)
Type 1	Seasonally Flooded Basin	6.5824	4.2731	2.5166
Type 4	Deep Marsh	2.4892	0.1038	1.0138
Type 5	Open Water	3.6152	1.6922	0.4195

[1] Wetland types classified based on *Wetland Plants and Plant Communities of Minnesota and Wisconsin* by Eggers and Reed (USACE St. Paul District).

[2] Wetland types classified based on US Fish and Wildlife Circular 39.

[3] Wetland impacts of 1.692 acres are the area of the elevated platform above Grimes Pond. Actual impacts are assumed to be less than 1.692 acres and would be the cumulative footprint of the cross-sections of the support piers.

2.3.2 Stream and Other Aquatic Resource Impacts within the Proposed BLRT Extension Project Area

A portion of Bassett Creek, a stream reach of approximately 450 feet total length, near the Plymouth Avenue bridge would be relocated to accommodate the Blue Line Extension LRT and associated infrastructure. The upstream limit of the stream relocation would be approximately 200 feet north of the Plymouth Avenue centerline, and the downstream limit would be approximately 250 feet south of the Plymouth Avenue bridge centerline. This reach of Bassett Creek would be moved approximately 20 feet west. The final design of the creek realignment will include considerations for construction staging to ensure that flow rates are managed and to ensure safe discharge of the flows during construction. These may include diversion and pumping and scheduling the construction during winter when the flows are typically low.

Table 6 summarizes impacts to those areas within the proposed BLRT Extension project area that are designated as DNR public waters, public waters wetlands, or public watercourses.

Table 6. Summary of DNR Public Waters, Public Waters Wetlands, and Public Watercourses within the Proposed BLRT Extension Project Area

Public Waters ID[1]	Wetland Basin ID	Potential Impacts (acres or linear feet)	Notes
644W	Wetlands 32 and 33	1.692 [2]	North Rice Pond and Grimes Pond
651P	Wetland 46	1.0440	Backwaters of Bassett Creek near Plymouth Avenue
36P	Wetland 48	0.1540	Backwaters of Bassett Creek near Olson Memorial Highway
Bassett Creek	Adjacent to Wetland 46	Approximately 450 linear feet of Bassett Creek	Channel of Bassett Creek

Source: DNR Public Waters Inventory

[1] "W" indicates DNR public waters wetlands; "P" indicates public waters; unnumbered waterbodies indicate public watercourses.

[2] Impacts reported here are based on the area of the elevated rail platform. Actual impacts would likely be less and would be based on the cumulative footprint of the support pillars within the public water.

2.4 Potential Mitigation

Throughout the planning and design phases of the proposed BLRT Extension project, wetland impacts will be avoided and minimized to the extent practicable. For those wetland impacts that cannot be avoided, suitable wetland mitigation will be required.

The current replacement ratio for wetland credits in the Twin Cities Metropolitan Area including the proposed BLRT Extension project study area is 2.5 to 1, although under certain conditions it may be reduced to 2 to 1. Such conditions include the use of mitigation that is functioning prior to wetland impacts, mitigation using the same wetland type as the impacts and mitigation geographically close to the impacts. The final amount, type, and location of wetland replacement or bank credits will be determined by the respective permitting agencies during final design and the permit review process.

Wetland mitigation for the proposed BLRT Extension project will be accomplished through a combination of on-site wetland mitigation and purchases of private wetland credits from existing mitigation banks in suitable Major Watersheds and Bank Service Areas. As presented in the Minnesota Interagency Water Resource Application (the joint Section 404/WCA wetland permit application—see **Appendix I** of the Final EIS) 4.1623 acres of the wetland impacts within the proposed BLRT Extension project will require mitigation under USACE requirements, and 6.2815 acres of wetland impacts will require mitigation under WCA requirements. Much of the USACE and WCA jurisdictional impacts overlap; the wetland permit application notes that about 12–14 acres of wetland mitigation will be required. The remainder of delineated basins are stormponds and would require storm volume replacement but not wetland mitigation. Given the urbanized and rapidly urbanizing nature of the proposed BLRT Extension project area, on-site wetland mitigation opportunities are somewhat limited. Some mitigation opportunities are being considered within Theodore Wirth Regional Park within the proposed floodplain mitigation area associated with Bassett Creek. Opportunities to combine wetland mitigation and floodplain mitigation are being studied.

The entire proposed BLRT Extension project alignment lies within the "<50 percent area" of Minnesota, Major Watershed #20 (Mississippi River – Twin Cities) and Bank Service Area (BSA) 7. Thus, purchases of private wetland mitigation credits will first be sought within the "<50 percent area" of Minnesota, BSA 7 and Major Watershed #20. Purchase of credits form Hennepin County banks will be prioritized. However, as a result of the scarcity of suitable credits within Hennepin County, additional suitable credits will likely be purchased from banks in Carver County. The search for suitable private wetland credits will be expanded to adjacent BSAs and Major Watersheds if needed, though a mitigation ratio higher than 2:1 would typically apply in this scenario.

The reach of Bassett Creek near the Plymouth Avenue Bridge will be moved several feet to the west. During construction, this reach of Bassett Creek will be diverted to accommodate the required in-stream work. Mitigation for these impacts to Bassett Creek will use appropriate erosion control and stream restoration methods.

Standard erosion control BMPs will be used for work within adjacent wetland and aquatic resources where necessary, minimizing impacts to the waterbodies down slope and to aquatic wildlife.

Re: Modified Phase I Environmental Site Assessment
Metro Blue Line Extension Light Rail Transit (BLRT) Project
Minneapolis, Golden Valley, Robbinsdale, Crystal, and Brooklyn Park, Minnesota
Metropolitan Council Contract Number: 14P232

Dear Ms. O'Brien:

In accordance with Metropolitan Council Contract 14P232, Braun Intertec Corporation conducted a Modified Phase I Environmental Site Assessment (ESA) of the above-referenced site (Corridor). The objective of the Modified Phase I ESA was to serve as a screening tool to identify, to the extent possible, existing sources of contamination (based on present or former uses) at locations that could impact future construction of the Corridor.

The Modified Phase I ESA was prepared on behalf of and for use by Metropolitan Council and the Minnesota Department of Transportation (MnDOT). No other party has a right to rely on the contents of the Modified Phase I ESA without written authorization by Braun Intertec. Please refer to the attached report for the scope, methods, and conclusions of this assessment.

Braun Intertec appreciates the opportunity to provide professional services to you for this project. If you have any questions regarding this letter or the attached report, please contact Joseph Foline at 952.995.2484 or Jaclyn Dylla at 952.995.2490.

Sincerely,

BRAUN INTERTEC CORPORATION

Executive Summary

Braun Intertec received authorization from the Metropolitan Council (Met Council) to conduct a Modified Phase I Environmental Site Assessment (ESA) for the planned Metro Blue Line Extension Light Rail Transit (LRT) Project along the locally preferred alternative (LPA) from Target Field Station located in Minneapolis, Minnesota north to the Oak Grove Parkway Park and Ride facility in Brooklyn Park, Minnesota, and including an Operation and Maintenance Facility (OMF) located north of the Oak Grove Parkway Park and Ride facility (Corridor). For the purposes of this report, the Corridor includes the LPA, the OMF site, and the area within 500 feet of the LPA and OMF site. The Corridor is located in the cities of Minneapolis, Golden Valley, Robbinsdale, Crystal, and Brooklyn Park, in Hennepin County, Minnesota, a distance of approximately 13 miles.

This Modified Phase I ESA was divided into six segments based on municipality:

- Segment M, located within the City of Minneapolis, a distance of approximately 2 miles
- Segment GV, located within the City of Golden Valley, a distance of approximately 1.4 miles
- Segment R, located within the City of Robbinsdale, a distance of approximately 2.6 miles
- Segment C, located within the City of Crystal, a distance of approximately 1.9 miles
- Segment BP2, located within the City of Brooklyn Park, a distance of approximately 2.6 miles
- Segment BP1, located within the City of Brooklyn Park, a distance of approximately 2.4 miles

Please refer to the Corridor Location Map attached as Figure 1 and the Project Corridor Feature Maps attached as Figure 2 for a depiction of the Corridor location, as well as the locations of the above-listed segments.

The Modified Phase I ESA was completed in anticipation of preliminary design and future construction activities and included the area within 500 feet of the proposed centerline of the Corridor. The Modified Phase I ESA was completed in conformance with the scope of services outlined by Metropolitan Council Contract Number 14P232, as well as the United States Environmental Protection Agency (USEPA) All Appropriate Inquiry and ASTM 1527-13, as modified by the Minnesota Department of Transportation (MnDOT) for transportation projects. The modified approach includes ranking identified parcels within the Corridor as having a low, medium, or high potential for contamination. The objective of the Modified Phase I ESA was to serve as a screening tool to identify, to the extent possible, existing sources of contamination (based on present or former uses) at locations that could impact future construction of the Corridor.

At the time of this assessment, the majority of the Corridor was developed with residential and commercial parcels.

Specifically, the M (Minneapolis) Segment has been developed since the 1880s, with residential and park areas on the west end and commercial development on the east end. In the GV, R, C, and BP2 Segments, the Corridor follows an existing BNSF railroad track, which has been present since the 1880s. The remainder of the GV (Golden Valley) Segment has been residential and park areas since the 1930s, with additional development in the 1960s and 1970s. The R (Robbinsdale) Segment was mixed residential and farmland until the 1960s when the commercial district in the central portion of the segment and additional residences replaced the farmland. The C (Crystal) Segment includes the Crystal Airport in the central portion of the segment, with commercial and residential in the remainder of the segment. This area was developed in the 1950s and 1960s. The Corridor follows the railroad until the central portion of the BP2 Segment, when the Corridor trends to the east. The BP2 and BP1 (Brooklyn Park) Segments were cultivated farmland until the 1950s and 1960s when the areas were converted to commercial with some residential areas. The northern end of the Corridor, in the BP1 Segment, has some formerly cultivated areas, which are currently undeveloped.

Braun Intertec evaluated all parcels in the Corridor to determine if they met the ranking criteria established by MnDOT as having a low, medium, or high potential for contamination. Parcels summaries were prepared for parcels that were determined to have a low, medium, or high potential for contamination. A parcel summary table of these ranked parcels and the corresponding parcel summaries are included in Appendices A and E, respectively. Corridor Sketches depicting the locations of the ranked parcels with a low, medium, or high potential for contamination are included as Figure 2. The parcel summaries provide an overview of the regulatory and historical review of the information attached as Appendices G through J.

Some parcels were evaluated but were determined not to have a low, medium, or high potential for contamination. These additional parcels are summarized in Appendix F. Parcel summaries for these additional parcels were not prepared and these parcels are not further discussed in this report.

Based on Braun Intertec's assessment, 271 parcels were identified within the Corridor as having a low, medium, or high potential for contamination. More specifically, 47 parcels were identified within the M Segment, 9 parcels were identified within the GV Segment, 67 parcels were identified in the R Segment, 63 parcels were identified in the C Segment, 54 parcels were identified in the BP2 Segment, and 31 parcels were identified in the BP1 Segment.

The following is a discussion of the parcel ranking criteria and the corresponding parcels identified within each segment of the Corridor with a low, medium, or high potential for contamination.

Low Potential for Contamination Parcels include parcels that are hazardous waste generators (HWGS), light industrial facilities, and possibly some parcels where site reconnaissance showed poor housekeeping or soil disturbance, etc. Braun Intertec identified 112 *Low Potential for Contamination Parcels* within the Corridor. Specifically, 9 parcels were identified within the M segment, 3 parcels were identified in the GV segment, 37 parcels were identified in the R segment, 20 parcels were identified in the C segment, 24 parcels were identified in the BP2 Segment, and 19 parcels were identified in the BP1 Segment. The specific parcels identified are included in the Parcel Summary Table in Appendix A and on the Parcel Summary Table – Low Potential for Contamination Sites in Appendix B.

Medium Potential for Contamination Parcels include parcels with closed leaking underground or aboveground storage tanks (LUASTs), all parcels with underground or aboveground storage tanks (UASTs), all parcels with historic or current vehicle and/or auto body repair activities and petroleum use or storage, and unintentional hazardous materials release (HMIRSR05) sites. Braun Intertec identified 135 *Medium Potential for Contamination Parcels* within the Corridor. Specifically, 28 parcels were identified within the M segment, 6 parcels were identified in the GV segment, 23 parcels were identified within the R segment, 41 parcels were identified within the C segment, 26 parcels were identified within the BP2 Segment, and 11 parcels were identified within the BP1 Segment. The specific parcels identified are included in the Parcel Summary Table in Appendix A and on the Parcel Summary Table – Medium Potential for Contamination Sites in Appendix C.

High Potential for Contamination Parcels include all active and inactive Voluntary Investigation and Cleanup Program (VIC), Minnesota Environmental Response and Liability Act (MERLA) sites, all heavy industry sites, all active and inactive dumpsites, all Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) sites, and all active LUAST sites. Braun Intertec identified 24 *High Potential for Contamination Parcels* within the Corridor. Specifically, 10 parcels were identified within the M segment, 7 parcels were identified within the R segment, 2 parcels were identified within the C segment, 4 parcels were identified within the BP2 Segment, and 1 parcel was identified within the BP1 Segment. The specific parcels identified are included in the Parcel Summary Table in Appendix A and on the Parcel Summary Table – High Potential for Contamination Sites in Appendix D.

The following table provides a summary of the ranked sites by segment:

Table 1. Parcels with Low, Medium, or High Potential for contamination by segment

Segment	# of Parcels with Low potential	# Parcels with Medium potential	# Parcels with High potential	Totals
M	9	28	10	**47**
GV	3	6	0	**9**
R	37	23	7	**67**
C	20	41	2	**63**
BP 2	24	26	4	**54**
BP-1	19	11	1	**31**
TOTAL	**112**	**135**	**24**	**271**

Additional Considerations

Based on a review of historical information, many properties within the Corridor were farmsteads prior to the 1930s or have been residences since the 1880s. Fuel oil tanks or other hazardous materials may be present within these parcels. In those cases where the historical information confirmed the presence of tanks or other contaminants, the parcel was assigned a parcel number and was ranked in accordance with the MnDOT definitions of having a low, medium, or high potential for contamination. For those parcels where the historical information did not confirm tanks or hazardous materials were present, the parcels were not assigned a parcel number and were not ranked. These additional parcels are summarized on the table in Appendix F.

Drilling Investigation activities, including the collection and analysis of soil and groundwater samples, are recommended along the Corridor where a medium or high potential for contamination is both adjacent to or in close proximity to the Corridor or where significant amounts of fill materials will be excavated during future construction.

A. Introduction

A.1. Purpose

Braun Intertec received authorization from the Metropolitan Council (Met Council) to conduct a Modified Phase I Environmental Site Assessment (ESA) for the planned Metro Blue Line Extension Light Rail Transit (LRT) Project along the locally preferred alternative (LPA) from Target Field Station located in Minneapolis, Minnesota north to the Oak Grove Parkway Park and Ride facility in Brooklyn Park, Minnesota, and including an Operation and Maintenance Facility (OMF) located north of the Oak Grove Parkway Park and Ride facility (Corridor). For the purposes of this report, the Corridor includes the LPA, the OMF site, and the area within 500 feet of the LPA and OMF site. The Corridor is located in the cities of Minneapolis, Golden Valley, Robbinsdale, Crystal, and Brooklyn Park, in Hennepin County, Minnesota, a distance of approximately 13 miles.

This Modified Phase I ESA divided into six segments based on municipality:

- Segment M, located within the City of Minneapolis, a distance of approximately 2 miles
- Segment GV, located within the City of Golden Valley, a distance of approximately 1.4 miles
- Segment R, located within the City of Robbinsdale, a distance of approximately 2.6 miles
- Segment C, located within the City of Crystal, a distance of approximately 1.9 miles
- Segment BP2, located within the City of Brooklyn Park, a distance of approximately 2.6 miles
- Segment BP1, located within the City of Brooklyn Park, a distance of approximately 2.4 miles

The Modified Phase I ESA was completed in conformance with the United States Environmental Protection Agency (USEPA) All Appropriate Inquiry and ASTM 1527-13, as modified by the Minnesota Department of Transportation (MnDOT) for transportation projects, including ranking identified parcels within the Corridor as having a low, medium, or high potential for contamination. The objective of the Modified Phase I ESA was to serve as a screening tool to identify, to the extent possible, existing sources of contamination (based on present or former uses) at locations that could impact future construction of the Corridor.

The Modified Phase I ESA was prepared on behalf of and for the use by Met Council and MnDOT in accordance with Contract number 14P232 between Met Council and Braun Intertec. No other party has a right to rely on the contents of the Modified Phase I ESA without written authorization by Braun Intertec. All authorized parties are entitled to rely on the attached report according to Braun Intertec's contract with Met Council, and under the same terms, conditions and circumstances.

A.2. Scope of Services

Services provided for this assessment included:

- Prepared a description of the Corridor location and current uses of properties within the Corridor.
- Prepared a general description of the topography, soils, geology, and groundwater flow direction at the Corridor.
- Reviewed reasonably ascertainable and practically reviewable regulatory information published by state and federal agencies, health, and/or environmental agencies.
- Determined the location/boundaries of any Wellhead Protection Areas that exist in the vicinity of the Corridor.
- Reviewed Minnesota Pollution Control Agency (MPCA) or Minnesota Department of Agriculture (MDA) files to obtain additional information about the magnitude and extent of known contamination and the regulatory status of parcels in the Corridor.
- Reviewed the history of the Corridor, including aerial photographs, directories, and other readily available Corridor development data.
- Conducted a reconnaissance of the Corridor, which included, at a minimum, drive- and walk-by reviews.
- Interviewed local government officials or agencies having jurisdiction over hazardous waste disposal or other environmental matters in the area of the Corridor.
- Ranked all identified parcels within the Corridor as having low, medium, or high potential for contamination based on criteria established by MnDOT.

A.3. General Definitions

The following are definitions of terms used in this report:

- Corridor: The area and parcels located within 500 feet of the Metro Blue Line Extension LRT project northbound track centerline. This includes parcels that are only partially located within 500 feet of the proposed boundaries.
- Light Rail Line (LRT): The proposed light rail line alignment subject to this Modified Phase I ESA.
- Parcel: A property, or portion of a property, located within the Corridor that has been evaluated.
- Site: A parcel or group of parcels that were collectively investigated or documented within a regulatory listing.
- Facility: A building, business, or land use located on the parcel.
- Right-of-Way: The land adjacent to the Corridor, which may be acquired by the Met Council/MnDOT to facilitate project construction. Public right-of-way is land adjacent to currently publicly owned roadways.

A.4. Corridor Ranking Definitions

As indicated, identified parcels within the Corridor were ranked as having a low, medium, and high potential for contamination to the project area using criteria established by MnDOT. Braun Intertec amended the definitions to ensure consistency with ranking and include situations not originally covered by the MnDOT criteria. The rankings, defined by MnDOT and amended by Braun Intertec, are as follows:

Low Potential for Contamination Parcels include parcels that are hazardous waste generators, light industrial facilities, and possibly some parcels where site reconnaissance showed poor housekeeping or soil disturbance, etc.

Medium Potential for Contamination Parcels include parcels with closed leaking underground storage tanks (LUASTs), all parcels with underground or aboveground storage tanks (UASTs), all parcels with historic or current vehicle and/or auto body repair activities and petroleum use or storage, and unintentional hazardous materials release sites.

High Potential for Contamination Parcels include all active and inactive Voluntary Investigation and Cleanup Program (VIC) sites, all active Petroleum Brownfields Program (PBP) sites, Minnesota Environmental Response and Liability Act (MERLA) sites, all heavy industry sites, all active and inactive dumpsites, all Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) sites, and all active LUAST sites.

Please refer to Appendix A for a Parcel Summary Table for parcels which were identified within the Corridor as having a low, medium, or high potential for contamination. Parcels that did not meet the criteria as having a low, medium, or high potential for contamination are summarized in the Additional Parcel Summary Table in Appendix F.

B. General Corridor Description and Location

The total length of the Corridor is approximately 13 miles. The length of each segment is as follows:

- Segment M: approximately 2 miles
- Segment GV: approximately 1.4 miles
- Segment R: approximately 2.6 miles
- Segment C: approximately 1.9 miles
- Segment BP2: approximately 2.6 miles
- Segment BP1: approximately 2.4 miles

The Corridor is a proposed LRT project that will provide for transit improvements in the northwest area of the Twin Cities. The Metro Blue Line Extension LRT project will include up to 11 new stations, three of which will include new or renovated park and ride lots. Traction Power Substations (TPSS) are proposed to be located along the Corridor on limited-access sites. The TPSS buildings are the sites in which the alternating current (AC) of the power grid is converted by rotary transformers into the voltage and direct current (DC) that is required by the electric trains. The current is routed to the trains via a utility duct bank that connects to the overhead catenary (contact) systems poles.

To facilitate construction, the project may include the acquisition of new right of way and parcels for park and rides. For the purposes of this report, the Modified Phase I ESA study area included the area within 500 feet of the proposed alignment of the Corridor. Please refer to the Corridor Location Map and Project Corridor Features, attached as Figures 1 and 2, for a depiction of the Corridor location.

At the time of this assessment, the majority of the Corridor was developed with residential and commercial parcels.

Specifically, the M (Minneapolis) Segment has been developed since the 1880s, with residential, park areas on the west end, and commercial development on the east end. In the GV, R, C, and BP2 Segments, the Corridor follows an existing BNSF railroad track, which has been present since the 1880s. The remainder of the GV (Golden Valley) Segment has been residential and park areas since the 1930s, with additional development in the 1960s and 1970s. The R (Robbinsdale) Segment was mixed residential and farmland until the 1960s when the commercial district in the central portion of the segment and additional residences replaced the farmland. The C (Crystal) Segment includes the Crystal Airport in the central portion of the segment, with commercial and residential in the remainder of the segment. This area was developed in the 1950s and 1960s. The Corridor follows the railroad until the central portion of the BP2 Segment, when the Corridor trends to the east. The BP2 and BP1 (Brooklyn Park) Segments were cultivated farmland until the 1950s and 1960s when the areas were converted to commercial with some residential areas. The northern end of the Corridor, in the BP1 Segment, has some formerly cultivated areas, which are currently undeveloped.

C. Records Review

C.1. Physical Setting Information

C.1.a. Topography

The Corridor is located on the Anoka, Coon Rapids, Minneapolis North, Minneapolis South, and Osseo the United States Geological Survey (USGS) 7.5-minute topographic map series.

According to the USGS 7.5-minute topographic map series, the elevation along the Corridor is generally level, ranging from to 840 – 850 feet above mean sea level (amsl) at the south/east end (in Segments GV and M) to 880 – 900 feet amsl along the north end (in Segments BP1, BP2, C, and R).

C.1.b. Geology and Hydrogeology by Segment

M Segment

- The unconsolidated sediment beneath the Corridor in the M Segment starts with Pleistocene age middle-terrace deposits, which consist of sand, gravelly sand, and loamy sand with thin deposits of silt, loam, or organic sediment on top, and transitions to postglacial lacustrine deposits, which consist of sand, loamy sand, and loam with local organic-rich layers, and then

upper-terrace deposits, which consist of sand, gravelly sand and loamy sand (Meyer and Hobbs, 1989). The west or north end of the M Segment contains Pleistocene age loamy till deposits, which are loam in texture with a few beds and lenses of stratified sediment, underlain by Superior lobe stratified sediment or till and are generally at a depth of more than 50 feet, including small areas of thick, fine, loamy colluvium sediment, and also by postglacial organic deposits. The organic deposits have largely been drained and filled (Meyer and Hobbs, 1989).

- The uppermost bedrock unit beneath the east/south end of the M Segment is the Middle Ordovician, St. Peter Sandstone (Olsen and Bloomgren, 1989). The St. Peter Sandstone is described as a fine- to medium-grained, friable quartz sandstone in the upper half to two thirds of the unit. The lower part of the St. Peter Sandstone contains multicolored beds of mudstone, siltstone and shale with interbedded, very coarse sandstone. The central portion of the M Segment is the Lower Ordovician, Prairie du Chien Group (Olsen and Bloomgren, 1989). The Prairie du Chien Group is described as Dolostone that varies greatly in thickness because its top is a major erosional surface. The lower part of the section is less sandy except within 10 to 15 feet of the base. The west or north end of the M Segment is underlain by the Middle Ordovician, Platteville and Glenwood Formation (Olsen and Bloomgren, 1989). The Platteville Formation is described as fine-grained limestone containing thin shale partings near the top and base, underlain by green, sandy shale of the Glenwood Formation, which is very thin.

- In general, the depth to bedrock beneath the M Segment ranges from approximately 51 to 100 feet below the land surface. A southwest-northeast trending bedrock valley is present along the south and east end of the M Segment.

- According to published geologic information, the depth to groundwater beneath the M Segment ranges from approximately 10 to 20 feet below land surface. The regional groundwater flow direction beneath the segment is to the east toward the Mississippi River.

GV Segment

- The unconsolidated sediment beneath the GV Segment of the Corridor is postglacial organic deposits at the south end, transitioning to Pleistocene age till of mixed composition deposits, which are complexly intermixed yellowish brown to gray and reddish brown to reddish gray in color, loam to sandy loam. Reddish colored till or stratified sediment are commonly within 20

feet of the surface. Locally, this deposit includes small areas of thick reddish brown-colored till and thick loamy to sandy colluvium. Lenses of stratified sediment, primarily sand and gravel, are common (Meyer and Hobbs, 1989).

- The uppermost bedrock unit beneath the GV Segment is the Platteville and Glenwood Formation along the south end of the GV Segment, replaced by the St. Peter Sandstone in the north end. Bedrock descriptions are provided in the M Segment geology discussion above.

- In general, the depth to bedrock beneath the GV Segment ranges from approximately 101 to 200 feet below the land surface, with the depth along the majority of the Segment between 151 and 200 feet below land surface.

- According to published geologic information, the depth to groundwater beneath the GV Segment ranges from approximately 10 to 20 feet below land surface. The regional groundwater flow direction beneath the segment is to the east toward the Mississippi River.

R Segment

- The unconsolidated sediment beneath the R Segment of the Corridor is Pleistocene age till on the south end, and then Pleistocene age sandy till deposits that consist of loam to sandy loam and are commonly capped by and interbedded with thin deposits of silty to gravely stratified sediment. This deposit includes small areas of thick loamy to sandy colluviums in the central area, followed by the Pleistocene age upper-terrace deposits.

- The uppermost bedrock beneath the R Segment is the St. Peter Sandstone. Bedrock descriptions are provided in the M Segment geology discussion above.

- In general, the depth to bedrock beneath the R Segment ranges from approximately 101 to 200 feet below the land surface, with the depth along the majority of the segment between 151 and 200 feet below land surface.

- According to published geologic information, the depth to groundwater beneath the R Segment ranges from approximately 30 to 60 feet below land surface. The regional groundwater flow direction beneath the segment is to the east toward the Mississippi River.

C Segment

- The unconsolidated sediment beneath the C Segment is Pleistocene age upper-terrace deposits (Meyer and Hobbs, 1989). A description of the Pleistocene age upper-terrace deposits is provided in the M Segment geology discussion above.

- The uppermost bedrock beneath the C Segment is the St. Peter Sandstone. Bedrock descriptions are provided in the M Segment geology discussion above.

- In general, the depth to bedrock beneath the C Segment ranges from approximately 51 to 200 feet below the land surface, with the depth along the majority of the segment between 151 and 200 feet below land surface.

- According to published geologic information, the depth to groundwater beneath the C Segment ranges from approximately 30 to 60 feet below land surface. The regional groundwater flow direction beneath the segment is to the east toward the Mississippi River.

BP2 Segment

- The unconsolidated sediment beneath the BP2 Segment is Pleistocene age upper-terrace deposits (Meyer and Hobbs, 1989). A description of the Pleistocene age upper-terrace deposits is provided in the M Segment geology discussion above.

- The uppermost bedrock unit beneath the BP2 Segment is the St. Peter Sandstone at the south end, replaced by the Prairie du Chien Group in the central portion; the northern portion is underlain by the Upper Cambrian, Jordan Sandstone (Olsen and Bloomgren, 1989). A description of the St. Peter Sandstone and the Prairie du Chien Group is provided in the M Segment geology discussed above. The Jordan Sandstone is described as quartzose sandstone that is carbonate cemented in the upper 10 to 15 feet of the deposit. The middle part of the deposit is coarse grained, and the basal 10 to 20 feet is finer grained and may contain minor amounts of shale.

- In general, the depth to bedrock beneath the BP2 Segment ranges from approximately 51 to 150 feet below the land surface, with the depth along the majority of the Corridor between 101 and 150 feet below land surface.

- According to published geologic information, the depth to groundwater beneath the BP2 Segment ranges from approximately 20 to 60 feet below land surface. The regional groundwater flow direction beneath the segment is to the east/southeast toward the Mississippi River.

BP1 Segment

- The unconsolidated sediment beneath the BP1 Segment is Pleistocene age upper-terrace deposits (Meyer and Hobbs, 1989). A description of the Pleistocene age upper-terrace deposits is provided in the M Segment geology discussion above.

- The uppermost bedrock unit beneath the BP1 Segment is the Jordan Sandstone on the south end, which is replaced in the north by the Upper Cambrian, St. Lawrence and Franconia Formations (Olsen and Bloomgren, 1989). The St. Lawrence Formation consists of dolomitic siltstone and shale in eastern Hennepin County. The fine-grained, glauconitic sandstone and shale of the Franconia becomes dolomitic in western Hennepin County, where the two units are distinguishable only by the higher glauconite content of the Franconia. Fine- to medium-grained quartzose sandstone with minor amounts of white or light-colored shale forms the upper part of the Franconia in parts of the north and west.

- In general, the depth to bedrock beneath the BP1 Segment ranges from approximately 101 to 200 feet below land surface, with the depth along the majority of the Corridor between 151 and 200 feet below land surface. An east-west trending bedrock valley crosses the BP1 Segment in the northern portion.

- According to published geologic information, the depth to groundwater beneath the BP1 Segment ranges from approximately 20 to 40 feet below land surface. The regional groundwater flow direction beneath the segment is to the east/southeast toward the Mississippi River.

The groundwater flow was identified in some parcel summaries through review of available data, but was the Corridor-specific groundwater flow direction was not determined through direct measurement during this Modified Phase I ESA. Additional field investigation, beyond the Scope of Services of this Modified Phase I ESA, would be required to determine this information.

C.2. Regulatory Information

Braun Intertec obtained regulatory information pertaining to the Corridor and surrounding area from GeoSearch. The GeoSearch report is a compilation of records of facilities that are included on current federal and state environmental regulatory databases. The databases were searched to a distance of one-quarter mile from the Corridor. Braun Intertec reviewed the GeoSearch report to identify records that indicate known or potential environmental hazards within the Corridor and/or surrounding area and to evaluate the likelihood for those hazards to impact the Corridor. Information obtained from the GeoSearch report was used to determine which facilities are located within the Corridor and have known or potential contamination associated with current and/or past uses. The GeoSearch report also includes a description, source reference, and date of acquisition.

In addition to the information obtained from the GeoSearch report, Braun Intertec reviewed select files at the MPCA. Pertinent information obtained from GeoSearch or the MPCA file review is included in the parcel summaries in Appendix E. Copies of the GeoSearch report and information reviewed as part of the MPCA file review are included as Appendices G and H, respectively.

C.2.a. Corridor

Parcels along the Corridor are listed on the following federal and/or state databases in the GeoSearch report:

Table 2: Regulatory Database Summary

Database Name	Parcel Numbers Identified
Resource Conservation and Recovery Act (RCRA) Hazardous Waste Generators (RCRAGR05)	1, 2, 3, 7, 10, 11, 14, 15, 16, 18, 26, 28, 43, 46, 68, 72,75, 76, 81, 82, 83, 86, 93, 109, 110, 111, 116, 117, 122, 123, 133, 134, 135, 138, 139, 140, 141, 142, 143, 144, 148, 149, 151, 152, 155, 157, 159, 162, 163, 173, 174, 181, 182, 185, 188, 193, 195, 196, 197, 199, 202, 209, 210, 212, 214, 225, 226, 227, 232, 236, 241, 243, 250, 251, 257, 258, 259
Facility Registry System (FRS)	1, 2, 3, 5, 6, 7, 8, 10, 12, 13, 14, 16, 17, 18, 21, 23, 24, 26, 28, 31, 43, 53, 62, 65, 68, 72, 75, 76, 78, 81, 83, 93, 97, 104, 110, 111, 114, 116, 117, 122, 123, 125, 127, 131, 132, 133, 134, 138, 139, 140, 141, 142, 143, 144, 148, 149, 150, 151, 152, 153, 154, 155, 157, 158, 159, 162, 163, 172, 172, 173, 174, 179, 181, 182, 185, 188, 191, 195, 196, 197, 199, 201, 209, 210, 212, 214, 225, 230, 232, 233, 236, 237, 243, 247, 250, 253, 257

Database Name	Parcel Numbers Identified
RCRA No Longer Regulated Facility (NLRRCRAG)	1, 2, 5, 6, 8, 11, 12, 13, 17, 21, 23, 41, 75, 97, 132, 148, 151, 155, 171, 179, 181, 205, 207, 230, 233, 237
Hazardous Waste Generator Site (HWGS)	1, 2, 3, 6, 7, 8, 10, 11, 12, 13, 14, 15, 16, 17, 18, 21, 23, 24, 26, 28, 43, 46, 62, 68, 72, 75, 76, 78, 81, 82, 83, 86, 87, 93, 97, 109, 110, 111, 116, 117, 122, 123, 125, 127, 131, 132, 133, 134, 135, 138, 139, 140, 141, 142, 143, 144, 148, 149, 150, 151, 152, 153, 155, 157, 158, 159, 162, 163, 166, 171, 172, 173, 179, 181, 182, 185, 193, 195, 196, 197, 199, 201, 202, 205, 207, 208?, 209, 210, 212, 214, 225, 226, 227, 230, 232, 236, 237, 241, 243, 246, 247, 250, 258, 259, 260
Registered Storage Tanks (UAST)	1, 2, 3, 5, 6, 7, 8, 10, 11, 12, 13, 15, 16, 17, 21, 22, 23, 30, 32, 46, 53, 66, 68, 72, 75, 76, 84, 90, 102, 105, 109, 110, 111, 123, 125, 126, 139, 142, 153, 156, 157, 160, 162, 163, 166, 169, 171, 174, 179, 181, 189, 192, 193, 195, 196, 197, 199, 201, 202, 205, 207, 208, 210, 214, 230, 237, 241, 243, 256, 257, 258, 260
Spills Listings (PCASPILLS)	1, 2, 3, 6, 10, 16, 17, 21, 26, 29, 38, 39, 40, 42, 49, 50, 56, 58, 60, 64, 69, 70, 78, 101, 110, 111, 126, 129, 136, 149, 155, 156, 162, 173, 181, 191, 194, 195, 196, 199, 209, 211, 214, 231, 239, 240, 242, 243, 255, 256, 257
Tier II Facility Listing (TIERII)	3, 7, 10, 16, 78, 72, 105, 125, 209, 214, 247, 257
Water Discharge Permit (WDP)	1, 3, 5, 6, 7, 8, 10, 15, 17, 20, 21, 26, 75, 123, 126, 149, 157, 179, 181, 195, 196, 199, 202, 209, 212, 241, 256, 257, 260
National Pollutant Discharge Elimination System (NPDESR05)	257
Permit Compliance System (PCSR05)	3, 257
Registered Leaking Storage Tanks (LUAST)	1, 2, 3, 5, 6, 7, 10, 11, 2, 13, 16, 17, 21, 25, 30, 31, 32, 38, 46, 66, 74, 75, 76, 96, 109, 110, 111, 123, 125, 126, 156, 160, 169, 174, 181, 189, 195, 196, 197, 199, 201, 202, 205, 207, 208, 210, 241, 243, 258, 260
Petroleum Brownfields Program (PBF)	2, 3, 5, 8, 75, 162, 172, 195, 196, 219, 258, 260,
Voluntary Investigation and Cleanup Program (VIC)	1, 2, 3, 5, 7, 8, 12, 17, 21, 47, 59, 75, 76, 88, 90, 107, 172, 190, 192, 195, 196, 258,
Site Response Section (SRS)	1, 2, 3, 7, 8, 17, 21, 59, 75, 192, 195, 196, 258

Emergency Response Notification System (ERNS)	52

Sites 1 – 47 are located within the M Segment, 48 – 56 are within the GV Segment, 57 – 123 are within the R Segment, 124 – 186 are within the C Segment, 187 – 240 are within the BP2 Segment, and 241 – 271 are within the BP1 Segment.

Pertinent information obtained from GeoSearch report is included in the parcel summaries in Appendix E.

Sites identified in the GeoSearch report that were determined to be located within or partially within the Corridor are presented in the table above.

Of these sites, Braun Intertec requested to review the MPCA files for 84 LUAST/PBF listings and 50 VIC/SRS listings that were identified in the GeoSearch report and were determined by Braun Intertec to be located within or partially within the Corridor. Supplemental environmental information was obtained from the MPCA Tank and Leak and/or VIC databases. Due to the volume of information obtained from the current assessment of MPCA file reviews, it was deemed impractical to include hard copies of the information as appendices to the bound hard copy of this report. However, this information is provided as Appendix H in the pdf version of this report included on the attached CD. Select diagrams and tables referencing the MPCA files subsurface investigations are included under the regulatory review narrative in the parcel summaries included as Appendix E.

C.2.b. Adjoining Properties

We reviewed the GeoSearch report for properties that adjoin the Corridor and are located within the approximate minimum search distances on the standard environmental records sources as specified in the ASTM Standard that may indicate a release or likely release of hazardous substances and/or petroleum products that may impact the Corridor. Based on factors that include regulatory status, distance from the Corridor, and/or location relative to the regional groundwater flow direction, as referenced in Section C.1., no facilities are identified in the GeoSearch report that warrant further consideration as potential for contamination.

C.2.c. Unmapped Sites

The GeoSearch report did not identify any "orphan" sites, which, because of poor or inadequate address information could not be mapped by GeoSearch.

C.3. Additional Government Records

C.3.a. Interviews

Braun Intertec made inquiry to the following individuals to obtain knowledge or records of historical and current land-use information regarding the Corridor and surrounding area:

- Gilbert Gabanski, Hennepin County Public Works, Environment and Energy Department, Land and Water, Contaminated Lands Unit
- Jim DeLuca, MnDOT Office of Environmental Stewardship
- John Crelly, Fire Chief, City of Golden Valley
- Mark Fairchild, Fire Chief, City of Robbinsdale
- Shelby Wolf, Deputy Fire Marshal, City of Crystal
- Kenneth Prillaman, Fire Chief, City of Brooklyn Park

Section D of this report provides the discussion of the results of Braun Intertec inquiry and presents any applicable information obtained.

C.3.b. Met Council

Braun Intertec obtained information regarding the project location and proposed construction plans from Met Council.

C.3.c. Minnesota County Well Index

The Minnesota Geological Survey (MGS) maintains the Minnesota County Well Index (MCWI), which is a limited database of water well records. The MCWI was accessed through the Minnesota Department of Health (MDH) website. Several private wells were identified within the Corridor. The locations of the wells are indicated on Figure 2.

Braun Intertec also accessed the MCWI to determine the location/boundaries of any Wellhead Protection Areas (WPA) that exist within the Corridor. According to the MCWI, four WPAs that intersect the Corridor were identified. The locations of these WPAs are shown on the sheet index in Figure 2.

C.3.d. State Regulatory Web Pages

Braun Intertec accessed MPCA's Aboveground/Underground Storage Tank Site Search web page, MDA's "What's In My Neighborhood" Agricultural Interactive Mapping web page, MPCA's Petroleum Remediation Program "What's In My Neighborhood" web page, and MPCA's "What's In My Neighborhood" web pages for information regarding the potential for sites located within the Corridor to be of environmental concern that were not identified in the GeoSearch report. The additional facilities identified that were not included in the GeoSearch report are included in the parcel summaries in Appendix E.

C.4. Historical-Use Information

The objective of the historical-use information review was to develop a history of the previous uses of properties located within the Corridor in order to help evaluate the likelihood of past uses having led to environmental issues that may affect the Corridor. Braun Intertec consulted only those historical sources that were readily available, practically reviewable, and likely to be useful to develop a history of previous uses of the Corridor and surrounding area within the time and cost constraints of this Modified Phase I ESA.

C.4.a. Aerial Photographs

Braun Intertec retained Historic Information Gatherers (HIG) to obtain aerial photographs for the Corridor and surrounding areas. Braun Intertec obtained aerial photographs from HIG for years 1937, 1947, 1956, 1960-62 (partial), 1966-67, 1970-71, 1978, 1984, 1987, 1994, 1997, 200, 2004, 2009, and 2012. Information obtained for low, medium, and high potential for contamination parcels from the aerial photographs review are included in the parcel summaries in Appendix E. Copies of the aerial photographs are attached in Appendix I.

C.4.b. City Directory Information

Braun Intertec retained HIG to obtain city directory information for streets within the Corridor. HIG provided city directories for approximate five-year intervals between the years 1930 and 2012. Braun Intertec reviewed the city directories to assist in identifying properties by name alone that could impact the Corridor. Information obtained for low, medium, and high potential for contamination parcels from the city directory review are included in the parcel summaries in Appendix E.

C.4.c. Fire Insurance Maps

Braun Intertec retained HIG to obtain historical fire insurance maps within the Corridor. Fire insurance maps were produced by private fire insurance companies and indicated uses of properties at specific dates. The information noted on the maps commonly includes uses of individual structures, locations of fuel and/or chemical storage tanks, and storage of other toxic substances. Maps were provided for the years 1885, 1892, 1904, 1912, 1914, 1924, 1929, 1930, 1940, 1950, 1952, and 1963. Each map may not provide coverage for the entire Corridor. Information obtained for low, medium, and high potential for contamination parcels from the review of the fire insurance maps are included in the parcel summaries in Appendix E. Copies of fire insurance maps are attached as Appendix J.

C.4.d. Historical Topographic Maps

The USGS topographic maps for the Corridor were reviewed for the years 1896, 1901, 1902, 1952, 1954, 1955, 1967, 1972, 1977, 1980, 1993, and 2013. Each map may not provide coverage for the entire Corridor. Information obtained for low, medium, and high potential for contamination parcels from review of the topographic maps are included in the parcel summaries in Appendix E. Copies of historical topographic maps are included in Appendix K.

C.4.e. Hennepin County Information

The Hennepin County Property Information website provides information on Hennepin County properties including but not limited to taxes due (tax statement), current and prior year taxes, assessment values, tax parcel description, and sales information. Property Identification Numbers (PINs) and other property information obtained for low, medium, and high potential for contamination parcels from review of the topographic maps are included in the parcel summaries in Appendix E. A list of the PINs for low, medium, and high potential for contamination parcels is included in Appendix L.

D. Interviews

Braun Intertec made inquiry to the following local government officials to obtain knowledge or records of historical and current land-use information regarding the Corridor and surrounding area:

- Gilbert Gabanski, Hennepin County Public Works, Environment and Energy Department, Land and Water, Contaminated Lands Unit
- Jim DeLuca, MnDOT Office of Environmental Stewardship
- John Crelly, Fire Chief, City of Golden Valley
- Mark Fairchild, Fire Chief, City of Robbinsdale
- Shelby Wolf, Deputy Fire Marshal, City of Crystal
- Kenneth Prillaman, Fire Chief, City of Brooklyn Park

No additional environmental concerns within the Corridor were identified during the interviews that were not already addressed in the GeoSearch report and included in this report for Sections B, C, and D.

E. Corridor Reconnaissance

Braun Intertec environmental professional Kelly Brown conducted reconnaissance of the Corridor on May 8, 21 and 27, June 22 and 24, and July 9, 2015. General observations were made along the length of the Corridor from public areas such as roads, sidewalks, retail/commercial buildings, and other publicly accessible areas. Observations of the facilities included, but were not limited to:

- Occupant/property use
- Type of structure
- Evidence of water wells and/or septic systems
- Evidence of storage tanks
- Evidence of use and/or storage of hazardous substances and/or petroleum products
- Evidence of spills or releases of hazardous substances and/or petroleum products
- Evidence of dumping, landfilling, or non-native fill

Specific observations of the parcels with a low, medium, and high potential for contamination parcels within the Corridor are included in Appendix E.

F. Current and Historical Corridor Land-Use

At the time of this assessment, the Corridor passed through primarily residential and commercial areas of Minneapolis, Golden Valley, Robbinsdale, Crystal, and Brooklyn Park.

Specifically, the M (Minneapolis) Segment has been developed since the 1880s, with residential and park areas on the west end, and commercial development on the east end. In the GV, R, C, and BP2 Segments, the Corridor follows an existing BNSF railroad track, which has been present since the 1880s. The remainder of the GV (Golden Valley) Segment has been residential and park areas since the 1930s, with additional development in the 1960s and 1970s. The R (Robbinsdale) Segment was mixed residential and farmland until the 1960s when the commercial district in the central portion of the segment and additional residences replaced the farmland. The C (Crystal) Segment includes the Crystal Airport in the central portion of the segment, with commercial and residential in the remainder of the segment. This area was developed in the 1950s and 1960s. The Corridor follows the railroad until the

central portion of the BP2 Segment, when the Corridor trends to the east. The BP2 and BP1 (Brooklyn Park) Segments were cultivated farmland until the 1950s and 1960s when the areas were converted to commercial with some residential areas. The northern end of the Corridor, in the BP1 Segment, has some formerly cultivated areas, which are currently undeveloped.

G. MnDOT Contamination Potential Ranking

As indicated, identified parcels within the Corridor were ranked/classified as having a low, medium, or high potential for contamination to the Corridor using criteria established by MnDOT, as amended and discussed in Section A.4. The remaining parcels, which were evaluated but did not meet the ranking criteria, are summarized in Appendix F, but are not otherwise included within this report. The rankings, defined by MnDOT, and amended for this project, and the number of parcels identified within each criterion is discussed in the following sections. A complete listing of these parcels is provided in Appendix A.

Low Potential for Contamination Parcels include parcels that are hazardous waste generators (HWGS), light industrial facilities, and possibly some parcels where site reconnaissance showed poor housekeeping or soil disturbance, etc.

Medium Potential for Contamination Parcels include parcels with closed leaking underground or aboveground storage tanks (LUASTs), all parcels with underground or aboveground storage tanks (UASTs), all parcels with historic or current vehicle and/or auto body repair activities and petroleum use or storage, and unintentional hazardous materials release sites.

High Potential for Contamination Parcels include all active and inactive Voluntary Investigation and Cleanup Program (VIC), all active Petroleum Brownfields Program (PBP) sites, Minnesota Environmental Response and Liability Act (MERLA) sites, all heavy industry sites, all active and inactive dumpsites, all Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) sites, and all active LUAST sites.

Based on Braun Intertec's assessment, 271 parcels were identified within the Corridor as having a low, medium, or high potential for contamination. More specifically, 47 parcels were identified within the M Segment, 9 parcels were identified within the GV Segment, 67 parcels were identified in the R Segment, 63 parcels were identified in the C Segment, 54 parcels were identified in the BP2 Segment, and 31 parcels were identified in the BP1 Segment. The following table provides a summary of the ranked sites by segment:

Table 1. Parcels with Low, Medium, or High Potential for contamination by segment

Segment	# of Parcels with Low potential	# Parcels with Medium potential	# Parcels with High potential	Totals
M	9	28	10	**47**
GV	3	6	0	**9**
R	37	23	7	**67**
C	20	41	2	**63**
BP 2	24	26	4	**54**
BP-1	19	11	1	**31**
TOTAL	**112**	**135**	**24**	**271**

G.1. Parcels with Low Potential for Contamination

Braun Intertec identified 112 parcels with *Low Potential for Contamination* within the Corridor, as shown on Table 1 above. Specifically, 9 parcels were identified within the M segment, 3 parcels were identified in the GV segment, 37 parcels were identified in the R segment, 20 parcels were identified in the C segment, 24 parcels were identified in the BP2 Segment, and 19 parcels were identified in the BP1 Segment. The specific parcels identified are included in the Parcel Summary Table in Appendix A and on the Parcel Summary Table – Low Potential for Contamination Sites in Appendix B.

G.2. Parcels with Medium Potential for Contamination

Braun Intertec identified 135 parcels with *Medium Potential for Contamination* within the Corridor, as shown on Table 1 above. Specifically, 28 parcels were identified within the M segment, 6 parcels were identified in the GV segment, 23 parcels were identified within the R segment, 41 parcels were identified within the C segment, 26 parcels were identified within the BP2 Segment, and 11 parcels were identified within the BP1 Segment. The specific parcels identified are included in the Parcel Summary Table in Appendix A and on the Parcel Summary Table – Medium Potential for Contamination Sites in Appendix C.

G.3. Parcels with High Potential for Contamination

Braun Intertec identified 24 parcels with *High Potential for Contamination* within the Corridor, as shown on Table 1 above. Specifically, 10 parcels were identified within the M segment, seven parcels were identified within the R segment, two parcels were identified within the C segment, four parcels were identified within the BP2 Segment, and one parcel was identified within the BP1 Segment. The specific parcels identified are included in the Parcel Summary Table in Appendix A and on the Parcel Summary Table – High Potential for Contamination Sites in Appendix D.

H. Limitations and Data Gaps

This assessment was conducted in conformance with the USEPA All Appropriate Inquiry and ASTM 1527-13, as modified by MnDOT. The conclusions presented in this report are based on inquiries with public officials, available literature cited in this report, conditions noted at the time of the reconnaissance, and Braun Intertec's interpretation of the information obtained as part of this Modified Phase I ESA. Braun Intertec's conclusions are limited to the specific project and properties described in this report and by the accuracy and completeness of information provided by others.

An environmental site assessment cannot wholly eliminate uncertainty regarding the potential for recognized environmental conditions in connection with a property. Performance of this practice is intended to reduce, but not eliminate, uncertainty regarding the potential for recognized environmental conditions in connection with a property within reasonable limits of time and cost.

Braun Intertec's visual observations of portions of the Corridor were limited to public road right-of-ways, sidewalks, commercial/retail properties, and other areas that are accessible to the public. None of the buildings on the Corridor were inspected by Braun Intertec, as it was not within the scope of this Modified Phase I ESA. Contaminant sources and/or hazardous materials and substances may exist within the buildings in the Corridor or on areas of the parcels that were not visible from public areas.

Braun Intertec's review of historical sources was limited to those which were reasonably ascertainable and which were likely to be useful, accurate, or complete in terms of identifying obvious past uses and activities in the Corridor. In addition, Braun Intertec reviewed only as many historical sources that were needed to meet this objective.

No data gaps were identified during the Modified Phase I ESA process, with the exception that Braun Intertec did not interview property owners located within the Corridor.

The identified data gaps did not affect the environmental professional's ability to render opinions regarding conditions indicative of a release or threatened release. Information requested during the Modified Phase I ESA and received after issuance of the report will be forwarded to all parties relying on this report. An addendum will be provided if the information received alters the findings of the report.

I. Additional Considerations

Based on a review of historical information, many properties within the Corridor were farmsteads prior to the 1930s or have been residences since the 1880s. Fuel oil tanks or other hazardous materials may be present within these parcels. In those cases where the historical information confirmed the presence

of tanks or other contaminants, the parcel was assigned a parcel number and was ranked in accordance with the MnDOT definitions of having a low, medium, or high potential for contamination. For those parcels where the historical information did not confirm tanks or hazardous materials were present, the parcels were not assigned a parcel number and were not ranked. These additional parcels are summarized on the table in Appendix F.

J. Recommendations

Drilling Investigation activities, including the collection and analysis of soil and groundwater samples, are recommended along the Corridor where a medium or high potential for contamination is both adjacent to or in close proximity to the Corridor or where significant amounts of fill materials will be excavated during future construction.

K. References

References are listed in Appendix M.

L. Statement and Qualifications

We have the specific qualifications based on education, training, and experience to assess a property of the nature, history and setting of the subject area. The Modified Phase I ESA was conducted in general conformance with the USEPA All Appropriate Inquiry and ASTM 1527-13, as modified by MnDOT for transportation projects.

M	33	2-M, sheet 4	Kingdom of Jehovah's Witnesses	Low	Past and current use as a church
M	34	2-M, sheet 4	Residential Duplex	Medium	Past filling station
M	35	2-M, sheet 5	Harrison Park	Medium	Past commercial uses including filling stations
M	36	2-M, sheet 6	Zion Baptist Church	Low	Past and current commercial use
M	37	2-M, sheet 6	La Crèche Early Childhood Center	Low	Past and current commercial uses including manufacturing
M	38	2-M, sheet 5	Bruns Residence	Medium	Closed spill site, closed LUST
M	39	2-M, sheet 5	Tompkins Residence	Medium	Closed spill site
M	40	2-M, sheet 5	Skoug Residence	Medium	Closed spill site
M	41	2-M, sheet 6	Baur Residence	Low	Hazardous waste generator
M	42	2-M, sheet 6	Hoang Residence	Medium	Closed spill site
M	43	2-M, sheet 7	Moen Property	Low	Hazardous waste generator
M	44	2-M, sheets 7 & 8	Former Railroad Area	Medium	Former commercial buildings and railroad tracks
M	45	2-M, sheet 7	Railroad Right of Way	Medium	Past and current railroad use
M	46	2-M, sheets 7-8	Theodore Wirth Park Golf Course	Medium	Past and current use as golf course, ASTs, USTs, closed LUST, closed MDA spill, hazardous waste generator
M	47	2-M, sheet 8	Undeveloped Parcels	High	Inactive VIC site
GV	48	2-GV, sheets 1-5	Railroad Right of Way	Medium	Past and current railroad use
GV	49	2-GV, sheet 1	Wilson Residence	Medium	Closed spill site
GV	50	2-GV, Sheet 2	Krawczyk Residence	Medium	Closed spill site
GV	51	2-GV, sheet 2	The Family Partnership	Low	Past and current commercial use for offices
GV	52	2-GV, sheets 2 & 3	Runion Residence	Low	Identified on ERNS
GV	53	2-GV, sheet 4	St. Margaret Mary Catholic Church	Medium	Past and current use as a church, USTs, and ground disturbance and fill of unknown origin
GV	54	2-GV, sheet 4	Golden Valley Fire Station	Low	Current use as a fire station
GV	55	2-GV, sheets 4 and 5	Mary Hills Nature Area	Medium	Possible past dumping or fill activities
GV	56	2-GV, Sheet 5	Single Family Residences	Medium	Closed spill site
R	57	2-R, sheets 1-8	Railroad Right of Way	Medium	Past and current railroad use
R	58	2-R, sheets 1-4	Walter Sochacki Community Park	High	Unpermitted dump site, active Sate Assessment site, closed spill site
R	59	2-R, sheet 2	South Halifax park	High	Inactive VIC site, inactive SRS site, restrictive covenant
R	60	2-R, sheet 3	Bratsch Residence	Medium	Closed spill site
R	61	2-R, sheet 3	Xcel Energy Indiana Substation	Medium	Current use as an electric substation
R	62	2-R, sheet 3	Markeson Residence	Low	Non-generator of hazardous waste
R	63	2-R, sheet 4	Lee Square	Low	Past use as a school
R	64	2-R, sheet 4	Gray Residence	Medium	Closed spill site
R	65	2-R, sheet 4	Lee Park	Low	Past use as a school
R	66	2-R, sheets 4 & 5	Windsor Court	Medium	USTs, closed LUST
R	67	2-R, sheet 5	Bridgeway Apartments	Low	Past commercial uses
R	68	2-R, sheet 5	Undeveloped Land	Medium	Past bus garage, USTs, hazardous waste generator
R	69	2-R, sheet 5	Beard Residence	Medium	Closed spill site
R	70	2-R, sheet 5	Kasprick Residence	Medium	Closed spill site
R	71	2-R, sheets 5 & 6	Park	Low	Past and current use as park with swimming pool

Segment	Parcel	Figure Number	Name	Rank	Rationale
R	72	2-R, sheet 6	Sacred Heart Catholic Church & School	Medium	USTs, hazardous waste generator
R	73	2-R, sheet 6	P&D Mechanical Contractor	Low	Past and current commercial uses
R	74	2-R, sheet 6	Parking Lot	Medium	Past commercial uses, closed LUST
R	75	2-R, sheet 6	Walgreens	High	Past commercial uses include filling station and auto repair facilities, ASTs, USTs, closed LUST, PBP site, inactive VIC site, hazardous waste generator
R	76	2-R, sheet 6	Broadway Court Apartments	High	Former gasoline station and dry cleaner, USTs, closed LUST, inactive VIC, inactive CERCLIS, inactive Superfund, hazardous waste generator
R	77	2-R, sheet 6	Robin Hotel	Low	Past and current commercial use
R	78	2-R, sheet 6	Robbinsdale Police and Fire Department and Water Filtration Plant #1	Medium	Hazardous waste generator, closed spill site
R	79	2-R, sheet 6	Papa John's Pizza/Payday	Low	Past and current commercial uses (mainly retail)
R	80	2-R, sheet 6	Commercial Building	Low	Past and current commercial uses (mainly retail)
R	81	2-R, sheet 6	Lions Gym & Wellness Center	Low	Hazardous waste generator
R	82	2-R, sheet 6	Minnesota Dental Group	Low	Current commercial use, hazardous waste generator
R	83	2-R, sheet 6	Strait Stuff Screen Printing	Low	Hazardous waste generator
R	84	2-R, sheet 6	Pawn America	Medium	Past commercial uses including filling station, USTs
R	85	2-R, sheet 6	Chestnut Café	Medium	Past and current commercial uses including dry cleaning
R	86	2-R, sheet 6	Robbinsdale Marine	Medium	Past and current commercial use as boat sales and service, hazardous waste generator
R	87	2-R, sheet 6	Hirshfields/Ace Hardware	Low	Past and current commercial use (retail hardware), hazardous waste generator
R	88	2-R, sheet 6	Wuollet Bakery & Espresso	High	Past and current commercial uses, former dry cleaner, inactive VIC site
R	89	2-R, sheet 6	Home Options	Low	Past and current commercial uses
R	90	2-R, sheet 6	Hubbard Market Place	High	Past auto repair activities, USTs, inactive VIC
R	91	2-R, sheet 6	Parking Lot	Low	Past commercial uses (retail and restaurants)
R	92	2-R, sheet 6	Outdoor Patio	Low	Past commercial uses
R	93	2-R, sheet 6	Commercial Building	Low	Hazardous waste generator
R	94	2-R, sheet 6	Canton Garden Restaurant	Low	Past and current commercial uses
R	95	2-R, sheet 6	McDonalds	Low	Past commercial uses including a car wash
R	96	2-R, sheet 6	Retail Commercial Building	Medium	Past and current commercial uses (mainly retail), closed LUST
R	97	2-R, sheet 6	Golden Age Design	Low	Hazardous waste generator
R	98	2-R, sheet 6	Parking Lot	Low	Past commercial uses
R	99	2-R, sheet 6	Hackenmueller's Meat Market	Low	Past and current commercial uses
R	100	2-R, sheet 6	Commercial Building	Low	Past and current commercial uses
R	101	2-R, sheet 6	Northside Oriental	Medium	Past auto repair activities, closed spill site
R	102	2-R, sheet 6	Nonna Rosa's	Medium	Past commercial use include dry cleaner, USTs
R	103	2-R, sheet 6	Commercial Building	Low	Past and current commercial uses
R	104	2-R, sheet 6	EMI Audio	Low	Past and current commercial uses
R	105	2-R, sheet 6	Commercial Building	Medium	Past and current commercial uses, UST
R	106	2-R, sheet 6	Tailor Shop	Medium	Past cleaners
R	107	2-R, sheet 6	The Steinhauser Group	High	Past dry cleaner, inactive VIC site
R	108	2-R, sheet 6	Robbinsdale Gallery of Art/Historical Museum/Library	Low	Past and current commercial uses

Segment	Parcel	Figure Number	Name	Rank	Rationale
R	109	2-R, sheet 6	Pilgrim Cleaners	Medium	Past commercial uses including gasoline station, current dry cleaner, USTs, closed LUST, hazardous waste generator
R	110	2-R, sheet 6	Sipe's Shell	Medium	Past and current use as a gasoline station, UST, closed LUST, spill site, hazardous waste generator
R	111	2-R, sheet 6	BP Gas Station	Medium	Past and current use as a gasoline station, USTs, closed LUST, spill site, hazardous waste generator
R	112	2-R, sheet 6	Commercial Building	Low	Past and current commercial uses

BP1	266	2-BP1, sheet 10	Undeveloped Land	Low	Former residence
BP1	267	2-BP1, sheet 10	Undeveloped Land	Low	Former residence
BP1	268	2-BP1, sheet 14	Three Rivers Park District Rush Creek Regional Trail	Low	Former farmstead
BP1	270	2-BP1, sheet 14	Undeveloped Land	Low	Former farmstead

Appendix C

Parcel Summary Table – Medium Potential for Contamination Sites

Segment	Parcel	Figure Number	Name	Rank	Rationale
M	6	2-M, sheets 1 & 2	Holiday Gasoline Station/Convenience Store	Medium	Past and current auto repair and filling station, USTs, closed LUST, closed spill, hazardous waste generator
M	9	2-M, sheet 1	Mary My Hope Children's Center	Medium	Past commercial uses including auto repair activities
M	10	2-M, sheets 1 & 2	Metro Transit Garage and Offices	Medium	Past and current auto repair activities, ASTs, USTs, closed LUST, closed spill, hazardous waste generator
M	11	2-M, sheet 1	City of Minneapolis Department of Public Works Royalston Maintenance Facility	Medium	Past coal yard, ASTs, USTs, closed LUST, hazardous waste generator
M	13	2-M, sheet 1	Commercial Buildings	Medium	USTs, closed LUST, hazardous waste generator
M	14	2-M, sheet 2	Wells Fargo Bank	Medium	Storage tanks, hazardous waste generator
M	15	2-M, sheet 1	Commercial Building	Medium	ASTs, hazardous waste generator
M	16	2-M, sheet 1	G&K Services	Medium	ASTs, USTs, closed LUST, closed spill site, hazardous waste generator
M	20	2-M, sheet 3	Heritage Park	Medium	Former filling station
M	22	2-M, sheet 3	Apartment Building	Medium	AST, USTs
M	23	2-M, sheet 3	Commercial Buildings	Medium	Past filling station, USTs, hazardous waste generator
M	24	2-M, sheet 3	Commercial Building	Medium	Past dry cleaner, automotive service training school, hazardous waste generator
M	25	2-M, sheet 4	Hennepin County Sumner Library	Medium	Closed LUST site
M	26	2-M, sheet 3	Undeveloped Parcel	Medium	Past filling station, closed spill site, hazardous waste generator
M	27	2-M, sheet 4	Harvest Preparatory School and A.M.W. Church	Medium	Past commercial uses including filling stations
M	29	2-M, sheet 3	Olson Townhomes	Medium	Closed spill site
M	30	2-M, sheet 3	Park Plaza Apartments II	Medium	UST and closed LUST
M	31	2-M, sheet 4	Seed Academy/Harvest Prep School	Medium	Past and current commercial uses including auto repair, closed LUST
M	32	2-M, sheet 3	Park Plaza Apartments	Medium	Past commercial uses including a filling station, UST, closed LUST
M	34	2-M, sheet 4	Residential Duplex	Medium	Past filling station
M	35	2-M, sheet 5	Harrison Park	Medium	Past commercial uses including filling stations
M	38	2-M, sheet 5	Bruns Residence	Medium	Closed spill site, closed LUST
M	39	2-M, sheet 5	Tompkins Residence	Medium	Closed spill site
M	40	2-M, sheet 5	Skoug Residence	Medium	Closed spill site
M	42	2-M, sheet 6	Hoang Residence	Medium	Closed spill site
M	44	2-M, sheets 7 & 8	Former Railroad Area	Medium	Former commercial buildings and railroad tracks
M	45	2-M, sheet 7	Railroad Right of Way	Medium	Past and current railroad use
M	46	2-M, sheets 7-8	Theodore Wirth Park Golf Course	Medium	Past and current use as golf course, ASTs, USTs, closed LUST, closed MDA spill, hazardous waste generator
GV	48	2-GV, sheets 1-5	Railroad Right of Way	Medium	Past and current railroad use
GV	49	2-GV, sheet 1	Wilson Residence	Medium	Closed spill site
GV	50	2-GV, Sheet 2	Krawczyk Residence	Medium	Closed spill site
GV	53	2-GV, sheet 4	St. Margaret Mary Catholic Church	Medium	Past and current use as a church, USTs, and ground disturbance and fill of unknown origin
GV	55	2-GV, sheets 4 and 5	Mary Hills Nature Area	Medium	Possible past dumping or fill activities
GV	56	2-GV, Sheet 5	Single Family Residences	Medium	Closed spill site
R	57	2-R, sheets 1-8	Railroad Right of Way	Medium	Past and current railroad use
R	60	2-R, sheet 3	Bratsch Residence	Medium	Closed spill site
R	61	2-R, sheet 3	Xcel Energy Indiana Substation	Medium	Current use as an electric substation
R	64	2-R, sheet 4	Gray Residence	Medium	Closed spill site

Segment	Parcel	Figure Number	Name	Rank	Rationale
R	66	2-R, sheets 4 & 5	Windsor Court	Medium	USTs, closed LUST
R	68	2-R, sheet 5	Undeveloped Land	Medium	Past bus garage, USTs, hazardous waste generator
R	69	2-R, sheet 5	Beard Residence	Medium	Closed spill site
R	70	2-R, sheet 5	Kasprick Residence	Medium	Closed spill site
R	72	2-R, sheet 6	Sacred Heart Catholic Church & School	Medium	USTs, hazardous waste generator
R	74	2-R, sheet 6	Parking Lot	Medium	Past commercial uses, closed LUST
R	78	2-R, sheet 6	Robbinsdale Police and Fire Department and Water Filtration Plant #1	Medium	Hazardous waste generator, closed spill site
R	84	2-R, sheet 6	Pawn America	Medium	Past commercial uses including filling station, USTs
R	85	2-R, sheet 6	Chestnut Café	Medium	Past and current commercial uses including dry cleaning
R	86	2-R, sheet 6	Robbinsdale Marine	Medium	Past and current commercial use as boat sales and service, hazardous waste generator
R	96	2-R, sheet 6	Retail Commercial Building	Medium	Past and current commercial uses (mainly retail), closed LUST
R	101	2-R, sheet 6	Northside Oriental	Medium	Past auto repair activities, closed spill site
R	102	2-R, sheet 6	Nonna Rosa's	Medium	Past commercial use include dry cleaner, USTs
R	105	2-R, sheet 6	Commercial Building	Medium	Past and current commercial uses, UST
R	106	2-R, sheet 6	Tailor Shop	Medium	Past cleaners
R	109	2-R, sheet 6	Pilgrim Cleaners	Medium	Past commercial uses including gasoline station, current dry cleaner, USTs, closed LUST, hazardous waste generator
R	110	2-R, sheet 6	Sipe's Shell	Medium	Past and current use as a gasoline station, UST, closed LUST, spill site, hazardous waste generator
R	111	2-R, sheet 6	BP Gas Station	Medium	Past and current use as a gasoline station, USTs, closed LUST, spill site, hazardous waste generator
R	123	2-R, sheet 8	City of Robbinsdale Municipal Shop	Medium	AST, UST, closed LUST, hazardous waste generator
C	124	2-C, sheets 1-6	Railroad Right of Way	Medium	Past and current railroad use
C	125	2-C, sheet 1	Century Link	Medium	ASTs, USTs, closed LUST, hazardous waste generator.
C	126	2-C, sheet 1	Blind Installation & Repair	Medium	USTs, closed LUST
C	129	2-C, sheet 1	Full Proof Ministry and Thomas Tool & Supply	Medium	Closed spill site
C	134	2-C, sheet 2	Fun Services	Medium	Past commercial uses including a machine shop, hazardous waste generator
C	136	2-C, sheet 2	Stormwater pond	Medium	Former auto repair activities, closed spill site
C	138	2-C, sheet 2	Crystal Collision Center and Car Wash	Medium	Auto repair activities, hazardous waste generator
C	139	2-C, sheet 2	Kilmer Electric	Medium	Auto repair activities, AST, UST, hazardous waste generator
C	140	2-C, sheet 2	Auto Plus Auto Parts	Medium	Automotive machine shop and other possible auto repair activities, hazardous waste generator
C	141	2-C, sheet 2	Midwest Motor Craft	Medium	Auto repair activities, hazardous waste generator
C	142	2-C, sheet 2	North Suburban Towing and Thomas Auto Body & Collision	Medium	Auto repair activities, ASTs, hazardous waste generator
C	143	2-C, sheet 3	Bill's Economy Glass	Medium	Past and current commercial uses including machine shop and manufacturing, hazardous waste generator

Segment	Parcel	Figure Number	Name	Rank	Rationale
C	144	2-C, sheet 3	Multi-Tenant Commercial Building	Medium	Auto repair activities, hazardous waste generator
C	147	2-C, sheets 2 & 3	Golden Valley Heating & Air	Medium	Past and current commercial uses including manufacturing
C	148	2-C, sheet 3	BGD Companies	Medium	Past use as foundry, hazardous waste generator
C	149	2-C, sheet 3	Vacant Parcel	Medium	Past foundry and auto repair activities, closed spill site, hazardous waste generator
C	150	2-C, sheet 3	All American Storage	Medium	Past and current commercial uses including machine shops and manufacturing, hazardous waste generator
C	151	2-C, sheet 3	Collision Masters	Medium	Auto repair activities, past use as a tool manufacturer, hazardous waste generator
C	152	2-C, sheet 3	Standard Water Control Systems	Medium	Metal fabrication operations, hazardous waste generator
C	153	2-C, sheet 3	Skip's Auto Repair	Medium	Auto repair activities, AST, hazardous waste generator
C	155	2-C, sheet 3	Miller Diversified Machining	Medium	Auto repair activities, closed spill site, hazardous waste generator
C	156	2-C, sheet 3	Creative Partnership/Rise	Medium	UST, close LUST, close spill site
C	157	2-C, sheet 3	Curbside Waste	Medium	ASTs, USTs, waste services, hazardous waste generator.
C	158	2-C, sheet 3	Industrial Stainless Supply Inc.	Medium	Machine shop and manufacturing, potential dump or fill site, hazardous waste generator
C	159	2-C, sheet 3	Beaver Machine	Medium	Potential dump or fill site, machine shop use, hazardous waste generator
C	160	2-C, sheet 3	Holiday	Medium	Gasoline station, USTs, closed LUST
C	161	2-C, sheet 3	Car Hop	Medium	Former gasoline station
C	163	2-C, sheets 3 & 4	Crystal Business Commons	Medium	Automotive, AST, hazardous waste generator
C	165	2-C, sheet 3	Steen Engineering and Douglas Storage	Medium	Past commercial uses including repair activities and past outdoor storage of unknown materials
C	166	2-C, sheet 3	U-Haul Center	Medium	USTs, hazardous waste generator
C	167	2-C, sheets 3 & 4	Cedarwood Apartments	Medium	Past commercial uses including repair facility
C	168	2-C, sheets 3 & 4	The Schrader Building	Medium	Past and current commercial uses including auto sales and outdoor storage
C	169	2-C, sheet 4	Undeveloped Land	Medium	former gasoline station, UST, closed LUST
C	170	2-C, sheet 4	Becker Park and Crystal Arts and Activity Center	Medium	Former gasoline station
C	171	2-C, sheet 4	Undeveloped Land	Medium	AST, hazardous waste generator
C	173	2-C, sheet 4	Bass Lake Center	Medium	Closed spill site, hazardous waste generator
C	174	2-C, sheet 4	Undeveloped Land	Medium	Gasoline station, USTs, closed LUST, hazardous waste generator
C	176	2-C, sheet 4	Parking Lot	Medium	Former gasoline station
C	179	2-C, sheet 4	Crystal Medical Center	Medium	AST, hazardous waste generator
C	181	2-C, sheets 5 & 6	Crystal Airport	Medium	ASTs, USTs, closed LUST, closed spill site, hazardous waste generator
C	185	2-C, sheet 6	Jack's Auto Sales	Medium	Auto repair activities, hazardous waste generator
BP2	187	2-BP2, sheets 1-6	Railroad Right of Way	Medium	Past and current railroad use
BP2	189	2-BP2, sheet 1	The Waterford	Medium	USTs, closed LUSTs
BP2	191	2-BP2, sheet 1	Multi-Tenant Commercial Building	Medium	Closed spill site, hazardous waste generator
BP2	193	2-BP2, sheet 1	Stormwater Pond and Undeveloped Land	Medium	USTs, hazardous waste generator
BP2	194	2-BP2, sheet 2	The Groves Apartments	Medium	Closed spill site
BP2	197	2-BP2, sheet 2	TN Transportation and Automotive	Medium	Auto repair facilities, ASTs, USTs, closed LUST, hazardous waste generator
BP2	198	2-BP2, sheet 2	Nguyen Residence	Medium	Closed AgSpill

Segment	Parcel	Figure Number	Name	Rank	Rationale
BP2	199	2-BP2, sheets 2 & 3	O'Reilly Auto Parts	Medium	ASTs, USTs, closed LUST, closed spill site, hazardous waste generator
BP2	201	2-BP2, sheet 4	Broadway Rentals	Medium	USTs, ASTs, closed LUST, hazardous waste generator
BP2	202	2-BP2, sheet 4	Carmax	Medium	USTs, ASTs, closed LUST, hazardous waste generator
BP2	205		Interstate North Business Center	Medium	USTs, closed LUST, hazardous waste generator
BP2	207	2-BP2, sheet 4	U-Haul	Medium	Former gasoline station, USTs, closed LUST, hazardous waste generator
BP2	208	2-BP2, sheet 4	Wendy's	Medium	Former gasoline station, USTs, closed LUST, hazardous waste generator
BP2	209	2-BP2, sheets 4 & 5	Americold Distribution	Medium	Closed spill site, hazardous waste generator
BP2	210	2-BP2, sheet 5	Mister Carwash	Medium	Former gasoline station, USTs, closed LUST, hazardous waste generator
BP2	211	2-BP2, sheet 5	Consignment Central	Medium	Former motorcycle sales and service, closed spill site
BP2	212	2-BP2, sheet 5	North American Gear & Forge	Medium	Past and current commercial uses including machine shop, hazardous waste generator
BP2	214	2-BP2, sheet 5	Penske	Medium	UST, AST, closed spill site, hazardous waste generator
BP2	219	2-BP2, sheet 5	American Furniture Market	Medium	Inactive PBP site
BP2	220	2-BP2, sheet 5	Modern Dental Studio	Medium	Former filling/service station
BP2	230	2-BP2, sheet 7	Buerkle Acura	Medium	ASTs, USTs, hazardous waste generator.
BP2	231	2-BP2, sheet 7	Popeye's	Medium	Closed spill site
BP2	233	2-BP2, sheet 7	Northwind Plaza	Medium	Former dry cleaner
BP2	237	2-BP2, sheet 7	Park Square	Medium	UST, hazardous waste generator, past use as a possible dry cleaners
BP2	239	2-BP2, sheet 8	Residential Dwelling	Medium	Closed spill site
BP2	240	2-BP2, sheet 8	Prusinowski Residence	Medium	Closed spill site
BP1	241	2-BP1, sheets 1 & 2	North Hennepin Community College	Medium	ASTs, USTs, closed LUST, hazardous waste generator
BP1	242	2-BP1, sheet 2	Ronning Residence	Medium	Closed spill site
BP1	243	2-BP1, sheet 2	Broadway Square	Medium	Former gasoline station and drycleaner, USTs, closed LUST, closed spill, hazardous waste generator
BP1	255	2-BP1, sheet 6	Northwest EMC	Medium	Closed spill site
BP1	256	2-BP1, sheet 6	Holiday	Medium	gasoline station, USTs, closed spill site
BP1	257	2-BP1, sheets 6 & 8	Baxter Healthcare	Medium	ASTs, closed spill site, hazardous waste generator
BP1	260	2-BP1, sheets 9, 11 & 12	Target Corporation	Medium	USTs, closed LUST, PBP site, hazardous waste generator
BP1	263	2-BP1, sheets 8 & 11	Undeveloped Land	Medium	Former farmstead and greenhouse/nursery
BP1	264	2-BP1, sheet 11	Undeveloped Land	Medium	Former multi-building residence
BP1	269	2-BP1, sheet 10	Grace Fellowship Church	Medium	AST
BP1	271	2-BP1, sheets 13 & 14	Three Rivers Park District Rush Creek Regional Trail	Medium	Former farmstead

Appendix D

Parcel Summary Table – High Potential for Contamination Sites

Segment	Parcel	Figure Number	Name	Rank	Rationale
M	1	2-M, sheet 1	Ford Center	High	ASTs, closed LUST, closed spill, inactive VIC, hazardous waste generator
M	2	2-M, sheets 1 & 2	Be The Match	High	AST, closed LUST, closed spill, active VIC, active PBF, hazardous waste generator
M	3	2-M, sheet 1	Hennepin County Energy Recovery Center and Caribou Coffee	High	Past filling stations and auto repair facilities, ASTs, USTs, closed LUST, closed spill, inactive VIC, inactive PBP, inactive CERCLIS, hazardous waste generator
M	5	2-M, sheet 2	Parcel Under Construction	High	ASTs, USTs, closed LUST, active VIC, active PBP, hazardous waste generator
M	7	2-M, sheet 2	Weather Rite	High	Past and commercial uses including machine shop, metal manufacturing, waste (garbage) management, and automotive repair and junkyard, USTs, closed LUST, inactive VIC, active SAS, hazardous waste generator
M	8	2-M, sheet 2	Junction Flats	High	Past auto repair and junkyard, ASTs, USTs, active VIC, inactive PBP, active SR, hazardous waste generator
M	12	2-M, sheet 1	Sharing and Caring Hands	High	Past auto repair and filling stations, UST, closed LUST, inactive VIC, hazardous waste generator
M	17	2-M, sheet 2	Velocity Express	High	ASTs, USTs, closed LUST, closed spill site, active VIC, hazardous waste generator
M	21	2-M, sheet 4	Heritage Park II	High	Past commercial uses, USTs, closed LUST, closed spill, inactive VIC, hazardous waste generator
M	47	2-M, sheet 8	Undeveloped Parcels	High	Inactive VIC site
R	58	2-R, sheets 1-4	Walter Sochacki Community Park	High	Unpermitted dump site, active Sate Assessment site, closed spill site
R	59	2-R, sheet 2	South Halifax park	High	Inactive VIC site, inactive SRS site, restrictive covenant
R	75	2-R, sheet 6	Walgreens	High	Past commercial uses include filling station and auto repair facilities, ASTs, USTs, closed LUST, PBP site, inactive VIC site, hazardous waste generator
R	76	2-R, sheet 6	Broadway Court Apartments	High	Former gasoline station and dry cleaner, USTs, closed LUST, inactive VIC, inactive CERCLIS, inactive Superfund, hazardous waste generator
R	88	2-R, sheet 6	Wuollet Bakery & Espresso	High	Past and current commercial uses, former dry cleaner, inactive VIC site
R	90	2-R, sheet 6	Hubbard Market Place	High	Past auto repair activities, USTs, inactive VIC
R	107	2-R, sheet 6	The Steinhauser Group	High	Past dry cleaner, inactive VIC site
C	162	2-C, sheet 3	Commercial Building	High	USTs, closed spill site, active PBP site, hazardous waste generator, machine shops
C	172	2-C, sheet 4	Cell Tower and Undeveloped Land	High	Former gasoline station and auto repair, inactive VIC site, inactive PBP site, hazardous waste generator
BP2	190	2-BP2, sheet 1	Former Latzke Iron Works	High	Inactive VIC site
BP2	192	2-BP2, sheet 1	Waterford Senior Townhomes	High	ASTs, USTs, inactive VIC
BP2	195	2-BP2, sheet 2	Stormwater Pond	High	USTs, closed LUST, closed spill site, active PBP, active VIC, hazardous waste generator, exterminating company
BP2	196	2-BP2, sheet 2	Metro Transit Bottineau & 63rd Park & Ride	High	ASTs, USTs, closed LUST, closed PBP, inactive VIC, hazardous waste generator
BP1	258	2-BP1, sheet 6	Undeveloped Land	High	USTs, closed LUST, PBP site, VIC site, hazardous waste generator

The following appendices are not included in this version of the Modified Phase I ESA report due to volume.

They are available for viewing at the Blue Line Extension Project Office at 5514 West Broadway Ave, Suite 200, Crystal, MN 55428. Or, can be requested by contacting Robin Caufman at (651) 602-1457**.**

Blue Line Extension Project Technical Report

METROPOLITAN COUNCIL

This page intentionally left blank

Executive Summary

This Noise and Vibration Technical Report has been prepared as a supplement to the Final Environmental Impact Statement (EIS) document, to provide additional information on the noise and vibration impact assessment for the proposed METRO Blue Line Light Rail Transit (BLRT) Extension project. The technical report contains detailed information regarding the criteria, methodology, noise and vibration measurements, impact assessment results, and proposed mitigation measures. Additional information regarding the measurements and other technical data is found in the appendices to this report. Supplemental information regarding proposed BLRT Extension project specific information is also contained in the Draft EIS Noise and Vibration Technical Report, which is referenced where appropriate.

The results of the noise and vibration assessment for the proposed BLRT Extension project indicate that with the proposed mitigation measures, most residential noise impacts which meet the threshold for mitigation will be eliminated, and all vibration impacts will be eliminated from the proposed BLRT Extension project. The majority of the noise impacts from the proposed BLRT Extension project will be eliminated through the use of Quiet Zones or wayside devices. The vibration impacts from the proposed BLRT Extension project are localized to three areas and will be mitigated through conventional mitigation measures. **Section 1** of the report provides a summary of the impacts and mitigation measures for the proposed BLRT Extension project.

1 Introduction and Summary

Cross-Spectrum Acoustics, Inc. (CSA) conducted a noise and vibration impact assessment for the proposed METRO Blue Line Light Rail Transit (BLRT) Extension project. Noise and vibration have been assessed in accordance with guidelines specified in the Federal Transit Administration's (FTA) *Transit Noise and Vibration Impact Assessment* guidance manual (FTA, 2006). The assessment was carried out in support of the Final Environmental Impact Statement (Final EIS). The objective of the assessment was to document the noise and vibration impacts at sensitive locations and identify mitigation measures as a part of the proposed BLRT Extension project.

A summary of the assessment results are described below in **Section 1**. **Section 2** provides a discussion of the regulatory context, including noise and vibration basics and details regarding the noise and vibration criteria used to assess impact. **Section 3** describes the methodology used to assess noise and vibration impact. **Section 4** discusses the existing conditions, including a description of the noise and vibration sensitive land uses and the measurements conducted to determine the existing noise and vibration conditions. **Section 5** includes the results of the noise and vibration impact assessment. Mitigation measures are discussed in **Section 6**. A**ppendices A and B** contain detailed information on the supplemental noise measurements conducted for the Final EIS. **Appendices C and D** contain figures showing the location of noise and vibration impacts, respectively. Where appropriate, references are made to the *Bottineau Transitway Draft EIS Noise and Vibration Technical Report* (December 2012).

Based on the screening distances provided in Chapters 4 and 9 of the FTA guidance manual *Transit Noise and Vibration Impact Assessment* (May 2006), the noise and vibration study area for the proposed BLRT Extension project was typically within 300 feet of the proposed BLRT Extension project except for areas near shared Federal Railroad Administration (FRA) grade crossings, where land uses within 800 feet were identified. This extended distance takes into account the light rail transit (LRT) horn sounding required at these crossings.

1.1 Noise

Prior to mitigation, there would be 366 moderate and 618 severe noise impacts at residential and institutional locations along the proposed BLRT Extension project. The majority of the noise impacts are due to the sounding of LRT horns at at-grade crossings, primarily those shared with existing freight operations. The remaining noise impacts are due primarily to the proximity of sensitive receptors to the proposed alignment.

Mitigation measures, as detailed in **Section 6**, will eliminate most residential noise impacts with meet the threshold for mitigation, based on FTA criteria, at locations throughout the proposed BLRT Extension project corridor. The primary mitigation measure will be the implementation of Quiet Zones at the shared at-grade crossings. This will eliminate the LRT horn sounding and will have the added benefit of eliminating the freight horns as well. Other mitigation measures may include wayside horns, wayside noise barriers, and sound insulation improvements. Details regarding specific mitigation measures are contained in **Section 6**.

1.2 Vibration

Prior to mitigation, there would be 28 residential vibration impacts at various locations along the proposed BLRT Extension project. Mitigation measures, as detailed in **Section 6**, will eliminate all vibration impacts at locations throughout the proposed BLRT Extension project corridor. The primary mitigation measure will be the use of ballast mats or equivalent mitigation measures. Details regarding specific mitigation measures are contained in **Section 6**.

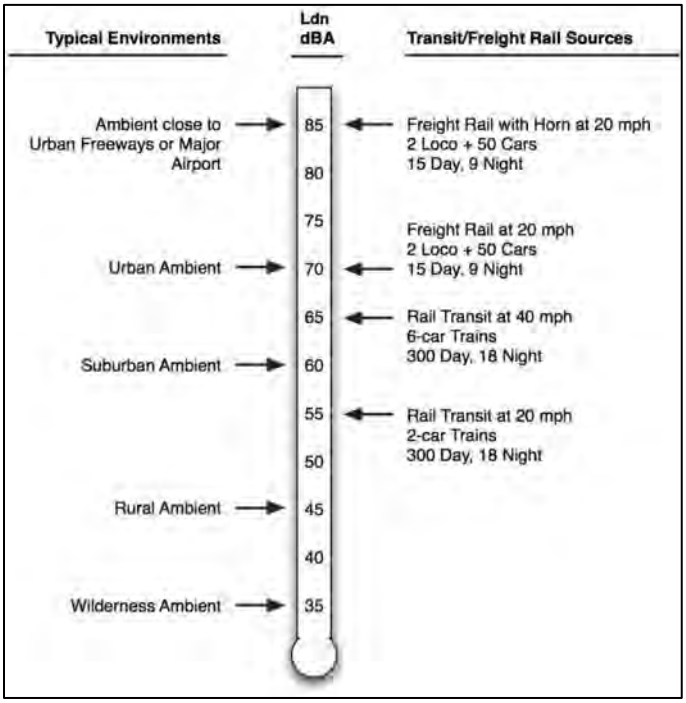
2 Regulatory Context

2.1 Noise

2.1.1 Noise Basics

Sound is defined as small changes in air pressure above and below the standard atmospheric pressure and noise is usually considered to be unwanted sounds. The three parameters that define noise include:

- **Level:** The level of sound is the magnitude of air pressure change above and below atmospheric pressure, and is expressed in decibels (dB). Typical sounds fall within a range between 0 dB (the lower limits of human hearing) and 120 dB (the highest sound levels experienced in the environment). A 3-dB change in sound level is perceived as a barely noticeable change outdoors and a 10-dB change in sound level is perceived as a doubling (or halving) of the sound level.
- **Frequency:** The frequency (pitch or tone) of sound is the rate of air pressure changes and is expressed in cycles per second, or Hertz (Hz). Human ears can detect a wide range of frequencies from around 20 Hz to 20,000 Hz; however, human hearing is not effective at high and low frequencies, and the A-weighting system (dBA) is used to correlate with human response to noise. The A-weighted sound level has been widely adopted by acousticians as the most appropriate descriptor for environmental noise.
- **Time Pattern:** Because environmental noise is constantly changing, it is common to condense all of this information into a single number, called the "equivalent" sound level (L_{eq}). The L_{eq} represents the changing sound level over a period of time, typically 1 hour or 24-hours in transit noise assessments. For LRT and freight rail projects, the Day-Night Sound Level (L_{dn}) is the common noise descriptor used, and has been adopted by most agencies as the best way to describe how people respond to noise in their environment. L_{dn} is a 24-hour cumulative A-weighted noise level that includes all noises that happen within a day, with a 10 dB penalty for nighttime noise (10 p.m. to 7 a.m.). This nighttime penalty means that any noise events at night are equivalent to ten similar events during the day. Typical L_{dn} values for various transit and freight operations are shown in **Figure 2-1**.



2.1.2 Noise Impact Criteria

2.1.2.1 FTA Transit Noise Criteria

The noise impact criteria used for the proposed BLRT Extension project are based on the information contained in Chapter 3 of the FTA noise and vibration guidance manual.[1] The FTA noise impact criteria are based on well-documented research on community response to noise and are based on both the existing level of noise and the change in noise exposure due to a project. The FTA noise criteria compare the proposed BLRT Extension project noise with the existing noise (not the No-Build noise).

The FTA noise criteria are based on the land use category of the sensitive receptor, and use L_{dn} for locations where people sleep (Category 2) and L_{eq} for locations with daytime and/or evening use (Category 1 or 3), as shown in **Table 2-1**.

Figure 2-1. Cumulative Noise Levels from LRT and Freight Rail

Source: CSA, 2015

[1] US Federal Transit Administration, "Transit Noise and Vibration Impact Assessment." Report FTA-VA-90-1003-06, May 2006.

The noise impact criteria are defined by the two curves shown in **Figure 2-2**, which allow increasing project noise as existing noise levels increase, up to a point at which impact is determined based on project noise alone. The FTA noise impact criteria include three levels of impact, as shown in **Figure 2-2**. The three levels of impact include:

- **No Impact:** In this range, the proposed BLRT Extension project is considered to have no impact since, on average the introduction of the proposed BLRT Extension project would result in an insignificant increase in the number of people highly annoyed by the proposed BLRT Extension project noise.
- **Moderate Impact:** At the moderate impact range, changes in the cumulative noise level are noticeable to most people, but may not be sufficient to cause strong, adverse reactions from the community. In this transitional area, other proposed BLRT Extension project–specific factors must be considered to determine the magnitude of the impact and the need for mitigation, such as the existing noise level, predicted level of increase over existing noise levels and the types and numbers of noise-sensitive land uses affected.
- **Severe Impact:** At the severe impact range, a significant percentage of people would be highly annoyed by the proposed BLRT Extension project noise. Severe noise impacts are considered to be "significant" under the National Environmental Policy Act, and should be avoided if possible. Noise mitigation should be applied for severe impacts where feasible.

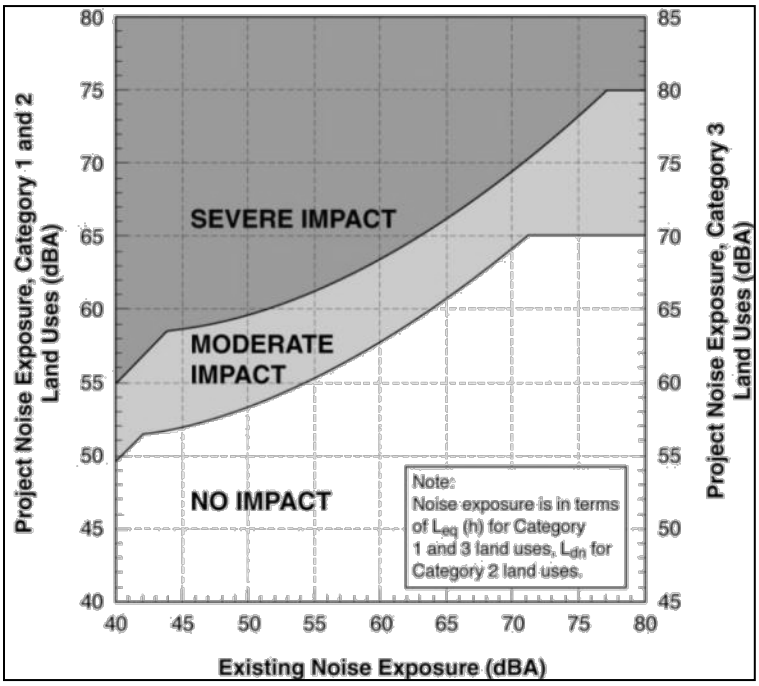


Table 2-1. Land Use Categories and Metrics for Transit Noise Impact Criteria

Land Use Category	Noise Metric (dBA)	Description of Land Use Category
1	Outdoor $L_{eq}(h)$ [1]	Tracts of land where quiet is an essential element in their intended purpose. This category includes lands set aside for serenity and quiet, and such land uses as outdoor amphitheaters and concert pavilions, as well as National Historic Landmarks with significant outdoor use. Also included are recording studios and concert halls.
2	Outdoor L_{dn}	Residences and buildings where people normally sleep. This category includes homes, hospitals, and hotels where a nighttime sensitivity to noise is assumed to be of utmost importance.
3	Outdoor $L_{eq}(h)$ [1]	Institutional land uses with primarily daytime and evening use. This category includes schools, libraries, theaters, and churches where it is important to avoid interference with such activities as speech, meditation and concentration on reading material. Places for meditation or study associated with cemeteries, monuments, museums, campgrounds and recreational facilities can also be considered to be in this category. Certain historical sites and parks are also included.

Source: FTA, 2006

[1] L_{eq} for the noisiest hour of transit-related activity during hours of noise sensitivity.

Figure 2-2. FTA Noise Impact Criteria

Source: FTA, 2006

2.1.2.2 Cultural Resources

Under FTA guidance, historic sites are designated as noise sensitive depending on the land use of the site, not their designation as historic. Sites of national significance with considerable outdoor use required for site interpretation would be in Category 1.[2] Historic sites that are currently used as residences would be in Category 2. Historic buildings with indoor use of an interpretive nature involving meditation and study would be in Category 3. These include museums, significant birthplaces and buildings in which significant historical events occurred.

Most downtown areas have buildings which are historically significant because they represent a particular architectural style or are prime examples of the work of a historically significant designer. If the buildings or structures are used for commercial or industrial purposes and are located in busy commercial areas, they are not considered noise sensitive and the impact criteria do not apply.

Similarly, historical transportation structures, such as terminals and railroad depots, are not considered noise sensitive land uses. These buildings or structures may however be afforded special protection under Section 4(f) of the Department of Transportation (DOT) Act and Section 106 of the National Historic Preservation Act.

In the Section 106 process protecting historic and cultural properties, noise may or may not be considered an "adverse effect" depending on the individual circumstances and whether or not the

[2] Transit Noise and Vibration Impact Assessment, Chapter 3 (FTA, 2006)

use is noise sensitive, because, as previously noted, historic and cultural properties are only noise sensitive based on how they are used. The regulatory processes stemming from these statutes require coordination and consultation with agencies and organizations having jurisdiction over these resources. Their views on the proposed BLRT Extension project's impact on protected resources are given careful consideration by FTA and the proposed BLRT Extension project sponsor, and their recommendations may influence the decision to adopt noise reduction measures.[3]

2.1.2.3 Minnesota Pollution Control Agency Noise Standards

The Minnesota Pollution Control Agency (MPCA) has an established set of Noise Standards (Minnesota Rules, Chapter 7030), which provide limits on environmental noise using the L_{10} and L_{50} descriptors, which represent the noise level exceeded 10 percent (6 minutes) and 50 percent (30 minutes) of the time during an hour, respectively. The standards include both daytime and nighttime limits for three different categories of land use or noise area classification, with residential lands included in noise area classification 1. Classifications 2 and 3 are generally for commercial and industrial land uses, respectively. The standards are shown in **Table 2-2**.

Table 2-2. MPCA Noise Standards

Noise Area Classification	Daytime		Nighttime	
	L_{10} (dBA)	L_{50} (dBA)	L_{10} (dBA)	L_{50} (dBA)
1	65	60	55	50
2	70	65	70	65
3	80	75	80	75

Source: Minnesota Rules, Chapter 7030, Noise Pollution

Because of the time limit component of the MPCA noise standards, the proposed BLRT Extension project would not exceed the standards under the proposed operating conditions. Light rail vehicles would pass by a location for approximately 10 seconds 12 times an hour (based on the operating assumptions of 10 minute headways in each direction) for a total of 120 seconds, or 2 minutes. Because the duration of exposure to LRT noise does not exceed the L_{10} (6 minutes) and L_{50} (30 minutes) time components, there is no potential for the proposed BLRT Extension project to exceed MPCA thresholds. Because the proposed BLRT Extension project would not exceed the MPCA thresholds, the FTA noise impact criteria described previously are more protective than the MPCA standards and have been used to assess and mitigate noise impacts identified within this Final EIS.

[3] For historic or cultural resources, the following two circumstances in assessing impacts and mitigation measures: (1) The noise sensitivity of the property. While Table 1 gives a comprehensive list of noise sensitive land uses, there can be differences in noise sensitivity depending on individual circumstances. For example, a historic park or recreational area could vary in its sensitivity to noise depending on the type of use of the park (active versus passive recreation) and the settings in which it is located. (2) Special protection provided by law. Section 106 of the National Historic Preservation Act and Section 4(f) of the DOT Act (which protects historic sites, as well as publicly owned parks, recreation areas, wildlife, and waterfowl refuges) come into play frequently during the environmental review of transit projects. See pages 3-12 and 3-13 of the FTA Transit Noise and Vibration Impact Assessment for additional information on considerations given to resources that have special protection provided by law.

Information regarding the existing noise levels, which are not included in the MPCA assessment, in the proposed BLRT Extension project corridor and any exceedances of the MPCA standards is described in **Section 4.1.2**.

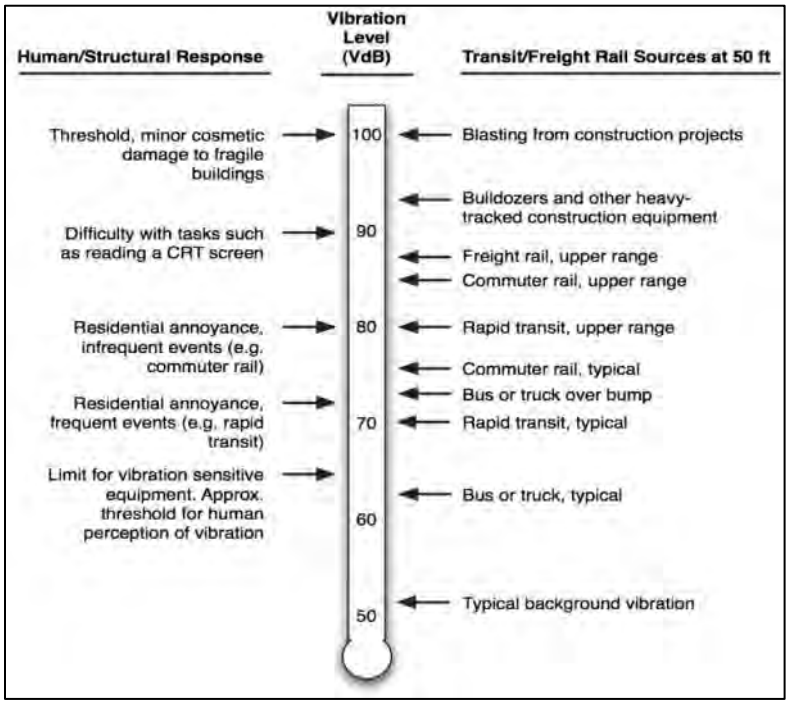
2.1.2.4 FTA Construction Noise Criteria

FTA's construction noise criteria, summarized in **Table 2-3**, were used for the short-term noise impact analysis. The FTA construction noise criteria provide adequate protection for short-term noise impacts and allow for reasonable mitigation measures to be applied to the proposed BLRT Extension project. Additionally, MPCA noise criteria were evaluated for the proposed BLRT Extension project, and the Metropolitan Council (Council) will work with local jurisdictions to ensure that reasonable measures are taken to limit construction noise.

Table 2-3. FTA Construction Noise Criteria

	8-hour L_{eq}, dBA		Noise Exposure, dBA
Land Use	Day	Night	30-day Average
Residential	80	70	75
Commercial	85	85	80
Industrial	90	90	85

Source: FTA, 2006



2.2 Vibration

Ground-borne vibration is the motion of the ground transmitted into a building that can be described in terms of displacement, velocity, or acceleration. Vibration velocity is used in transit and freight rail and is defined by the following:

- **Level:** Vibration is expressed in terms of vibration velocity level, using vibration decibels (VdB), with a reference of 1 micro-inch per second. The level of vibration represents how much the ground is moving. The threshold of human perception to transit and freight rail vibration is approximately 65 VdB and annoyance begins to occur for frequent events at vibration levels over 70 VdB.
- **Frequency:** Vibration frequency is expressed in Hertz (Hz). Human response to vibration is typically from about 6 Hz to 200 Hz.
- **Time Pattern:** Environmental vibration changes all the time and human response is roughly correlated to the number of vibration events during the day. The more events that occur, the more sensitive humans are to the vibration.

Figure 2-3 shows typical ground-borne vibration levels for transit and freight projects as well as the corresponding human and structural responses to vibration.

Figure 2-3. Vibration Levels from LRT and Freight Rail

Source: CSA, 2015

2.2.1 Vibration Impact Criteria

2.2.1.1 FTA Transit Vibration Criteria

The vibration impact criteria used for the proposed BLRT Extension project are based on the information contained in Chapter 8 of the FTA noise and vibration guidance manual. The criteria for a general vibration assessment are based on land use and train frequency, as shown in **Table 2-4**. Some buildings, such as concert halls, recording studios and theaters, can have a higher sensitivity to vibration (or ground-borne noise) but do not fit into the three categories listed in **Table 2-4**. Because of the sensitivity of these buildings, special attention is paid to these buildings during the environmental assessment of a project. **Table 2-5** shows the FTA criteria for acceptable levels of vibration for several types of special buildings.

Tables 2-4 and 2-5 include additional criteria for ground-borne noise, which is a low-frequency noise that is radiated from the motion of room surfaces, such as walls and ceilings in buildings due to ground-borne vibration. Ground-borne noise is defined in terms of dBA, which emphasizes middle and high frequencies, which are more audible to human ears. The criteria for ground-borne noise are much lower than for airborne noise to account for the low-frequency character of ground-borne noise; however, because airborne noise typically masks ground-borne noise for above

ground (at-grade or elevated) transit systems, ground-borne noise is only assessed for operations in tunnels, where airborne noise is not a factor, or at locations such as recording studios, which are well insulated from airborne noise.

Table 2-4. Ground-Borne Vibration and Ground-Borne Noise Impact Criteria for General Assessment

Land Use Category	Ground-Borne Vibration Impact Levels (VdB re 1 micro-inch/sec)			Ground-Borne Noise Impact Levels (dBA re 20 micro-Pascals)		
	Frequent Events[1]	Occasional Events[2]	Infrequent Events[3]	Frequent Events[1]	Occasional Events[2]	Infrequent Events[3]
Category 1: Buildings where vibration would interfere with interior operations.	65[4]	65[4]	65[4]	N/A[5]	N/A[5]	N/A[5]
Category 2: Residences and buildings where people normally sleep.	72	75	80	35	38	43
Category 3: Institutional land uses with primarily daytime use.	75	78	83	40	43	48

Source: FTA, 2006

[1] "Frequent Events" is defined as more than 70 vibration events of the same source per day. Most rapid transit projects fall into this category.

[2] "Occasional Events" is defined as between 30 and 70 vibration events of the same source per day. Most commuter trunk lines have this many operations.

[3] "Infrequent Events" is defined as fewer than 30 vibration events of the same kind per day. This category includes most commuter rail branch lines.

[4] This criterion limit is based on levels that are acceptable for most moderately sensitive equipment such as optical microscopes. Vibration-sensitive manufacturing or research will require detailed evaluation to define the acceptable vibration levels. Ensuring lower vibration levels in a building often requires special design of the HVAC systems and stiffened floors.

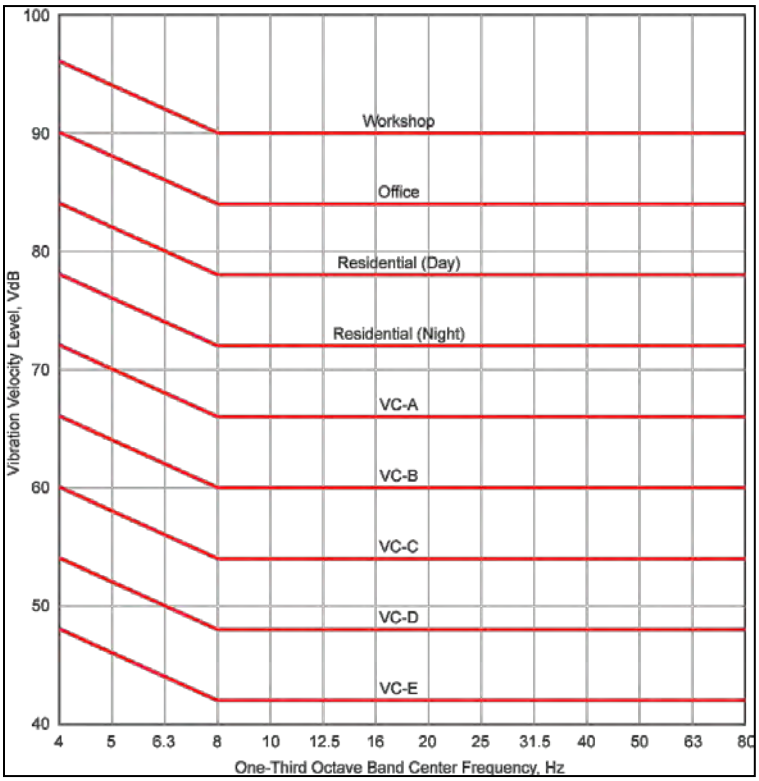
[5] Vibration-sensitive equipment is generally not sensitive to ground-borne noise.

Table 2-5. Ground-Borne Vibration and Ground-Borne Noise Impact Criteria for Special Buildings

Type of Building or Room	Ground-Borne Vibration Impact Levels (VdB re 1 micro-inch/sec)		Ground-Borne Noise Impact Levels (dBA re 20 micro Pascals)	
	Frequent Events[1]	Occasional or Infrequent Events[2]	Frequent Events[1]	Occasional or Infrequent Events[2]
Concert halls	65	65	25	25
TV studios	65	65	25	25
Recording studios	65	65	25	25
Auditoriums	72	80	30	38
Theaters	72	80	35	43

Source: FTA, 2006

[1] "Frequent Events" is defined as more than 70 vibration events per day. Most rapid transit projects fall into this category.



[2] "Occasional or Infrequent Events" is defined as fewer than 70 vibration events per day. This category includes most commuter rail systems.

If the building will rarely be occupied when the trains are operating, there is no need to consider impact. As an example, consider locating a commuter rail line next to a concert hall. If no commuter trains would operate after 7 p.m., it should be rare that the trains interfere with the use of the hall.

The criteria for a detailed vibration assessment are shown in **Figure 2-4** and descriptions of the curves are shown in **Table 2-6**. The curves in **Figure 2-4** are applied to the projected vibration spectrum for the proposed BLRT Extension project. If the vibration level at any one frequency exceeds the criteria, there would be impact. Conversely, if the entire proposed vibration spectrum of the proposed BLRT Extension project is below the curve, there would be no impact.

For the proposed BLRT Extension project, the general vibration assessment criteria will be used at special buildings. The detailed vibration assessment criteria will be used to assess LRT ground-borne vibration.

Figure 2-4. Detailed Vibration Criteria

Source: FTA, 2006

Table 2-6. Interpretation of Vibration Criteria for Detailed Analysis

Criterion Curve (see Figure 2-4)	Max Level (VdB)[1]	Description of Use
Workshop	90	Distinctly feelable vibration. Appropriate to workshops and non-sensitive areas.
Office	84	Feelable vibration. Appropriate to offices and non-sensitive areas.
Residential Day	78	Barely feelable vibration. Adequate for computer equipment and low-power optical microscopes (up to 20×).
Residential Night, Operating Rooms	72	Vibration not feelable, but ground-borne noise may be audible inside quiet rooms. Suitable for medium-power optical microscopes (100×) and other equipment of low sensitivity.
VC-A	66	Adequate for medium- to high-power optical microscopes (400×), microbalances, optical balances, and similar specialized equipment.
VC-B	60	Adequate for high-power optical microscopes (1,000×), inspection and lithography equipment to 3 micron line widths.
VC-C	54	Appropriate for most lithography and inspection equipment to 1 micron detail size.
VC-D	48	Suitable in most instances for the most demanding equipment, including electron microscopes operating to the limits of their capability.
VC-E	42	The most demanding criterion for extremely vibration-sensitive equipment.

Source: FTA, 2006

[1] As measured in 1/3-octave bands of frequency over the frequency range 8 to 80 Hz.

2.2.1.2 Cultural Resources

Under FTA guidance, historic sites are designated as vibration sensitive depending on the land use of the site, not their designation as historic. Historical sites that are currently used as residences will be in Category 2. Historic buildings with indoor use of an interpretive nature involving meditation and study will be in Category 3. These include museums, significant birthplaces, and buildings in which significant historical events occurred. One difference between noise and vibration is that outdoor land uses are not considered vibration sensitive. Only indoor land uses are considered vibration sensitive.

Most downtown areas have buildings which are historically significant because they represent a particular architectural style or are prime examples of the work of a historically significant designer. If the buildings or structures are used for commercial or industrial purposes and are located in busy commercial areas, they are not considered vibration sensitive and the impact criteria do not apply.

Similarly, historical transportation structures, such as terminals and railroad depots, are not considered vibration-sensitive land uses. These buildings or structures may however be afforded special protection under Section 4(f) of the DOT Act and Section 106 of the National Historic Preservation Act.

In the Section 106 process protecting historic and cultural properties, vibration may or may not be considered an “adverse effect” depending on the individual circumstances and whether or not the

use is vibration sensitive, because, as previously noted, historic and cultural properties are only vibration sensitive based on how they are used. The regulatory processes stemming from these statutes require coordination and consultation with agencies and organizations having jurisdiction over these resources. Their views on the project's impact on protected resources are given careful consideration by FTA and the project sponsor, and their recommendations may influence the decision to adopt vibration reduction measures.

2.2.1.3 FTA Construction Vibration Criteria

In addition to the vibration criteria for human annoyance and interference with equipment and spaces described above, there are also vibration criteria for damage from construction activities. Typical transit operations do not have the potential for damage, so only certain construction activities are assessed for damage.

The thresholds for damage to structures are typically several orders of magnitude above the thresholds for human response to vibration. **Table 2-7** shows the FTA criteria for vibration damage to structures. This is based on the structure and construction type (and not a designation as historic). **Table 2-7** includes criteria in both VdB and peak particle velocity (PPV).

Table 2-7. FTA Vibration Damage Criteria from Construction

Building Category	PPV (in/sec)	Approximate Lv[1]
I. Reinforced-concrete, steel or timber (no plaster)	0.5	102
II. Engineered concrete and masonry (no plaster)	0.3	98
III. Non-engineered timber and masonry buildings	0.2	94
IV. Buildings extremely susceptible to vibration damage	0.12	90

3 Impact Assessment Methodology

3.1 Noise

This section describes the methodology for assessing the potential impact from the proposed BLRT Extension project.

Projected noise levels for the Final EIS Detailed Noise Analysis are based on noise measurements of the METRO Blue Line vehicles, which were conducted for the Central Corridor project, and the operating characteristics and current design of the proposed BLRT Extension project. Specific inputs used in the noise impact assessment include the following:

- Light rail train speeds would generally range from 20 miles per hour (mph) to 65 mph for revenue operations, except for entry and exit from station areas. Light rail train speeds are based on modeled speed profiles in both directions (i.e., inbound and outbound) that reflect train operating characteristics, track geometry, and station locations.
- Light rail trains would comprise three rail cars during hours of operation.
- The operating hours and headways[4] would be as follows:
  - Early morning hours (12:15 a.m. to 2:00 a.m.): 60-minute headways
  - Morning hours (4:00 a.m. to 5:30 a.m.): 30-minute headways
  - Early peak morning operating hours (5:30 a.m. to 6:30 a.m.) 15-minute headways
  - Peak operating hours (6:30 a.m. to 9:00 p.m.): 10-minute headways
  - Evening hours (9:00 p.m. to 10:15 p.m.): 20-minute headways
  - Late evening hours (10:15 p.m. to 12:15 a.m.): 30-minute headways
- The reference noise levels are shown in **Table 3-1**.

[4] Headways are the average time between transit vehicles operating in the same direction by a common point over a given period of time (e.g., four inbound light rail trains passing by a station within 1 hour will result in a 15-minute headway).

Table 3-1. Blue Line Reference Noise Levels

Noise Source	Sound Exposure Level,[1] 50 feet (dBA)
LRT on embedded track	84
LRT on ballast-and-tie track	81
Crossing bells	76[2]
LRT bells	86/87[3]
LRT horn	109/115[4]

Source: CSA, 2015

[1] The sound exposure level (SEL) is the cumulative noise from a single event, taking into account both the level and duration of the sound.

[2] The maximum noise level from crossing bells is 77 dBA at 10 feet. Crossing bells will be sounded for 20 seconds for each light rail vehicle at an at-grade crossing.

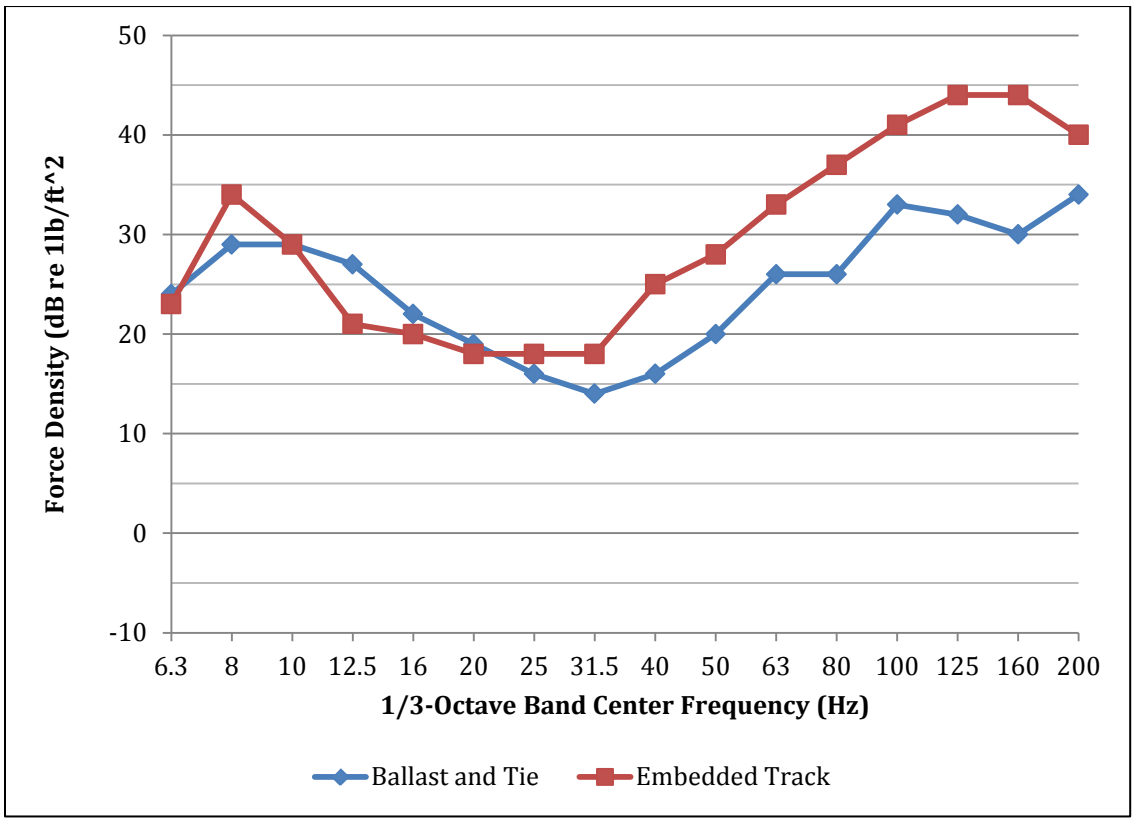
[3] The maximum noise level from LRT bells is 80 dBA at 50 feet. LRT bells will be sounded 3 times when entering and exiting stations (86 dBA SEL) and will be sounded for 5 seconds at each non-FRA at-grade crossing (8 dBA SEL).

[4] The maximum noise level from LRT horns is 96 dBA at 100 feet. LRT horns will be sounded for 5 seconds at certain higher speed at-grade crossings (109 dBA SEL) and for 15 seconds at all FRA at-grade crossings (115 dBA SEL).

- Locations of elevated structures, crossovers and embedded track were identified based on plan and profile maps provided by the engineering team.
- Crossovers increase the noise levels by up to 6 dB for nearby sensitive receptors due to the gap in the track.
- Elevated structures increase the noise levels by 4 dB for nearby sensitive receptors due to structure-borne noise.
- Anticipated use of bells and horns at each at-grade crossing and station was determined by Metro Transit Operations and proposed BLRT Extension project staff based on the following considerations:
  - Light rail vehicle bells will be sounded three times when entering and exiting station platforms
  - Light rail vehicle horns or bells will be sounded at at-grade crossings – horn or bell usage will be determined by Metro Transit Operations and will be based on a variety of factors, including train speeds at the crossing, type of crossing warning devices, at-grade crossing and adjacent roadway geometry, proximity to a freight rail crossing under the jurisdiction of FRA (the light rail vehicle horn or bell will be sounded for 5 seconds at non-FRA crossings; the light rail vehicle horn or bell will be sounded long, long, short, long for 15 seconds at FRA crossings) and other relevant factors
  - Grade crossing bells will be used at at-grade crossings for 20 seconds for each light rail train where there will be flashing lights and gates at the crossing.

- Light rail bells or horns will be sounded in the following manner for locations with stations directly adjacent to at-grade crossings:
  - For the side opposite the station, vehicles will sound their horns or bells in accordance with the procedures above for a grade crossing. No additional sounding will occur upon entering the station.
  - For the side with the station, vehicles will sound their bells in accordance with the procedure above upon entering the station. The vehicle will then sound either the horn or bell upon exiting the station until the front of the vehicle passes through the far side of the crossing.

3.2 Vibration



This section describes the methodology for assessing the potential impact from the proposed BLRT Extension project. Specific inputs used in the vibration impact assessment include the following:

- Projected LRT operating speeds would range from approximately 20 mph to 65 mph for LRT revenue operations, except for entry and exit from station areas. Light rail train speeds are based on modeled speed profiles in both directions (i.e., inbound and outbound) that reflect train operating characteristics, track geometry, and station locations.
- All light rail trains would consist of three cars during hours of operation.
- The operating hours and headways are described in **Section 3.1**, which would result in "frequent" events, as defined in the vibration criteria section.
- Locations of elevated structures, crossovers, and embedded track were identified based on plan and profile maps provided by the engineering team.
- Crossovers increase the vibration levels by up to 10 dB for nearby sensitive receptors due to the gap in the track.
- Elevated structures decrease the vibration levels by 10 dB for nearby sensitive receptors.
- Future vibration levels from LRT operations were based on a combination of the force density (vehicle) and propagation (soil) data at sensitive locations. The procedure for projecting future vibration levels is to measure the vibration propagation characteristics of the soil (line source transfer mobility [LSTM]) and combine that information with the vehicle information independent of the soil (force density [FD]). The formula for calculating the future vibration levels is:

  Lv = FD + LSTM

  Where: Lv is the projected train vibration level, FD is the vehicle force density, and LSTM is the line source transfer mobility at a site.
- Vehicle force density levels were based on measurements conducted for the Central Corridor LRT project (ATS Consulting, 2008) for both ballast-and-tie and embedded track. Representative force density spectra for both ballast-and-tie and embedded track are shown in **Figure 3-1**.
- Vibration propagation measurements were conducted at representative locations throughout the proposed BLRT Extension project vicinity during the Draft EIS.

Figure 3-1. Force Density Levels at 40 mph

4 Affected Environment

4.1 Noise

4.1.1 Noise Sensitive Land Use

Noise-sensitive land use for the Final EIS was identified based on aerial photography, proposed BLRT Extension project drawings, and a site survey. Based on the information from these sources, the noise-sensitive land use, from south to north by city is as follows.

4.1.1.1 Minneapolis

The noise-sensitive land uses for the City of Minneapolis includes Mary's Place, Summit Academy, Sumner Branch Library, Wayman African Methodist Episcopal (AME) Church, Seed Academy, Zion Baptist Church, La Creche Early Childhood Center and a mixture of single-family and multi-family residences. The dominant noise sources are traffic on Olson Memorial Highway (Trunk Highway [TH] 55) and local street traffic for areas off Olson Memorial Highway.

4.1.1.2 Golden Valley

The noise-sensitive land uses for the City of Golden Valley includes Theodore Wirth Park, The Chalet at Theodore Wirth Park, The Family Partnership, Saint Margaret Mary Church, Loveworks Academy and primarily single-family residences with some multi-family residences as well. The dominant noise source is traffic on local streets.

4.1.1.3 Robbinsdale

The noise-sensitive land uses for the City of Robbinsdale includes Bethel World Outreach Church, Elim Lutheran Church, Sacred Heart Catholic Church and School, Robbinsdale Library Branch, Washburn McReavy Funeral Home, a Masonic Lodge, Redeemer Lutheran Church and a mixture of single-family and multi-family residences. The dominant noise sources are occasional freight trains and traffic on local streets.

4.1.1.4 Crystal

The noise-sensitive land uses for the City of Crystal includes Crystal Medical Center, Little Folks Daycare and a mixture of single-family and multi-family residences. The dominant noise sources are occasional freight trains, traffic on Bottineau Boulevard (County Road 81) and flight operations at Crystal Airport.

4.1.1.5 Brooklyn Park

The noise-sensitive land uses for the City of Brooklyn Park includes Brooklyn Crystal Cemetery, Prince of Peace Lutheran Church, Brooklyn Park Evangelical Free Church, North Hennepin Community College, Step by Step Montessori School, Berean Baptist Church, Ebenezer Community Church and a mixture of single-family and multi-family residences. The dominant noise sources are occasional freight trains, and traffic on Bottineau Boulevard and West Broadway Avenue (County State-Aid Highway 103).

4.1.2 Existing Noise Measurements

4.1.2.1 Noise Measurement Procedures and Equipment

In order to supplement the existing noise measurements conducted during the Draft EIS, a series of noise measurements were conducted during May 2015 at nine locations along the proposed BLRT Extension project corridor to refine the existing noise levels and to respond to comments received on the Draft EIS.

Because the thresholds for impact in the FTA noise criteria are based on the existing noise levels, measuring the existing noise and characterizing noise levels at sensitive locations along the corridor is an important step in the impact assessment. The noise measurements included both long-term (24-hour) and short-term (1-hour) monitoring of the A-weighted sound level at noise-sensitive locations near the proposed BLRT Extension project.

The additional noise measurements conducted during the Final EIS were performed with NTi Audio model XL2 noise monitors that conform to American National Standard Institute (ANSI) standards for Type 1 (precision) sound measurement equipment. Calibrations, traceable to the National Institute of Standards and Technology (NIST) were conducted before and after each measurement. The noise monitors were set to continuously monitor and record multiple noise level metrics, as well as obtain audio recordings during the measurement periods.

4.1.2.2 Noise Measurement Locations and Results

Table 4-1 summarizes the results of the existing noise measurement program and **Figure 4-1** shows the location of the 21 long-term noise monitoring sites (LT) and eight short-term noise monitoring sites (ST) for the proposed BLRT Extension project. The long-term noise measurements were used to characterize the existing noise at residential locations because the FTA assessment methodology uses L_{dn} (24-hour noise descriptor) for all residential locations, and the short-term noise measurements were used to characterize the existing noise at non-residential locations because the FTA assessment methodology uses L_{eq} (1-hour noise descriptor) for all non-residential locations.

At each site, the measurement was conducted at the approximate set back of the building or buildings relative to the proposed BLRT Extension project location. The results of the existing noise measurements program are used to determine the existing noise levels for all the noise-sensitive locations. The noise measurement results at each Final EIS site (which are identified by letters) are described below. See the Draft EIS Noise and Vibration Technical Report for information regarding the Draft EIS noise measurement results (which are identified by numbers).

Detailed information regarding the Final EIS noise measurement results are contained in **Appendix A** and photographs of noise measurement sites are contained in **Appendix B**.

Figure 4-1. Existing Noise Measurement Locations

Sources: CSA, 2015; HMMH, 2012

Golden Valley

Site LT-A – 1821 York Avenue: The L_{dn} measured at this location was 54 dBA. The dominant noise source was traffic on local streets and distant aircraft. Noise levels were measured for 24 hours in the backyard of the residence.

Site LT-B – 2145 Bonnie Lane: The L_{dn} measured at this location was 53 dBA. The dominant noise source was traffic on local streets and distant aircraft. Noise levels were measured for 24 hours in the front yard of the residence.

Robbinsdale

Site LT-C – 3954 Noble Avenue: The L_{dn} measured at this location was 55 dBA. The dominant noise source was traffic on local streets, freight operations and distant aircraft. Noise levels were measured for 24 hours in the back yard of the residence.

Site LT-I – 4416 Toledo Avenue North: The L_{dn} measured at this location was 61 dBA. The dominant noise source was traffic on Highway 100. Other sources of noise included traffic on local streets, freight operations and distant aircraft. Noise levels were measured for 24 hours in the back yard of the residence.

Crystal

Site LT-G – 6102 Hampshire Avenue North: The L_{dn} measured at this location was 62 dBA. The dominant noise source was traffic on Bottineau Boulevard. Other sources of noise included traffic on local streets, freight operations and aircraft operations at Crystal Airport. Noise levels were measured for 24 hours in the back yard of the residence.

Brooklyn Park

Site LT-H – 7501 Myers Avenue: The L_{dn} measured at this location was 62 dBA. The dominant noise source was traffic on Bottineau Boulevard and Interstate 94. Other sources of noise included traffic on local streets and freight operations. Noise levels were measured for 24 hours in the front yard of the residence.

Site ST-A – Prince of Peace Lutheran Church: The L_{eq} measured at this location was 62 dBA. The dominant noise source was traffic on Bottineau Boulevard. Noise levels were measured for 1 hour in the parking lot of the church.

Site LT-D – 8220 Quebec Court North: The L_{dn} measured at this location was 65 dBA. The dominant noise source was traffic on West Broadway. Noise levels were measured for 24 hours in the back yard of the residence.

Site LT-E – 8558 S. Maplebrook Circle: The L_{dn} measured at this location was 65 dBA. The dominant noise source was traffic on West Broadway. Noise levels were measured for 24 hours in the front yard of the residence.

Site LT-F – 9125 Nevada Court: The L_{dn} measured at this location was 57 dBA. The dominant noise source was traffic on West Broadway. Noise levels were measured for 24 hours in the back yard of the residence.

4.1.2.3 MPCA Noise Standards Analysis

Using the noise measurement data gathered during the Draft and Final EIS at the long-term noise measurement sites described above, an analysis was also conducted using the MPCA L_{10} and L_{50} noise standards. At each location where a long-term noise measurement was conducted, the maximum L_{10} and L_{50} over a 24-hour period were calculated.

The results, shown in **Table 4-2**, show that at most locations along the proposed BLRT Extension project corridor, the L_{10} and L_{50} standards are already being exceeded by existing noise sources. Most of the exceedances are due to exempt noise sources, such as roadway noise and aircraft overflights. The higher existing L_{10} and L_{50} noise levels are at locations close to major roadways along the proposed BLRT Extension project corridor. At locations further from roadways, the L_{10} and L_{50} noise levels are lower.

Table 4-2. Summary of Existing L_{10} and L_{50} Noise Levels at Long-Term Noise Measurement Locations

Sources: CSA, 2015; HMMH, 2012

[1] The L_{10} descriptor represents noise levels exceeded 10 percent (6 minutes) of the time during an hour (60 minutes). This standard includes both daytime and nighttime limits.

[2] The L_{50} descriptor represents noise levels exceeded 50 percent (30 minutes) of the time during an hour (60 minutes). This standard includes both daytime and nighttime limits.

4.2 Vibration

4.2.1 Vibration Sensitive Land Use

Vibration-sensitive land use for the Final EIS was identified based on aerial photography, proposed BLRT Extension project drawings, and a site survey. Based on the information from these sources, the vibration-sensitive land use, from south to north by city is as follows.

4.2.1.1 Minneapolis

The vibration-sensitive land uses for the City of Minneapolis include Mary's Place, Summit Academy, Sumner Branch Library, Wayman AME Church, Seed Academy, Zion Baptist Church, La Creche Early Childhood Center and a mixture of single-family and multi-family residences.

4.2.1.2 Golden Valley

The vibration-sensitive land uses for the City of Golden Valley include The Chalet at Theodore Wirth Regional Park, The Family Partnership, Saint Margaret Mary Church, Loveworks Academy and primarily single-family residences with some multi-family residences as well.

4.2.1.3 Robbinsdale

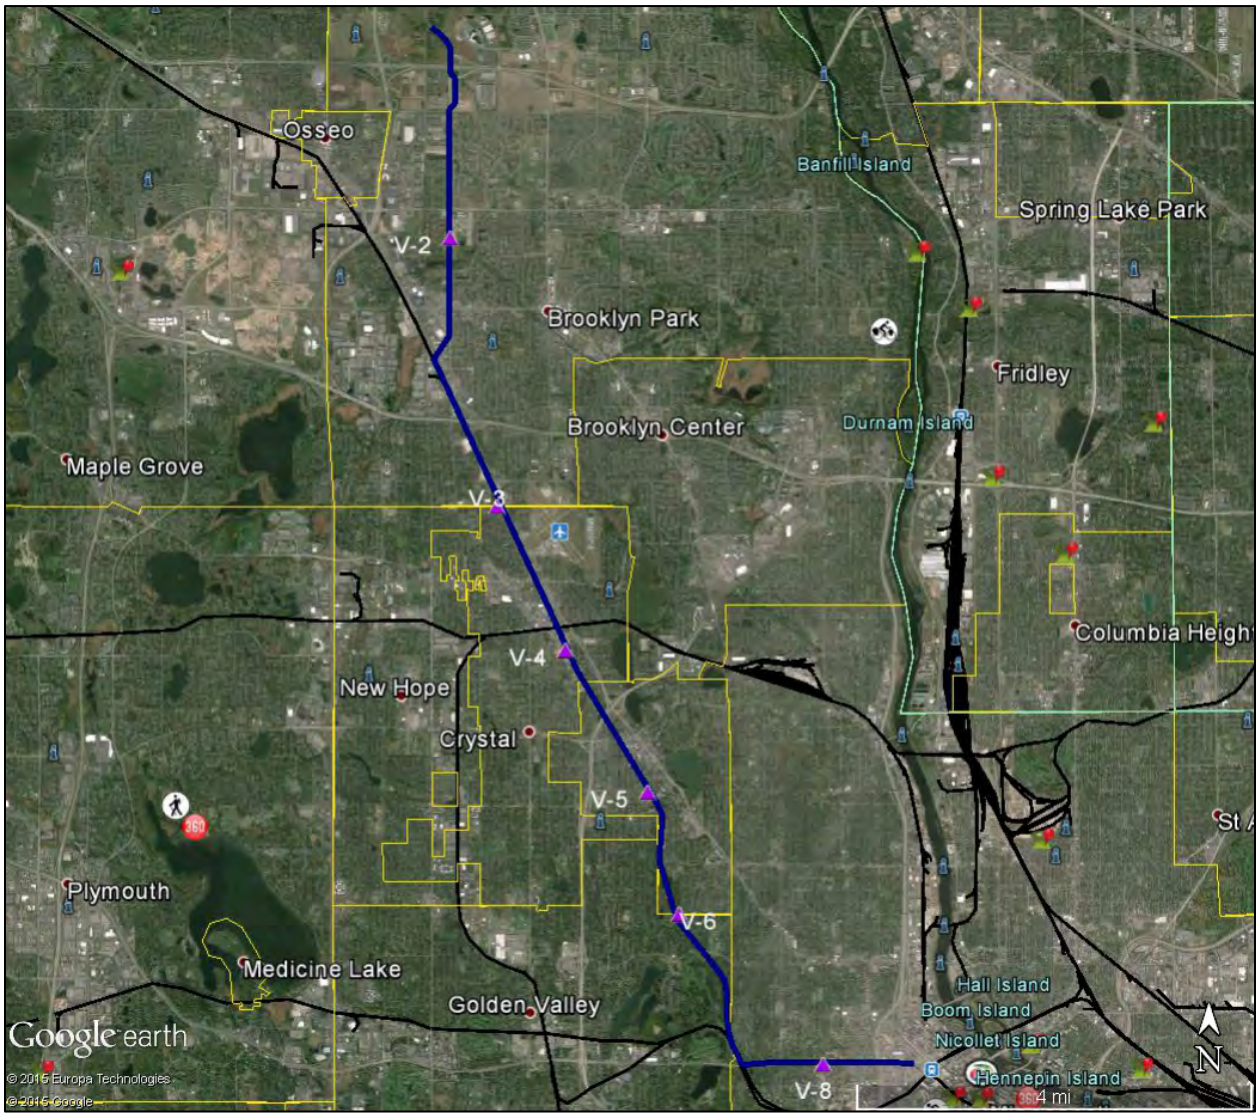
The vibration-sensitive land uses for the City of Robbinsdale include Bethel World Outreach Church, Elim Lutheran Church, Sacred Heart Catholic Church and School, Robbinsdale Library Branch, Washburn McReavy Funeral Home, a Masonic Lodge, Redeemer Lutheran Church and a mixture of single-family and multi-family residences.

4.2.1.4 Crystal

The vibration-sensitive land uses for the City of Crystal include Crystal Medical Center, Little Folks Daycare and a mixture of single-family and multi-family residences.

4.2.1.5 Brooklyn Park

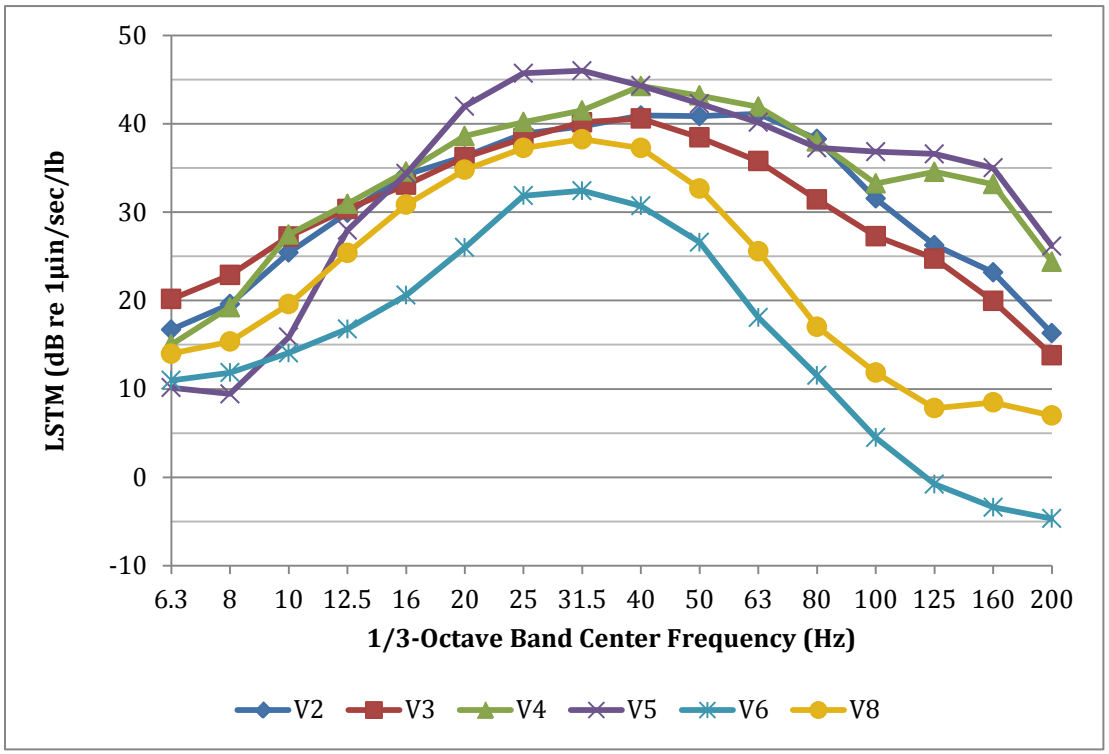
The vibration-sensitive land uses for the City of Brooklyn Park include Prince of Peace Lutheran Church, Brooklyn Park Evangelical Free Church, North Hennepin Community College, Step by Step Montessori School, Berean Baptist Church, Ebenezer Community Church and a mixture of single-family and multi-family residences.



4.2.2 Existing Vibration Measurements

The existing vibration measurements for the proposed BLRT Extension project were conducted during the Draft EIS phase of the proposed BLRT Extension project. Specific information regarding instrumentation, procedures, analysis methods and measurement locations are available in the Draft EIS Noise and Vibration Technical Report. Detailed information regarding the vibration propagation measurement results are contained in the appendices of the Draft EIS Noise and Vibration Technical Report.

The vibration measurements conducted for the Draft EIS were used to characterize the response of the soil at locations within the proposed BLRT Extension project corridor. At each site, vibration propagation tests were conducted by impacting the ground with an instrumented weight and measuring the response of the soil and/or building foundations at various distances (LSTM). The results of the vibration propagation tests were combined with the force density (vehicle input force) to project vibration levels from LRT operations at locations along the proposed BLRT Extension project corridor.



The locations of the six vibration measurement sites used in the Final EIS are shown in **Figure 4-2**. The results of the LSTM tests for the Final EIS are shown in **Figure 4-3**. **Figures 4-4 and 4-5** show the projected vibration levels (combining the force density and transfer mobility data) for the proposed BLRT Extension project for ballast-and-tie and embedded track, respectively.

5 Environmental Consequences

5.1 Noise

The FTA guidance manual on noise and vibration (FTA, 2006) is the primary source for the noise methodology. Noise impact has been evaluated using the Detailed Noise Assessment methodology contained in Chapter 6 of the FTA guidance manual (FTA, 2006). The noise assessment included the following steps:

- Identified noise-sensitive land uses in the proposed BLRT Extension project corridor using aerial photography, GIS data and field surveys, typically within 300 feet of the alignment.
- Measured the existing noise levels in the proposed BLRT Extension project corridor at sensitive receptors (see **Section 4.1 – Affected Environment**).
- Projected proposed BLRT Extension project noise levels from transit operations, using proposed BLRT Extension project drawings provided by the engineering team, and information on speeds, headways, track type, vehicle type, and at-grade-crossing operations.
- Assessed the impact from transit by comparing the proposed BLRT Extension project noise with the existing noise using the FTA noise impact criteria in Chapter 3 of the FTA guidance manual (FTA, 2006).
- Recommended mitigation at locations where proposed BLRT Extension project noise levels exceed the impact criteria.

5.1.1 Proposed BLRT Extension Project Noise

This section describes the noise impacts for the proposed BLRT Extension project. The results of the Detailed Noise Analysis are presented in **Tables 5-1 and 5-2** for residential and institutional (e.g., churches and schools) land uses, respectively.

The results include a tabulation of location information for each sensitive receptor group, the existing noise levels, the projections of future noise levels, the impact criteria, and whether there would be noise impacts. The tables also show the total number of moderate and severe noise impacts for each location, without mitigation measures. Because the proposed BLRT Extension project would never exceed the MPCA standards, the FTA criteria are more protective in assessing impacts from the proposed BLRT Extension project.

As shown in **Table 5-1**, the proposed BLRT Extension project would result in 366 moderate noise impacts and 618 severe noise impacts for residential land uses with the inclusion of LRT horns (see **Appendix C** for locations of impacts). The impacts represent the number of impacted units (including those in multi-family buildings), not the number of buildings. The majority of the noise impacts are related to LRT horn sounding at FRA-shared at-grade crossings in the proposed BLRT Extension project corridor. With the implementation of Quiet Zones[5] at all FRA-shared at-grade

[5] Quiet Zones are locations, at least one-half mile in length, where the routine sounding of horns has been eliminated because of safety improvements at at-grade crossings, including modifications to the streets, raised median barriers, four quadrant gates, and other improvements designed and implemented as a part of the proposed BLRT Extension

crossings, the proposed BLRT Extension project would result in 176 moderate noise impacts and 120 severe noise impacts, as shown in **Table 5-1**. A summary of each location that would experience noise impacts follows. However, if any of the municipalities decide not to apply to FRA for Quiet Zones, this decrease in moderate and severe noise impacts would not be achieved and residual noise impacts would not be mitigated.

Table 5-1. Summary of Noise Impacts for Residential Land Use – LRT With and Without Quiet Zones

project and consistent with Quiet Zone readiness. Horns are sounded in emergency situations at these locations. Municipalities must apply to FRA for approval of Quiet Zones. If the municipality fails to apply for a Quiet Zone or FRA fails to approve the Quiet Zone, the proposed BLRT Extension project may result in residual noise impacts.

Source: CSA, 2015

The "Type and # of Impacts" column identifies whether the LRT noise level exceeds FTA's moderate or severe noise impact criteria thresholds, which are found under the "Proposed BLRT Extension project Noise Levels" column. It also reports the number of units that experience a moderate or severe noise impact. The numbers in parentheses represent the number of impacts remaining after implementation of Quiet Zones.

Predicted noise levels for each location are highest for each location. Projected noise levels at other receptors within each location are lower.

The reported noise levels are rounded to the nearest decibel.

Mod = moderate; Sev = severe.

- **I-94 to Humboldt Avenue North, Minneapolis.** There are sixteen multi-family residences located on the northbound side of the proposed alignment along the Olson Memorial Highway projected to have moderate noise impacts, without noise mitigation. The noise impacts at this location would be due to the sounding of bells at grade crossings.
- **Humboldt Avenue North to Penn Avenue North, Minneapolis**. There are nine single- and multi-family residences located on the northbound side of the proposed alignment along the Olson Memorial Highway projected to have moderate noise impacts, without noise mitigation. The noise impacts at this location would be due to the proximity of the tracks to the residences and the sounding of bells at grade crossings.
- **Olson Memorial Highway to Oak Park Avenue North, Minneapolis**. There is one single-family residence located on the northbound side of the proposed alignment at 8th Avenue and Washburn Avenue projected to have moderate noise impacts, without noise mitigation. The noise impacts at this location would be due to the proximity of the tracks to the residence.
- **Oak Park Avenue North to Plymouth Avenue North, Minneapolis**. There are three single-family residences located on the northbound side of the proposed alignment at Xerxes Avenue and Oak Park Avenue projected to have moderate noise impacts, without noise mitigation. The noise impacts at this location would be due to the proximity of the tracks to the residences.
- **Plymouth Avenue North to 16th Avenue North, Golden Valley**. There are nine single-family residences located on the northbound side of the proposed alignment along Xerxes Avenue projected to have moderate noise impacts, without noise mitigation. The noise impacts at this location would be due to noise from the Plymouth Avenue Station.
- **16th Avenue North to Golden Valley Road, Golden Valley**. There is one single-family residence located on the northbound side of the proposed alignment along York Avenue projected to have moderate noise impact, without noise mitigation. The noise impact at this location would be due to the proximity of the tracks to the residence.
- **Golden Valley Road to 26th Avenue North, Golden Valley**. There are 23 single-family residences located on the northbound side of the proposed alignment along Kewanee Way projected to have moderate and severe noise impacts, without noise mitigation. The noise impacts at this location would be due to the proximity of the tracks to the residences and the presence of a crossover.
- **26th Avenue North to 31½ Avenue North, Robbinsdale**. There are three single- and multi-family residences located on the northbound side of the proposed alignment just north of Kewanee Way projected to have moderate noise impacts, without noise mitigation. The noise impacts at this location would be due to the proximity of the tracks to the residences.
- **31½ Avenue North to 34th Avenue North, Robbinsdale**. There are sixteen single- and multi-family residences located on the northbound side of the proposed alignment along Indiana Avenue projected to have moderate and severe noise impacts, without noise mitigation. The noise impacts at this location would be due to the proximity of the tracks to the residences.

- **34th Avenue North to 36th Avenue North, Robbinsdale**. There are 25 single-family residences located on the northbound side of the proposed alignment between 34th Avenue and 36th Avenue projected to have moderate and severe noise impacts, without noise mitigation. The noise impacts at this location would be due to the proximity of the tracks to the residences.
- **34th Avenue North to 36th Avenue North, Robbinsdale**. There is one single-family residence located on the southbound side of the proposed alignment between 34th Avenue and 36th Avenue projected to have moderate and severe noise impacts, without noise mitigation. The noise impact at this location would be due to the proximity of the tracks to the residence.
- **36th Avenue North to 38th Avenue North, Robbinsdale.** There are 35 single- and multi-family residences located on the northbound side of the proposed alignment al between 36th Avenue and 38th Avenue projected to have moderate and severe noise impacts, without noise mitigation. The noise impacts at this location would be due to the proximity of the tracks at the southern portion of this area and the sounding of horns at grade crossings in the northern portion of this area.
- **36th Avenue North to 38th Avenue North, Robbinsdale**. There are 22 single-family residences located on the southbound side of the proposed alignment al between 36th Avenue and 38th Avenue projected to have moderate and severe noise impacts, without noise mitigation. The noise impacts at this location would be due to the proximity of the tracks at the southern portion of this area and the sounding of horns at grade crossings in the northern portion of this area.
- **38th Avenue North to 40½ Avenue North, Robbinsdale**. There are 88 single-family residences located on the northbound side of the proposed alignment al between 38th Avenue and 40½ Avenue projected to have moderate and severe noise impacts, without noise mitigation. The noise impacts at this location would be due to the proximity of the tracks and the sounding of horns at grade crossings.
- **38th Avenue North to 40th Avenue North, Robbinsdale**. There are 105 single- and multi-family residences located on the southbound side of the proposed alignment al between 38th Avenue and 40½ Avenue projected to have moderate and severe noise impacts, without noise mitigation. The noise impacts at this location would be due to the proximity of the tracks and the sounding of horns at grade crossings.
- **40½ Avenue North to 42nd Avenue North, Robbinsdale**. There are 57single- and multi-family residences located on the northbound side of the proposed alignment between 40½ Avenue and 42nd Avenue projected to have severe noise impacts, without noise mitigation. The noise impacts at this location would be due to the proximity of the tracks and the sounding of horns at grade crossings.
- **40th Avenue North to 42nd Avenue North, Robbinsdale**. There are 74 single- and multi-family residences located on the southbound side of the proposed alignment between 40½ Avenue and 42nd Avenue projected to have moderate and severe noise impacts, without noise mitigation. The noise impacts at this location would be due to the proximity of the tracks and the sounding of horns at grade crossings.

- **42nd Avenue North to MN-100, Robbinsdale**. There are 37 single- and multi-family residences located on the northbound side of the proposed alignment between 42nd Avenue and MN-100 projected to have moderate and severe noise impacts, without noise mitigation. The noise impacts at this location would be due to the proximity of the tracks and the sounding of horns at grade crossings.
- **42nd Avenue North to MN-100, Robbinsdale**. There are 24 single- and multi-family residences located on the southbound side of the proposed alignment between 42nd Avenue and MN-100 projected to have moderate and severe noise impacts, without noise mitigation. The noise impacts at this location would be due to the proximity of the tracks and the sounding of horns at grade crossings.
- **MN-100 to 47th Avenue North, Robbinsdale**. There are 32 single-family residences located on the northbound side of the proposed alignment between MN-100 and 47th Avenue projected to have moderate and severe noise impacts, without noise mitigation. The noise impacts at this location would be due to the proximity of the tracks and the sounding of horns at grade crossings.
- **MN-100 to 47th Avenue North, Robbinsdale**. There are 58 single- and multi-family residences located on the southbound side of the proposed alignment between MN-100 and 47th Avenue projected to have moderate and severe noise impacts, without noise mitigation. The noise impacts at this location would be due to the proximity of the tracks and the sounding of horns at grade crossings.
- **47th Avenue North to CP Rail Crossing, Crystal**. There are 128 single- and multi-family residences located on the northbound side of the proposed alignment between 47th Avenue and the freight track crossing projected to have moderate and severe noise impacts, without noise mitigation. The noise impacts at this location would be due to the proximity of the tracks and the sounding of horns at grade crossings.
- **47th Avenue North to CP Rail Crossing, Crystal**. There are 50 single- and multi-family residences located on the southbound side of the proposed alignment between 47th Avenue and the freight track crossing projected to have moderate and severe noise impacts, without noise mitigation. The noise impacts at this location would be due to the proximity of the tracks and the sounding of horns at grade crossings.
- **56th Avenue North to 60th Avenue North, Crystal**. There are five single-family residences located on the northbound side of the proposed alignment between 56th Avenue and 60th Avenue projected to have moderate noise impacts, without noise mitigation. The noise impacts at this location would be due to the sounding of horns at the Bass Lake Road grade crossing.
- **56th Avenue North to 60th Avenue North, Crystal**. There are six single-family residences located on the northbound side of the proposed alignment between 56th Avenue and 60th Avenue projected to have moderate and severe noise impacts, without noise mitigation. The noise impacts at this location would be due to the sounding of horns at the Bass Lake Road grade crossing.

- **60th Avenue North to 63rd Avenue North, Crystal**. There is one single-family residence and a motel located on the northbound side of the proposed alignment between 60th Avenue and 63rd Avenue projected to have moderate and severe noise impacts, without noise mitigation. The noise impacts at this location would be due to the sounding of horns at the 63rd Avenue grade crossing.
- **60th Avenue North to 63rd Avenue North, Crystal**. There are 108 multi-family residences located on the southbound side of the proposed alignment between 60th Avenue and 63rd Avenue projected to have moderate and severe noise impacts, without noise mitigation. The noise impacts at this location would be due to the sounding of horns at the 63rd Avenue grade crossing.
- **63rd Avenue North to I-694, Brooklyn Park**. There are nineteen single- and multi-family residences located on the northbound side of the proposed alignment between 63rd Avenue and I-694 projected to have moderate and severe noise impacts, without noise mitigation. The noise impacts at this location would be due to the sounding of horns at the 63rd Avenue grade crossing.
- **I-694 to 73rd Avenue North, Brooklyn Park**. There are eight multi-family residences located on the northbound side of the proposed alignment between I-694 and 73rd Avenue projected to have moderate noise impacts, without noise mitigation. The noise impacts at this location would be due to the sounding of horns at the West Broadway grade crossing.
- **I-694 to 73rd Avenue North, Brooklyn Park**. There are five single- and multi-family residences located on the southbound side of the proposed alignment between I-694 and 73rd Avenue projected to have moderate and severe noise impacts, without noise mitigation. The noise impacts at this location would be due to the sounding of horns at the West Broadway grade crossing.
- **73rd Avenue North to Brooklyn Blvd, Brooklyn Park**. There are four multi-family residences located on the northbound side of the proposed alignment to the south of 76th Avenue projected to have moderate noise impacts, without noise mitigation. The noise impacts at this location would be due to the proximity of the tracks and sounding of bells at the 76th Avenue grade crossing.
- **Shingle Creek to 85th Avenue North, Brooklyn Park**. There are five single-family residences located on the southbound side of the proposed alignment across from the North Hennepin Community College projected to have moderate noise impacts, without noise mitigation. The noise impacts at this location would be due to the presence of a crossover and noise from the nearby station.
- **89th Avenue North to 93rd Avenue North, Brooklyn Park**. There are five single-family residences located on the northbound side of the proposed alignment near Seltzer Parkway projected to have moderate noise impacts, without noise mitigation. The noise impacts at this location would be due to the proximity of the tracks and the sounding of bells at the Seltzer Parkway grade crossing.

As shown in **Table 5-2**, the proposed BLRT Extension project would result in one moderate noise impact and five severe noise impacts for institutional land uses (see **Appendix C** for locations of impacts). All of the noise impacts are related to LRT horn sounding at FRA-shared at-grade crossings in the proposed BLRT Extension project corridor. There would be no remaining impacts at institutional locations with the implementation of Quiet Zones. A summary of each institutional location that would experience noise impacts follows.

[1] These receptors were assessed as land use category 1 receptors. All other institutional receptors were assessed as land use category 3 receptors.

The reported noise levels are rounded to the nearest decibel.

Mod = moderate; Sev = severe.

- **Sacred Heart Church.** The Sacred Heart Church is projected to have severe noise impact, without noise mitigation. The noise impact at this location is due to the sounding of the LRT horn at grade crossings in the shared freight corridor.
- **Robbins Gallery.** The Robbins Gallery is projected to have severe noise impact, without noise mitigation. The noise impact at this location is due to the sounding of the LRT horn at grade crossings in the shared freight corridor.
- **Washburn McReavy Funeral Home.** The Washburn McReavy Funeral Home is projected to have severe noise impact, without noise mitigation. The noise impact at this location is due to the sounding of the LRT horn at grade crossings in the shared freight corridor.
- **Glen Haven Memorial Garden.** The Glen Haven Memorial Garden is projected to have moderate noise impact, without noise mitigation. The noise impact at this location is due to the sounding of the LRT horn at grade crossings in the shared freight corridor.
- **Crystal Medical Center.** The Crystal Medical Center is projected to have severe noise impact, without noise mitigation. The noise impact at this location is due to the sounding of the LRT horn at grade crossings in the shared freight corridor.
- **Little Folks Daycare.** The Little Folks Daycare is projected to have severe noise impact, without noise mitigation. The noise impact at this location is due to the sounding of the LRT horn at grade crossings in the shared freight corridor.

5.1.2 Cultural Resources

Based on data provided by the Minnesota Department of Transportation (MnDOT) Cultural Resources Unit (CRU) of listed and eligible historic properties within the proposed BLRT Extension project vicinity, an assessment of the historic and cultural resources was conducted for the proposed BLRT Extension project. The assessment was conducted to determine the noise sensitivity of the resources along the proposed BLRT Extension project corridor. For each resource site, a determination was made regarding the noise sensitivity of the use and the FTA category it would fall under based on FTA guidance.

The result of the assessment, which is summarized in **Table 5-3**, shows that there would be noise impacts at the West Broadway Avenue Residential Historic District, Former Hennepin County Library, Robbinsdale Branch, Sacred Heart Catholic Church and Homewood Residential Historic District. However, with Quiet Zones, only five residences within the two residential historic districts would have moderate noise impacts remaining. Each of these locations was assessed for impact as a part of the noise assessment detailed in **Section 5.1.1**.

Table 5-3. Summary of Historic and Cultural Resources Noise Assessment

Inventory #	Property Name	City	FTA Noise Cat.[1]	Notes
HE-CRC-199	Minneapolis & Pacific Railway Historic District (Soo Line)	Crystal	N/A	Not noise sensitive.
HE-RBC-264	Jones-Osterhus Barn	Robbinsdale	N/A	Not noise sensitive.
HE-RBC-158	West Broadway Avenue Residential Historic District	Robbinsdale	2	Severe noise impacts. Two moderate noise impacts remaining with Quiet Zone.
HE-RBC-024	Former Hennepin County Library, Robbinsdale Branch	Robbinsdale	3	Severe noise impact. No impact with Quiet Zone.
HE-RBC-286	Robbinsdale Waterworks	Robbinsdale	N/A	Not noise sensitive.
HE-RBC-1462	Sacred Heart Catholic Church	Robbinsdale	3	Severe noise impact. No impact with Quiet Zone.
XX-PRK-001	Grand Rounds Historic District – Theodore Wirth Park Segment	Golden Valley, Minneapolis	3, N/A	No noise impacts.
HE-GVC-0050	Bridge No. L9327	Golden Valley	N/A	Not noise sensitive.
HE-MPC-12101	Homewood Residential Historic District	Minneapolis	2	Three moderate noise impacts at southwestern corner of the district.
HE-MPC-9013	Floyd B. Olson Memorial Statue	Minneapolis	N/A	Not noise sensitive.
HE-MPC-7553	Labor Lyceum	Minneapolis	3	No noise impacts.
HE-MPC-8290	Wayman AME Church	Minneapolis	3	No noise impacts.
HE-MPC-8081	Sumner Branch Library	Minneapolis	3	No noise impacts.
HE-MPC-8125	Northwestern Knitting Company Factory	Minneapolis	2	No noise impacts.
HE-MPC-0441	Minneapolis Warehouse Historic District	Minneapolis	2	No noise impacts.
XX-RRD-010 (district)	St. Paul, Minneapolis & Manitoba (StPM&M)/Great Northern (GN) Railway Historic District	Minneapolis	N/A	Not noise sensitive.
Including HE-RRD-002; HE-BPC-0084; HE-CRC-0238; HE-RBC-0304; HE-MPC-16389	Osseo Branch of the StPM&M/GN Railway Historic District	Minneapolis, Golden Valley, Robbinsdale, Crystal, Brooklyn Park	N/A	Not noise sensitive.

Source: CSA, 2015

[1] N/A - Not included in any of the FTA noise-sensitive categories. Not noise sensitive.

5.1.3 Stations

The major noise source at stations, other than LRT operations, is the sounding of the LRT bells as the trains enter and exit the stations. The noise from the LRT bells has been captured in the proposed BLRT Extension project noise assessment detailed above.

5.1.4 Operations and Maintenance Facility

The operations and maintenance facility (OMF) is located more than 1,000 feet from any noise-sensitive receptors and therefore no noise impact is projected.

5.1.5 Construction Noise

This section describes the short-term (construction-phase) noise impacts of the proposed BLRT Extension project.

Construction noise levels are subject to local noise ordinances and noise rules administered by MPCA (Minnesota Rules, Chapter 7030). MPCA administers these noise rules to establish maximum allowable noise levels; where applicable, MPCA procedures allow for the issuance of noise variances. To address both the applicable local noise ordinances and the MPCA noise rules, the Council will develop a Noise Control Plan. The Noise Control Plan will contain information regarding when advanced notice of construction activities will be provided to affected communities. The Noise Control Plan will also contain other stipulations to help avoid or minimize construction noise impacts. For example, the Noise Control Plan will require that construction equipment used by contractors be properly muffled and in proper working order. Most of the construction will consist of site preparation and laying new tracks, which should occur primarily during daytime hours, except when required and allowable within local noise ordinance procedures.

Construction noise varies greatly depending on the type of construction activities, equipment used, staging of the construction process, the layout of the construction site, and the distance to sensitive receptors. Elevated noise levels during construction are, to a degree, unavoidable for this type of project, and short-term noise during construction of the proposed BLRT Extension project can be intrusive to residents near the construction sites. For most construction equipment, diesel engines are typically the dominant noise source. For other activities, such as impact pile driving and jackhammering, noise generated by the actual process dominates. The contractor will provide specific information on equipment and methods as a part of the Noise Control Plan for construction of the proposed BLRT Extension project. The contractor will also indicate whether or not the proposed BLRT Extension project would pursue a noise variance in any municipality along the proposed BLRT Extension project corridor. The Council will review noise variance requests prior to submittal to MPCA for approval.

Advanced notice will be provided to affected communities of any planned abnormally loud construction activities. In general, construction would occur within daytime hours. However, night construction may sometimes be required, for example to minimize traffic impacts or to improve safety. If nighttime construction is deemed necessary, during the proposed BLRT Extension

project's final design and construction stages, a nighttime construction mitigation plan will be developed.

Table 5-4 shows noise levels of typical construction equipment from the FTA guidance manual, in terms of the maximum levels at 50 feet. Construction noise predictions at noise-sensitive locations depends on the amount of noise during each construction phase, the duration of the noise, and the distance from the construction activities to the sensitive receptor. Conducting a construction noise impact assessment requires knowledge of the equipment likely to be used, the duration of its use, and the way it will be used by a contractor. The L_{eq} for a particular set of assumptions is estimated using typical noise levels from **Table 5-4**.

Table 5-4. Typical Construction Noise Levels

Equipment Type	Typical Noise Level (dBA) 50 ft
Backhoe	80
Compactor	82
Concrete mixer	85
Concrete pump	82
Crane, derrick	88
Crane, mobile	83
Dozer	85
Grader	85
Loader	85
Paver	89
Pump	76
Roller	74
Truck	88

Source: FTA, 2006

Table 5-5 provides an example of a construction noise projection for typical at-grade track construction. Using these assumptions, an 8-hour L_{eq} of 88 dBA would be projected at a distance of 50 feet from the construction site.

Using the criteria in **Section 2.1.2** and the example for at-grade construction in **Table 5-4**, screening distances for at-grade track construction noise impact can be determined. For residential land use, the potential for short-term at-grade track construction noise (**Table 5-5**) impact could extend to approximately 120 feet from the proposed BLRT Extension project corridor; however, if nighttime construction is conducted, the potential for short-term noise impact from at-grade construction could extend to approximately 380 feet from the proposed BLRT Extension project corridor.

See **Section 6.1.2** for more information regarding the approach to mitigating construction noise.

Table 5-5. Typical Construction Scenario, At-Grade Track Construction

Equipment Type	Typical Noise Level (dBA) 50 ft	Equipment Utilization Factor (%)	L_{eq} (dBA)
Grader	85	50	82
Backhoe	80	40	76
Compactor	82	20	75
Loader	85	20	78
Roller	74	20	67
Truck	88	40	84
Crane, mobile	83	20	76
		Total 8-hour workday L_{eq} at 50 ft	**88**

5.2 Vibration

The FTA guidance manual on noise and vibration (FTA, 2006) is the primary source for the vibration methodology. The Final EIS uses a Detailed Vibration Assessment methodology, as described in Chapter 11 of the FTA guidance manual (FTA, 2006).

The vibration assessment steps employed included the following:

- Identified vibration-sensitive land uses in the proposed BLRT Extension project corridor using aerial photography, GIS data, and field surveys, typically within 300 feet of the alignment.
- Measured vibration-propagation characteristics of the soil in the proposed BLRT Extension project corridor at sensitive receptors (see **Section 4.2.2 – Affected Environment**).
- Projected proposed BLRT Extension project vibration levels from transit operations, using proposed BLRT Extension project drawings provided by the engineering team, and information on speeds, headways, track type, and vehicle vibration characteristics.
- Assessed the impact from transit by comparing the proposed BLRT Extension project vibration with the FTA vibration impact criteria in Chapter 8 of the FTA guidance manual (FTA, 2006).
- Recommended mitigation at locations where proposed BLRT Extension project vibration levels exceed the impact criteria.

5.2.1 Proposed BLRT Extension Project Vibration

This section describes the vibration impacts for the proposed BLRT Extension project. The proposed BLRT Extension project team conducted a Detailed Vibration Analysis and summaries of the analysis results are presented in **Tables 5-6 and 5-7** for residential and institutional (e.g., churches and schools) land uses, respectively.

The results include a tabulation of location information for each sensitive receptor group, the projections of future vibration levels, the impact criteria, and whether there would be vibration

impacts. The tables also show the total number vibration impacts for each location, without mitigation measures.

As shown in **Table 5-6**, the proposed BLRT Extension project would result in 28 vibration impacts for residential land uses (see **Appendix D** for locations of impacts). A summary of each residential location that would experience vibration impacts follows.

Table 5-6. Summary of Vibration Impacts for Residential Land Use

The vibration levels for each location are the highest levels projected for that location. Vibration projections at other receptors within each location would be lower. The threshold of human perception to LRT vibration is approximately 65 VdB or less, and annoyance begins to occur for frequent events at vibration levels over 70 VdB.

- **36th Avenue North to 38th Avenue North.** The vibration impacts at this location include the Windsor Court Apartments and a duplex to the north of the apartments. The residences are located to the east of the alignment. The impacts at this location are due to the speed of the LRT and the proximity of the residences to the proposed LRT alignment.
- **38th Avenue North to 40½ Avenue North.** The vibration impacts at this location include one single-family residence located to the east of the alignment. The impacts at this location are due to the speed of the LRT and the proximity of the residence to the proposed LRT alignment.
- **47th Avenue North to CP Rail Crossing.** The vibration impacts at this location include one single-family residence located to the east of the alignment. The impacts at this location are due to the speed of the LRT and the proximity of the residence to the proposed LRT alignment.

As shown in **Table 5-7**, the proposed BLRT Extension project would result in no vibration impacts for institutional land uses.

The vibration levels for each location are the highest levels projected for that location. Vibration projections at other receptors within each location would be lower. The threshold of human perception to LRT vibration is approximately 65 VdB or less, and annoyance begins to occur for frequent events at vibration levels over 70 VdB.

5.2.2 Cultural Resources

Based on data provided by MnDOT CRU of listed and eligible historic properties within the proposed BLRT Extension project vicinity, an assessment of the historic and cultural resources was conducted for the proposed BLRT Extension project. The assessment was conducted to determine the vibration sensitivity of the resources along the proposed BLRT Extension project corridor. For each resource site, a determination was made regarding the vibration sensitivity of the use and the FTA category it would fall under based on FTA guidance. The result of the assessment, which is summarized in **Table 5-8**, is that there are no vibration impacts at any historic or cultural resources along the proposed BLRT Extension project corridor.

In addition to the operational (long-term) assessment described above, an assessment for the potential for vibration-related construction (short-term) impacts also was conducted. The criteria for construction vibration impacts to damage buildings are based on the building category and fragility of the building, not its designation or use as a historic resource. In most cases, vibration generated by construction activities does approach levels high enough to cause damage, even for fragile buildings. The exceptions to this can be for activities such as vibratory rolling and impact pile driving. At distances within approximately 50 feet, these activities have the potential for damage to the most sensitive structures. Based on the list of the structures in **Table 5-7**, they would either not be included in the most stringent category or would not be close enough for there to be any potential for damage. Therefore additional assessment is not warranted.

5.2.3 Stations

There is no additional vibration associated with stations, and no vibration assessment for stations has been conducted.

5.2.4 Operations and Maintenance Facility

The operations and maintenance facility (OMF) is located more than 1,000 feet from any vibration-sensitive receptors and therefore no vibration impact is projected.

Table 5-8. Summary of Historic and Cultural Resources Vibration Assessment

Inventory #	Property Name	City	FTA Noise Cat.[1]	Notes
HE-CRC-199	Minneapolis & Pacific Railway Historic District (Soo Line)	Crystal	N/A	Not vibration sensitive.

Source: CSA, 2015

[1] N/A - Not included in any of the FTA vibration-sensitive categories. Not vibration sensitive.

5.2.5 Construction Vibration

Unlike typical LRT operations, there is the potential for damage to nearby structures at close distances due to construction vibration from activities such as pile driving, hoe rams, vibratory compaction and loaded trucks. Most limits on construction vibration are based on reducing the potential for damage to nearby structures. Although construction vibrations are only temporary, it is still reasonable to assess the potential for human annoyance and damage.

Since most of the buildings in the study area are typical engineered concrete and masonry or reinforced concrete, steel or timber construction, a vibration criterion of 98 VdB has been used to asses potential damage impact and 72 VdB has been used to assess potential vibration annoyance from construction activities. Vibration source levels at 25 feet and the distances to potential residential annoyance and potential damage are shown in **Table 5-9**. With the exception of impact pile driving, the potential for damage is limited to within 20 feet of construction activities. For impact pile driving, the distance for the potential for damage is up to 40 feet.

Because the exact location of construction equipment is important in projecting vibration levels, a more detailed assessment of potential vibration damage will be performed during final design when more accurate equipment locations are known. It is important to note that this assessment does not address potential damage to structures due to soil settlement or displacement due to construction activities. A summary of geological conditions and soils is found in Section 5.4 of the Final EIS. Section 4.3 of the Final EIS addresses issues related to potential displacement of residents and businesses resulting from the proposed BLRT Extension project.

Table 5-9. Summary of Potential Construction Vibration Impacts

Equipment	Vibration Level at 25 ft (VdB)	Distance to Potential Damage (98 VdB), ft	Distance to Potential Annoyance (72 VdB), ft
Impact pile driving	104	40	300
Push piling	84	8	62
Hoe ram	87	10	80
Caisson drilling	87	10	80
Loaded trucks	86	10	75
Clam shovel	94	20	135
Vibratory roller	94	20	135

6 Mitigation Measures

6.1 Noise

FTA guidance states that severe noise impacts should be mitigated unless there are no feasible or practical means to do so (FTA, 2006). For moderate impacts, discretion should be used, and proposed BLRT Extension project–specific factors should be included in the consideration of mitigation. The proposed BLRT Extension project–specific factors can include both the existing noise levels and the projected increase in noise levels; the types and number of noise-sensitive land uses with impacts; existing sound insulation of buildings; and the cost-effectiveness of providing noise mitigation. The Council has adopted a mitigation approach that details which moderate impacts will qualify for mitigation. This approach is detailed in **Section 6.1.1** below.

6.1.1 Metro Transit Noise Mitigation Approach

6.1.1.1 Noise Mitigation Thresholds (Part A)

Per FTA guidance, noise mitigation will be provided for all "Severe" impacts that meet the criteria for reasonableness, feasibility, and cost-effectiveness, as defined under Part B below.

At the "Moderate" impact level, FTA guidance requires the proposed BLRT Extension project sponsor to consider mitigation based on a number of factors, as defined in the FTA guidance manual. For the proposed BLRT Extension project, noise mitigation will be provided for all "Moderate" impacts, caused by the proposed BLRT Extension project, that meet the criteria for reasonableness, feasibility, and cost-effectiveness, as defined under Part B below, and at locations where the proposed BLRT Extension project has a "Moderate" impact and one of the following thresholds are exceeded:

1. Location(s) where the existing noise levels without the proposed BLRT Extension project are already 65 dBA L_{dn} or greater (see Exhibit 2.1-1).[6]
2. Location(s) where there is an increase of 3 dB or more in the L_{dn} over the existing level due to the proposed BLRT Extension project.[7]
3. The predicted increase in the L_{dn} over the existing level is less than 3 dB, the location is adjacent to an area with either "Severe Impact" or "Moderate Impact" with an increase in the L_{dn} of 3 dB or greater, and the inclusion of the adjacent properties will provide a logical and equitable terminus to the mitigation.

[6] A noise level of 65 dBA or greater is considered a "normally unacceptable" noise environment by the US Department of Housing and Urban Development. This threshold is also used by the Federal Aviation Administration for compatible land use.

[7] An increase in noise of 3 dB is generally considered the threshold for a noticeable change in noise in an outdoor setting and falls roughly at the midpoint of the "Moderate" impact range. This is a common threshold used in transit agency noise mitigation policies for an increase requiring mitigation.

6.1.1.2 Noise Mitigation Criteria (Part B)

Criteria for reasonableness, feasibility, and cost-effectiveness as included in FTA guidance are described below.

1. **Reasonableness:** For noise mitigation to be considered reasonable, it must provide at least a 5-dB reduction in proposed BLRT Extension project noise.[8]
2. **Feasibility:**
   - For noise mitigation to be considered feasible it must be practical from engineering, operations, and safety standpoints.
   - Other proposed BLRT Extension project factors may need to be considered in determining feasibility of mitigation. These could include community input, visual impacts and other proposed BLRT Extension project features that might limit mitigation.
3. **Cost-Effectiveness:** For noise mitigation to be considered cost-effective, the cost per benefited should be approximately what it would cost to build a 10-foot-high noise wall.

6.1.2 Noise Mitigation Methods

Several options exist for providing noise mitigation at the source, path or receiver. The most common noise mitigation measures are described below.

6.1.2.1 Source

Resilient or Damped Wheels: Using either resilient or damped wheels can achieve approximately a 2-dB reduction in wheel/rail noise from transit vehicles on typical track sections.

Track Dampers: Using damping materials on tracks can achieve an approximately 1–3-dB reduction in noise radiated from the tracks on typical track sections.

Vehicle Design: Certain design features of transit vehicles can provide some shielding and/or absorption of the noise generated by the vehicle. Acoustical absorption under the car can provide up to a 5-dB reduction in wheel/rail noise and propulsion-system noise on rapid transit trains. Similarly, vehicle skirts (which the existing Metro Transit vehicles have) over the wheels can provide up to 5 dB of reduction in noise.

Special Trackwork: Gaps in the rails at crossovers and turnouts generates around 6 dB of increased noise for locations close to the track. If crossover are located in sensitive areas and cannot be moved, one approach is to use special trackwork, such as spring-rail, moveable point, or flange bearing frogs to eliminate the gap in the rail at the crossover.

Quiet Zones: Quiet Zones are locations, as least one-half mile in length, where the sounding of horns has been eliminated because of safety improvements at at-grade crossings, including modifications

[8] 5 dB is a typical minimum reduction used by many agencies for mitigation to be considered an effective and reasonable mitigation measure.

to the streets, raised median barriers, four quadrant gates, and other improvements. Horns will only be sounded in emergency situations at these locations.

Wayside Devices: Wayside devices are mounted at the at-grade-crossing, directed down the roadway instead of mounted on the vehicle. The wayside devices are directive and provide warning to motorists and pedestrians at the at-grade crossing while limiting the noise exposure to areas adjacent to the crossing.

6.1.2.2 Path

Noise Barriers: This is the most common approach to reducing noise impacts from transit and rail projects. For noise barriers to be effective, they must break the line-of-sight between the source of the noise and the receiver. Additionally, the barrier must be made of a material that has a minimum surface density of 4 pounds/square foot and not have any gaps or holes that could degrade the performance of the barrier. Noise barriers can be made of virtually any material that meets these requirements, and can typically provide between 5 and 10 dB of reduction, depending on the design of the barrier. Proposed BLRT Extension project features, such as retaining walls or crash walls can act as effective noise barriers.

Berms: Berms are another approach to mitigating noise at the path. Berms work in much the same way as barriers, and need to block the line of sight between the source and the receiver to be effective. Berms can also provide between 5 and 10 dB of reduction, but are not commonly used in transit applications due to the space requirements (a berm typically must be twice as wide as it is tall).

6.1.2.3 Receiver

Sound Insulation: In locations where noise barriers are not feasible or practical, for multi-story buildings, or at locations where there is no exterior use, sound insulation of buildings can be an effective approach to noise mitigation. While it does not provide mitigation for exterior use, it can be very effective for indoor uses and provide between 5 and 10 dB of reduction. Sound insulation typically focuses on improvements to windows and doors, sealing any gaps or holes and providing central ventilation and air conditioning so that windows can remain closed. The criterion for indoor noise levels is 45 dBA L_{dn}.

6.1.3 Proposed BLRT Extension Project Noise Mitigation

The results in **Table 6-1** indicate that most residential noise impacts which meet the threshold for mitigation will be eliminated, based on FTA criteria, with the proposed mitigation measures. Quiet Zones, which allow for the use of LRT bells instead of horns at at-grade crossings, will eliminate most noise impacts. Additionally, the Quiet Zones will have the additional benefit of eliminating the existing freight horns as well. Additional mitigation measures required after implementation of Quiet Zones are shown in **Table 6-1**. More detailed descriptions of the noise mitigation measures are provided below.

N/A = not applicable

[1] The number of impacts without mitigation reflects the implementation of Quiet Zones. Quiet Zones are locations, at least one-half mile in length, where the routine sounding of horns has been eliminated because of safety improvements at at-grade crossings, including modifications to the streets, raised median barriers, four quadrant gates, and other improvements designed and implemented by the proposed BLRT Extension project and consistent with Quiet Zone readiness. Horns are sounded in emergency situations at these locations. Municipalities must apply to FRA for approval of Quiet Zones.

[2] The reported noise level increases are the range of increases in noise levels (without mitigation) due to the proposed BLRT Extension project for each location.

[3] If the proposed noise mitigation does not meet the reasonableness criteria as defined in the Regional Transitways Guidelines (March 2016) (see **Appendix F** of the Final EIS), or if the property owner(s) does not approve sound insulation, the proposed BLRT Extension project will result in additional residual noise impacts.

[4] The moderate impacts at these locations do not meet the threshold for mitigation as defined by the Regional Transitways Guidelines (March 2016) (see **Appendix F** of the Final EIS).

[5] The Council has determined that a noise barrier at these locations would not meet the reasonableness criteria for noise mitigation as defined in the Regional Transitways Guidelines (March 2016); specifically, a noise barrier at these locations does not meet cost-effectiveness criteria. As such, no noise barrier will be constructed to mitigate impacts to these residences. Final determination of mitigation measures for these residences will be assessed with on-site testing to determine if the residences meet the interior noise level criteria. Based on the results, the Council will identify the noise mitigation to be implemented for these residences during Engineering and once on-site measurements are completed. If an exceedance of interior noise level is identified at these locations, the Council will work with property owners on applicable mitigation. This could include implementation of sound insulation, which would still require approval by the property owner(s).

- **Olson Memorial Highway to Oak Park Avenue North, Minneapolis**. The potential mitigation measure at this location would include on-site testing to determine if the residences meet the interior noise level criteria.
- **Oak Park Avenue North to Plymouth Avenue North, Minneapolis**. The potential mitigation measure at this location would include on-site testing to determine if the residences meet the interior noise level criteria.

- **Plymouth Avenue North to 16th Avenue North, Golden Valley**. The potential mitigation measure at this location would include on-site testing to determine if the residences meet the interior noise level criteria.
- **16th Avenue North to Golden Valley Road, Golden Valley**. The potential mitigation measure at this location would include on-site testing to determine if the residences meet the interior noise level criteria.
- **Golden Valley Road to 26th Avenue North, Golden Valley**. The potential mitigation measure at this location would include a 10-foot-high, 2,540-foot-long noise barrier.
- **26th Avenue North to 31½ Avenue North, Robbinsdale**. The potential mitigation measure at this location would include a 10-foot-high, 2,540-foot-long noise barrier.
- **31½ Avenue North to 34th Avenue North, Robbinsdale**. The potential mitigation measure at this location would include a 10-foot-high, 1,200-foot-long noise barrier.
- **34th Avenue North to 36th Avenue North (NB), Robbinsdale**. The potential mitigation measure at this location would include an 8-foot-high, 1,325-foot-long noise barrier.
- **34th Avenue North to 36th Avenue North (SB), Robbinsdale**. The potential mitigation measure at this location would include on-site testing to determine if the residences meet the interior noise level criteria.
- **36th Avenue North to 38th Avenue North (NB), Robbinsdale.** The potential mitigation measure at this location would include an 8-foot-high, 3,110-foot-long noise barrier.
- **36th Avenue North to 38th Avenue North (SB), Robbinsdale**. The potential mitigation measure at this location would include a 6-foot-high, 650-foot-long noise barrier.
- **38th Avenue North to 40½ Avenue North, Robbinsdale**. The potential mitigation measure at this location would include an 8-foot-high, 3,110-foot-long noise barrier.
- **38th Avenue North to 40th Avenue North, Robbinsdale**. The potential mitigation measures at this location would include a 6-foot-high, 1,850-foot-long noise barrier and on-site testing to determine if the residences meet the interior noise level criteria.
- **40½ Avenue North to 42nd Avenue North, Robbinsdale**. The potential mitigation measures at this location would include a wayside device and an 8-foot-high, 3,110-foot-long noise barrier.
- **40th Avenue North to 42nd Avenue North, Robbinsdale**. The potential mitigation measures at this location would include a wayside device and on-site testing to determine if the residences meet the interior noise level criteria.
- **42nd Avenue North to MN-100 (NB), Robbinsdale**. The potential mitigation measure at this location would include on-site testing to determine if the residences meet the interior noise level criteria.
- **42nd Avenue North to MN-100 (SB), Robbinsdale**. The potential mitigation measure at this location would include a wayside device.

- **MN-100 to 47th Avenue North, Robbinsdale (NB)**. The potential mitigation measures at this location would include a wayside device, a 10-foot-high, 1,300-foot-long noise barrier, and on-site testing to determine if the residences meet the interior noise level criteria.
- **MN-100 to 47th Avenue North, Robbinsdale (SB)**. The potential mitigation measures at this location would include a wayside device and on-site testing to determine if the residences meet the interior noise level criteria.
- **47th Avenue North to CP Rail Crossing, Crystal**. The potential mitigation measures at this location would include a wayside device, a 10-foot-high, 1,300-foot-long noise barrier, and a 10-foot-high, 1,100-foot-long noise barrier and on-site testing to determine if the residences meet the interior noise level criteria.

The results of the noise assessment indicate that residential noise impacts at two locations (Golden Valley Road to 26th Avenue North and 31½ Avenue North to 34th Avenue North) are not mitigated, and that residual noise impacts would remain at these locations after mitigation. The results also indicate that all institutional noise impacts will be eliminated with the proposed mitigation measures. At all institutional locations, Quiet Zones, which allow for the use of LRT bells instead of horns at at-grade crossings, will eliminate the noise impacts. Additionally, the Quiet Zones will have the additional benefit of eliminating the existing freight horns as well. However, if the municipality fails to apply to FRA for Quiet Zone or if FRA fails to approve the Quiet Zone, the proposed BLRT Extension project would result in residual noise impacts at the associated locations.

6.1.4 Construction Noise Mitigation

The primary means of mitigating noise from construction activities is to require the contractors to prepare a detailed Noise Control Plan. A noise control engineer or acoustician will work with the contractor to prepare a Noise Control Plan in conjunction with the contractor's specific equipment and methods of construction. Key elements of a Plan include:

- Contractor's specific equipment types
- Schedule and methods of construction
- Maximum noise limits for each piece of equipment with certification testing
- Prohibitions on certain types of equipment and processes during the nighttime hours without local agency coordination and approved variances
- Identification of specific sensitive sites where near construction sites
- Methods for projecting construction noise levels
- Implementation of noise control measures where appropriate
- Methods for responding to community complaints

6.2 Vibration

Vibration and ground-borne noise impacts that exceed the FTA criteria are considered significant and should be mitigated unless there are no feasible or practical means to do so. Vibration mitigation is primarily applied at the source, generally the track structure, and is dependent on the frequency content of the vibration and any resonances of the materials. The most common vibration mitigation measures are described below.

6.2.1 Vibration Mitigation Methods

Ballast Mats: A ballast mat is a pad made of rubber or other material placed underneath the ballast and mounted on top of an asphalt or concrete base. Ballast mats provide a modest reduction in vibration levels at frequencies above 40 Hz.

Tire Derived Aggregate: Tire Derived Aggregate, or shredded tires, consists of a layer of tire shreds wrapped in geotechnical fabric placed underneath the ballast and placed on hard packed ground. This is a low-cost, but still unproven mitigation option that provides a reduction in vibration levels at frequencies above 25 Hz.

Resilient Rail Fasteners: Resilient fasteners are typically used on direct fixation track on aerial structures or in tunnels. They include a resilient component in the fastener to provide vibration isolation. Resilient rail fasteners provide a reduction in vibration at frequencies above 40 Hz.

Resiliently Supported Concrete Ties: Resiliently supported concrete ties, or undertie pads, consist of a rubber pad mounted on the bottom of a concrete tie. The pads provide vibration isolation at frequencies above 25 Hz.

Floating Slabs: Floating slabs consist of thick concrete slabs mounted on rubber or steel springs pads on a concrete foundation. Floating slabs can provide vibration isolation at very low frequencies, but are expensive to build and maintain.

Special Trackwork: Gaps in the rails at crossovers and turnouts generates around 10 dB of increased vibration for locations close to the track. If crossovers are located in sensitive areas and cannot be moved, one approach is to use special trackwork, such as spring-rail, moveable point, or flange bearing frogs to eliminate the gap in the rail at the crossover.

6.2.2 Proposed BLRT Extension Project Vibration Mitigation

The results in **Table 6-2** indicate that all residential vibration impacts will be eliminated with the proposed mitigation measures (there are no projected institutional vibration impacts). Ballast mats or the equivalent will eliminate the vibration impacts at all locations. Detailed descriptions of the noise mitigation measures are provided below.

Table 6-2. Summary of Residential Vibration Mitigation Measures

Location	City	# of Impacts without Mitigation	Proposed Mitigation Measure	Residual Impacts with Mitigation
6th Ave N to 38th Ave N	Robbinsdale	26	700-foot ballast mat	0
38th Ave N to 40½ Ave N	Robbinsdale	1	300-foot ballast mat	0
47th Ave N to CP rail crossing	Crystal	1	300-foot ballast mat	0
	Total	**28**	**1,300-foot ballast mat**	**0**

Source: CSA, 2015

- **36th Avenue North to 38th Avenue North.** The proposed mitigation at this location would be a ballast mat 700 feet in length under both tracks from Station 2246+50 to Station 2253+50. The ballast mat should be designed to provide at least 5 dB of reduction in vibration levels at 100 Hz and higher.
- **38th Avenue North to 40½ Avenue North.** The proposed mitigation at this location would be a ballast mat 300 feet in length under both tracks from Station 2260+00 to Station 2263+00. The ballast mat should be designed to provide at least 5 dB of reduction in vibration levels at 100 Hz and higher.
- **47th Avenue North to CP Rail Crossing.** The proposed mitigation at this location would be a ballast mat 300 feet in length under both tracks from Station 2335+50 to Station 2338+50. The ballast mat should be designed to provide at least 5 dB of reduction in vibration levels at 100 Hz and higher.

6.2.3 Construction Vibration Mitigation

The most effective methods for minimizing the impact from construction vibration is to limit the use of high-vibration activities such as impact pile driving and vibratory rolling and to include vibration limits in the construction specifications. To mitigate potential vibration impact from construction activities, the following measures will be applied where feasible:

- **Limit Construction Hours:** Prohibit high-vibration activities at night.
- **Construction Specifications:** Include limits on vibration in the construction specifications, especially at locations where high-vibration activities such as impact pile driving may occur.
- **Alternative Construction Methods:** Minimize the use of impact and vibratory equipment, where possible and appropriate. Use low vibration alternatives, such as push piling or pre-drilled holes for piling.
- **Truck Routes:** Use truck haul routes that minimize exposure to sensitive receptors and minimizes damage to roadway surfaces, where appropriate.
- **Pre-Construction Survey:** Perform pre-construction surveys to document the existing conditions of all structures in the vicinity of sites where high-vibration construction activities will be performed.
- **Vibration Monitoring:** If a construction activity has the potential to exceed the damage criteria at any building, the contractor is required to conduct for vibration monitoring and, if the vibration exceeds the limit, the activity must be modified or terminated.

Biological Environment Technical Report

May 2016

Blue Line Extension Project Technical Report

METROPOLITAN COUNCIL

This page intentionally left blank

Executive Summary

This technical report summarizes the biological environment within the proposed METRO Blue Line Light Rail Transit (BLRT) Extension project area. The intent of this technical report is to support and augment the Final Environmental Impact Statement (Final EIS) being prepared for the proposed BLRT Extension project. Federally listed or monitored species potentially within the proposed BLRT Extension project corridor included the northern long-eared bat (*Myotis septentrionalis*; Federally Threatened) and the bald eagle (*Haliaeetus leucocephalus*; de-listed but on the "Watchlist"). State-listed species potentially within the proposed BLRT Extension project corridor include Blanding's turtle (*Emydoidea blandingii*; State Threatened). Several swallows nests were identified under proposed BLRT Extension project area bridges, though the numbers of nests are very low. Swallows are under the purview of the Migratory Bird Treaty Act. Habitats throughout the proposed BLRT Extension project area are generally highly disturbed. As a result of disturbance, a variety of noxious weed species have infested undeveloped habitats throughout the proposed BLRT Extension project area.

1 Introduction

1.1 Report Purpose

The purpose of this technical report is to augment the Final Environmental Impact Statement (Final EIS) that was prepared for the proposed METRO Blue Line Light Rail Transit (BLRT) Extension project. This technical report:

- Summarizes biological resources in and near the proposed BLRT Extension project area
- Discusses the potential for impacts to biological resources as a result of the proposed BLRT Extension project and the regulatory context associated with them
- Discusses measures to avoid, minimize and mitigate for potential impacts to biological resources within the proposed BLRT Extension project area

This report discusses both aquatic and terrestrial biological resources within the proposed BLRT Extension project area. Additional information concerning related aquatic resources in the proposed BLRT Extension project area is included in the Water Resources Technical Report (SEH, 2015).

1.2 Project Limits

The proposed BLRT Extension project includes a corridor from the Target Field Station in the City of Minneapolis that extends westward along Olson Memorial Highway (Trunk Highway [TH] 55) to the BNSF Railway (BNSF) rail corridor, then north and west along the BNSF rail corridor to approximately 73rd Avenue in the City of Brooklyn Park, then northeastward to West Broadway Avenue (County State-Aid Highway 103), then north to an area just north of TH 610. A portion of the alignment is within the separate West Broadway Avenue Reconstruction project which is being developed by Hennepin County. Biological resources within the West Broadway Avenue Reconstruction segment are described in the Environmental Assessment Worksheet (EAW) prepared for that Hennepin County project.

Figure 1 on page 17 provides a general location map for the proposed BLRT Extension project area. **Figure 2** starting on page 21 is a 24-page mapbook of the proposed BLRT Extension project area showing aerial imagery and notable terrestrial habitats within and near the proposed BLRT Extension project area.

2 Affected Environment and Environmental Consequences

Section 2.1 – **Affected Environment** discusses biological resources that have been documented, historically or recently, within or near the proposed BLRT Extension project area. In this section, each notable species or feature is assessed as to whether there is some potential for impact as a result of the proposed BLRT Extension project. Those species or features that have a negligible potential for impact as a result of the proposed BLRT Extension project are not discussed further, while those species or features for which impacts may potentially occur are discussed further (**Section 2.2** – **Environmental Consequences**).

2.1 Affected Environment

Generally, the proposed BLRT Extension project area is characterized as fully urbanized land use from downtown Minneapolis west and north to TH 610, and urbanizing rural land use north of TH 610. Land north of TH 610 is a mosaic of agricultural fields, abandoned old agricultural fields, scattered forest patches, a manicured corporate campus, and limited development.

The portion of the proposed BLRT Extension project area from Theodore Wirth Regional Park (TWRP) eastward into downtown Minneapolis is highly urbanized with no natural habitat types present.

The large central portion of the proposed BLRT Extension project area from Olson Memorial Highway to approximately 36th Avenue North (cities of Minneapolis, Golden Valley, and Robbinsdale) is characterized by abundant parkland with a mosaic of forested habitat types and aquatic resources.

The portion of the proposed BLRT Extension project area that lies between approximately 36th Avenue North and TH 610 (cities of Robbinsdale, Crystal, and Brooklyn Park) is highly urbanized residential and industrial land with sparse open lands. Undeveloped property tends to be heavily disturbed, vacant land, or utilized for stormwater treatment.

The proposed BLRT Extension project area north of TH 610 lies at the southern edge of the Anoka Sand Plain. As such, existing plant communities are underlain by thick deposits of sand. The extent of wetlands within the Anoka Sand Plain has been diminishing over time as a result of sinking water tables.

2.1.1 Federally Listed Species (Endangered Species Act)

2.1.1.1 Regulatory Context

Rare species are regulated at the federal level by the US Fish and Wildlife Service (USFWS) under the Endangered Species Act and several related laws. The Endangered Species Act classifies species as Endangered, Threatened, or as Watchlist; “Endangered” meaning a species is in danger of extinction throughout all or a significant portion of its range, “Threatened” meaning a species is likely to become endangered within the foreseeable future and “Watchlist” meaning species that are rigorously monitored prior to listing or after de-listing.

Potential impacts to federally listed species require coordination with USFWS in a process known as Section 7 Endangered Species Act consultation. The end result of the Section 7 Endangered Species Act consultation is a determination of:

- **No Effect.** No impacts positive or negative on the subject species.
- **May Affect, Not Likely to Adversely Affect.** Any potential impacts are either beneficial, insignificant, or discountable.
- **May Affect, Likely to Adversely Affect.** Any potential impacts would be negative and beyond an insignificant or discountable level.

2.1.1.2 Potential Documented Species

Northern Long-Eared Bat (*Myotis septentrionalis*). The northern long-eared bat (NLEB) has a biogeographical range that includes all counties in Minnesota. The NLEB was listed as Federally Threatened in May 2015. The NLEB typically winters in large groups within caves (hibernacula) and migrates to forested areas for the spring, summer, and early fall. Known hibernacula are not present within the proposed BLRT Extension project area; however, several are known along the Mississippi River in the vicinity of the Twin Cities (USFWS, 2015). Known hibernacula would not be impacted as a result of the proposed BLRT Extension project. Pregnant female NLEB congregate in maternity colonies, often under the bark or in cavities of maternity roost trees. The NLEB then disperses to other forested areas to forage before migrating back to the hibernacula in the fall (USFWS, 2015a). There are no documented maternity roost trees in Hennepin County (NHIS, 2015). Typical summer foraging habitat (non maternity colonies) for the NLEB consists of larger forested area and forest remnants. Summer habitat may consist of any of approximately 35 tree species of a size 3 inches diameter at breast height (DBH) or larger.

Summer habitat (forest remnants) for the NLEB is present throughout portions of the proposed BLRT Extension project area. Some tree clearing and grubbing would be required for the proposed BLRT Extension project; therefore, it is discussed further in **Section 2.2 – Environmental Consequences**.

Bald Eagle (*Haliaeetus leucocephalus*). Some forested habitat adjacent to aquatic resources could be suitable for bald eagle nesting in and near the proposed BLRT Extension project. There are no nests currently known within the immediate vicinity of the proposed BLRT Extension project area; however, a single nest has been documented approximately 1 mile east of the proposed BLRT Extension project area. Bald eagle nest locations change over time; therefore, the bald eagle is discussed further in **Section 2.2 – Environmental Consequences**.

Dwarf Trout Lily (*Erythronium propullans*). Based on field data collection throughout the spring and summer of 2015, habitat for the dwarf trout lily is not likely present in the proposed BLRT Extension project area. However, this documented population of dwarf trout lilies was transplanted to the Eloise Butler Wildflower Sanctuary (part of TWRP about ½ to ¾ mile southwest of the proposed BLRT Extension project) early in the 20th century from a population in southern Minnesota. The dwarf trout lily typically requires rich maple basswood forest and relatively undisturbed elm and cottonwood dominated floodplain forests. Forests throughout the proposed

BLRT Extension project area are highly disturbed and not suitable habitat for this rare plant species.

Table 1 summarizes federally listed species discussed in this technical report (NHIS, 2015).

Table 1. Summary of Federally Listed Species Documented near the Proposed BLRT Extension Project Area

Species	Federal Status	Notes
Northern long-eared bat (*Myotis septenrtionalis*)	Threatened	Listed per the Endangered Species Act in May 2015. Forested areas throughout Minnesota potentially used for summer roosting habitat.
Bald eagle (*Haliaeetus leucocephalus*)	Watchlist	De-listed from the federal list of threatened and endangered species; population still monitored. Documented nest east of the proposed BLRT Extension project.
Dwarf trout lily (*Erythronium propullans*)	Endangered	Re-discovered in 2005 in TWRP in the Eloise Butler Wildflower Garden well to the southwest of the proposed BLRT Extension project area (south of Olson Memorial Highway).

Source: Natural Heritage Information System database search (Licensing Agreement 722_2014)

2.1.2 Migratory Bird Treaty Act

2.1.2.1 Regulatory Context

The Migratory Bird Treaty Act (MBTA) was enacted in 1918 as a means of protecting migratory bird populations from over-harvesting. USFWS oversees and enforces the MBTA. USFWS issues depredation permits for destruction of active nests of species covered under the MBTA. A depredation permit is not needed for destruction of nests that are not active. The Minnesota Department of Natural Resources (DNR) also has permit authority over the destruction of active bird nests.

2.1.2.2 Potential Documented Species

A large number of migratory bird species are covered under the MBTA. These species may pass through or nest in or near the proposed BLRT Extension project area as part of their seasonal migrations. Some species may nest in vegetated habitats and others, like the Barn Swallow and Cliff Swallow, have adapted to building mud nests under bridges and on other human-made structures.

Bridges and structures were examined during the summer of 2015 for the presence of barn and cliff swallows and nests. Several empty and occupied nests were observed on the underside of proposed BLRT Extension project area bridges; however, the number of nests was low. **Table 2** summarizes swallow nest locations and characteristics.

Table 2. Summary of Observed Swallow Nests within the Proposed BLRT Extension Project Area

Location	Nests Observed	Notes
Golden Valley Road Bridge	2 nests	Observed on June 10, 2015. No swallows were present.
Theodore Wirth Parkway Bridge	0 nests	Observed on June 10, 2015. No nests or swallows were observed.
Plymouth Avenue Bridge	1 nest	Observed on June 10, 2015. Swallow observed sitting on electrical conduit next to nest.
36th Avenue Bridge	0 nests	Observed on June 10, 2015. No swallows observed.

Source: Metropolitan Council (Council) Field Observations (2015)

2.1.3 State-Listed Species and Other Element Occurrences

2.1.3.1 Regulatory Context

Minnesota's Endangered Species Statute (Minnesota Statutes, Section 84.0895) requires DNR to adopt rules designating species meeting the statutory definitions of endangered, threatened, or species of special concern. The resulting List of Endangered, Threatened, and Special Concern Species is codified as Minnesota Rules, Chapter 6134. The Endangered Species Statute also authorizes DNR to adopt rules that regulate treatment of species designated as endangered and threatened. These regulations are codified as Minnesota Rules, Parts 6212.1800 to 6212.2300.

Data concerning rare species and element occurrences derive from the Natural Heritage Information System (NHIS, 2015) and are summarized below per rules restricting the public disclosure of exact locations of rare species and features.

2.1.3.2 Potential Documented Species

The following species have been historically documented within approximately a 1 mile buffer of the proposed BLRT Extension project.

Long-Bearded Hawkweed (*Heiraceum longipilum*). Long-bearded hawkweed may be present in dry old field habitat north of TH 610, it is not State-listed; therefore, it is not discussed further in **Section 2.2 – Environmental Consequences**.

Water Willow (*Decodon verticillatus*). Water willow is not likely present in the proposed BLRT Extension project area and it is not a State-listed species; therefore, it is not discussed further in **Section 2.2**.

Valerian (*Valerian edulis* var. *ciliata*). The valerian, last observed in 1891 near but outside the proposed BLRT Extension project area, is not likely present; therefore, it will not be discussed further in **Section 2.2**.

Least Darter (*Etheostoma microperca*). The least darter is not likely present in the proposed BLRT Extension project area and it is not a State-listed species; therefore, it is not discussed further in **Section 2.2**.

Hooded Warbler (*Setophaga citrina*). The hooded warbler may be present in the proposed BLRT Extension project area; however, it is not a State-listed species; therefore, it is not discussed further in **Section 2.2**.

Bullfrog (*Lithobates catesbeiana*). The bullfrog is may be present in the proposed BLRT Extension project area; however, it is not a State-listed species; therefore, it is not discussed further in **Section 2.2**.

Peregrine Falcon (*Falco peregrinus*). The peregrine falcon is not likely present in the proposed BLRT Extension project area; therefore, it is not discussed further in **Section 2.2**.

Blanding's Turtle (*Emydoidea blandingii*). The Blanding's turtle is potentially present in the proposed BLRT Extension project area; therefore, it is discussed further in **Section 2.2**.

Table 3 summarizes status and documented observations of species listed as State Endangered, State Threatened, or state Special Concern (NHIS, 2015).

Table 3. Summary of State-Endangered, State-Threatened and State Special Concern Species Documented Near the Proposed BLRT Extension Project

Species	State Status	Notes
Long-bearded hawkweed (*Hieracium longipilum*)	Not-listed (State Watchlist)	Known from two dry prairie/old field locations north and east of the northern terminus of the proposed BLRT Extension project area.
Water willow (*Decodon verticillatus*)	Special Concern	Observed in the 1940s and 1950s in two lakes in the City of Robbinsdale outside (east) of the proposed BLRT Extension project area.
Valerian (*Valeriana edulis* var. *ciliata*)	Threatened	Last observed in 1891 outside (southwest) of the proposed BLRT Extension project area.
Least darter (*Etheostoma microperca*)	Special Concern	Observed in 1931 in a lake in the City of Robbinsdale outside (east) of the proposed BLRT Extension project area.
Hooded warbler (*Setophaga citrina*)	Special Concern	Observed during breeding season in 1979 in TWRP.
Bullfrog (*Lithobates catesbeianus*)	Not-listed (State Watchlist)	Observed in 2003, 2008, and 2011 in a shallow pond connected to Bassett Creek.
Peregrine falcon (*Falco peregrinus*)	Special Concern	Observed nesting in 2000, 2003 and 2011 in downtown Minneapolis on several skyscraper buildings.
Blanding's turtle (*Emydoidea blandingii*)	Threatened	A dead female Blanding's turtle was observed in 2000 on Olson Memorial Highway near TWRP.

Source: Natural Heritage Information System database search (Licensing Agreement # LA722_2014)

2.1.3.3 Documented Other Element Occurrences

Colonial Waterbird Nesting Areas. Colonial Waterbird Nesting Areas are not currently present in the proposed BLRT Extension project area; however, rookery locations do change over time and therefore locations will be monitored. Locations of colonial waterbird nesting areas are not discussed further in **Section 2.2 – Environmental Consequences**. Occupied rookeries, typically occupied by Great Blue Herons and Double-Crested Cormorants, are usually quite obvious. Rookery locations will be monitored over the course of planning and construction of the proposed BLRT Extension project.

Tamarack Swamp (Southern) Type. The Tamarack Swamp identified in the Natural Heritage database is not located within the proposed BLRT Extension project area; therefore, it is not discussed further in **Section 2.2**.

Table 4 summarizes rare features that have documented near the proposed BLRT Extension project area.

Table 4. Summary of Rare Features Documented near the Proposed BLRT Extension Project Area

Element Occurrence	State Status	Notes
Colonial Waterbird Nesting Area	Tracked by DNR Natural Heritage Program	Two locations observed in 1997, 1998 and 2010 outside (east and west) of the proposed BLRT Extension project area.
Tamarack Swamp (Southern) Type	Tracked by DNR Natural Heritage Program	Observed in 1998 within TWRP outside (southwest) of the proposed BLRT Extension project area.

Source: Natural Heritage Information System, 2015 (Licensing Agreement # LA 722_2014)

2.1.4 Noxious Weeds

The Minnesota and Federal Noxious and Prohibited Weed List (updated May 15, 2014) (DNR, 2014) was reviewed to determine the status of invasive species encountered during spring and summer (2015) fieldwork by SEH within the proposed BLRT Extension project area and associated facilities.

The urbanized and highly disturbed nature of much of the proposed BLRT Extension project area provides abundant suitable habitat for infestations of noxious and invasive plant species.

Table 5 summarizes common noxious plant species, their status, and general locations observed during fieldwork.

Table 5. Noxious Plant Species Observed within the Proposed BLRT Extension Project Area

Plant Species	Noxious Status[1]	Notes
Garlic mustard (*Alliaria petiolata*)	RN	Ubiquitous in forested plant communities throughout the proposed BLRT Extension study area.
Spotted knapweed (*Centaurea stoebe* ssp. *micranthos*)	SN	Common on railroad ballast and adjacent dry ditches.
Canada thistle (*Cirsium arvense*)	SN	Common throughout the proposed BLRT Extension project area.
Leafy spurge (*Euphorbia esula*)	SN	Common on railroad ballast and adjacent dry ditches.
Wild parsnip (*Pastinaca sativa*)	SN	Common on disturbed embankments throughout the proposed BLRT Extension project area.
Japanese knotweed (*Polygonum cuspidatum*)	SN	Observed in highly disturbed forest.
European buckthorn (*Rhamnus cathartica*)	RN	Ubiquitous in the herbaceous, shrub and tree strata of forested areas throughout the proposed BLRT Extension project area and associated facilities.
Poison ivy (*Toxicodendron radicans*)	SN	Common in vegetated areas throughout the proposed BLRT Extension project area and associated facilities.

Source: The Minnesota and Federal Noxious and Prohibited Weed List (May 15, 2015, update) and field observations.

[1] RN = Restricted Noxious Weed, SN = State Noxious Weed

2.1.5 Notable Terrestrial and Aquatic Habitats within and near the Proposed BLRT Extension Project Area

Wildlife species that inhabit fallow land, terrestrial or aquatic, within and near the proposed BLRT Extension project area are generalist species adapted to urbanized conditions. These species are generally more tolerant of human presence and activities, including traffic (pedestrian, rail, and vehicular), and have demonstrated by their presence that they adapt readily to the human environment. **Table 6** and text below describe notable terrestrial and aquatic habitats, respectively.

The notable terrestrial habitats within and near the proposed BLRT Extension project area are relatively large forested areas in an urbanized setting. As such they provide feeding, loafing and resting habitat for generalist species adapted to urbanized conditions. Common generalist wildlife species that thrive in such urbanized terrestrial habitat include white-tailed deer, rabbit, coyote, red fox, raccoon, opossum, grey squirrel, chipmunk, wild turkey, red-tailed hawk, and a variety of common songbirds and migration stopover habitat for neo-tropical migratory songbird species. Additionally, notable terrestrial habitats within and near the proposed BLRT Extension project area may provide summer roosting habitat for the NLEB, a Federally Threatened species. The total acreage of notable terrestrial habitats in and near the proposed BLRT Extension project is approximately 269 acres.

Notable terrestrial habitats (i.e., large contiguous forest complexes) within and near the proposed BLRT Extension project area were identified with a combination of Minnesota Land Cover Classification System (MLCCS) and field data collection. MLCCS forest polygons were identified within approximately ¼ mile of the proposed BLRT Extension project. These polygons were compared to recent aerial photography to identify areas where forest had been cleared after the MLCCS data were gathered. The MLCCS polygons were trimmed accordingly. Areas of large contiguously forested areas were classified as notable terrestrial habitats (see **Table 6**).

The notable aquatic habitats identified in the proposed BLRT Extension project area provide refuge for a variety of frogs and toads, turtles, snakes, waterfowl and songbird species. The total acreage of notable aquatic habitat in and near the proposed BLRT Extension project area is approximately 49 acres. Notable aquatic habitats within and near the proposed BLRT Extension project area were identified through fieldwork conducted in the spring and summer of 2015.

MLCCS data did not identify any natural habitat within the proposed BLRT Extension project area of greater than a D letter grade. The majority of the habitat quality was given a grade of NN or NA as the habitat is considered non-native, altered, or disturbed. Field data collection during 2015 verified the disturbed nature of habitats within and near the proposed BLRT Extension project area.

Table 6. Notable Terrestrial and Aquatic Habitats within and near the Proposed BLRT Extension Project Area

Notable Habitat ID	Location	Total Size (ac)
101st Avenue North Complex (**Terrestrial**)	Northwest quadrant of Highway 169 and 101st Avenue North	16.8
Target Corp #1 Complex (**Terrestrial**)	North of TH 610 and east of Winnetka Avenue East	20.4
Target Corp #2 Complex (**Terrestrial**)	Adjacent to intersection of Winnetka Avenue North and West Broadway Avenue	23.2
Shingle Creek Complex (near the proposed BLRT Extension project) (**Terrestrial**)	Adjacent to Shingle Creek near the proposed BLRT Extension project	20.7
North Rice Pond – Sochacki Park Complex (**Terrestrial**)	West side of BNSF tracks from ~35th Avenue North to Golden Valley Road	57.5
Grimes Pond Complex (**Terrestrial**)	East side of BNSF tracks just south of Grimes Pond	11.9
Saint Mary Margaret – MPRB Complex (**Terrestrial**)	East side of BNSF tracks just north of Golden Valley Road	6.9
Theodore Wirth Complex (**Terrestrial**)	Both side of BNSF tracks from Golden Valley Road south to Olson Memorial Highway	62.1
Olson Memorial Highway Complex **(Terrestrial)**	South side of Olson Memorial Highway on both sides of existing BNSF tracks	24.7
Xerxes Complex (**Terrestrial**)	South side of Olson Memorial Highway near Glenwood Avenue and Xerxes Avenue North	24.9
North and South Rice Ponds (**Aquatic**)	Cities of Robbinsdale and Golden Valley on west side of existing BNSF tracks	24.72
Grimes Pond (**Aquatic**)	City of Robbinsdale on the east side of existing BNSF tracks	7.41
Golden Valley Road Ponds (**Aquatic**)	North side of Golden Valley Road on both sides of the existing BNSF tracks	5.08
TWRP (Bassett Creek and backwater) (**Aquatic**)	North and south of the Plymouth Avenue Bridge on the west side of the existing BNSF tracks	11.85

Source: MLCCS and field data collection (Council, 2015)

2.2 Environmental Consequences

2.2.1 Federally Listed Species

Species that are federally listed or on the Federal "Watchlist" that could potentially be affected by the proposed BLRT Extension project include the NLEB (Federally Threatened) and the bald eagle (on the federal "Watchlist").

2.2.1.1 Measures to Avoid and Minimize Impacts

Northern Long-Eared Bat (*Myotis septentrionalis*). Potential impacts to the NLEB can be minimized by avoiding tree clearing and grubbing. For forested areas 15 acres or larger that cannot be avoided, tree clearing would be restricted between April 1 and October 1 as prescribed in the Interim 4(d) Guidelines developed for the NLEB (USFWS, 2015c). The proposed BLRT Extension project team is working closely with USFWS in order to assure that potential impacts to the NLEB are minimized to the extent practicable.

Bald Eagle (*Haliaeetus leucocephalus*). Though the bald eagle has been de-listed from the ESA, it is still protected under several other federal laws. Bald eagle nest locations change over time and there is the potential for bald eagles to nest in and near the proposed BLRT Extension project area. Bald eagles are particularly vulnerable during the nesting season which extends from late January to late July. The non-nesting season is from August to mid-January. Nest locations will be monitored throughout the planning and construction phases of the proposed BLRT Extension project. If new bald eagle nests are observed in close proximity to the construction limits of the proposed BLRT Extension project during the planning and construction phases of the proposed BLRT Extension project, USFWS will be consulted to determine appropriate actions or restrictions that may apply.

2.2.1.2 Unavoidable Impacts

Northern Long-Eared Bat. Based on its analysis of proposed tree clearing in the proposed BLRT Extension project area and adherence to the Final "4(d) Rule," USFWS has concurred with the Federal Transit Administration's (FTA) determination that the proposed BLRT Extension project merits a determination of "may affect, Incidental Take Not Prohibited" with respect to the NLEB.

Bald Eagle. With ongoing nest reconnaissance and adherence to acceptable permit provisions and seasonal work windows, the proposed action is not likely to negatively impact the bald eagle.

2.2.2 Migratory Bird Treaty Act

2.2.2.1 Measures to Avoid and Minimize Impacts

Generally, USFWS and DNR require seasonal work windows in order to comply with the MBTA and the DNR General Permit 2004 – 0001 provisions. The following measures are acceptable to USFWS and DNR:

- Bridge work may be performed (started and finished) outside of the nesting season (i.e., before May 15 or after September 1). No permit would be required for this activity.
- Bridge work may begin after May 15 and nest completion can be prevented by removing the nests (at least three times per week) as they are being built, or through the use of barriers to prevent nest establishment from occurring. The success of this measure depends on the number of nests on a bridge, and the ability to restrict access. If the bridge contains only a few nests, the birds should be easily deterred from nesting. Removal of unfinished nests is acceptable to USFWS, which considers this to be non-lethal harassment. No permits would be required for this activity.

Very few swallow nests were observed on bridge structures within the proposed BLRT Extension project area. Therefore, it should be feasible to remove existing nests or exclude new nest establishment during a seasonal period when they are inactive. During construction of the proposed BLRT Extension project, nest building should be prevented on the underside of bridge structures by removing nests as they are built, if needed.

2.2.2.2 Unavoidable Impacts

With the implementation of acceptable measures to minimize (**Section 2.2.2.1**) there would be no impacts resulting from the proposed BLRT Extension project to species covered under the MBTA.

2.2.3 State-Listed Species and Other Element Occurrences

2.2.3.1 Measures to Avoid and Minimize Impacts

DNR has issued guidelines on measures to minimize potential impacts to Blanding's turtle. These measures include provisions such as seasonal work windows, installation and removal of silt fences, and educational materials to use at the construction site to inform the contractor and workers what the look for, and how to handle occurrences.

2.2.3.2 Unavoidable Impacts

Blanding's Turtle. The Blanding's turtle may be present within the proposed BLRT Extension project area. With adherence to the DNR guidelines concerning minimization of impacts to Blanding's turtle, we conclude that potential impacts to this species would likely be negligible.

Other Element Occurrences. The proposed subject project would not impact any rare plant communities or animal aggregation areas (i.e., colonial waterbird nesting areas) that have been inventoried by DNR.

2.2.4 Noxious Weeds

Given the urban and highly disturbed nature of the proposed BLRT Extension LRT project area, noxious weeds are ubiquitous. Some measures, such as spot spraying with appropriate herbicides, can be taken to control invasive species within construction areas and staging areas. A vegetation management plan will be developed to include measures like these to control noxious weeds along the proposed BLRT Extension project. However, permanent eradication of invasive or noxious weeds within the proposed BLRT Extension project area will not be feasible.

2.2.5 Notable Terrestrial and Aquatic Habitats within the Proposed BLRT Extension Project Area

2.2.5.1 Measures to Avoid and Minimize Impacts

Complete avoidance of impacts to notable terrestrial and aquatic habitats within the proposed BLRT Extension project area was not feasible. Several opportunities to minimize impacts are under consideration in the design process, summarized as follows:

- **Rail bridge across Golden Valley Ponds.** The proposed BLRT Extension project will use a bridge to cross Golden Valley Ponds, an identified notable aquatic resource. The alternative design would have used a continuous embankment of fill which would have caused considerably more impacts to this aquatic resource.
- **Rail bridge across Grimes Pond.** The proposed BLRT Extension project will use a bridge to cross Grimes Pond, an identified notable aquatic resource. The alternative design would have used a continuous embankment of fill which would have had considerably more impacts to this aquatic resource.
- **Pre-treatment storm BMPs.** Several BMPs, such as infiltration, retention and detention will be part of the proposed BLRT Extension project and associated facilities. These BMPs will serve to improve the water quality of downslope or downstream aquatic resources.
- **Design of on-site mitigation areas that would minimize impacts to forested areas and existing aquatic resources.** Several on-site mitigation areas have been identified that would require negligible tree clearing and would restore aquatic habitat that has been lost as a result of fill or diminished hydrology.

2.2.5.2 Unavoidable Impacts

Notable terrestrial habitats (i.e., large contiguous forest complexes) identified within and near the proposed BLRT Extension project area may provide suitable summer roosting habitat for the NLEB as well as foraging and resting habitat for a variety of generalist wildlife species. Notable aquatic habitats identified within and near the proposed BLRT Extension project area provide refuge for a variety of frogs and toads, turtles, waterfowl, and songbirds. **Table 7** summarizes total size and potential impacts to Forest Complexes within and near the proposed BLRT Extension project area.

In addition to impacts to notable terrestrial habitat summarized in **Table 7**, 194 acres of numerous small forest remnants (76 forest patches) are present within approximately ¼ mile of the proposed

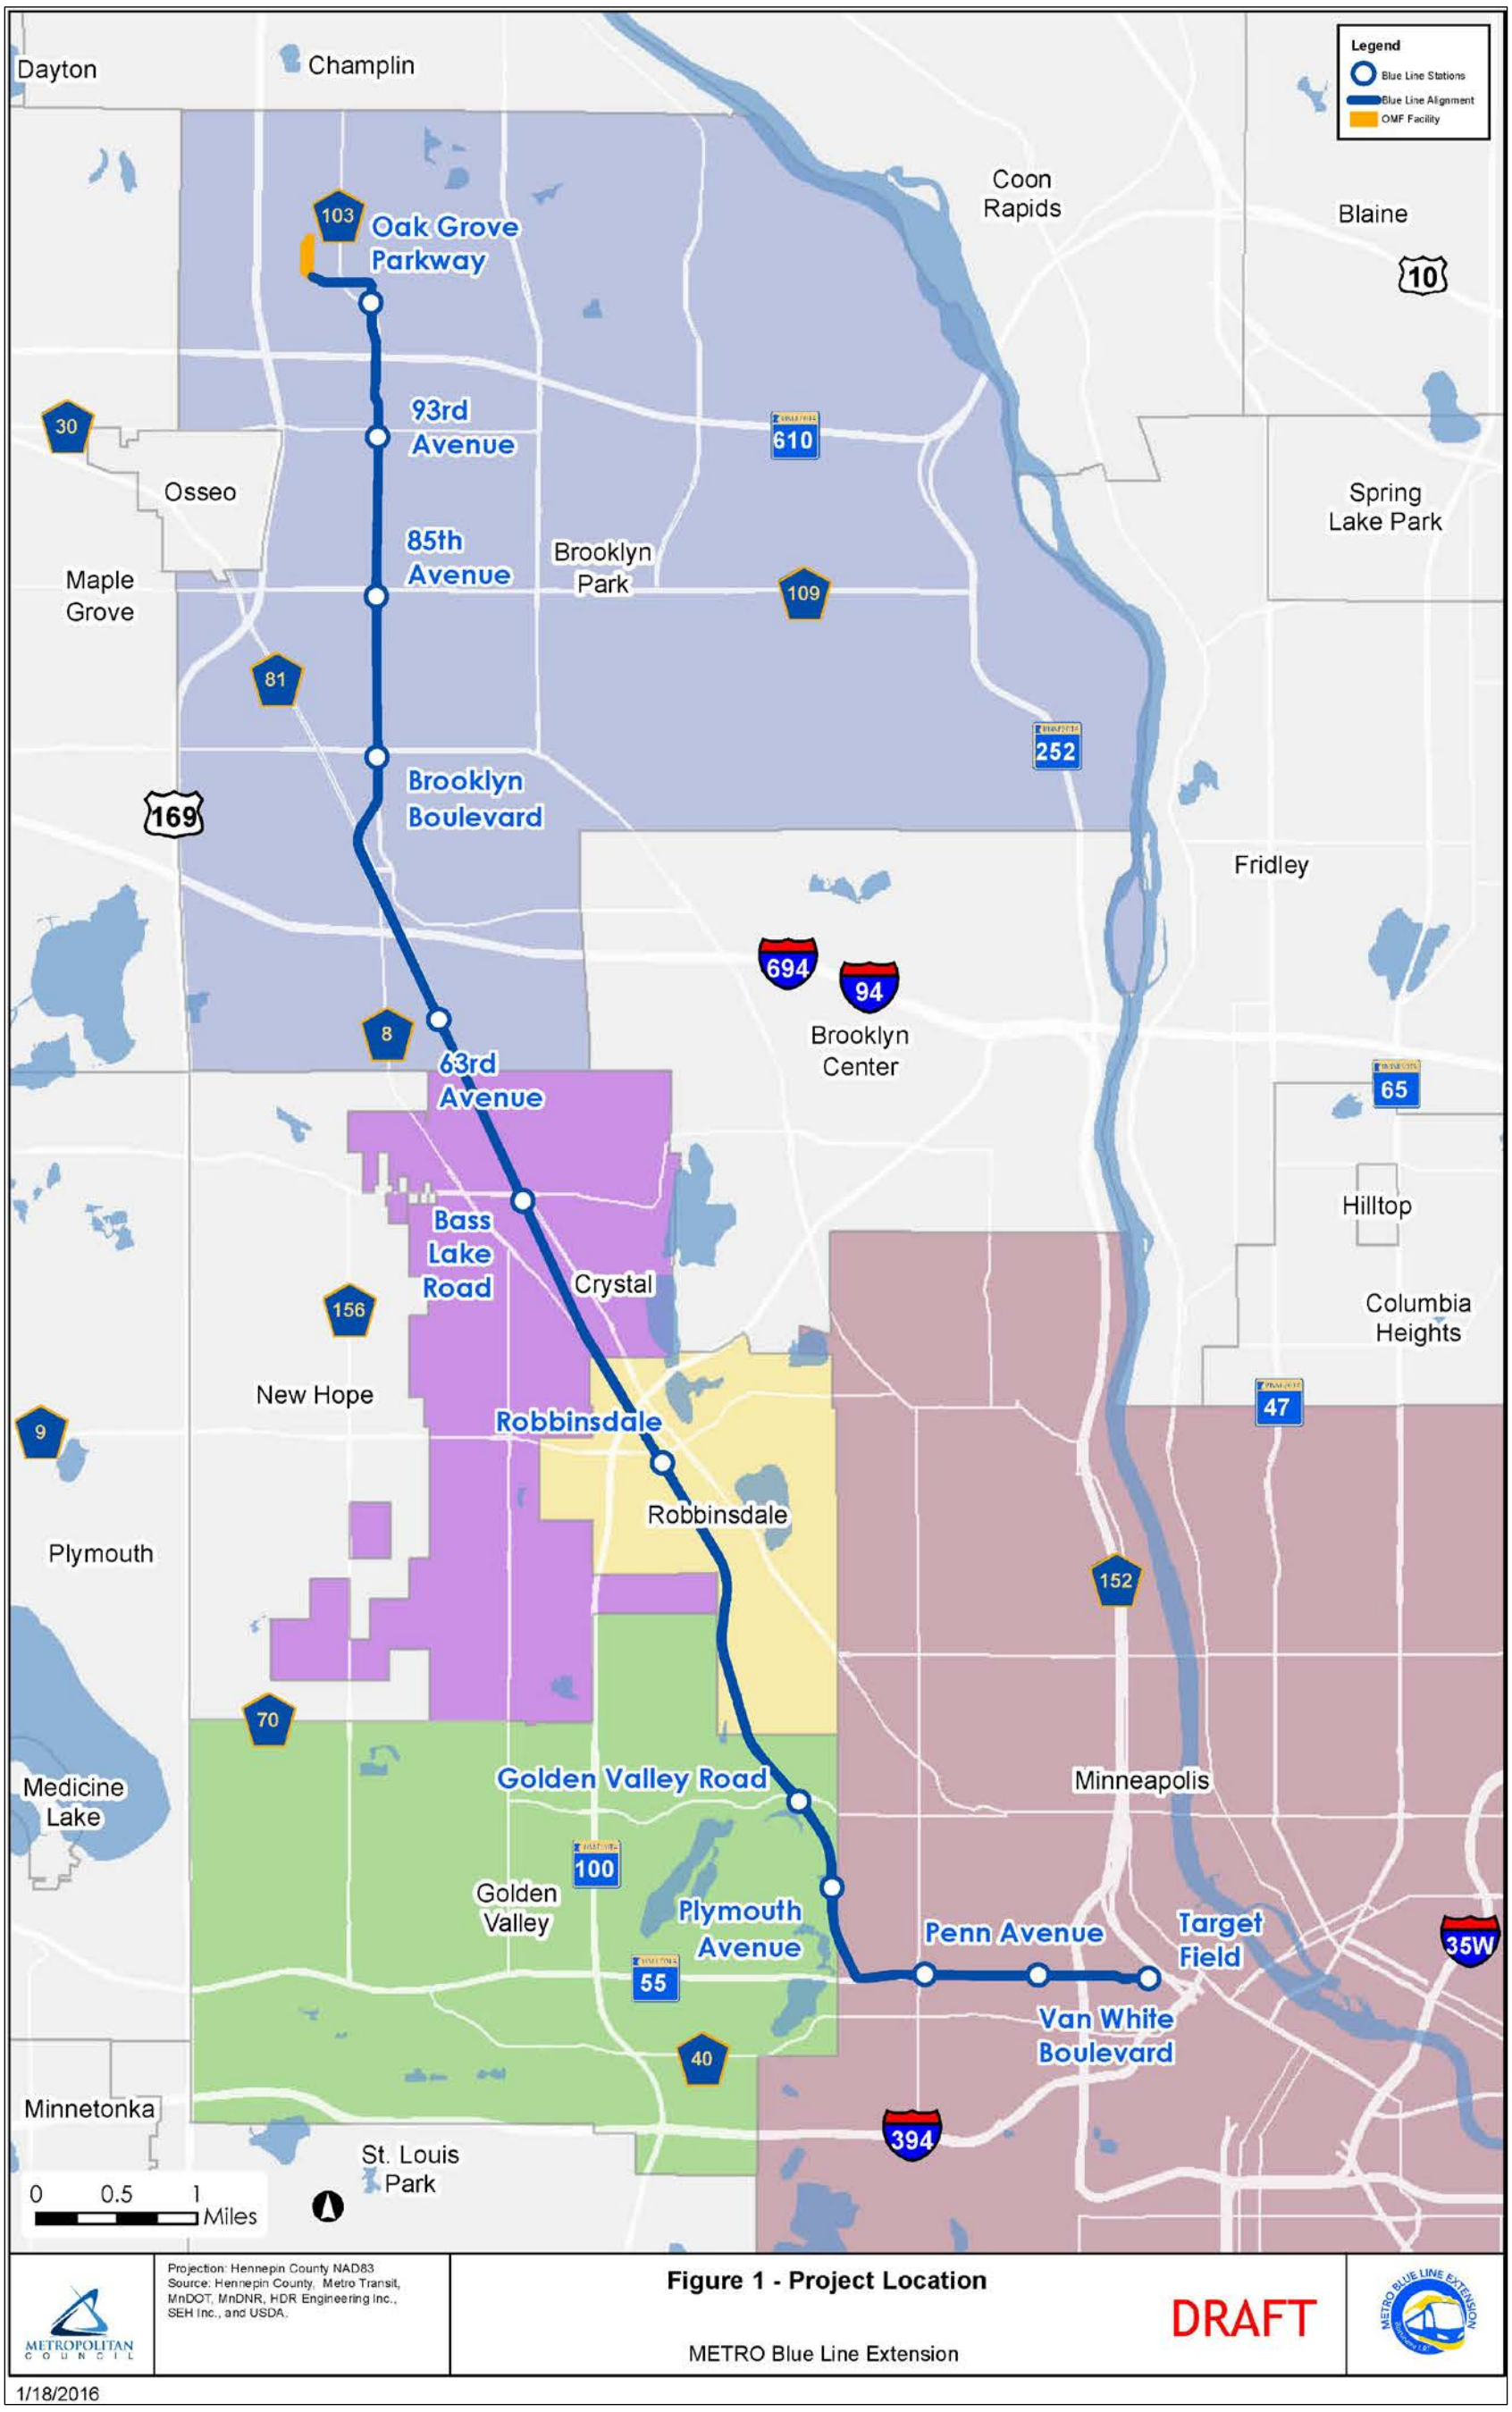
BLRT Extension project. Of these remnants, approximately 17 acres would be impacted by the proposed BLRT Extension project.

Table 7. Notable Terrestrial and Aquatic Habitat Impacts within the Proposed BLRT Extension Project Area

	Location	Total Size (ac)	Total Impacts (ac)
Terrestrial Habitats			
101st Avenue North Complex	Northwest quadrant of Highway 169 and 101st Avenue North	16.8	0.0
Target Corp #1 Complex	North of TH 610 and east of Winnetka Avenue East	20.4	0.51
Target Corp #2 Complex	Adjacent to intersection of Winnetka Avenue North and West Broadway Avenue	23.2	4.70
Shingle Creek Complex	Adjacent to Shingle Creek near the Blue Line LRT Extension project alignment	20.7	Part of West Broadway Avenue
North Rice Pond – Sochacki Park Complex	West side of BNSF tracks from ~35th Avenue North to Golden Valley Road	57.5	3.30
Grimes Pond Complex	East side of BNSF tracks just south of Grimes Pond	11.9	0.06
Saint Mary Margaret – MPRB Complex	East side of BNSF tracks just north of Golden Valley Road	6.9	0.29
Theodore Wirth Complex	Both side of BNSF tracks from Golden Valley Road south to Olson Memorial Highway	62.1	8.69
Olson Memorial Highway Complex	South side of Olson Memorial Highway on both sides of existing BNSF tracks	24.7	0.38
Xerxes Complex	South side of Olson Memorial Highway near Glenwood Avenue and Xerxes Avenue North	24.9	0.00
	Total notable terrestrial habitat and potential impacts	269	17.93
Aquatic Habitats			
North and South Rice Ponds	Cities of Robbinsdale and Golden Valley on west side of existing BNSF tracks	24.72	0.01
Grimes Pond	City of Robbinsdale on the east side of existing BNSF tracks	7.41	1.63
Golden Valley Road Ponds	North side of Golden Valley Road on both sides of the existing BNSF tracks	5.08	0.90
TWRP (Bassett Creek and backwater)	North and south of the Plymouth Avenue Bridge on the west side of the existing BNSF tracks	11.85	1.79
	Total notable aquatic habitat and potential impacts	**49.06**	**4.33**

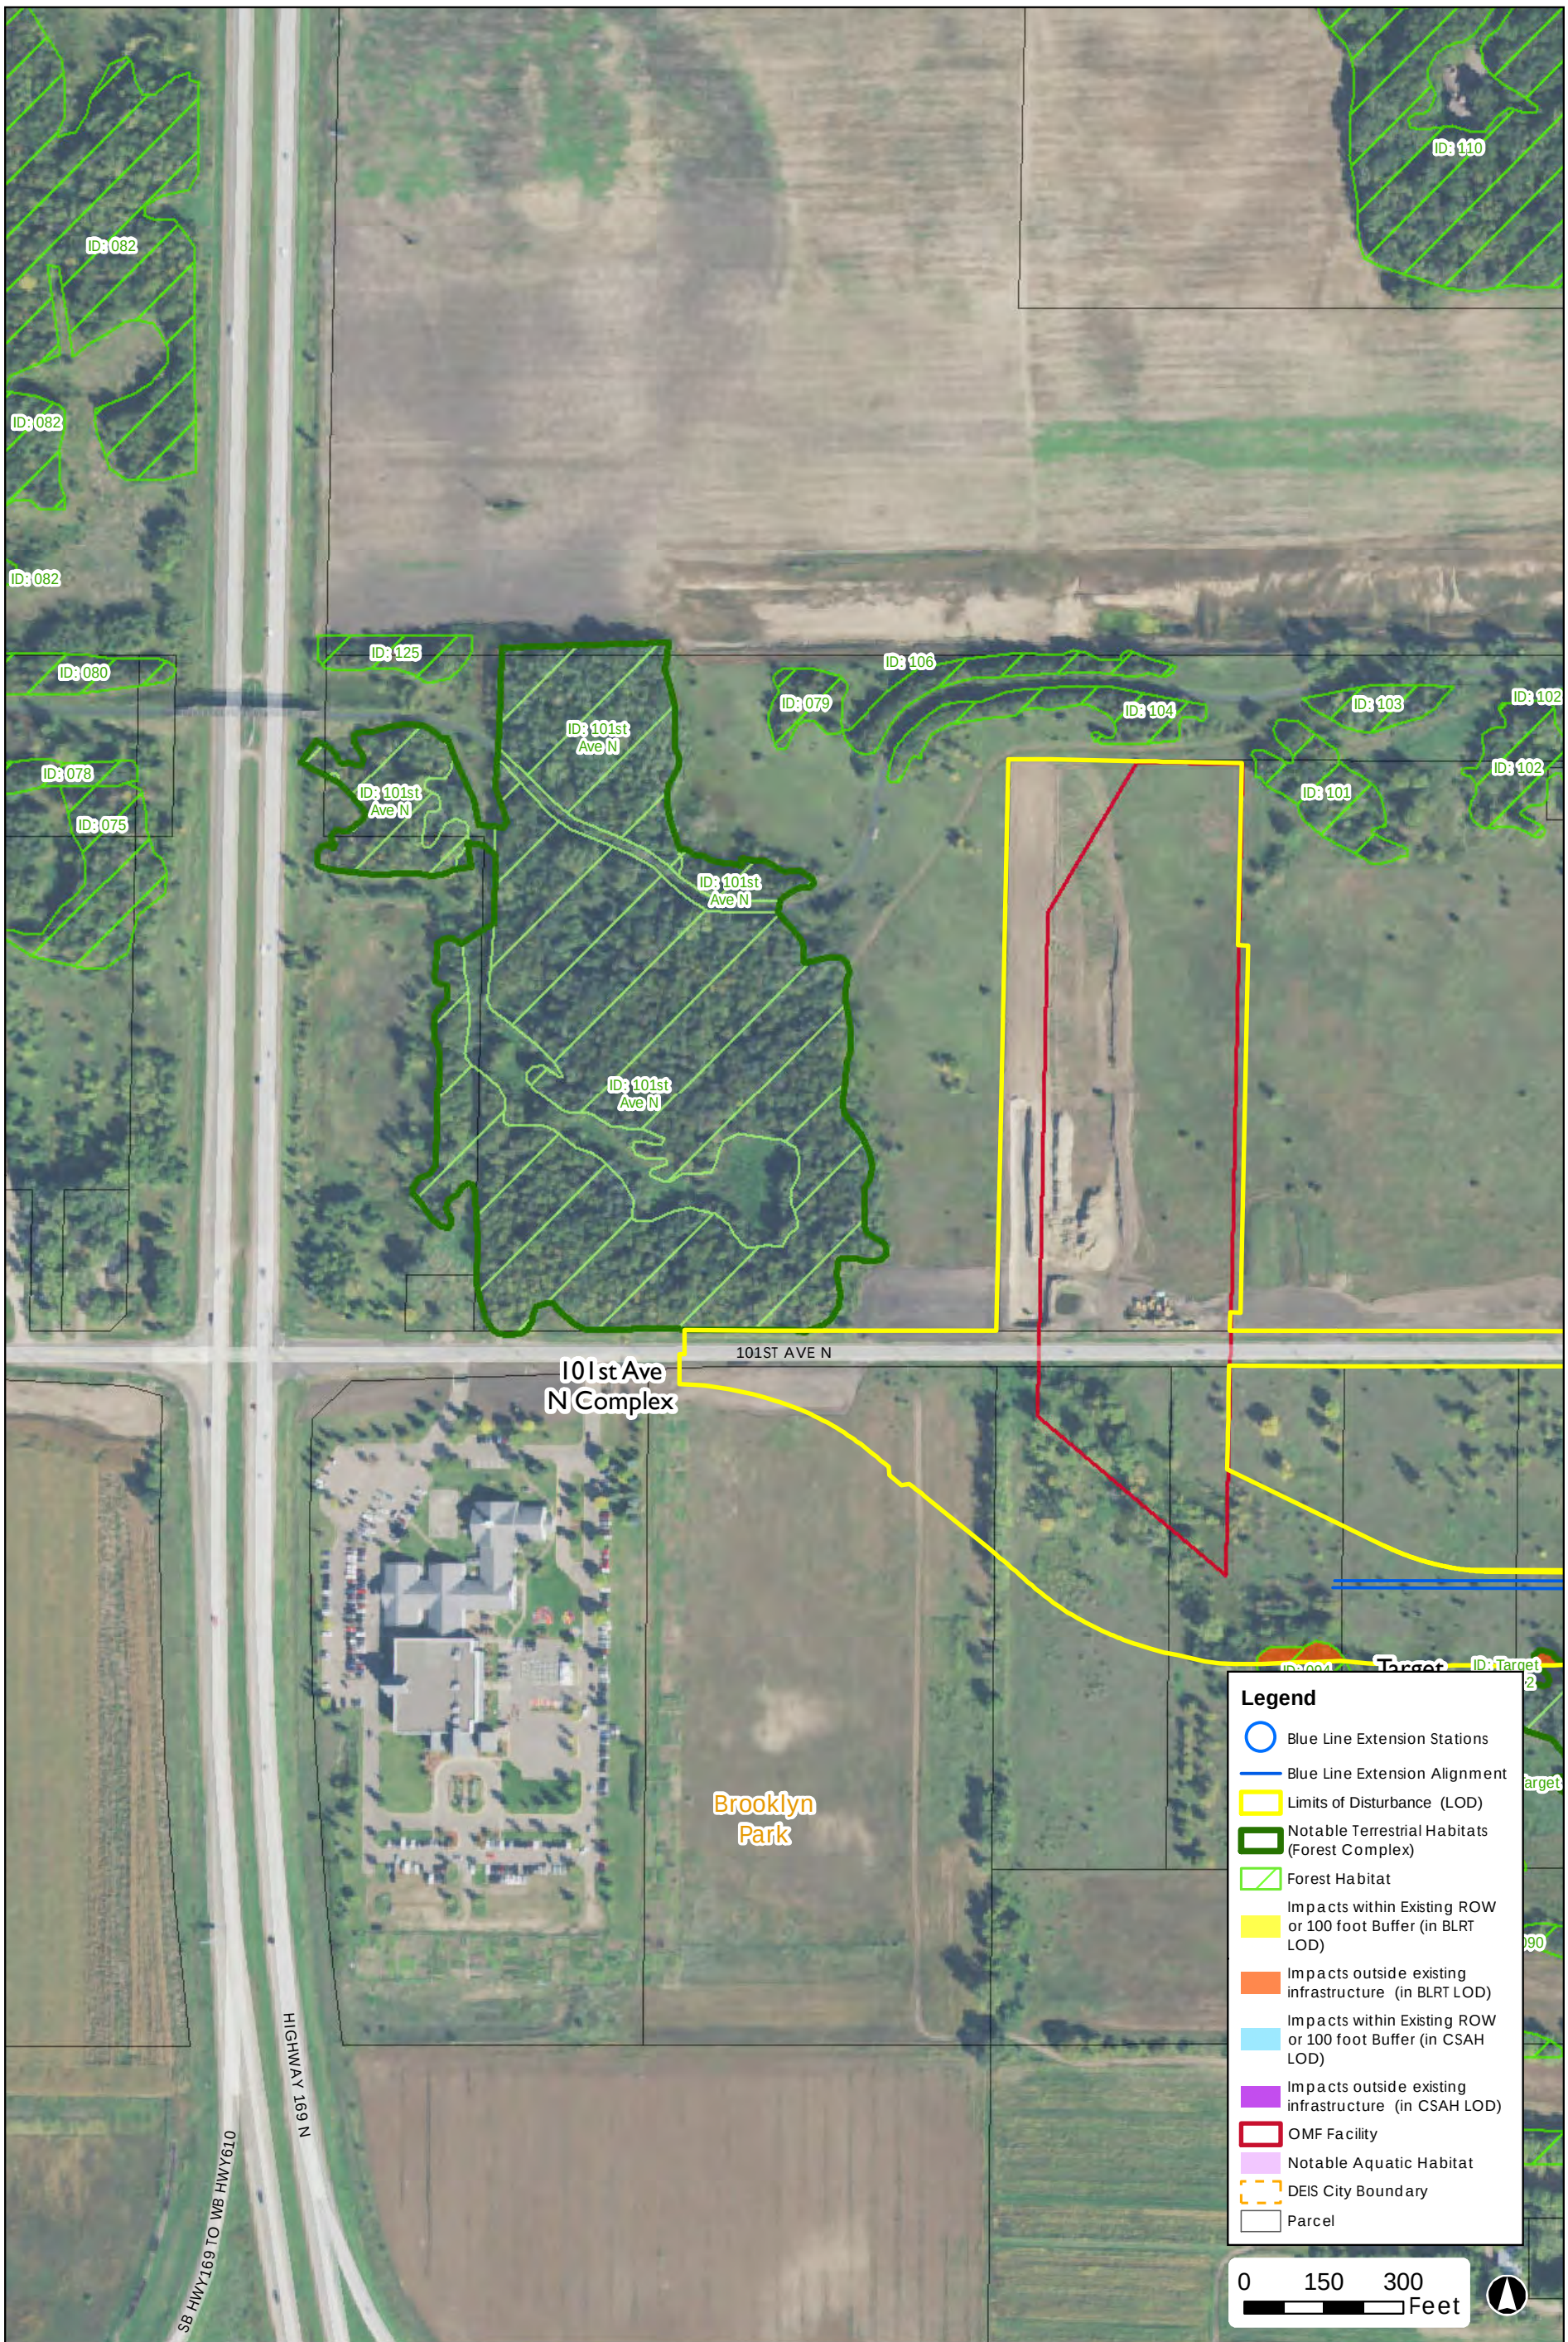
Source: MLCCS Dataset and recent aerial photography

2.2.5.3 Mitigation for Unavoidable Impacts



Mitigation for unavoidable impacts to aquatic habitat will be accomplished through a combination of on-site wetland mitigation and purchase of suitable wetland credits from an established wetland mitigation bank.

Mitigation for unavoidable impacts to notable terrestrial habitat will be accomplished through some tree plantings in and around TWRP and a few selected areas throughout the proposed BLRT Extension project area.



Where effective and feasible, suitable wildlife crossings will be accommodated within proposed culverts to allow some wildlife species to cross from one side of the proposed BLRT Extension project and freight rail tracks to the other.

F.10 Preliminary Stormwater Management Plan

This page intentionally left blank

To:	Nick Landwer Director of Design and Engineering, Blue Line LRT Extension Project
From:	Lisa Goddard, PE, LEED AP Water Resources Sub-Task Lead, SRF Consulting Group
Date:	January 6, 2016
Subject:	Preliminary Stormwater Management Plan

1.0 Introduction

1.1 Project Location

The METRO Blue Line LRT Extension (BLRT) project will extend light rail passenger service from the Target Field Station in Minneapolis to Oak Grove Parkway/101st Avenue N in Brooklyn Park. The project corridor is approximately 13 miles and runs through the cities of Minneapolis, Golden Valley, Robbinsdale, Crystal, and Brooklyn Park. The project has been divided into six segments corresponding with municipal boundaries where possible, which have been labeled according to city. The portion within Brooklyn Park has been further divided into two segments: Brooklyn Park 1, which is the northernmost segment, and Brooklyn Park 2.

Roughly eight miles of the proposed project will be constructed within the existing BNSF Railway corridor. This includes portions of the Golden Valley, Robbinsdale, Crystal and Brooklyn Park segments. Most of the Minneapolis segment is located within the median of TH 55 (Olson Memorial Highway), and portions of the two Brooklyn Park segments are within the median of CSAH 103 (West Broadway Avenue). The proposed project also includes the construction and/or reconstruction of affected roadways, construction of station platforms, several park-and-ride facilities, and an Operations and Maintenance Facility (OMF).

Hennepin County is in the preliminary design phase of a portion of CSAH 103 (West Broadway Avenue) that coincides with a portion of the Brooklyn Park 1 segment. A separate environmental assessment worksheet (EAW) and preliminary stormwater design have been completed for the Hennepin County project, which incorporates the floodplain and wetland impacts and stormwater treatment best management practices (BMPs) required to treat runoff from the BLRT Extension project. These have been documented in the EAW and in supporting technical memoranda.

1.2 Purpose

This *Stormwater Technical Memorandum* has been prepared in support of the Final Environmental Impact Statement (Final EIS) for the BLRT Extension project. The objective of this memorandum is to evaluate the project's potential stormwater impacts within the study area and to identify potential mitigation measures. This includes the following:

- Identify regulatory requirements that will set forth mitigation standards that are specific to stormwater management
- Determine how the proposed improvements would affect existing drainage patterns and nearby water resources
- Identify stormwater BMPs that would be used to satisfy current regulatory requirements for the project corridor

- Determine approximate sizes and locations for BMPs along the corridor

This report contains qualitative and quantitative design recommendations for the BLRT Extension project corridor that will be used by the consultant team preparing the Final EIS and will provide information about how the project would meet various regulatory requirements. Potential impacts to existing stormwater infrastructure (e.g., storm sewer and culverts) will be investigated during the next stages of design.

A separate technical memorandum has been prepared to discuss floodplains in the corridor. The analysis of wetlands adjacent to the project limits and the potential impacts to those is being performed by others.

1.3 Data Collection

The storm sewer and hydrology data employed for this study was obtained from a variety of sources. The following is a brief summary of the data used.

1.3.1 Regulatory Criteria

Meetings and discussions took place with staff from the various cities and watershed management organizations (WMOs) to obtain a better understanding of existing systems and their respective criteria for evaluating and designing new drainage systems and BMPs.

1.3.2 Hydrology

Hydrologic information came from a variety of sources, including:

- Contour data was developed from a flight of the corridor and the 2012 Hennepin County LiDAR data
- Existing drainage boundaries were based on those shown in the local water management plans of the cities and watersheds and those from recent reconstruction projects along the corridor. These were then adjusted as needed to reflect the existing contour data
- For the portion of the project within Brooklyn Park:
    - The 1995 Brooklyn Park Comprehensive Stormwater Management Plan listed discharge limits for subwatersheds and peak outflows from ponds along the corridor. After discussion with staff from the City of Brooklyn Park, it was determined that areas where drainage boundaries had not changed significantly were held to these discharge rates and that they were still applicable. Areas that experienced significant changes in land use as determined by comparing aerial images and recent construction site plans would also be held to the 1995 discharge limits.
    - In addition, ponds that discharged to creeks and channels within the Setzler Pond/Century Channel subwatershed were designed to limit discharge to 0.1 cubic-feet per second per acre of tributary drainage area.

1.3.3 Existing Stormwater Infrastructure

Record drawings were collected for the BLRT Extension project, and additional record drawings were collected by Hennepin County for the CSAH 103 (West Broadway Avenue) project, which coincides with a portion of the project corridor. This information was supplemented with storm sewer maps from the various local water management plans and used to determine the connectivity of the existing storm sewer system to ponds, wetlands, and other water features.

2.0 Regulatory Environment

Regulatory and permitting authority for stormwater management falls to the cities, the Minnesota Pollution Control Agency (MPCA), and the WMOs. Each watershed organization is governed by a Joint Powers Agreement that is

held between the watershed organization and the member communities that are located within the boundaries of the WMO. Regulations change from time to time, and the project will be subject to regulations in effect when the design is submitted for approval by the permitting authorities. The stormwater management system for the project corridor was designed to meet the most stringent requirements for that particular segment according to the WMO and municipality boundaries. In all cases except for the OMF and park-and-ride structures, the WMO rules were the most stringent requirements. The rate and volume control requirements of the B3 Guidelines are more stringent and will be applied to those sites. The agencies listed below play a role in stormwater management within the project area; Appendix B contains a matrix listing the specific requirements of each agency.

- Minnesota Pollution Control Agency (MPCA)
- Mississippi Watershed Management Organization (MWMO)
- Bassett Creek Water Management Commission (BCWMC)
- Shingle Creek and West Mississippi Watershed Management Commission (SCWMC and WMWMC, or SCWM WMC when referred to in reference to their joint watershed management plan)
- City of Minneapolis
- City of Golden Valley
- City of Robbinsdale
- City of Crystal
- City of Brooklyn Park

2.1 Minnesota Pollution Control Agency

2.1.1 NPDES Construction Stormwater Permit

The MPCA administers the National Pollutant Discharge Elimination System (NPDES) Construction Stormwater Permit program in the State of Minnesota (MN 115; MN Rule 7050). The NPDES permit program requires creation of a site-specific Storm Water Pollution Prevention Plan (SWPPP). The SWPPP must detail temporary and permanent erosion prevention and sediment control BMPs that would be utilized during construction. The NPDES permit also requires permanent treatment of stormwater runoff on sites where construction activity results in a net increase of more than one acre of impervious surface area. The NPDES permit requires treatment for the water quality volume, which is equivalent to one-inch of runoff from the new impervious surface created by the project. The primary treatment mechanism preferred by the NPDES permit is infiltration, but other BMPs are allowed when site conditions are not conducive for infiltration.

2.1.2 Impaired Waters and TMDLs

Section 303(d) of the Clean Water Act (CWA) requires states to assess all waters to determine if they meet water quality standards and to conduct total maximum daily load (TMDL) studies in order to set pollutant reduction goals. Project areas that outlet within one mile of MPCA-designated impaired or special waters must incorporate additional BMPs, including stricter stormwater treatment requirements. There are 10 impaired waters identified within one-mile of the project area, of which five would receive runoff from the project area. Impaired receiving waters within one mile of the project area are shown on **Figures 1 through 12** in Appendix A and include, from south to north:

Impaired Receiving Water	Impairments	TMDL Status
Mississippi River	Mercury In Fish Tissue; Fecal Coliform; PCB In Fish Tissue	Upper Mississippi River Bacteria TMDL and Protection Plan (2014)
Bassett Creek	Chloride; Fecal Coliform; Fishes Bioassessments	Included in the above TMDL plan
Crystal Lake	Nutrient/Eutrophication Biological Indicators	Crystal Lake Nutrient TMDL Implementation Plan (2009)
Twin Lakes: Lower, Middle, and Upper	Mercury in Fish Tissue; Nutrient/ Eutrophication Biological Indicators; PCB in Fish Tissue; PFOS in Fish Tissue	Twin and Ryan Lakes Nutrient TMDL (2007); Plans are required for mercury, PCB and PFOS
Shingle Creek	Aquatic Macroinvertebrate Bioassessments; Chloride; Oxygen, Dissolved	Shingle and Bass Creeks Biota and Dissolved Oxygen TMDL Implementation Plan (2012) Shingle Creek Chloride TMDL Implementation Plan (2007)

The TMDL plans identify BMPs appropriate to addressing the impairments. BMPs for nutrient impairments may include increasing infiltration and filtration through the use of rain gardens, native plantings, and reforestation, and retrofitting existing detention ponds as ways to implement the TMDL plan. BMPs for dissolved oxygen impairments may include improving aeration and reducing nutrients. The chloride TMDL calls for a reduction in the use of sodium chloride for ice control in the watershed.

2.2 Watershed Agencies

2.2.1 Mississippi Watershed Management Organization

The MWMO manages waters within its boundaries through its Watershed Management Plan that was amended in 2011. This plan complies with the water resource protection requirements under Minnesota Statutes 103A through 103G in conformance with Minnesota Rules Chapters 8410 and 8420. The communities within the boundaries include parts of Lauderdale, Minneapolis, St. Anthony, and St. Paul, as well as property owned by the Minneapolis Park and Recreation Board (MPRB).

The MWMO does not issue permits or provide approval letters for construction projects, but works with the member communities to ensure the implementation of its standards. The MWMO requires its member cities to develop stormwater management ordinances that reduce runoff and promote increased stormwater management for construction and redevelopment projects. The following provides a summary of the design requirements for rate control, water quality, and water quantity.

2.2.1.1 Rate Control Requirements

Runoff rates for the proposed activity shall match pre-development rates for the 2-year, 10-year, and 100-year storm events. Discharge rates may be restricted to less than pre-development rates when the capacity of the downstream conveyance system is limited.

2.2.1.2 Water Quality Requirements

Projects shall achieve a removal of 90% total suspended solids (TSS) from the 95th percentile daily rainfall total (1.17 inches over 24 hours) over the entire project area. The MWMO has an alternative compliance process for

sites that are not able to meet the MWMO's water quality standard for TSS. This is described in more detail in the MWMO Standards document.

2.2.1.3 Volume Control Requirements

The MWMO does not currently have a volume control standard. The MWMO has indicated a desire to add such a standard in the future. The stormwater management standards should be reviewed during final design.

2.2.2 Bassett Creek Watershed Management Commission

The BCWMC manages waters within its boundaries through its 2015 – 2025 Watershed Management Plan. This Plan complies with the water resource protection requirements under Minnesota Statutes 103A through 103G in conformance with Minnesota Rules Chapters 8410 and 8420. The BCWMC is governed by a Joint Powers Agreement that is held between the watershed organization and the member communities that are located within the boundaries of the WMO. The member municipalities include Crystal, Golden Valley, Medicine Lake, Minneapolis, Minnetonka, New Hope, Plymouth, Robbinsdale, and St. Louis Park.

The BCWMC reviews development and redevelopment project proposals once the project receives preliminary review by the municipality indicating general compliance with the existing local water management plan. All submittals involving floodplains, Bassett Creek trunk systems, water appropriations, variances, underground wet vaults or other alternative BMPs are presented at the BCWMC meetings. The BCWMC will review projects and developments to evaluate compliance with the MPCA's Minimal Impact Design Standards (MIDS) performance goals (which are adopted by the Commission as BCWMC water quality management standards) if the projects are located in member cities that have not adopted the MIDS performance goals, triggers, and flexible treatment options, or at the request of the member city. The BCWMC requires public agencies to comply with water quality management standards and policies presented in this Plan in order to maintain or improve water quality of stormwater runoff.

2.2.2.1 Rate Control Requirements

For projects containing more than one acre of new or redeveloped impervious area, stormwater runoff must be managed such that peak flow rates leaving the site are equal to or less than the existing rate leaving the site for the 2-, 10-, and 100-year events based on Atlas 14 precipitation amounts and using a nested 24-hour rainfall distribution. Documentation of existing and proposed discharge rates for the 2-, 10-, and 100-year events must be provided for BCWMC review.

2.2.2.2 Water Quality Requirements

The BCWMC requires all stormwater to be treated in accordance with MIDS performance goal for new development, redevelopment, and linear projects. If the MIDS performance goal is not feasible and/or is not allowed for a proposed project, then the project proposer must implement the MIDS flexible treatment options, as shown in the MIDS Design Sequence Flow Chart.

For linear projects, the MIDS performance goal is retention of whichever is greater:

- 0.55 inches from new or fully reconstructed impervious areas
- 1.1 inches from the net increase in impervious areas

2.2.2.3 Volume Control Requirements

The BCWMC's volume control requirement is the same as the water quality requirements, which is summarized in the preceding paragraph.

2.2.3 Shingle Creek and West Mississippi Watershed Management Commissions

The SCWMC and WMWMC are two separate WMOs; however, they plan and conduct business jointly, managing waters within its boundaries. Each is governed by a Joint Powers Agreement that is held between the watershed organization and the communities/members that are located within the boundaries of the WMOs. The communities within the boundaries include parts of Brooklyn Center, Brooklyn Park, Crystal, Maple Grove, Minneapolis, New Hope, Osseo, Plymouth, Robbinsdale, and Champlin.

The SCWM WMC manages waters through its Third Generation Watershed Management Plan, which was adopted in 2013. This Plan complies with the water resource protection requirements under Minnesota Statutes 103A through 103G in conformance with Minnesota Rules Chapters 8410 and 8420.

The SCWM WMC requires project reviews for non-single family detached projects that are 0.5 acres in size or larger and linear projects that create one or more acres of new impervious surface, as well as other types of projects described in the rules. The rules and standards of the SCWM WMC must be met for the *net new impervious surface*.

The SCWM WMC requires a project's Stormwater Management Plan to be consistent with all applicable management rules and standards. Specific BMPs that are identified include detention and infiltration systems. Each new or revised crossing of Shingle Creek is required to retain adequate hydraulic capacity with no adverse impact to conveyance of the 100-year flow. The following provides a summary of the design requirements for rate control, water quality, and water quantity.

2.2.3.1 Rate Control Requirements

Runoff rates for the proposed activity shall not exceed existing runoff rates for the 2-year, 10-year, and 100-year critical storm events for the project location as set forth in the NOAA Atlas 14 Volume 8, published in June 2013, or its successor, using the online NOAA Precipitation Frequency Data Server or a similar source. The applicant must document the location and event depths used. If an approved local water management plan requires more restrictive rate control, then the more restrictive rate shall govern. Runoff rates may be restricted to less than the existing rates when necessary for the public health and general welfare of the watershed. Member cities and project review applicants shall not exceed discharge rates at City boundaries as determined in the Commission's hydrologic model. Regional detention basins shall be utilized to manage peak discharge rates and meet water quality objectives when feasible.

2.2.3.2 Water Quality Requirements

Stormwater must be treated prior to discharge to remove 60 percent of phosphorus and 85 percent of TSS. Treatment may be provided by one or more permanent sedimentation and water quality ponds, infiltration practices, or a combination of BMPs that together will meet removal requirements.

If permanent sedimentation and water quality ponds are used they shall be designed to the Wet Pond Design Standards set forth in Appendix A of the SCWM WMC Rules and provide:

- Water quality features consistent with NURP criteria and best management practices.
- A permanent wet pool with dead storage of at least the runoff from a 2.5-inch storm event.

Runoff may be directed to a downstream facility within the same hydrologic subwatershed that has sufficient capacity to provide the required treatment. This means that no treatment may be required for an individual development provided there is a regional facility designed and constructed to accommodate the flow from this property.

The applicant may meet both the treatment requirement and the volume requirement by infiltrating all site runoff from a 1.3 inch rain event (see Water Quantity Requirements in the following sub-section).

2.2.3.3 Volume Control Requirements

Volume control BMPs must be incorporated into the site design to minimize the creation of new impervious surface and reduce existing impervious surfaces, minimize the amount of directly connected impervious surface, preserve the infiltration capacity of the soil, and limit increases in runoff volume exiting the site to the extent feasible considering site-specific conditions. Stormwater runoff volume abstraction shall be provided onsite in the amount equivalent to one inch of runoff generated from new impervious surfaces for linear projects.

2.3 City of Minneapolis

The City of Minneapolis' Stormwater Management Ordinance (Chapter 54) establishes stormwater management requirements for land disturbing activities on sites greater than one acre including phased or connected actions, and for existing stormwater constructed devices.

2.3.1 Rate Control

The City of Minneapolis requires that development should be planned in a manner that does not increase peak flows from the existing flow rates.

2.3.2 Water Quality

Water quality BMPs must be designed to remove 70 percent TSS prior to stormwater discharge from the site.

2.3.3 Volume Control

The City of Minneapolis's ordinance includes a requirement to maximize infiltration. The requirement is to the greatest possible degree (except in the case of stormwater hotspots), natural drainage ways and vegetated soil surfaces should be used to convey store, filter, and retain stormwater before discharging runoff into public waters or the public storm drain system. Opportunities for maximizing infiltration include minimizing the extent of impervious surfaces and directing runoff from impervious surfaces and roof gutter systems onto lawns or other pervious surfaces.

2.4 City of Golden Valley

The City of Golden Valley's Stormwater Ordinance (Section 4.31) establishes regulatory requirements for land development and land disturbing activities aimed at minimizing the threats to public health, safety, public and private property and natural resources within the community resulting from construction site erosion and post-construction stormwater runoff. The portion of the BLRT Extension project that is located in Golden Valley is located within the BCWMC. Projects located within the City are required to comply with the WMO's stormwater management requirements for rate control, water quality, and volume control. Please see the BCWMC section for more detailed information on these requirements.

2.5 City of Robbinsdale

The City of Robbinsdale is located within the BCWMC and SCWMC. Projects located within the City are required to comply with the WMOs' stormwater management requirements for rate control, water quality, and volume control. Please see the BCWMC and SCWMC sections for more detailed information on these requirements.

2.6 City of Crystal

The City of Crystal's Planning and Land Use Regulations (Chapter V of Crystal City Code) include stormwater management criteria for permanent facilities.

2.6.1 Rate Control

The City of Crystal requires that the existing 2-year, 10-year, and 100-year storm peak discharge rates shall not be increased with the proposed development, and that accelerated channel erosion will not occur as a result of the proposed land disturbing or development activity.

2.6.2 Water Quality

The City of Crystal requires that detention facilities should have a permanent pond surface area equal to two percent of the impervious area draining to the pond, or one percent of the entire area draining to the pond, whichever is greater. An alternative requirement is that the volume of the permanent pool shall be equal to or greater than the runoff from a 2.0-inch rainfall over the fully developed site. The sequencing of preferred treatment options is natural infiltration of precipitation on-site; flow attenuation by use of open vegetated swales and natural depressions; stormwater retention facilities; and stormwater detention facilities.

2.6.3 Volume Control

The City of Crystal does not currently have a volume control standard. The City's Local Surface Water Management Plan indicates that the City may update the City's ordinances to include a volume control standard in the future. The stormwater management standards should be reviewed during final design.

2.7 City of Brooklyn Park

With the exception of drainage to the Setzler Pond/Century Channel system, the City of Brooklyn Park has adopted the SCWM WMC requirements for stormwater management. Development of previously open space areas draining to the Setzler Pond/Century Channel system are required by the City to control their discharge rates to 0.1 cubic-foot per second for every acres of area. The City works with the SCWM WMC on the permit reviews to ensure the stormwater management requirements are met.

2.8 Minnesota B3 Guidelines

Beginning in January 2004, all new buildings that receive funding from the bond proceeds fund are required to meet sustainable building design guidelines. The BLRT Extension project will be required to meet Version 2.2 of the B3 Guidelines for park-and-ride buildings and the OMF. The guidelines include a variety of criteria ranging from energy use, indoor air quality, and stormwater management to lifecycle costs. The intent of the stormwater management guideline is to minimize the negative impacts of the project, both on and off site, by maintaining a more natural hydrologic cycle through infiltration, evapotranspiration, and reuse. The particular performance criteria are listed below, but the project must meet the rules and regulations of the local governmental units if those rules are more stringent.

2.8.1 Runoff Rate and Volume Requirements

The rate of runoff from the post-development site must be controlled to match the runoff rates for the native soil and vegetation conditions for the 2-year and 10-year, 24-hour design storms. The stormwater management plan must be designed to prohibit discharge from the site for 1.1 inches of runoff from all new or redeveloped impervious (non-vegetated) areas.

2.8.2 Water Quality Requirements

The stormwater management plan must be designed to remove 80% of the post-development TSS and 60% of the post-development total phosphorus (TP).

2.8.3 Operations and Maintenance Requirements

The B3 Guidelines also requires that an operations and maintenance manual be created for all BMPs specifying the maintenance requirements and schedules for completion. Operations and maintenance manuals shall be recorded with the County Registrar.

3.0 Affected Environment

3.1 Existing Conditions

3.1.1 Segment M – Minneapolis

The Minneapolis segment extends from Target Field Station along 6th Avenue N and TH 55 (Olson Memorial Highway) west to the bridge over the existing BNSF Railway corridor, where the project corridor turns north. Approximately 25 percent of the segment drains to East Channel Bassett Creek, 60 percent drains to the old Bassett Creek tunnel crossing at TH 55 (Olson Memorial Highway), and 15 percent drains to the old Bassett Creek tunnel north of the project corridor. The majority of this segment of the project has an urban drainage system with curb and gutter containing runoff and conveying it to catch basins and storm sewer, but the portion within the BNSF Railway corridor has ditches and culverts to convey stormwater.

The predominant water resource in this segment is Bassett Creek, which crosses TH 55 (Olson Memorial Highway) today approximately 750 feet west of the BNSF Railway corridor. (Prior to construction of TH 55 (Olson Memorial Highway) in the 1940s, the crossing was approximately ¼ mile to the east, referred to in this report as the East Channel Bassett Creek.) A second open channel crossing of what is now TH 55 (Olson Memorial Highway) was located near Dupont Avenue N until the early 1900s, when the channel was replaced by a tunnel system. This tunnel is now known as the old Bassett Creek tunnel. The channel and the tunnel frequently flooded. As part of a flood abatement project in the 1980s and 1990s, Bassett Creek was rerouted into a new tunnel system, called the new Bassett Creek tunnel. The new tunnel is farther south and does not cross the BLRT corridor. Although Bassett Creek no longer flows into the old Bassett Creek tunnel, the old tunnel remains active, carrying stormwater runoff from local drainage systems and overflow from the new Bassett Creek tunnel. Both the old and new Bassett Creek tunnels drain to the Mississippi River.

Local areas draining to the old and new Bassett Creek tunnels are within the Mississippi Watershed Management Organization. The portion of the project which drains to East Channel Bassett Creek is within the Bassett Creek Watershed Management Commission. The jurisdictional watershed divide in the TH 55 (Olson Memorial Highway) corridor is at Russell Avenue N.

The soils in the Minneapolis segment have been highly disturbed over the past century of development. They consist of variable urban fill, frequently overlying clay loams or organic, clayey muck that was deposited when Bassett Creek flowed through the area. Therefore, Hydrologic Soil Group (HSG) C soils, which have slow infiltration rates, were assumed for the purposes of this level of analysis based upon recent soil borings and information received from the Heritage Park reconstruction. Groundwater elevations are not known for most of the corridor but are expected to be relatively close to the ground surface near the old Bassett Creek tunnel and very close to the ground surface where wetlands are adjacent to the BNSF Railway embankment.

These areas are described in detail in the following sections. See Appendix A, **Figures 1 and 2** for a representation of the flow patterns and receiving waters.

3.1.1.1 Drainage to Bassett Creek Tunnels, East of I-94 (Stations 2010+75 to 2021+80)

In this portion of the segment, runoff from 6th Avenue N and the BLRT Corridor between high points at 7th Street and the I-94 bridge is captured in storm sewer and leaves the corridor, flowing north in the East Lyndale Avenue right-of-way. The storm sewer drains to a tunnel owned by MnDOT near 3rd Street N and 12th Avenue N. The MnDOT tunnel crosses the old Bassett Creek tunnel and connects to the new Bassett Creek tunnel roughly 0.5 mile to the east.

Runoff east of 7th Street N enters another existing storm sewer system that runs north through the Heyward Garage parcel. This storm sewer eventually discharges to the old Bassett Creek tunnel.

This area is industrial with some existing grassed boulevard areas, and a small amount of offsite runoff enters the storm sewer system in Olson Memorial Highway. There are no existing stormwater BMPs in this area, other than those recently constructed as part of the Target Field Station stormwater management plan.

3.1.1.2 Drainage to Old Bassett Creek Tunnel, West of I-94 (Stations 2021+80 to 2075+60)

Runoff from the project corridor reaches the tunnel from two storm sewer systems in this portion of the segment. Just to the west of I-94, runoff enters a small storm sewer system that connects to the old Bassett Creek tunnel under TH 55 (Olson Memorial Highway) between Bryant Avenue N and Dupont Avenue N. Some offsite runoff from the south is collected in this storm sewer system. This area consists of both industrial businesses and multi-family homes. The median boulevard is paved for half of this area and is covered by turf grass for the rest.

A large storm sewer system starting at CSAH 2 (Penn Avenue N) runs east along TH 55 (Olson Memorial Highway) and also connects to the old Bassett Creek tunnel under TH 55 (Olson Memorial Highway) near Dupont Avenue N. This storm sewer trunk line serves a large residential area to the north of TH 55 (Olson Memorial Highway) from CSAH 2 (Penn Avenue N) to approximately James Avenue N. The trunk storm sewer also collects runoff from small offsite areas to the south of TH 55 (Olson Memorial Highway) between James Avenue N and Dupont Avenue N. This portion of the segment also features a grassed boulevard and a wide, grassed median with incrementally placed trees. Roadway runoff is not treated before entering the old Bassett Creek tunnel and eventually discharging to the Mississippi River.

3.1.1.3 Drainage to Old Bassett Creek Tunnel, Heritage Park South Treatment System (Stations 2075+60 to 2081+95)

Storm sewer on TH 55 (Olson Memorial Highway) from Russell Avenue N to Queen Avenue N collects runoff from the residential area north of TH 55 (Olson Memorial Highway) and roadway runoff at this location. The system drains south and then east, collecting runoff from residential neighborhoods south of TH 55 (Olson Memorial Highway). It eventually reaches the south treatment system in Heritage Park, a series of water quality BMPs constructed with the Heritage Park redevelopment project, located south of TH 55 (Olson Memorial Highway) along Van White Memorial Boulevard. Runoff is first routed through a sediment forebay and then through a filtration basin, before entering a large wet detention pond. The pond outlet drains to the old Bassett Creek tunnel, which eventually discharges into the Mississippi River.

3.1.1.4 Drainage to East Channel Bassett Creek, Russell Avenue N to TH 55 (Olson Memorial Highway) /BNSF Crossing

This portion of the segment has a storm sewer system that collects roadway runoff which discharges directly into East Channel Bassett Creek, south of TH 55 (Olson Memorial Highway). East Channel Bassett Creek diverts from the main channel just west of the existing BNSF Railway corridor and north of TH 55 (Olson Memorial Highway). The east channel crosses under the BNSF Railway corridor through three existing culverts located north of TH 55 (Olson Memorial Highway). Two large urban residential storm sewer systems discharge to the creek at this location before

the channel crosses the highway via a culvert. There is currently no treatment for this runoff prior to discharging into the East Channel Bassett Creek. East Channel Bassett Creek flows south and then east, making its way to the new Bassett Creek tunnel, which discharges into the Mississippi River.

The City of Minneapolis has discussed drainage concerns with the portion of the East Channel Bassett Creek between the BNSF Railway corridor and the TH 55 (Olson Memorial Highway) crossing. They indicated that the culvert under the highway may not have adequate capacity, may be undersized, or may be partially plugged with sediment.

3.1.1.5 Drainage to East Channel Bassett Creek and Bassett Creek, TH 55 (Olson Memorial Highway) to Oak Park Avenue (Stations 2095+00 to 2109+25)

See the Segment GV section for a general overview of the BLRT Corridor in Theodore Wirth Regional Park (TWRP). See the Floodplain and Wetland Technical Memoranda for additional information on this area.

West of Vincent Avenue, the project turns north along the BNSF Railway and Canadian Pacific Railway corridors. Segment M ends at Oak Park Avenue. Runoff from the corridor and residential areas to the east is picked up by ditches along the railroads, but it does not always appear to drain to the creek due to flat grades, poor soils, high groundwater, and buried or missing culverts. Generally, the ditches flow south and discharge to East Channel Bassett Creek except for the northernmost portion which discharges to Bassett Creek.

3.1.2 Segment GV – Golden Valley

The Golden Valley segment extends along the existing BNSF Railway corridor from Oak Park Avenue north to 26th Avenue N. The entire segment ultimately drains to Bassett Creek, but a portion drains first to the wetlands north of Golden Valley Road or to smaller wetlands adjacent to the creek. The entire segment is within the BCWMC boundaries.

The BNSF Railway corridor has a typical railroad section, with an embankment constructed of ballast rock and ditches or water bodies on either side. Outside of the BNSF Railway right-of-way, the corridor is surrounded by residential areas to the east and two parks, TWRP and Mary Hills Nature Area, to the west. Drainage from eastern residential areas drains into the ditches in the BNSF Railway corridor right-of-way and through culverts into the parks.

There are a number of areas along the BNSF Railway corridor where depressions in the ditches are not fully drained due to flat grades, poor soils, high groundwater, and buried or missing culverts. These areas have been delineated as wetlands. There are additional areas where ditches are very small or nonexistent and water appears to drain over the railroad embankment or through the ballast rock.

Like much of the Bassett Creek watershed, the soils in the Golden Valley segment are typically in HSG C or D, and groundwater is high in many places along the corridor where wetlands are present. The portion of the BLRT Corridor between Plymouth Avenue and 26th Avenue is in a Drinking Water Supply Management Area (DWSMA) with high vulnerability.

The segment is described in more detail in the following sections. See Appendix A, **Figures 2 and 3** for a representation of the flow patterns and receiving waters.

3.1.2.1 Drainage to Bassett Creek, Oak Park Avenue to Plymouth Avenue (Stations 2109+25 to 2122+55)

Drainage from residential areas to the east of the corridor collects in the eastern BNSF Railway corridor ditch and discharges to wetlands in TWRP and to Bassett Creek. The existing ditch provides a small amount of water quality treatment by slowing down runoff and allowing for some settlement of larger sediments and some degree of rate

attenuation due to the storage volume in the ditch. There is no ditch on the west side of the tracks, and runoff from the BNSF Railway corridor that drains directly to the west is untreated before it flows to Bassett Creek in the park.

Bassett Creek has undergone a recent streambank stabilization and habitat restoration project from Golden Valley Road to Irving Avenue, which extends south beyond the BLRT Extension project limits.

3.1.2.2 Drainage to Bassett Creek, Plymouth Avenue to Theodore Wirth Parkway (Stations 2122+55 to 2154+00)

Upstream of Plymouth Avenue and just south of 14th Avenue N, a large storm sewer system discharges to Bassett Creek. Approximately 680 acres of Minneapolis storm sewer drains through two large hydrodynamic separators located southwest of the intersection of Xerxes Avenue and 14th Avenue N. See Drainage Design Approach below for a description of BMPs such as these. The storm sewer passes under the BNSF Railway corridor and directly into Bassett Creek.

Additional residential areas east of the BNSF Railway corridor drain to the eastern railroad ditch before discharging through culverts to wetlands in TWRP and to Bassett Creek. North of 14th Avenue N, runoff discharges to a wide channelized wetland before entering Bassett Creek. The existing ditch provides a small amount of water quality treatment by slowing down runoff and allowing for some settlement of larger sediments and some degree of rate attenuation due to the storage volume in the ditch. There is no ditch on the west side between the tracks and the wetland, and runoff from the BNSF Railway corridor that drains west is untreated before it enters the wetland.

The City of Golden Valley and the BCWMC propose to construct a stormwater treatment BMP between the project corridor and Theodore Wirth Parkway at approximate northbound station 2142+00. The project will treat 115 acres of residential drainage. Both entities have included the project in their capital improvement plans for construction in 2018 to 2019. The exact location, size, and type of the BMP are not known at this time.

3.1.2.3 Drainage to Bassett Creek, Golden Valley Road Wetlands (Stations 2154+00 to 2165+50)

The wetlands just north of Golden Valley Road on either side of the BNSF Railway corridor cover an area that was historically one wetland that was divided into two when the BNSF Railway corridor was built. An east-west bisection was created in the 1930s, when a 48-inch watermain was installed, and a berm constructed over it. This berm has partially collapsed between the southeast and the northeast basins, allowing the eastern basins to function as one pond. The western basins are equalized through a submerged culvert under that portion of the berm.

The eastern basin drains to the western through a culvert under the BNSF Railway. The western basins drain to Bassett Creek via a surface overflow and small channel through Mary Hills Nature Area. According to field survey data, the basins on either side of the railroad embankment act independently, and the normal water level of the eastern basin is roughly two feet higher than that of the western basins. Initial modeling shows that the eastern wetland overtops the BNSF Railway in the 50-year storm event and that the 100-year high water level of the eastern basin is approximately five higher than that of the western basins. City of Golden Valley staff has expressed concern that any changes in the storage available in these basins could affect the 100-year flow rates and floodplain elevations of Bassett Creek. There are several homes adjacent to the creek in this area that have little to no freeboard above the 100-year flood elevation and that could be impacted by even small changes in the function of the basins.

Rainfall landing on the railroad embankment drains directly into the wetlands on either side. In addition to drainage to the ponds from the railroad corridor, approximately 100 acres of residential area to the east drain to the ponds through storm sewer.

3.1.2.4 Drainage to Bassett Creek, Station 2166+00 to 2185+00 at 26th Avenue N

Existing storm sewer carries residential drainage from Byrd Ave N and Kewanee Way to storm sewer that discharges to an undrained depression on the east side of the existing BNSF Railway corridor. It is not clear how water moves from the east depression to the west side of the railroad. There are two additional depressions on the west side of the railroad that also appear to be landlocked. Water that overtops the western depressions flows though the Mary Hills Nature Area, over an existing trail, through a wetland, and into Bassett Creek. It is possible that the east and west depressions were once connected by a culvert under the railroad, but there was no evidence of a culvert during field surveys for the BLRT project.

3.1.3 Segment R – Robbinsdale

The Robbinsdale segment extends from 26th Avenue N to 47th Avenue N along the existing BNSF Railway corridor. The area surrounding the corridor primarily consists of residential neighborhoods, with the southernmost portion of the segment running through Sochacki Park. Additionally, the corridor passes just to the east of two smaller parks, Lee Park and Triangle park, and just to the west of downtown Robbinsdale. The northernmost portion of the segment corridor, after crossing over TH 100, runs parallel to CSAH 8 (West Broadway Avenue), before making its way into Crystal.

Much of the existing offsite drainage flowing towards the BNSF Railway corridor is either collected in storm sewer systems before reaching the corridor or flows into the many wetlands along the corridor. However, in some cases, there are existing culverts and short runs of storm sewer that discharge into the ditches along the railroad. The corridor itself generally drains to ditches and flat grassed areas along the track or to the existing wetlands. This segment falls within the BCWMC south of 36th Avenue N and within the SCWMC north of 36th Avenue N. Stormwater runoff in BCWMC drains to Grimes, North Rice, and South Rice Ponds upstream of Bassett Creek. The stormwater in SCWMC primarily drains to Crystal Lake and Middle and Lower Twin Lakes which are nutrient-impaired lakes and have TMDL implementation plans. Approximately 34 percent of the corridor drainage ultimately flows to Bassett Creek (via Grimes, North Rice, and South Rice Ponds), 51 percent to Crystal Lake, and 15 percent to Twin Lakes.

Like much of the Bassett Creek watershed, the soils in the portion of the segment south of 36th Avenue N are typically HSG C or D, with slow to very slow infiltration rates. Between 36th Avenue N and TH 100, the soils consist of HSG B soils, with moderate infiltration rates, while the soils north of TH 100 are typically HSG A soils having high infiltration rates. The groundwater table is high in many places within the trench portion of the corridor, as indicated by the presence of many wetlands adjacent to the BNSF Railway embankment. Groundwater elevations elsewhere in the segment are not known.

The segment is described in more detail in the following sections. See Appendix A, **Figures 4 through 6** for a representation of the flow patterns and receiving waters.

3.1.3.1 Drainage to South Rice Pond, Existing Stormwater Pond in Sochacki Park (Stations 2185+00 to 2196+80)

South of 27th Avenue N, the corridor drains to adjacent wetlands that drain under the corridor and eventually to South Rice Pond via culverts. The City of Robbinsdale recently constructed a wet detention pond in Sochacki Park that receives stormwater from a storm sewer system draining the residential area east of the project corridor. The existing pond receives runoff from the project corridor in the existing condition. The pond ultimately discharges to South Rice Pond.

3.1.3.2 Drainage to Grimes and North Rice Ponds (Stations 2196+80 to 2252+35)

While the jurisdictional watershed divide between BCWMC and SCWMC is at 36th Avenue N and neighboring residential drainage is split here, the portion of the corridor starting at Lee Park drains south under the bridge at 36th Avenue N. Lee Park and an adjacent retirement home drain to a low lying area in Lee Park that eventually discharges to the corridor. This portion of the corridor is very flat and contains primarily HSG B soils, so it is likely that much of the corridor water infiltrates. The portion of stormwater runoff that does not infiltrate eventually discharges to Grimes and North Rice Ponds.

South of 36th Avenue N there are wetlands running along both the east and west sides of the corridor. These receive both corridor water and discharge from several storm sewer systems and only appear to have natural overflows that eventually discharge to Grimes and North Rice Ponds.

From 33rd Avenue N to just north of 27th Avenue N, the corridor drains to Grimes Pond on the east and North Rice Pond on the west through various wetlands. There is also residential runoff draining to both of these ponds, which are separated by the existing BNSF Railway embankment and connected by a 48"culvert on the south end of the ponds. Grimes and North Rice ponds discharge to South Rice Pond, which ultimately discharges to Bassett Creek.

3.1.3.3 Drainage to Crystal Lake (Stations 2251+00 to 2298+00)

The northern portion of Robbinsdale is in the SCWMC and drains to Crystal Lake and Middle and Lower Twin Lakes. In this portion of the corridor, instead of wetlands and ditches, the BNSF Railway corridor is adjacent to residential and commercial properties. The area south of TH 100 is characterized by HSG B soils. From north of Lee Park to 42nd Avenue N, corridor water that does not infiltrate and residential area runoff is picked up by storm sewer and drains to Crystal Lake. There are two storm sewer systems in this area that outlet directly to the lake.

3.1.3.4 Drainage to Middle Twin Lake (Station 2298+00 to 2329+00)

North of 42nd Avenue N, the adjacent storm sewer systems would likely only receive corridor runoff in large events. North of TH 100 the HSG A soils and the flat grassed edges of the corridor also likely infiltrate some runoff from the ballast. These storm sewer systems drain to a series of ponds near TH 100 before discharging to Lower and Middle Twin Lakes, which eventually drain to Shingle Creek. Middle Twin Lake receives the corridor and offsite water from north of TH 100 while Lower Twin Lake receives primarily residential water from between TH 100 and 42nd Avenue N.

3.1.4 Segment C – Crystal

The Crystal segment extends from 47th Avenue N to 62nd Avenue N. The proposed project continues in the BNSF Railway corridor, which is along the west side of CSAH 8 (West Broadway Avenue) in the south and transitions to run along the west side of CSAH 81 (Bottineau Boulevard) in the north. The area around the project limits is fully developed with a mixture of ¼-acre residential lots, townhomes, commercial, and industrial uses. There are several parks in the area adjacent to the project. The Crystal Airport is also near the project corridor in the north portion of the segment. Approximately 66 percent of the project area drains to the Upper and Middle Twin Lakes and 34 percent drains to the Crystal Airport infiltration area.

Web soil survey information for this segment categorizes the existing soils as predominantly "urban land". Soil borings for the area show fine-grained sand, occasionally with a layer of loamy sand and/or sandy loam above it. These would be typical of HSG A and B soils, with high to moderate infiltration capacity. The project falls within a wellhead protection area south of the Canadian Pacific Railway corridor but is not within an emergency response area. Groundwater elevations for this segment are not known at this time.

Figures 6 and 7 in Appendix A show the existing flow patterns and receiving waters. The sections below provide more detail regarding the drainage within this segment.

3.1.4.1 Drainage to Twin Lakes, BNSF Railway Corridor South of CSAH 10 (Bass Lake Road) (Station 2520+80 to 2380+90)

In the southern portion of the Crystal segment, the BNSF Railway corridor transitions from running along the west side of CSAH 8 (West Broadway Avenue) to the west side of CSAH 81 (Bottineau Boulevard). During this transition, the corridor runs through a commercial and industrial area and is not adjacent to a roadway. Due to the presence of sandy soil, most of the runoff infiltrates along the railroad corridor and there appears to be no catch basins or culverts to collect or direct runoff. Any runoff that does not infiltrate may flow into adjacent parking lots and enter catch basins, which ultimately discharge into Upper or Middle Twin Lake.

There are storm trunk lines which pass under the railroad corridor where it crosses Corvallis Avenue and to the west of the intersection of Wilshire Boulevard and CSAH 81 (Bottineau Boulevard). There is also a pair of culverts running underneath the track from the wetland southeast of the Canadian Pacific Railway crossing that connects to storm sewer lines that flow to an existing pond in the southwest quadrant of the intersection of CSAH 8 (West Broadway Avenue) with the Canadian Pacific Railway corridor.

3.1.4.2 Drainage to Twin Lakes, Bass Lake Road Park-and-Ride (Station 2371+25 and 2379+30)

The area proposed for a future park-and-ride between the BNSF Railway corridor and CSAH 81 (Bottineau Boulevard), immediately south of CSAH 10 (Bass Lake Road), is a petroleum brownfield with a high risk of groundwater contamination. The area is mostly open, grassy space, but other land uses include a small commercial property with a surface parking lot, walking path, and a cul-de-sac for vehicle access to a cellular tower. There is a catch basin located in the area that connects to the CSAH 10 (Bass Lake Road) trunk line which discharges into Upper Twin Lake without further treatment.

Another concern in the area is that, as noted in the Water Resources Preliminary Design Report (July 2004) prepared for the CSAH 81 reconstruction project, the existing CSAH 10 (Bass Lake Road) trunk storm sewer is known to have capacity issues and has an emergency relief system in place.

3.1.4.3 Drainage to Crystal Airport Infiltration Area (Station 2380+90 to 2418+75)

North of the intersection with CSAH 10 (Bass Lake Road), the BNSF Railway corridor continues along the west side of CSAH 81 (Bottineau Boulevard) throughout the remainder of the segment. Runoff in this section collects in ditches on either side of the track. Any runoff that does not infiltrate flows to a low point on the west side of CSAH 81 (Bottineau Boulevard) across from the Crystal Airport. At the low point, two culverts drain water from the west side of the tracks, and another culvert passes underneath CSAH 81 (Bottineau Boulevard) to drain the ditches, along with stormwater from a section of CSAH 81 (Bottineau Boulevard), into an infiltration area located on the Crystal Airport property. The outfall from the infiltration area is a series of ditches and culverts within the airport property to a large wetland complex and ultimately to Twin Creek and Upper Twin Lake.

The Metropolitan Airport Commission will not allow an increase in rate or volume being discharged to the existing infiltration area without permission, and the FAA will not allow surface ponds close to airports as they may attract birds which can interfere with airplane safety.

3.1.5 Segment BP2 – Brooklyn Park 2

The BP2 segment is in the portion of the project located in southern Brooklyn Park and extends from 62nd Avenue N to just south of Candlewood Drive N. The project corridor consists of the BNSF Railway corridor immediately adjacent to CSAH 81 (Bottineau Boulevard) from 62nd Avenue N to 73rd Avenue N, where the BLRT Extension

project will leave the BNSF Railway corridor, and the CSAH 103 (West Broadway Avenue) corridor from 73rd Avenue N to the northerly segment boundary. The reconstruction of CSAH 103 (West Broadway Avenue), including the addition of turn lanes, trails, and boulevards, and a portion of CSAH 152 (Brooklyn Boulevard) is included in this segment. The main receiving waters in this segment are Twin Creek, which flows into Upper Twin Lake and collects runoff from the portion of the segment south of I-94; and Shingle Creek, which collects runoff from the remainder of the segment. Approximately 22 percent of the project area drains to Twin Creek and 78 percent drains to Shingle Creek.

The soils in this segment of the BLRT Project corridor have been categorized as predominantly HSG B soils south of 75th Avenue N and predominantly HSG A soils north of 75th Avenue N. These soils have moderate to high infiltration capacity. Much of this segment falls within a wellhead protection area but is outside the emergency response area. Groundwater elevations are unknown at this time, except immediately adjacent to wetlands that are an expression of the surficial groundwater table.

Figures 7 through 9 in Appendix A show the existing flow patterns and receiving waters. The sections below provide more detail regarding the drainage within this segment.

3.1.5.1 Drainage to Twin Creek, 62nd Avenue Wetland (Stations 2418+75 to 2436+30)

The existing BNSF Railway corridor runs adjacent to a stormwater wetland located in the northwest quadrant of 62nd Avenue N and CSAH 81 (Bottineau Boulevard). Runoff that collects in ditches on the west side of the railroad corridor between 62nd Avenue N and 63rd Avenue N, and does not infiltrate, flows into the wetland. The ditch on the east side of the railroad corridor has a different drainage pattern which is explained below. The wetland currently receives runoff from a watershed of approximately 625 acres. Roughly 250 acres of that, consisting largely of ¼-acre residential lots located west of CSAH 81 (Bottineau Boulevard) and south of I-94, is routed directly to the wetland. The pond outlet is in the southeast corner. From there, the outlet pipe crosses under CSAH 81 (Bottineau Boulevard), runs along the property line directly east, and discharges to a wetland in Southbrook Park east of industrial properties. It eventually discharges to Twin Creek, where it crosses 63rd Avenue N.

In 2003, the City of Brooklyn Park re-graded the wetland and improved the outlet structures to reduce flooding in the City of Crystal and provide additional water quality benefits. The wetland system allows suspended sediments to settle out and also provides filtering through a buffer of wetland vegetation. According to hydraulic modeling performed by the City of Brooklyn Park, the high water level of the wetland is roughly 8.2 feet higher than the normal water elevation.

3.1.5.2 Drainage to Twin Creek, CSAH 81 (Bottineau Boulevard) (Stations 2436+30 to 2468+00)

As mentioned above, the BLRT project runs along the existing BNSF Railway corridor adjacent to CSAH 81 (Bottineau Boulevard) until the crossing at 73rd Avenue N. South of Dutton Avenue N, CSAH 81 (Bottineau Boulevard) has an urban drainage section with a trunk storm sewer that routes roadway runoff away from the ditch between the BNSF Railway corridor and CSAH 81 (Bottineau Boulevard). North of Dutton Avenue N, CSAH 81 (Bottineau Boulevard) currently has a rural drainage section.

The ditch on the east side of the existing BNSF Railway embankment collects runoff from about 700 feet south of the Brooklyn Park/Crystal border to 63rd Avenue N. The ditch flows to a low point across from the 62nd Avenue N wetland where a culvert drains into the CSAH 81 (Bottineau Boulevard) storm sewer. The east ditch between 63rd Avenue N and the I-94 interchange, which receives runoff from northbound CSAH 81 (Bottineau Boulevard) in the rural section north of Dutton Avenue N, also drains into the CSAH 81 (Bottineau Boulevard) storm sewer system through an inlet north of 63rd Avenue N. Both of these systems discharge to Twin Creek east of CSAH 81 (Bottineau Boulevard), near the intersection of 63rd Avenue N and Florida Avenue.

Runoff from southbound CSAH 81 (Bottineau Boulevard) flows into the ditch on the east side of the BNSF Railway corridor, where most of it infiltrates due to the presence of sandy soils. Any runoff not infiltrated flows to Twin Creek for the portion of the corridor south of I-94. In addition to the volume reduction from infiltration, the ditches also provide a degree of water quality treatment (due to vegetative filtering and plant uptake) and rate attenuation (due to the storage volume available). Hennepin County plans to reconstruct CSAH 81 (Bottineau Boulevard) in the near future. It is likely that the new roadway will utilize the same fully urban drainage section as for the portions of CSAH 81 (Bottineau Boulevard) reconstructed in Robbinsdale and Crystal. Further coordination with Hennepin County will be needed to understand the future drainage conditions.

3.1.5.3 Drainage to Shingle Creek, Stations 2468+00 to 2540+50 at CSAH 152 (Brooklyn Boulevard)

The project corridor continues along the west side of CSAH 81 until 73rd Avenue N, where it transitions to the CSAH 103 (West Broadway Avenue) corridor. South of station 2481+00, the characteristic of project corridor is consistent with the BNSF Railway corridor to the south. The portion of this segment between stations 2468+00 and 2481+00 drains into the ditches on either side of the BNSF Railway corridor. The ditches drain through the I-94 corridor and ultimately discharge to Shingle Creek to the east of the BLRT Corridor. Between station 2481+00 and the crossover to CSAH 103 (West Broadway Avenue), runoff from the project corridor drains to Shingle Creek to the west of the BLRT Corridor.

As the BLRT Corridor transitions to the CSAH 103 (West Broadway Avenue) alignment, it passes through commercial areas with a high percentage of impervious cover. There is minimal existing storm sewer in the area between CSAH 81 (Bottineau Boulevard) and CSAH 103 (West Broadway Avenue). Runoff flows to the surrounding vegetated areas and is infiltrated, collected by storm sewer in Jolly Lane, or flows into the roadside ditches along Lakeland Avenue. The storm sewer and ditches drain to a narrow pond on the east side of the BNSF Railway track adjacent to DNR Wetland #563W to the west of the project corridor, which ultimately drains to Shingle Creek.

CSAH 103 (West Broadway Avenue) has curb and gutter to channel stormwater into catch basins and storm sewer. There is a trunk storm sewer running to the north along CSAH 103 (West Broadway Avenue) from 73rd Avenue N to CSAH 152 (Brooklyn Boulevard). This trunk line connects to a larger trunk line running to the east along CSAH 152 (Brooklyn Boulevard) that discharges without treatment into Shingle Creek approximately 0.75 miles from the project corridor. In addition to the roadway runoff, the CSAH 103 (West Broadway Avenue) trunk storm sewer collects the outflow from stormwater BMPs in the Cub Foods/Target parking lot to the west.

3.1.5.4 Drainage to Shingle Creek, North of CSAH 152 (Brooklyn Boulevard) (Stations 2540+50 to 2552+65)

North of CSAH 152 (Brooklyn Boulevard), CSAH 103 (West Broadway Avenue) has curb and gutter with catch basins to collect the stormwater. A trunk storm sewer runs from just north of CSAH 152 (Brooklyn Boulevard) to just north of 78th Avenue N where it turns east and collects stormwater from the residential area north of CSAH 152 (Brooklyn Boulevard) and west of Idaho Avenue N. This area discharges into Shingle Creek where it intersects with Candlewood Drive. In addition, the trunk storm sewer collects runoff from a portion of the residential area around the 78th Court N cul-de-sac and the shopping area, including outflow from stormwater BMPs, to the northeast of the CSAH 103 (West Broadway Avenue) and CSAH 152 (Brooklyn Boulevard) intersection.

3.1.6 Segment BP1 – Brooklyn Park 1

This segment extends from the Shingle Creek Crossing at CSAH 152 (West Broadway Avenue) just south of Candlewood Drive north to Oak Grove Parkway/101st Avenue N, where the OMF will be located approximately one-half mile northwest of the Target North Campus. Drainage from the Shingle Creek crossing north to CSAH 109 (85th Avenue N) is within the SCWMC jurisdiction and drains to Shingle Creek. Drainage north of CSAH 109 (85th Avenue N) is within the WMWMC jurisdiction and is tributary to the Mississippi River via Century Channel and other

drainageways. These areas are described in more detail in the following sections. Approximately 20 percent of the project drains to Shingle Creek, 35 percent to Century Channel, and 45 percent to the Mississippi River.

The soils in this segment of the BLRT Project corridor has been categorized as HSG A and B soils, with high to moderate infiltration capacity. Much of this segment falls within a wellhead protection area, but only the portion between CSAH 109 (85th Avenue N) and Maplebrook Parkway N is within or near the emergency response area, which would be considered a highly vulnerable portion of the Brooklyn Park Central DWSMA.

See **Figures 9 through 12** in Appendix A for a representation of the existing flow patterns and receiving waters for this segment.

3.1.6.1 Drainage to Shingle Creek, Shingle Creek Crossing to Maplebrook Parkway N (Station 2552+65 to 2604+20)

The portion of CSAH 103 (West Broadway Avenue from Shingle Creek to roughly Maplebrook Parkway N consists of both rural and urban drainage systems. Inlets in the roadside ditches and catch basins in the street route the runoff into an existing trunk storm sewer under CSAH 103 (West Broadway Avenue). In addition to the road runoff, the trunk storm sewer serves large offsite areas consisting of single- and multi-family homes, the North Hennepin Community College (NHCC), and parks before discharging to Shingle Creek downstream of the crossing at CSAH 103 (West Broadway Avenue). Runoff from the rural roadway section receives some amount of water quality treatment through vegetative filtering and rate attenuation when flowing through ditches. However, much of the roadway runoff receives no treatment.

3.1.6.2 Drainage to Century Channel, Setzler Pond and the DNR Wetlands (#559W) (Station 2604+20 to 2644+15)

Setzler Pond is located in the northwest quadrant of the intersection of 89th Avenue N and CSAH 103 (West Broadway Avenue). Runoff from a portion of CSAH 103 (West Broadway Avenue) between 89th Avenue N and Setzler Parkway is conveyed to the pond via ditches. Setzler Pond was created as a regional rate control pond in the location of a public watercourse. Much of the stormwater that flows into Setzler Pond is runoff from the commercial and industrial land surrounding the pond from the north and west, as well as large contributing areas in the cities of Maple Grove and Osseo. Setzler Pond discharges through an existing culvert that crosses CSAH 103 (West Broadway Avenue), reconnecting into Century Channel. Century Channel is also known as Edinbrook Channel and Mattson Brook at various points along its course, with Mattson Brook at the most downstream end. Mattson Brook ultimately discharges into the Mississippi River.

DNR Wetland #559W is located between Setzler Parkway and 92nd Avenue N. The wetland was bisected with the original construction of CSAH 103 (West Broadway Avenue). DNR #559W receives stormwater runoff from CSAH 103 (West Broadway Avenue) between Setzler Parkway and CSAH 30 (93rd Avenue N), which has a rural drainage system. Roadway runoff receives some amount of water quality treatment through vegetative filtering prior to reaching the wetland. Although it was not designed as a treatment basin, the wetland provides additional water quality treatment via sedimentation and plant uptake, as well as rate attenuation. DNR #559W discharges through an existing culvert in the southwest corner of the west wetland. This culvert travels west until connecting into the trunk line traveling beneath Wyoming Avenue N. This trunk line discharges into Setzler Pond, which ultimately discharges to Century Channel.

The jurisdictional divide between the SCWMC and WMWMC falls at CSAH 109 (85th Avenue N). However, the hydrologic divide occurs at approximately Maplebrook Circle N.

3.1.6.3 Drainage to Century Channel, TH 610 Ponding System (Station 2644+15 to 2684+00)

CSAH 103 (West Broadway Avenue) between CSAH 30 (93rd Avenue N) and TH 610 has an urban drainage system with a trunk storm sewer running down the east gutter line. A small portion immediately north of CSAH 30 (93rd Avenue N) drains into an existing infiltration basin on the east side of CSAH 103 (West Broadway Avenue). This basin's outlet connects into the existing trunk line. The remainder of CSAH 103 (West Broadway Avenue) north to TH 610 drains directly into the trunk line, which discharges into existing stormwater treatment basins located inside the infield area in the southeast quadrant of the TH 610 interchange. CSAH 103 (West Broadway Avenue) runoff from approximately 800 feet north of the TH 610 bridge is conveyed via storm sewer running down the east gutter line and discharges into existing stormwater treatment basin located inside the infield area in the northeast quadrant of the TH 610 interchange. The TH 610 ponds ultimately discharge to Century Channel.

CSAH 103 (West Broadway Avenue) drainage from 800 feet north of TH 610 to 101st Avenue N is conveyed via storm sewer and roadside ditches to the existing stormwater pond located in the southeast quadrant of the intersection of CSAH 103 (West Broadway Avenue) and Oak Grove Parkway. Between Oak Grove Parkway and Winnetka Avenue N, CSAH 103 (West Broadway Avenue) transitions from an urban drainage section to rural section. Where the urban section ends, roadside culverts pick up ditch drainage, providing conveyance to the existing stormwater pond, which overflows south to the TH 610 system. The area bordered by TH 610, CSAH 103 (West Broadway Avenue), and Winnetka Avenue N flows south to an existing 42-inch culvert beneath CSAH 103 (West Broadway Avenue), and discharges to the north loop infield area of the TH 610 interchange, which ultimately drains to Century Channel.

3.1.6.4 Target North Campus Drainage

According to the 2012 AUAR Update – Stormwater Management for Target North Campus, the Target North Campus stormwater is treated with onsite BMPs that are routed to the existing stormwater pond southeast of Oak Grove Parkway and CSAH 103 (West Broadway Avenue) intersection, which then discharges to the TH 610 system. This appears to have been intended as a temporary drainage connection, and the City of Brooklyn Park 1995 Comprehensive Stormwater Management Plan (CSMP) and the 2013 Shingle Creek and West Mississippi Watershed Management Commissions Third Generation Watershed Management Plan indicate that the Target North Campus drainage is intended to flow northeast into a series of wetlands and drainageways that ultimately reach the Mississippi River. Further coordination is needed with the City of Brooklyn Park, WMWMC, Target North Campus, and other stakeholders to determine exactly how the Target North Campus drainage functions in the existing condition and whether the current drainage patterns will be maintained.

3.1.6.5 Drainage to Mississippi River, North of TH 610 (Station 2684+00 to OMF)

North of TH 610, the project includes additional site development outside of the corridor (i.e. park-and-ride, OMF, and the Oak Grove Parkway realignment), which extends approximately 1,500 feet to the west of Winnetka Avenue N. See **Figures 11 and 12** in Appendix A for Oak Grove Parkway N realignment concept design.

Per the 2013 Shingle Creek Third Generation Plan, the area west of Winnetka Avenue N is within the 'Northwest/Riverside' West Mississippi Subwatershed, which is within the Anoka sand plain and is relatively flat with little relief. Per the 2009 City of Brooklyn Park Draft Local Water Management Plan Update, runoff generated in this area that is not infiltrated within the numerous low areas eventually drains easterly into a series of wetlands, open channels, and a trunk storm sewer system. At the eastern end of 101st Avenue N, this system discharges into a large wetland complex, ultimately reaching the Mississippi River.

4.0 Drainage Design Approach

4.1 Proposed Project

The proposed project includes the following basic components:

- Construction of a northbound and a southbound BLRT guideway. The majority of the guideways will be ballasted track, except within at-grade intersections. In some areas, the guideways will replace existing vegetated surfaces. Where the guideway will be ballasted, six-inch perforated pipe track drains will be located below the subballast.
- Reconstruction of TH 55 (Olson Memorial Highway), the majority of CSAH 103 (West Broadway Avenue), and Oak Grove Parkway within the project limits
- Construction of new roadways as needed to support the OMF and park-and-ride in the BP1 segment
- Relocation of the BNSF tracks and construction of an access road to be used by BNSF for access to their facility
- Construction of LRT stations and platforms
- Construction of park-and-ride facilities

As noted above, the project has been divided into six segments: Minneapolis, Golden Valley, Robbinsdale, Crystal, Brooklyn Park 2, and Brooklyn Park 1. The following sections will describe the overall drainage design approach and the types of BMPs being considered. They will also provide more detail of the proposed changes in each segment and the specific stormwater strategies recommended.

4.2 Methodology

In general, a proposed stormwater plan needs to analyze three items, which are discussed in more detail in the sub-sections below:

1. Existing drainage patterns and the regulatory environment (the latter was summarized in the Section above).
2. Changes to hydrology due to an increase in impervious surface
3. Changes to hydraulics due to a conversion from one conveyance system to another (surface flow in ditches versus pipe flow) and due to reduction in the storage available

Following this, the stormwater management plan needs to include the design of BMPs in accordance with the regulatory agencies' rules and ordinances to manage changes to these three items. The sequencing approach to locating BMPs was as follows:

1. Locate BMPs within the available right-of-way to the greatest extent practicable
2. Locate BMPs within other public right-of-way or remnants of parcels that are anticipated to be acquired due to other project requirements
3. Locate BMPs within currently undeveloped land outside of the right-of-way

4.2.1 Drainage Patterns

The intent of the proposed drainage system for the BLRT Extension project is to mimic the existing drainage patterns to the greatest extent possible while also meeting the requirements of the regulatory agencies. There are some instances where small diversions in drainage patterns are proposed in order to route project runoff to a BMP. These diversions are limited to below the subwatershed level, such that stormwater will not be diverted between jurisdictional watershed agencies and typically will not be diverted between different water bodies within a

watershed. When diversions are proposed for treatment purposes, the BMPs will need to be designed to ensure that there is no increase in discharge rates to existing storm sewer facilities or to the receiving water.

4.2.2 Changes to Hydrology

For the purposes of this preliminary design, the portions of the project that will be constructed on ballast rock have been considered to be impervious surface due to the compacted class 5 aggregate underneath the ballast. However, the calculations have assumed the ballast to have a lower runoff coefficient (a curve number of 85) than other impervious surfaces, such as concrete and asphalt (with a curve number of 98), due to the higher percentage of surface area of the ballast rock to abstract more rainfall than pavement and due to the higher percentage of void spaces that allow for some storage of rainfall. Impervious surfaces translate to higher runoff volumes and higher discharge rates due to the decrease in pervious areas capable of infiltrating the rainfall. They also tend to correlate to a faster time of travel for the rainfall runoff due to the lower resistance of paved surfaces, which also results in higher discharge rates.

Changes from pervious to impervious land uses are also typically associated with increased pollutant loads in the runoff. This is especially true of impervious surfaces associated with automobiles, such as roadways and parking lots. Therefore, BMPs will be proposed that can provide rate attenuation, water quality treatment, and, where conditions permit, reduction in runoff volumes.

4.2.3 Changes to Hydraulics

The proposed conveyance system for the majority of the Minneapolis, Golden Valley, Robbinsdale, and Crystal segments will match that of the existing condition. However, due to widening of the roadway in the Brooklyn Park segments, the existing roadside ditches will be partially or completely eliminated, and the drainage will be captured in storm sewer systems instead. In general, changing the conveyance system from ditch flow to storm sewer flow increases the velocity of the stormwater. It tends to eliminate the attenuation of flow that happens in open channel systems. There is also an increase in the volume of stormwater due to the elimination of evapotranspiration. Therefore, changing to a storm sewer system from a ditch system can also result in an increase peak discharge rates and volumes.

The project corridor is bounded by natural and constructed stormwater detention basins along much of its length, in particular in the Golden Valley, Robbinsdale, and Brooklyn Park segments. Because the proposed BLRT and BNSF facilities will be wider than the existing BNSF facility, the area available to store stormwater in some of these basins will be reduced. Reduction in storage volumes can lead to an increase in high water levels (HWLs) and/or an increase in discharge rates. The proposed stormwater management plan includes various storage BMPs to mitigate increases in discharge rates and HWLs in an effort to match existing conditions.

It should be noted that several wetlands and regulated floodplains exist along the corridor. Many of these will also be partially filled by the project. A separate technical memorandum has been prepared to discuss floodplain impacts and mitigation. The analysis of wetlands adjacent to the project limits and the potential impacts to those is being performed by others.

4.3 Proposed BMPs

The proposed stormwater management plan includes a variety of BMPs that can provide water quality treatment, rate control, and volume reduction. The Proposed Conditions section below will discuss the BMPs that appear to be best suited for the particular segment and may suggest preferred options. However, specific BMP types and locations will need to be confirmed as the design progresses and as more is known about the existing soil conditions. Further coordination with city and watershed organization staff may also affect the ultimate stormwater management plan. The following includes a brief description of the BMPs being considered.

4.3.1 Bioretention Basins

Bioretention basins are shallow, dry depressions that rely on a combination of plants, microbes, and soil to provide water quality treatment. Stormwater runoff is captured in the basin where it then infiltrates through a soil medium. The soil medium may be the native soil where conducive to infiltration or may be an engineered soil mix where the native soils are too clayey, which is not conducive to infiltration. Plants and microbes within the basin take up nutrients and other pollutants in the runoff. The plants also create macropores in the soil that aid in the infiltration of runoff. Bioretention basins remove pollutants by a number of mechanisms, including filtration, adsorption, cation exchange, volatilization, plant uptake, and decomposition. It is important that the basins drain within 48 hours of a rainfall event so that the plants do not drown.

Basins are typically designed with 12 inches to 18 inches of depth. Therefore, while they will provide rate attenuation for smaller storms, they may not be sufficient to provide rate attenuation for the 100-year rainfall event on their own. Modeling will be completed during the next phase of design to ensure adequate storage has been incorporated.

Depending on site conditions, bioretention basins can be designed as infiltration or filtration basins. The former are sometimes referred to as bioinfiltration basins while the latter are referred to as biofiltration basins. Typically, bioretention basins are designed to promote infiltration, thereby attaining volume reduction through evapotranspiration and infiltration in addition to water quality treatment and some degree of rate attenuation. The NPDES permit provides guidance on the site conditions that preclude the use of bioinfiltration and infiltration practices (such as insufficient depth to the groundwater table, contaminated soil and groundwater, and “tight” soils). Where infiltration practices are not encouraged, biofiltration basins can be designed with perforated piping to minimize infiltration and ensure the basin drains within the specified 48 hours. In addition, a liner could be utilized to prevent infiltration.

Pretreatment is required before discharging runoff into bioretention basins. This can take the form of proprietary hydrodynamic oil and grit separators, wet sediment forebays, or filter strips.

4.3.2 Ditch Treatment and Bioswales

The ditches that will be constructed between the BLRT guideway and BNSF tracks and/or the outside ditches will be utilized to provide water quality treatment, rate attenuation, and volume reduction (where conditions permit). In general, these are long ditches with very flat longitudinal slopes that will convey stormwater as a traditional ditch does. These are expected to take one of two general forms:

1. It is expected that the center corridor protection ditch (CPD) and any ditch to the outside of the BNSF Railway will be rock lined, either with free-draining ballast rock or riprap. The flat longitudinal slope will slow the velocity of water flowing in the ditches, which will encourage sedimentation and infiltration. Where conditions allow infiltration, a sand section would be included if needed to increase the available storage volume prior to infiltration. Where soil or groundwater conditions do not allow infiltration, either a sand section with perforated piping would be included below the ditch bottom to allow for filtration of runoff, or rock weepers would be included to provide horizontal filtering. Furthermore, the elevations of culverts would be set above the bottom of the channel to encourage infiltration/filtration.
2. Vegetated ditches may be possible to the east of the BLRT guideways. Where conditions allow infiltration, a sand section would be included if needed to increase the available storage volume prior to infiltration. Where conditions do not allow infiltration, either a sand section with perforated piping would be included for filtration or rock weepers would be included to provide horizontal filtering. The vegetated ditches would act similarly to bioswales.

Bioswales are vegetated swales that use the same soil as a bioretention basin. They convey stormwater to low areas similarly to a traditional swale, but ditch checks, rock weepers, and other devices are used to encourage

infiltration or filtration. The vegetation, microbes, and soil in the bioswale allow this BMP to provide the same treatment functions as bioretention basins.

Treatment ditches and bioswales can be designed to provide rate attenuation in addition to the water quality treatment and volume reduction benefits. However, because bioswales are vegetated and therefore need to drain within 48 hours of a rain event, they may not be able to attenuate the 100-year rainfall event. Modeling will be completed during the next phase of design to ensure adequate storage has been incorporated.

4.3.3 Hydrodynamic Separators

Hydrodynamic oil and grit separators are underground structures that remove larger particles and the pollutants that may be attached to them, as well as floating debris and oils. They are not capable of providing the level of treatment required but are used to pretreat runoff routed to bioretention and other infiltration BMPs, thereby prolonging their lifespans. They can be used as the sole treatment measure if no other options are practicable, but they do not provide any rate attenuation or volume reduction.

4.3.4 Wet Detention Pond

Also called NURP (for National Urban Runoff Program) ponds, these ponds are usually constructed at the end of storm sewer pipes or near ditch low points. Their function is to remove a large majority of the sediment and associated pollutants contained in the stormwater runoff prior to being discharged downstream. Furthermore, most pond designs incorporate skimmer structures that cause floating debris and oils to be trapped in the pond. Because of their relatively large surface area, they also can be used to attenuate peak discharge rates. In general, wet detention ponds do not provide volume reduction, but they can be used to pretreat runoff upstream of bioretention or infiltration practices.

4.3.5 Tree Trenches

Tree trenches are typically used in the boulevard areas adjacent to roadways. They consist of a prepared soil mix, an underdrain system, and a tree. If the tree trench is located in a boulevard with turf grass, the soil mix is similar to that used in bioretention basins. If the tree trench is located in a more urbanized setting with a paved surface, a structural soil or other structural technique is used that provides adequate void space for tree roots to develop but also support for the paving above.

Tree trenches provide water quality treatment by filtering runoff through the prepared soil mix and through uptake of some pollutants by the trees and microbes. Tree trenches also reduce the volume of runoff through infiltration into the underlying soils and through evapotranspiration. However, the amount of rate attenuation provided, especially for the larger storm events, varies by the type and design of system used.

4.3.6 Underground Detention and Infiltration

Underground detention systems can be used solely to store stormwater runoff temporarily or they can include an infiltration component. These systems typically consist of multiple parallel pipes that can be solid wall, perforated, or have an open bottom. When infiltration is not possible due to site conditions, solid wall pipes or liners are used. Their primary function in this case is rate control. When infiltration is possible, perforated or open-bottom pipes are set on top of and within a free-draining aggregate layer that allows for water quality treatment through filtering, volume reduction, and rate attenuation.

4.4 Proposed Conditions

4.4.1 Segment M – Minneapolis

In the Minneapolis segment, the proposed BLRT alignment will run down the center of TH 55 (Olson Memorial Highway), replacing the existing grassed median. The track will be in track panels at intersections and in ballast with ballast curb for the remainder of the roadway section. Track drains will collect runoff from the BLRT guideway that will be connected to the roadway storm sewer. A variety of stormwater BMPs are being considered for this portion of the project in order to meet regulatory requirements to the greatest extent possible. See **Figures 1 and 2** in Appendix A for the potential locations of the stormwater BMPs. **Tables 1 and 2** below provide a summary of the changes in impervious surfaces and the sizes of potential BMPs.

In addition to the proposed pedestrian sidewalk, a 10-foot wide cycle track is currently proposed to run on the north side of TH 55 (Olson Memorial Highway) from Van White Memorial Boulevard west to the TH 55 (Olson Memorial Highway) bridge over the BNSF Railway corridor. The cycle track will tie in with existing cycle trails in TWRP on the west side of the BNSF Railway corridor. The design accommodates the future cycle track.

4.4.1.1 Drainage to Bassett Creek Tunnels, East of I-94 (Stations 2010+75 to 2021+80)

Right-of-way constraints and a high number of underground utilities limit the type and size of BMPs that can be used in this area. Runoff from this portion of the project is proposed to be treated using tree trenches placed in the boulevard between the roadway and sidewalk on the north side, and between the sidewalk and frontage road on the south side. Because of poor soils in this area of the project, the proposed tree trenches would use a perforated pipe underdrain to both distribute water through the trench, but also to prevent extended periods of full saturation of the soil that could damage the trees. This portion of the corridor is owned by MnDOT, but the TH 55 (Olson Memorial Highway) corridor was designated to follow Lyndale Avenue south of the I-94 crossing several years ago. Therefore, the roadway in this area is operated and maintained by the City of Minneapolis.

4.4.1.2 Drainage to Old Bassett Creek Tunnel, West of I-94 (Stations 2021+80 to 2076+20)

Design of the BLRT guideway in this portion of the corridor is complicated by the shallowness of the old Bassett Creek tunnel near Dupont Avenue N. Further complications for the project include the number of underground utilities, including major sanitary sewer lines owned by the City of Minneapolis and by Metropolitan Council.

This portion of the project is proposed to have two storm sewer trunk lines, one to the north and one to the south of the proposed BLRT alignment, in order to minimize the number of storm sewer crossings under the proposed guideway. These storm sewer trunk lines will start at approximately CSAH 2 (Penn Avenue N) and discharge into the old Bassett Creek tunnel where it crosses TH 55 (Olson Memorial Highway) near Dupont Avenue N. Storm sewer will also collect runoff from TH 55 (Olson Memorial Highway) between the I-94 bridge and approximately Dupont Avenue N that will connect to the old Bassett Creek tunnel at the same location. As part of the MnDOT trunk highway system, the BMPs within their right-of-way need to be limited to those acceptable to MnDOT. Therefore, further coordination with staff from MnDOT and the City of Minneapolis will be required to finalize BMP types and locations.

Because right-of-way and open space is very constrained between the old Bassett Creek tunnel and I-94, no stormwater BMPs are being proposed in this area. BMPs west of the old Bassett Creek tunnel would be designed to treat otherwise untreated off-site runoff to compensate for lack of treatment east of the tunnel. The BMPs west of the old Bassett Creek tunnel may also need to be designed to provide enough rate attenuation such that there is no increase in peak discharge rates to the tunnel at the connections near Dupont Avenue. Coordination with the the City of Minneapolis will be required to confirm this approach.

Several BMP options are being considered to treat roadway runoff in this segment of the project, including bioretention basins, hydrodynamic separators, underground detention, and a NURP pond. Bioretention basins could be implemented in the south boulevard within the current TH 55 (Olson Memorial Highway) right-of-way. However, MnDOT has committed to conveying surplus right-of-way along the south side of TH 55 (Olson Memorial Highway) between Russell Avenue and Knox Avenue to the City of Minneapolis once the BLRT project and roadway improvements are completed. City staff has indicated a desire to have redevelopment occur in these spaces. Therefore, the locations of any basins would balance stormwater treatment needs and minimizing the impacts to land that the City of Minneapolis is considering for future redevelopment. The basins will function as retention and filtration with perforated pipe underdrains to ensure the basins drain within the allowed 48-hour drawdown time. Hydrodynamic separators or similar pretreatment BMPs will be used where viable to pretreat runoff before entering a bioretention basin. The existing three-cell treatment system in the Heritage Park south park area described above may have capacity to provide water quality treatment and rate control for the project area and future redevelopment. Further coordination with the City of Minneapolis will be necessary to understand the constraints and opportunities in the south park area. East of Knox Avenue N, right-of-way is very constrained, leaving little to no room for traditional above-ground BMPs. For this reason, underground detention BMPs are being considered for locations under low-volume frontage roads, aiming to avoid potential utility conflicts. This type of BMP provides rate control only, and hydrodynamic separators would be used to provide some level of water quality treatment. These could be used in conjunction with bioretention basins as needed to manage the total project discharge rate to the old Bassett Creek tunnel in this portion west of I-94.

A wet detention pond or other regional BMP could be implemented as part of future redevelopment of the parcel currently owned by the Minneapolis Public Housing Authority south of TH 55 (Olson Memorial Highway) and west of Van White Memorial Boulevard. This may provide an opportunity to cooperate on construction of the BMP to accommodate runoff from the BLRT Extension project and obtain both rate control and water quality treatment.

4.4.1.3 Drainage to Old Bassett Creek Tunnel, Heritage Park South Treatment System (Stations 2075+60 to 2081+95)

Although this portion of the segment drains to a series of existing water quality and rate control BMPs, the increase in discharge rates will need to be mitigated before connecting to the existing storm sewer systems immediately downstream of the project corridor. Furthermore, the existing treatment facilities would need to be investigated to determine if there is excess capacity to provide the treatment for the additional runoff. Options being investigated include a bioretention basin, which would treat offsite and project runoff in the boulevard at Russell Avenue, and that would connect to the existing storm sewer, thereby maintaining existing flow patterns.

However, because the City of Minneapolis desires to use the existing grassed boulevard for future redevelopment, a similar bioretention basin or other above-ground BMP is not possible at Queen Avenue N, and runoff would therefore enter the existing system untreated. Alternatively, offsite runoff could continue south to the existing storm sewer by crossing under the BLRT and roadway, while project runoff is routed to other proposed BMPs to the east and west. The proposed high point is located approximately half way between Russell Avenue N and Queen Avenue N, so approximately half of project runoff in this area would be routed to the old Bassett Creek tunnel, and half to East Channel Bassett Creek. Further coordination with the City, MnDOT, and BCWMC will be required to resolve this location.

4.4.1.4 Drainage to East Channel Bassett Creek, Russell Avenue N to TH 55 (Olson Memorial Highway)/BNSF Crossing

Runoff from this portion of the roadway is currently proposed to be treated in bioretention basins and an underground detention BMP. To limit the need for storm sewer crossings under the BLRT guideway, BMPs are being considered on both sides of the road. Due to the limited right-of-way on the north side of TH 55 (Olson Memorial Highway), an underground detention BMP is being considered under the north frontage road, between Thomas

Avenue N and Sheridan Avenue N. Before entering the underground storage BMP, water would be routed through a hydrodynamic separator for pretreatment. Bioretention basins are being considered on the south side of TH 55 (Olson Memorial Highway), where there is sufficient right-of-way, and would be designed with extra storage to provide rate control. Because of limited right-of-way to the west of the BNSF corridor, BMPs east of the bridge would be designed to compensate for the project runoff that is unable to be treated west of the bridge.

Westbound TH 55 (Olson Memorial Highway) will be realigned to the north to accommodate the BLRT guideway. A retaining wall is proposed to limit the amount of fill placed into the area near the upstream end of the East Channel Bassett Creek culvert crossing the highway. As a result of this, the culvert will need to be lengthened. More analysis will be done during the next stages of design to verify the culvert has the necessary hydraulic capacity. It may also be necessary to coordinate with the City of Minneapolis and the MPRB to better understand the drainage issues and opportunities in this area.

4.4.1.5 Drainage to East Channel Bassett Creek and Bassett Creek, TH 55 (Olson Memorial Highway) to Oak Park Avenue (Stations 2095+00 to 2109+25)

See the Segment GV section for general discussion of the BLRT Extension project corridor in TWRP. See the floodplain and wetland technical memoranda for additional information on this area.

Some water quality treatment and rate control will be achieved in the CDP between station 2098+00 and station 2109+30, which will discharge to East Channel Bassett Creek. Limited right-of-way and flat grades restrict the options for BMPs in this area. Ditch treatment, both on the east side of the BLRT tracks and in CPD, will be maximized during final design to the extent practicable.

Table 1. Change in Impervious Cover

Receiving Water	Total Area (acres)	Existing Impervious (acres)	Existing Percent Impervious	Total Proposed Impervious(1) (acres)	Change in Impervious (acres)	Proposed Percent Impervious	Percent Impervious Increase
Bassett Creek Tunnels at 7th St (East of I-94)	6	5	83%	5	0	83%	0%
Old Bassett Creek Tunnel at TH 55 (West of I-94)	23	17	74%	20	3	87%	18%
Heritage Park South Pond	2	2	100%	2	0	100%	0%
East Channel Bassett Creek	8	4	50%	6	2	75%	50%
Bassett Creek	5	2	40%	3	1	60%	50%

(1) This reflects only the impervious surface that will be in place following construction of the proposed project, which includes the access road adjacent to the relocated BNSF track. It does not include the additional impervious area from possible expansion of operational capacity in the BNSF Railway corridor. See the Golden Valley segment below for more discussion.

Table 2. Potential BMP Strategies

Receiving Water/Location	Water Quality Volume Required (acre-feet)	BMP Options Considered	BMP Surface Area (square feet)	BMP Volume Provided (acre-feet)
Bassett Creek Tunnels at 7th St (East of I-94)	0.24	Tree Trenches	16,850	0.31
Old Bassett Creek Tunnel at TH 55 (West of I-94)	0.90	Bioretention Wet Pond Underground Detention Hydrodynamic Separator	30,500 37,120 N/A N/A	0.91 0.80 1.0(3) N/A
Heritage Park South Pond	0.09	Bioretention	4,050	0.10
East Channel Bassett Creek	0.28	Bioretention Underground Storage Hydrodynamic Separator	13,350 N/A N/A	0.27 0.17(3) N/A
East Channel Bassett Creek(1)	0.12	CPD	N/A(2)	0.05

(1) The Water Quality Volume Required calculation includes the approximate impervious area that would be added by an expansion in operational capacity by BNSF. Total area of future freight impervious in segment M is approximately 0.4 acres.
(2) The treatment BMP is incorporated into the ditches that are part of the typical section for the proposed project, and therefore, the surface area is not provided as a separate number.
(3) This BMP is designed for rate control only.

4.4.2 Segment GV – Golden Valley

In the Golden Valley segment, the BLRT Corridor is located within the easterly 50 feet of the BNSF right-of-way along the eastern edge of TWRP. To make room for the BLRT guideway, the existing BNSF tracks will be relocated to the western 50 feet of the right-of-way. An access road will be constructed on the west side of the proposed BNSF Railway from TH 55 (Olson Memorial Highway) to Theodore Wirth Parkway. Due to poor soils and wetlands, the access road has been eliminated from Theodore Wirth Parkway to the northern end of the segment. The preliminary stormwater management strategy has been to include mitigation for the access road, which is generally where potential expansion of the BNSF Railway would occur, to the extent practicable.

The BLRT Extension project corridor in this section is a ballasted section with retained embankment and retaining walls used as needed. Either ditches or walls are expected to be used throughout the segment for corridor protection. For the most part, the profile of the BNSF track is lower than the BLRT. The corridor does not have any at-grade crossings, but does pass under bridges at Plymouth Avenue, Theodore Wirth Parkway, and Golden Valley Road.

Limited right-of-way, the potential for expansion of BNSF operational capacity, and the effort to minimize park impacts has reduced the possibilities of placing BMPs, including ditch treatment, on the west side of the corridor. Infiltration will not be considered in the Golden Valley segment because of the prevalence of HSG C and D soils, high groundwater levels, and the DWSMA with high vulnerability. In part because the BNSF profile is lower than the BLRT profiles, much of the BNSF track drainage will be difficult to pick up and treat. It sheet flows into TWRP in the same way as in the existing condition. In final design as much runoff from the BNSF Railway will be collected and treated as is practicable.

Several stormwater BMPs are being considered for this portion of the project in order to meet regulatory requirements to the greatest extent possible. As much water quality treatment as possible will be achieved through biofiltration basins and in the CPDs. Ditch treatment, both on the east side of the BLRT and in the CPD, will be maximized in the final design to the extent practicable. Because of poorly drained soils, ditch treatment will be through filtration and detention via rock weepers. When other treatment options are unavailable, pretreatment via hydrodynamic separators will be used as feasible.

Figures 2 and 3 in Appendix A provide a representation of the potential locations of the stormwater BMPs. **Tables 3 and 4** below provide a summary of the changes in impervious surfaces and the sizes of potential BMPs. See the floodplain and wetland technical memoranda for additional information on other water resources impacts and mitigations of the project in this area.

4.4.2.1 Drainage to Bassett Creek, Oak Park Avenue to Plymouth Avenue (Stations 2109+25 to 2122+55)

Some water quality treatment and rate control will be achieved in the CPD from station 2109+30 to station 2114+50, which will discharge to the west into Bassett Creek.

A large biofiltration basin is currently proposed on the east side of the BLRT Corridor between Oak Park Avenue and Plymouth Avenue in the excess Canadian Pacific Railway right-of-way in this area. The biofiltration basin will treat as much corridor drainage as possible between station 2107+00 and 2135+00 as well as from residential areas to the east, and will discharge to Bassett Creek downstream of Plymouth Avenue. The basin is larger than what is required to treat the project water quality volume that can drain to it. The additional water quality volume provided will to be used to compensate for other areas within the segment where treatment is less feasible. Access for maintenance will be investigated more fully during final design, and if determined not to be feasible, this basin may be modified. The project will continue to coordinate with MPRB for any construction that affects parkland.

The alignment of the creek will be shifted to the east to accommodate the BLRT project. Effort will be made to minimize the impacts to the recent streambank restoration project.

4.4.2.2 Drainage to Bassett Creek, Plymouth Avenue to Theodore Wirth Parkway (Stations 2122+55 to 2154+00)

As described in the Existing Conditions section, the City of Golden Valley and the BCWMC are proposing to construct a stormwater BMP in the area to the west of the BNSF Railway corridor, north of Plymouth Avenue and east of Theodore Wirth Parkway. If the BMP is built, some corridor runoff would drain to it. If the city's project goes forward, it is possible that the BLRT Extension project could coordinate with the city and BCWMC to expand or deepen the BMP as needed to also provide treatment for corridor runoff. This will occur during the next phases of design.

A biofiltration basin/trench is proposed on the east side of the BLRT Corridor, north of 16th Avenue N. The biofiltration basin will treat as much corridor drainage as possible between station 2135+00 and 2147+00 as well as from residential areas to the east, and will drain to the wetland west of the corridor. Access for maintenance will be investigated more fully during final design, and if determined not to be feasible, this basin may be modified.

4.4.2.3 Drainage to Bassett Creek, Golden Valley Road Wetlands (Stations 2154+00 to 2165+50)

Drainage in this section discharges to the wetlands north of Golden Valley Road. The current BLRT Extension project design through the Golden Valley Road wetlands includes building bridges for the BLRT guideways while maintaining the existing BNSF embankment. The guideway bridges would minimize fill impacts to the wetlands. Any mitigation necessary to maintain existing water surface elevations and flow rates would be addressed in final design but could include excavation at the edges of the wetlands and lowering the normal water level of the basins to provide additional active storage.

Discharge to the Golden Valley Road wetlands from the project will be difficult to treat before it reaches the basins. Other corridor runoff would be treated as much as practicable through ditch treatment before being discharged to the ponds.

A park-and-ride between Theodore Wirth Parkway, Golden Valley Road, and the BNSF Railway corridor has been proposed but is not currently part of the project. If it is included in the final design, it is expected that water quality treatment will be provided to meet BCWMC requirements on the site via tree trenches, biofiltration, or other options that are determined to be feasible during the final design.

4.4.2.4 Drainage to Bassett Creek, Station 2166+00 to 2185+00 at 26th Avenue N

This section drains through Sochacki Park to Bassett Creek. The minimal space between the BLRT Extension project corridor and Kewanee Way limits the possibility of ditch treatment on the east side of the tracks in this area. The potential expansion of BNSF operational capacity and park land on the west side limit opportunities for ditch treatment on the west side. The CPD from station 2166+75 to station 2176+75 will provide some water quality treatment and rate attenuation to corridor runoff.

Two existing storm sewer systems from residential areas to the east discharge into the existing ditch. These will be extended and routed west, under the BLRT guideway and BNSF Railway, picking up drainage from the CPD and the west ditch. Because of elevation constraints, the pipe will outlet further west, to one of the existing channels at station 2169+00 or station 2176+00. From the pipe, the stormwater will flow through Mary Hills Nature Area before eventually reaching Bassett Creek.

Table 3. Change in Impervious Cover

Receiving Water	Total Area (acres)	Existing Impervious (acres)	Existing Percent Impervious	Total Proposed Impervious[2] (acres)	Change in Impervious (acres)	Proposed Percent Impervious	Percent Impervio Increase
Bassett Creek[1]	21	6	29%	16	10	76%	166%

(1) This includes 5.1 acres that drain to the Golden Valley Road wetlands before draining to Bassett Creek.
(2) This reflects only the impervious surface that will be in place following construction of the proposed project, which includes the access road adjacent to the relocated BNSF track. It does not include the additional impervious area from possible expansion of operational capacity in the BNSF Railway corridor.

Table 4. Potential BMP Strategies

Receiving Water/Location	Water Quality Volume Required[1] (acre-feet)	BMP Options Considered	BMP Surface Area (square feet)	BMP Volume Provided (acre-feet)
Bassett Creek/ South of Golden Valley Road	0.61	CPD Biofiltration Basin (Sta 2112 to Sta 2122) Biofiltration Basin (Sta 2136 to 2139)	2,100 18,000 3,600	0.02 1.10 0.29
Golden Valley Roads Wetlands	0.22	Additional treatment volume will be provided in other portions of the segment		
Bassett Creek/ North of Manor Drive[3]	0.25	CPD	N/A[2]	0.05

(1) The Water Quality Volume Required calculation includes the approximate impervious area that would be added by an expansion in operational capacity by BNSF. Total area of future freight impervious in segment GV is approximately 2 acres.
(2) The treatment BMP is incorporated into the ditches that are part of the typical section for the proposed project, and therefore, the surface area is not provided as a separate number.
(3) Some of this area drains to the Robbinsdale segment.

4.4.3 Segment R – Robbinsdale

In the Robbinsdale segment, the BLRT Corridor is located within the easterly 50 feet of the BNSF right-of-way. To make room for the BLRT guideway, the existing BNSF tracks will be relocated to the western 50 feet of the right-of-way. An access road will be constructed on the west side of the proposed BNSF Railway from the north end of Grimes and North Rice Ponds to the northerly end of the segment. (Due to poor soils and wetlands, the access road has been eliminated from the southerly end of the segment through Grimes and North Rice Ponds.) The preliminary stormwater management strategy has been to include mitigation for the access road, which is generally where potential expansion of the BNSF Railway would occur, to the extent practicable.

The primary method of achieving water quality treatment in Robbinsdale is through treatment ditches, either by infiltrating where soils are suitable (HSG A and B) or via filtration through rock check dams. All ditches within the jurisdictional boundary of the BCWMC will function as filtration ditches with ditch blocks due to the presence of HSG C soils. It has been assumed that these ditches will be covered with ballast rock but will have uncompacted native soils beneath the ballast rock. Overall drainage patterns will be maintained as much as is feasible and corridor water will be treated to the extent practicable. Ditch volumes have been checked to ensure that they can accommodate both the BLRT Extension project site runoff and the BNSF access road, which is generally where potential expansion of the BNSF Railway would occur. Although there are currently ditch sections proposed along the western edge of the corridor, these ditches were not included in water quality computations because parts of them would be eliminated if there is a future expansion in BNSF operational capacity. In final design, freight and access road runoff will be collected and treated with runoff from the BLRT Corridor where feasible. The alignment may also shift east, impacting the amount of treatment volume available, so ponding offsite is also being considered, although not preferred.

Figures 4 through 6 in Appendix A provide a representation of the potential locations of the stormwater BMPs in the Robbinsdale segment. **Tables 5 and 6** below provide a summary of the changes in impervious surfaces and the sizes of potential BMPs. See the floodplain and wetland technical memoranda for additional information on other water resources impacts and proposed mitigation in this area.

4.4.3.1 Drainage to South Rice Pond, Existing Stormwater Pond in Sochaki Park (Stations 2185+00 to 2196+80)

There will be an eastern ditch from station 2184+00 to 2190+00 that will treat water before discharging to the existing stormwater pond in Sochacki Park that was recently constructed by the City of Robbinsdale. This ditch has enough capacity to treat water from the portion of the corridor within Robbinsdale south of Grimes and North Rice Ponds. Runoff from the Golden Valley segment also drains to this area and may require the existing pond be expanded or deepened if it does not have enough capacity to accommodate the project runoff. The expanded pond will also likely be needed for rate control as City of Golden Valley staff has expressed concern about increasing discharge rates to Bassett Creek due to the proximity of several homes to the creek's flood elevation.

4.4.3.2 Drainage to Grimes and North Rice Ponds (Stations 2196+80 to 2252+35)

In the BCWMC portion of Robbinsdale, the BLRT guideway will run along the eastern side of the corridor. The current design puts the BLRT on bridges over the ponds while the BNSF freight track will remain on its existing embankment. The fill at the BLRT bridge abutments will be compensated for by excavation at the edges of Grimes and North Rice Ponds in order to maintain the existing 100-year HWL and peak discharge rates of the ponds. The relocated BNSF track will run along the western side with an access road starting at the north end of Grimes and North Rice Ponds and extending to the northern end of the watershed.

Stormwater runoff from the project will be treated in CPDs where they have been incorporated into the corridor and in eastern ditches from station 2219+00 to 2230+00 and station 2210+00 to 2211+00. The outflow from these BMPs drains to Grimes and North Rice Ponds. Infiltration will occur in eastern ditches from station 2240+00

to station 2245+00. This is the area adjacent to Lee Park that currently infiltrates and drains over the watershed divide. This infiltration ditch would continue to discharge to the south through the eastern ditches and eventually to Grimes Pond in large events.

4.4.3.3 Drainage to Crystal Lake (Stations 2251+00 to 2298+00)

There will be infiltration in ditches from approximately station 2253+00 to station 2290+00 and underground detention at the proposed park-and-ride and station at 42nd Avenue N. The overflow would drain to existing storm sewer running down Hubbard Ave N, eventually discharging to Crystal Lake. Runoff would be routed through a pretreatment BMP, such as a hydrodynamic separator, before entering the underground detention system.

4.4.3.4 Drainage to Middle Twin Lake (Station 2298+00 to 2329+00)

A portion of the Crystal segment flows into the Robbinsdale segment to a low point near 45-1/2 Avenue N. Infiltration will occur in the CPD between approximately station 2313+00 to station 2325+00 and the east side ditch from station 2308+00 to station 2312+00 before discharging to Graeser Pond, an existing wet detention pond in MnDOT right-of-way that may need to be enlarged to accommodate the additional runoff from the project corridor. As design progresses, the intent will be to treat project runoff within the treatment ditches to the greatest extent practicable and thereby limit any changes needed to Graeser Pond. Outflow from Graeser Pond is routed to another existing pond east of CSAH 81 before the stormwater discharges to Middle Twin Lake.

Table 5. Change in Impervious Cover

Receiving Water	Total Area (acres)	Existing Impervious (acres)	Existing Percent Impervious	Total Proposed Impervious(1) (acres)	Change in Impervious (acres)	Proposed Percent Impervious	Percent Impervious Increase
Bassett Creek	5	2	40%	3	1	60%	50%
Grimes and Rice Ponds	7	2	29%	6	4	86%	200%
Crystal Lake	18	11	61%	15	4	83%	36%
Middle Twin Lake	6	3	50%	4	1	67%	33%

(1) This reflects only the impervious surface that will be in place following construction of the proposed project, which includes the access road adjacent to the relocated BNSF track. It does not include the additional impervious area from possible expansion of operational capacity in the BNSF Railway corridor.

Table 6. Potential BMP Strategies

Receiving Water/Location	Water Quality Volume Required(1) (acre-feet)	BMP Options Considered	BMP Surface Area (square feet)	BMP Volume Provided (acre-feet)
Bassett Creek	0.22	Treatment Ditch	1,660	0.22
Grimes and Rice Ponds	0.38	Treatment Ditch	3,620	0.48
		CPD	N/A(2)	0.31
Crystal Lake	0.76	Treatment Ditch	12,320	1.32
		Underground Detention	5,530	0.41
Middle Twin Lake	0.15	CPD	N/A(2)	0.48
		Treatment Ditch	1,210	0.13

(1) The Water Quality Volume Required calculation includes the approximate impervious area that would be added by an expansion in operational capacity by BNSF. Total area of impervious associated with the future BNSF track in segment R is approximately 3 acres.

(2) The treatment BMP is incorporated into the ditches that are part of the typical section for the proposed project, and therefore, the surface area is not provided as a separate number.

4.4.4 Segment C – Crystal

In the Crystal segment, the BLRT Corridor is located within the easterly 50 feet of the BNSF right-of-way as it runs along CSAH 8 (West Broadway Avenue) in the south portion of the segment and transitions to along CSAH 81 (Bottineau Boulevard) in the north portion. To make room for the BLRT guideway, the existing BNSF tracks will be relocated to the western 50 feet of the right-of-way. An access road will be constructed on the west side of the proposed BNSF track. The preliminary stormwater management strategy has been to include mitigation for the access road, which is generally where potential expansion of the BNSF Railway would occur, to the extent practicable.

There are at-grade crossings at CSAH 8 (West Broadway Avenue), Corvallis Avenue, and CSAH 10 (Bass Lake Road). Where the BNSF track crosses the Canadian Pacific Railway north of Corvallis Avenue, a bridge will be constructed for the BLRT while the freight track will cross at-grade. One station and park-and-ride surface lot is proposed for this segment at CSAH 10 (Bass Lake Road).

Tables 7 and 8 provide a summary of the anticipated increases in impervious area from this project and the sizes of potential BMPs. **Figures 6 and 7** in Appendix A show the potential locations of BMPs. The floodplain and wetland technical memoranda contain more information about the impacts to those resources.

4.4.4.1 Drainage to Twin Lakes, BNSF Railway Corridor South of CSAH 10 (Bass Lake Road) (Station 2520+80 to 2380+90)

Along the stretch of the BNSF Railway corridor south of CSAH 10 (Bass Lake Road), the freight railroad and the BLRT run between CSAH 8 (West Broadway Avenue) and CSAH 81 (Bottineau Boulevard). This section of track has ditches on either side of the proposed ballasted sections and a wall or retained embankment between the BNSF track and the BLRT for corridor protection. This section can be split into two drainage boundaries at proposed high points as explained below.

The first drainage area extends from just north of the end of the segment to just north of Corvallis Avenue. The remainder of the segment to the south will go to a BMP located in the Robbinsdale segment. A bioretention basin is proposed to provide volume control and water quality treatment through infiltration and plant uptake and will likely be located on the parcel of land currently occupied by Steve O's Bar and Grill, which will likely be acquired by the project. Pretreatment will be used before the BLRT track drains discharge to the bioretention practice. An overflow structure will direct overflow into existing storm sewer along CSAH 8 (West Broadway Avenue) which discharges to Middle Twin Lake.

The second drainage area extends just north of Corvallis Avenue to CSAH 10 (Bass Lake Road). This area contains the BLRT bridge over the Canadian Pacific Railway. Options for stormwater BMPs in this portion of the segment are limited due to lack of open space and right-of-way constraints. The track drains in this segment will discharge to another bioretention basin or to an underground detention BMP. The bioretention basin will likely be located in open space to the west of station 2366+00 or a currently vacant lot west of station 2359+00. If these are determined to not be feasible during final design, BMPs located elsewhere in the corridor that take offsite stormwater would be oversized to provide the necessary treatment volume. A hydrodynamic separator or other pretreatment method will be used prior to discharge into the basin or underground detention. An overflow structure will direct overflow into existing storm sewer near the BMP which discharges to Upper Twin Lake.

4.4.4.2 Drainage to Twin Lakes, Bass Lake Road Park-and-Ride (Station 2371+25 and 2379+30)

There is a surface parking lot proposed on the site between the BNSF Railway corridor and CSAH 81 (Bottineau Boulevard) south of CSAH 10 (Bass Lake Road). Due to the high likelihood of existing contamination on the site, infiltration practices are not allowed. To provide water quality treatment, an underground filtration BMP or other

underground practice will be used as there is a lack of available space for surface treatment. There are two potential outlets for the site: the trunk storm sewer in CSAH 10 (Bass Lake Road), which drains to Upper Twin Lake, and the storm sewer system in CSAH 81 (Bottineau Boulevard), which drains south through Wilshire Pond and Xenia Pond before discharging to Upper Twin Lake. The design of the storage for the underground BMP and the outlet will need to balance the capacity concerns of the trunk storm sewer in CSAH 10 (Bass Lake Road) and maintaining drainage flow patterns if the CSAH 81 (Bottineau Boulevard) ponds do not have capacity to take the site runoff.

4.4.4.3 Drainage to Crystal Airport Infiltration Area (Station 2380+90 to 2418+75)

North of CSAH 10 (Bass Lake Road) the BLRT Corridor follows the BNSF Railway corridor along the west side of CSAH 81 (Bottineau Boulevard). The existing ditch between CSAH 81 (Bottineau Boulevard) and the BNSF Railway corridor will be filled as part of the BLRT project. Further investigation will be needed during final design to ensure that adequate conveyance systems are provided for systems that drained into the ditch.

The Metropolitan Airports Commission prohibits the construction of new open water features within a specified distance of airport runways due to the potential for conflicts between waterfowl and planes taking off and landing. All stormwater BMPs within that zone will need to meet their criteria for maximum duration of ponded water.

There is a CPD proposed between the realigned BNSF track and the BLRT guideway. This CPD can serve as an infiltration trench as the in situ soils in this area appear to be sandy and have a high infiltration rate. Additional treatment is planned for the ditches on the outside of the tracks, which will also provide opportunities to infiltrate the runoff. The existing culverts under the freight track and CSAH 81 (Bottineau Boulevard) will be maintained or replaced. Careful design will be necessary to ensure there is no increase in the rate or volume discharging to the infiltration area at the Crystal Airport. Some of the overflow from both the inside and outside ditches may need to be routed to another BMP.

Table 7. Change in Impervious Cover

Receiving Water	Total Area (acres)	Existing Impervious (1) (acres)	Existing Percent Impervious	Total Proposed Impervious (acres)	Change in Impervious (acres)	Proposed Percent Impervious	Percent Impervious Increase
Twin Lakes	19	6	32%	14	8	74%	133%
Crystal Airport infiltration area	10	2	20%	7	5	70%	250%(2)

(1) This reflects only the impervious surface that will be in place following construction of the proposed project, which includes the access road adjacent to the relocated BNSF track. It does not include the additional impervious area from possible expansion of operational capacity in the BNSF Railway corridor.

(2) The feasibility of infiltration in the treatment ditches will need to be verified during final design to ensure there is no increase in discharges to the Crystal Airport.

Table 8. Potential BMP Strategies

Receiving Water/Location	Water Quality Volume Required (1) (acre-feet)	BMP Options Considered	BMP Surface Area (square feet)	BMP Volume Provided (acre-feet)
Twin Lakes/Steve O's Bar and Grill	0.32(3)	Bioretention	8,520	0.30
Twin Lakes/Sta 2366+00 LT or Sta 2359+00 LT	0.43	Bioretention	15,730	0.54
Twin Creek/Bass Lake Rd Park-and-Ride	0.33	Underground Detention (Filtration)	13,125	0.36
Shingle Creek/North of Bass Lake Road	0.60(4)	Treatment Ditch	N/A(2)	0.88

(1) The Water Quality Volume Required calculation includes the approximate impervious area that would be added by an expansion in operational capacity by BNSF. Total area of future freight impervious in segment C is approximately 1.6 acres.

(2) The treatment BMP is incorporated into the ditches that are part of the typical section for the proposed project, and therefore, the surface area is not provided as a separate number.

(3) Some of this area drains to the Robbinsdale segment.

(4) Some of this area drains to segment BP2.

4.4.5 Segment BP2 – Brooklyn Park 2

In the BP2 segment, the BLRT Corridor is located in the easterly 50 feet of the BNSF right-of-way along CSAH 81 (Bottineau Boulevard) south of 73rd Avenue N. To make room for the BLRT guideway, the existing BNSF tracks will be relocated to the westerly 50 feet of the right-of-way. An access road will be constructed on the west side of the proposed BNSF track. The preliminary stormwater management strategy has been to include mitigation for the access road, which is generally where potential expansion of the BNSF Railway would occur, to the extent practicable.

At 73rd Avenue N, the BLRT Extension will cross CSAH 81 (Bottineau Boulevard) on a bridge structure and then transition to the center median of CSAH 103 (West Broadway Avenue). CSAH 103 (West Broadway Avenue) will be reconstructed to accommodate the BLRT and will include the addition of turn lanes, trails, and sidewalk.

Tables 9 and 10 below provide a summary of the anticipated increases in impervious area from this project and the sizes of potential BMPs. **Figures 7 through 9** in Appendix A show the potential locations of BMPs. The floodplain and wetland technical memoranda contain more information about the impacts to those resources.

4.4.5.1 Drainage to Twin Creek, 62nd Avenue Wetland (Stations 2418+75 to 2436+30)

To accommodate the repositioned BNSF Railway and access road, there will be fill placed along the east edge of the 62nd Avenue wetland. As noted above, the basin has a high 100-year high water level elevation associated with it that is based on city modeling. The existing storage volume needed to attenuate larger rain events and maintain the 100-year HWL will be partially filled by the project. Although the wetland is not a regulated floodplain, mitigation for both the wetland and storage impacts is proposed along the northwest edge and the southeast corner As currently conceived, neither the fill nor the grading will affect the above-mentioned buffer section in the center. The outlet for the wetland may need to be reconstructed depending on the final grading limits. No changes to drainage into or out of this basin are anticipated with this project at this time.

The existing ditch between CSAH 81 (Bottineau Boulevard) and the BNSF Railway corridor will be filled as part of the BLRT project. Further investigation will be needed during final design to ensure that adequate conveyance systems are provided for systems that drained into the ditch.

There has been discussion about reconstructing the surface parking lot at the existing park-and-ride at 63rd Avenue to the west of the project corridor. At the time of this memorandum, the proposed BLRT Extension project does not include this work. If the park-and-ride is reconstructed in the future, a stormwater management plan will be developed that will include any changes to the existing stormwater BMPs and any new BMPs that are needed to meet the effective regulatory environment at that time.

4.4.5.2 Drainage to Twin Creek, CSAH 81 (Bottineau Boulevard) (Stations 2436+30 to 2468+00)

The proposed BLRT will run along the BNSF Railway corridor adjacent to CSAH 81 (Bottineau Boulevard) until the crossing at 73rd Avenue N. The addition of the two BLRT tracks and an access road create an increase in the impervious area of approximately 12.6 acres along this portion of the corridor. The existing ditch between the railroad corridor and CSAH 81 (Bottineau Boulevard) south of 63rd Avenue N will be filled in to accommodate the BLRT Corridor.

The proposed CPDs between the BNSF track and BLRT, which run along most of CSAH 81 (Bottineau Boulevard), will likely be used as infiltration trenches. Because of the sandy soils present in this area, the infiltration rate of the in situ soil is high. Infiltration will be encouraged due to the flat longitudinal grade of the ditches and through the use of check dams or by setting culvert elevations above the bottom of the ditches. The storage in the ditches and

the rock will also provide rate attenuation. Additional water quality volume could be similarly treated and infiltrated in ditches to the outside of the tracks as well.

In the 63rd Avenue station area where there is no ditch, runoff will be routed to the ditches to the north and south via track drains. Overflow structures will be used to make sure stormwater does not overtop the tracks and will direct the overflow into existing storm sewer.

Hennepin County is proposing to reconstruct CSAH 81 (Bottineau Boulevard) from Dutton Avenue to 71st Avenue. It may be possible that the Hennepin County project could provide stormwater BMPs that would include runoff from the BLRT Extension project north of Dutton Avenue if the CPDs are not able to. Further coordination with Hennepin County during final design will determine whether this is feasible.

4.4.5.3 Drainage to Shingle Creek, Stations 2468+00 to 2540+50 at CSAH 152 (Brooklyn Boulevard)

To accommodate the BLRT track's transition from the BNSF Railway corridor along CSAH 81 (Bottineau Boulevard) to the center median of the CSAH 103 (West Broadway Avenue) corridor, property will be acquired by the project. The intersection of Jolly Lane and CSAH 103 (West Broadway Avenue) will be removed with Jolly Lane ending in a cul-de-sac just north of the proposed BLRT Corridor. BMPs being considered include a bioretention basin in the remnants of the parcel(s) being acquired, an underground storage/infiltration practice, and a hydrodynamic separator or similar pretreatment. The BMP(s) will drain to the proposed trunk along CSAH 103 (West Broadway Avenue), which will connect to the trunk line on CSAH 152 (Brooklyn Boulevard) and ultimately discharges to Shingle Creek.

After crossing from the BNSF corridor, the BLRT will run down the center median of CSAH 103 (West Broadway Avenue). CSAH 103 (West Broadway Avenue) will be reconstructed to make room for the BLRT and will also include the construction of trails and grass boulevards on either side of the road. A station will be constructed just south of the intersection with CSAH 152 (Brooklyn Boulevard). In order to minimize the number of crossings under the BLRT guideways needed for a single trunk line, two trunk storm sewer lines are proposed, one for each outside gutter, to collect roadway drainage. These will then connect into the trunk along CSAH 152 (Brooklyn Boulevard) as in the existing condition. This system ultimately drains to Shingle Creek.

There is very limited right-of-way available in this area for stormwater BMPs other than in the boulevards. Due to a potential redevelopment project within the Target/Cub Foods complex, it will not be possible to expand the existing ponds within the parking lot. Therefore, tree trenches in the boulevards between 75th Avenue N and CSAH 152 (Brooklyn Boulevard) are the primary BMP being investigated. Underdrains will connect to the CSAH 103 (West Broadway Avenue) trunk, which will connect to the CSAH 152 (Brooklyn Boulevard) system that ultimately discharges to Shingle Creek.. If the tree trenches are not possible, additional treatment capacity will need to be added to other proposed BMPs to compensate for the area.

4.4.5.4 Drainage to Shingle Creek, North of CSAH 152 (Brooklyn Boulevard) (Stations 2540+50 to 2552+65)

North of Brooklyn Boulevard, the BLRT continues down the center of CSAH 103 (West Broadway Avenue). Similar to above, two trunk lines on either side of CSAH 103 (West Broadway Avenue) are proposed which will connect with a system to be constructed by Hennepin County to carry stormwater down CSAH 103 (West Broadway Avenue) to a wet detention pond, also constructed by Hennepin County, just south of Shingle Creek and will drain into Shingle Creek. The pond will provide rate control with an outlet control structure as well as water quality treatment through sedimentation. The residential area around the 78th Court N cul-de-sac will continue to discharge to the trunk line as in the existing condition. The portion of existing storm sewer from where the existing trunk turns east north of 78th Avenue N will be separated from the CSAH 103 (West Broadway Avenue) roadway drainage.

Table 9. Change in Impervious Cover

Receiving Water	Total Area (acres)	Existing Impervious (acres)	Existing Percent Impervious	Total Proposed Impervious[1] (acres)	Change in Impervious (acres)	Proposed Percent Impervious	Percent Impervious Increase
Twin Creek	12	3	25%	8	5	67%	167%
Single Creek	33	17	52%	25	8	76%	47%

(1) This reflects only the impervious surface that will be in place following construction of the proposed project, which includes the access road adjacent to the relocated BNSF track. It does not include the additional impervious area from possible expansion of operational capacity in the BNSF Railway corridor.

Table 10. Potential BMP Strategies

Receiving Water/Location	Water Quality Volume Required[1] (acre-feet)	BMP Options Considered	BMP Surface Area (square feet)	BMP Volume Provided (acre-feet)
Twin Creek/South of I-94	0.56	Treatment Ditch	N/A[2]	0.61
Shingle Creek/North of I-94	0.38	Treatment Ditch	N/A[2]	0.59
Shingle Creek/Crossover Section	0.26	Bioretention	1,800	0.05
Shingle Creek/West Broadway Ave: 75th Ave N to Brooklyn Blvd	0.50	Tree Trenches	Maximize available boulevard space	0.76
Shingle Creek/North of Brooklyn Blvd	0.56	See **Table 12**	See **Table 12**	See **Table 12**

(1) The Water Quality Volume Required calculation includes the approximate impervious area that would be added by an expansion in operational capacity by BNSF. Total area of future freight impervious in segment BP2 is approximately 1.4 acres

(2) The treatment BMP is incorporated into the ditches that are part of the typical section for the proposed project, and therefore, the surface area is not provided as a separate number

4.4.6 Segment BP1 – Brooklyn Park 1

In the BP1 segment, the BLRT Corridor alignment follows the center median of CSAH 103 (West Broadway Avenue), which will be incorporated into Hennepin County's reconstruction of CSAH 103 (West Broadway Avenue) from just south of Candlewood Drive to approximate northbound station 2651+15. North of this, the BLRT guideway alignment will shift west of CSAH 103 (West Broadway Avenue) and run northerly parallel to CSAH 103 (West Broadway Avenue) across a new TH 610 bridge. The BLRT alignment will continue north of the bridge for approximately 2,250 feet, where it will turn 90 degrees and head west for another 2,250 feet to the new OMF.

This segment includes construction of the BLRT guideway, reconstruction of CSAH 103 (West Broadway Avenue) north of the Hennepin County project, reconstruction of Oak Grove Parkway and 101st Avenue N, construction of new roads as necessary to serve project facilities, and construction of park-and-ride and OMF facilities. The guideway will be ballasted throughout this section except through at-grade intersections, and track drains will route runoff to the same BMPs as described by drainage segment in the CSAH 103 (West Broadway Avenue) EAW. The CSAH 103 (West Broadway Avenue) project has committed to constructing BMPs that will provide stormwater treatment for the portion of the BLRT footprint located within the CSAH 103 (West Broadway Avenue) project limits, as is summarized in the following paragraphs.

Tables 11 and 12 below provide a summary of the anticipated increases in impervious area from this project and the sizes of potential BMPs. **Figures 9 through 12** in Appendix A show the potential locations of BMPs. The floodplain and wetland technical memoranda contain more information about the impacts to those resources.

4.4.6.1 Drainage to Shingle Creek, Shingle Creek Crossing to Maplebrook Parkway N (Station 2552+65 to 2604+20)

This portion of the segment consists solely of the BLRT guideway, which will be in the center median of CSAH 103 (West Broadway Avenue). Hennepin County is currently working on the design of the reconstruction of CSAH 103 (West Broadway Avenue) as noted above. As part of Hennepin County's project, stormwater BMPs are planned that will accommodate runoff from the BLRT project. Although not part of the BLRT project, the BMPs that are currently being proposed by the County are summarized here.

Underground BMPs (either for detention or infiltration/filtration) are proposed at College Park Drive and/or North Hennepin Community College (NHCC) to treat stormwater draining from just north of 85th Avenue N to College Park Drive before ultimately discharging to Shingle Creek. Runoff from the area between College Park and Shingle Creek will be treated in a sedimentation basin on the west side of CSAH 103 (West Broadway Avenue) and with a hydrodynamic separator on the east side of CSAH 103 (West Broadway Avenue) before ultimately discharging to Shingle Creek. For more detail on this design, see the *West Broadway (CSAH 103) Reconstruction Final Stormwater Technical Memorandum*.

CSAH 103 (West Broadway Avenue) will be widened at the Shingle Creek crossing to accommodate the BLRT and trail crossings. The proposed changes will result in floodplain fill. Refer to *West Broadway (CSAH 103) Reconstruction Final Floodplain Technical Memorandum* for additional details on proposed impacts and mitigation options under consideration.

4.4.6.2 Drainage to Century Channel, Setzler Pond and the DNR Wetlands (#559W) (Station 2604+20 to 2644+15)

As noted above, this portion of the project falls within the area of CSAH 103 (West Broadway Avenue) that will be reconstructed by Hennepin County. The BMPs proposed with that project are summarized here. Setzler Pond will

continue to receive corridor drainage and offsite drainage. Because of the added impervious area that will be directed to this pond, additional volume will be created and a new outlet control structure will be added in order to provide water quality and rate control before discharging to Century Channel. A flow splitter and hydrodynamic separator are proposed upstream of DNR Wetland #559W to maintain hydrology to this wetland and send additional runoff generated by new impervious directly to Setzler Pond for treatment. There is also the possibility of expanding sediment forebays already present at this wetland, such that a flow splitter may not be needed. Setzler Pond will continue to receive corridor drainage and offsite drainage. Because of the added impervious area that will be directed to this pond, additional volume will be created and a new outlet control structure will be added in order to provide water quality and rate control before discharging to Century Channel.

The expansion of CSAH 103 (West Broadway Avenue) will result in floodplain fill impacts to Setzler Pond and DNR #559W. Refer to *West Broadway (CSAH 103) Reconstruction Final Floodplain Technical Memorandum* for additional details on proposed impacts and mitigation options under consideration.

4.4.6.3 Drainage to Century Channel, TH 610 Ponding System (Station 2644+15 to 2684+00)

The southernmost part of this area falls within the Hennepin County CSAH 103 (West Broadway Avenue) project limits, between CSAH 30 (93rd Avenue N) and northbound station 2651+15. North of that, the BLRT Extension project will reconstruct CSAH 103 (West Broadway Avenue) in addition to construction of the BLRT guideway. The existing culvert just north of CSAH 30 (93rd Avenue N), which drains a small portion of CSAH 103 (West Broadway Avenue) runoff to a basin at the TH 610 Commerce Center, will be lengthened and the flow to the basin will be maintained. The remainder of West Broadway/BLRT guideway drainage will be re-routed to a new wet pond on the property southwest of the TH 610 and CSAH 103 (West Broadway Avenue) intersection, in what is known as the Baxter Property. An existing wet pond at the southeast corner of this property will be partially filled in to accommodate the shift of the BLRT alignment west of CSAH 103 (West Broadway Avenue) in this location. This pond will be relocated to the west of its existing location and the existing trunk storm sewer currently routing runoff from this segment to the TH 610 ponds will be removed and a new trunk storm sewer will be installed to convey CSAH 103 (West Broadway Avenue) runoff to the new pond. The pond will be increased in size to accommodate all existing tributary areas and the new impervious surface created by the BLRT project. The pond overflow will likely be directed north to discharge into the existing stormwater treatment basin located inside of the infield area in the south loop of the TH 610 interchange, which discharges to Century Channel.

CSAH 103 (West Broadway Avenue) will be realigned north of the intersection with Oak Grove Parkway. This intersection will shift north approximately 800 feet, and north of the intersection, CSAH 103 (West Broadway Avenue) will shift west to tie into Winnetka Avenue approximately 1,000 feet north of 101st Avenue N. The proposed CSAH 103 (West Broadway Avenue) section will widen 650 feet north of TH 610 to accommodate a series of bioretention basins to be located within the 100-foot wide median between the northbound and southbound CSAH 103 (West Broadway Avenue) lanes. The widened section will end just past the new intersection of Oak Grove Parkway and CSAH 103 (West Broadway Avenue). The BLRT alignment will turn west at the new Oak Grove Parkway and CSAH 103 (West Broadway Avenue) intersection and will follow along the north side of the proposed Oak Grove Parkway extension that will tie into 101st Avenue N just past the proposed OMF location. See **Figure 11 and 12** in Appendix A for illustrations of the concept plan for this area.

Construction of Oak Grove Parkway will occur in multiple phases. At the opening of the METRO Blue Line Light Rail Extension, Oak Grove Parkway west of CSAH 103 (West Broadway Avenue) will be an undivided two-lane roadway. Similarly, CSAH 103 (West Broadway Avenue) transitions to an undivided two-lane roadway north of the Oak Grove Parkway. Future plans could include adding a second set of lanes for a four-lane divided parkway.

The proposed bioretention basins will provide storage and treatment for parts of the reconstructed portions of Oak Grove Parkway, CSAH 103 (West Broadway Avenue), Main Street, as well as the Oak Grove Park-and-Ride and Station. Pretreatment such as hydrodynamic separators will be provided prior to stormwater discharge to the bioretention basins. It appears that these basins would overflow to the TH 610 system unless coordination with adjacent landowners allows for conveyance of this drainage to the drainageway system consistent with the City of Brooklyn Park CSMP and Shingle Creek Third Generation Plan.

A potential regional treatment pond has been discussed on the property northwest of the intersection of TH 610 and CSAH 103 (West Broadway Avenue). This regional pond could provide storage and treatment for some of the surrounding area, and could be discharged into the TH 610/MnDOT drainage system. Another regional treatment pond has been discussed for a location near the intersection of CSAH 103 (West Broadway Avenue) and Oak Grove Parkway. Given that the drainage for the larger subwatershed flows in the general direction of the latter pond, it is likely that it could provide treatment for much of the rest of the surrounding area. Further coordination will be required between the City of Brooklyn Park, MnDOT, the WMWMC and other stakeholders during final design.

4.4.6.4 Target North Campus Drainage

The proposed CSAH 103 (West Broadway Avenue) section will have a wider footprint than the existing section, which will require filling in the existing stormwater pond located southeast of the intersection of Oak Grove Parkway and CSAH 103 (West Broadway Avenue). The existing ditch system and associated infrastructure along CSAH 103 (West Broadway Avenue) that currently conveys runoff from the pond, which appears to include Target North Campus drainage, will be maintained and/or replaced as needed, unless a potential regional treatment pond northwest of the Target North Campus is implemented. This pond could provide storage and treatment of much of the surrounding area before discharging northeast to the existing drainageway, consistent with the flow pattern shown in the 2013 Shingle Creek Third Generation Plan.

4.4.6.5 Drainage to Mississippi River, North of TH 610 (Station 2684+00 to OMF)

Treatment of runoff from the proposed OMF is currently proposed to occur in two new BMPs located in the southern portions of the property and just south of the property. The BMPs would provide treatment of runoff from the ballast and pavement runoff north of the building, runoff from the roof, ballast south of the building, parking lot, and the adjacent roadways. These ponds would drain to the adjacent roadway trunk storm sewer systems, which will flow to the series of wetlands and open channels that eventually discharge to the Mississippi River.

In **Table 12** below, the 'BMP Volume Provided' includes only project runoff, but could be revised to accommodate future development runoff and expansion of Oak Grove Parkway. Further coordination to determine feasibility will be required with the City of Brooklyn Park, the WMWMC, Hennepin County and other stakeholders during final design.

Table 11. Change in Impervious Cover

Receiving Water	Total Area[1] (acres)	Existing Impervious (acres)	Existing Percent Impervious	Total Proposed Impervious (acres)	Change in Impervious (acres)	Proposed Percent Impervious	Percent Impervious Increase
Shingle Creek	4[2]	4[2]	100%	4[2]	0	100%	0%
Century Channel	3[2]	3[2]	100%	3[2]	0	100%	0%
TH 610	21	10	48%	15	6	71%	60%
Oxbow Creek	42	4	10%	33	29	79%	725%

(1) Total area within LOD, does not include "Future Construction"
(2) Only accounts for impervious areas due to the Blue Line Light Rail Transit Extension project, see the EAW for the Hennepin County CSAH 103 project for changes due to that project.

Table 12. Potential BMP Strategies

Receiving Water/Location	Water Quality Volume Required (acre-feet)	BMP Options Considered	BMP Surface Area	BMP Volume Provided (acre-feet)
Shingle Creek	(1)	(1)	(1)	(1)
Century Channel	(1)	(1)	(1)	(1)
TH 610/West Broadway Sta 2676+00 to Sta 2685+00	1.13	Bioretention	38,335	1.31
Oxbow Creek/West Broadway north of Sta 2685+00	1.48	Bioretention	49,660	1.72
TH 610/Baxter Property, SW of TH 610	2.68	Wet Pond	32,121	2.68
Oxbow Creek/Reconstructed Oak Grove Parkway west of Sta 2702+00	1.16	Wet Pond	16,012	1.16
Oxbow Creek/Southern OMF Property	1.11	Wet Pond	15,444	1.11
Oxbow Creek/Northern OMF Property	0.33	Wet Pond	6,167	0.33

(1) Stormwater runoff from the project corridor will drain to the BMPs being constructed by the Hennepin County CSAH 103 project. See the EAW for that project for more information.

5.0 Conclusion

Construction of the proposed BLRT Extension project will affect water resources in a variety of ways. The increased impervious surfaces and the decrease in ditch capacity will have the effect of increasing runoff quantity and pollutant loading without mitigation. The preliminary stormwater management plan proposes several mitigation measures, including the use of existing regional facilities, expansion of existing facilities, and construction of new BMPs at key locations throughout the corridor near storm sewer outfalls.

Further coordination with the cities is needed regarding DWSMA and wellhead protection requirements, groundwater elevations, and soil types in order to finalize the selected BMP strategies. Additional soil borings and piezometers may be needed to better understand the feasibility of implementing BMPs as shown. Further coordination is also needed regarding the BMP options for the portions of the corridor within MnDOT and Hennepin County right-of-way to clarify ownership and maintenance responsibilities of the BMPs. Although not covered in the sections above, the final plans will include temporary and permanent erosion and sediment control measures to protect water resources and stormwater infrastructure during and after construction in compliance with the NPDES permit. Finally, coordination with the cities is needed to better understand the condition and capacity of existing storm sewer systems that are to remain in place and to provide maintenance access to existing or proposed storm sewer systems.

The stormwater management plan will need to be approved by the BCWMC, SCWM WMC, the cities, and the MPCA, and therefore, to the extent practicable, adverse impacts due to the project will be mitigated.

APPENDIX B. SUMMARY OF REGULATORY CRITERIA

Blue Line LRT Extension
Water Resources - Regulatory Matrix - DRAFT
2/5/2015
Revised 10/5/2015

RFPE = Regulatory Flood Protection Elevation [2]

Requirements Summary								
Organization	**Applies to**	**Rainfall Data**	**Rate Control**	**Water Quality (1)**	**Volume Control**	**Floodplain/Flood Control Requirements**	**Plan Review Process**	**Comments**
MWMO MWMO Watershed Management Plan 2011-2021, dated May 10, 2011	Segment M	TP-40 or "subsequent revisions"	Match pre-development rates for 2-, 10-, and 100-year; may be restricted to less than pre-development rates when the capacity of the downstream conveyance system is limited	Remove 90% TSS from 95th percentile daily rainfall total (1.17 in. over 24 hrs) over entire project area, or Alternate Compliance which involves payments and/or credits and is summarized in MWMO standards document	Includes statement: placeholder for future volume standard by ~ 2013	Public Roadway Condition - roadway shall not flood when adjacent to stormwater storage basin or subsurface stormwater managmeent BMP designed to store the 100-year event. Freeboard requirement set by road authority. Alternative - minimum freeboard requirement above the 100-year HWL may be calculated as the height determined by adding depth of volume of runoff received by BMP from two-year event over the BMP.	The MWMO works with the member communities to ensure the implementation of its standards. The MWMO recommends members adopt its ordinance-ready MWMO Standards language into their local ordinances.	Note in the Standards Section that the MWMO will be working with agencies and its member organizations over the next 2.5 years to review or determine new water quality and volume standards.
BCWMC BCWMC 2015-2025 Watershed Management Plan, dated September 2015	Segment GV and Segment R	Atlas 14	Match existing rates for 2-, 10-, and 100-year events	Meet MIDS performance goals FOR LINEAR PROJECTS: Retention of whichever is greater: - 0.55 in from new or fully reconstructed areas or -1.1 in from the net increase in impervious areas If the MIDS performance goal is not feasible and/or is not allowed for a proposed project, then the project must implement the MIDS flexible treatment options, as shown in the MIDS Design Sequence Flow Chart	Meet MIDS performance goals FOR LINEAR PROJECTS: Retention of whichever is greater: - 0.55 in from new or fully reconstructed areas or -1.1 in from the net increase in impervious areas If the MIDS performance goal is not feasible and/or is not allowed for a proposed project, then the project must implement the MIDS flexible treatment options, as shown in the MIDS Design Sequence Flow Chart	Prohibits new structures or improvements in the floodplain, which would be subject to damage by the 100-year flood, including basements, public utilities, and streets. Where streets, utilities, and structures currently exist below the 100-year floodplain, BCWMC encourages member cities to remove these features as development/redevelopment allows. Projects within the floodplain must maintain no net loss to floodplain storage and no increase in flood level at any point along the trunk system. Prohibits expansion of existing non-conforming land uses within floodplain unless fully flood-proofed. OLD REQUIREMENTS DOC: Filling will generally not be allowed within the floodplain. Proposals to fill within the established floodplain must obtain BCWMC approval and must provide compensating storage and/or channel improvement so that the flood level shall not be increased at any point along the trunk system due to the fill	BCWMC reviews development/redevelopment proposals after project receives preliminary review by municipality indicating general compliance with existing local water management plan. Complex projects may require additional review time. All submittals involving floodplains, Bassett Creek trunk system, appropriations, variances, underground wet vaults or other alternative BMPs are presented at the BCWMC meetings.	Requirements for Improvements and Development Proposals' document has not been updated to match the revised standards in the 2015 Draft plan.

Requirements Summary								
Organization	**Applies to**	**Rainfall Data**	**Rate Control**	**Water Quality (1)**	**Volume Control**	**Floodplain/Flood Control Requirements**	**Plan Review Process**	**Comments**
SCWMC SCWMC Rules and Standards, dated April 2013	Segment C, Segment BP2, and Segment BP1	Atlas 14	Match existing rates for 2-, 10-, and 100-year events	Remove 60% of P and 85% of TSS Use NURP ponds or infiltrate all site runoff from 1.3-inch event NURP pond dead storage requirement is runoff from 2.5-inch storm event over the contributing drainage area Linear projects that create one acre or more of new impervious surface must meet all Commission requirements for the **net new impervious surface.**	1-inch of runoff from impervious surfaces. Linear projects that create one acre or more of new impervious surface must meet all Commission requirements for the **net new impervious surface.**	Floodplain alteration/filling shall not cause a net decrease in flood storage capacity below the 100-year critical flood elevation unless it is shown that the proposed alteration or filling, together with the alteration or filling of all other land on the affected reach to the same degree of encroachment will not cause high water or aggravate flooding on other land and will not unduly restrict flood flows.	The Commission reviews proposed land development and redevelopment projects affecting water resources. Projects are reviewed in accordance with the management standards and policies of the SCWMC and recommendations are made to the member City in which the project is located. It is the City's responsibility to enforce the Commission's recommendations. Linear projects that create one acre or more of new impervious surface must meet all Commission requirements for the **net new impervious surface**. Projects impacting wetlands where Commission is LGU must be reviewed regardless of size. Plans for developemtn within the 100-year floodplain as defined by the FIS must be reviewed.	
MPCA (via NPDES permit issued 8/1/2013) As of 2/5/2015, the impaired and special waters within 1 mile of corridor include: Shingle Creek Upper Twin Lake Middle Twin Lake Lower Twin Lake Crystal Lake Bassett Creek Mississippi River	All segments	N/A	N/A	Water quality volume of 1-inch of runoff from new impervious surfaces must be retained on site. If infiltration is prohibited,must use other methods of volume reduction and the water quality volume (or remainder if some volume reduction is achieved) must be treated by a wet sedimentation basin, filtration system, regional ponding or equivalent methods prior to discharge of stormwater to surface waters. If use wet sedimentation pond to provide treatment, dead storage requirement is 1800 cubic feet per acre of surface area drained.	Retain on site 1-inch of runoff from new impervious surfaces. If infiltration is prohibited, must use other methods of volume reduction and the water quality volume (or remainder if some volume reduction is achieved) must be treated by a wet sedimentation basin, filtration system, regional ponding or equivalent methods prior to discharge of stormwater to surface waters. NOTE: infiltration BMPs are prohibited when soil infiltration rates are > 8.3 in/hr unless the soil is amended to slow it down. See permit for other conditions that prohibit infiltration.	N/A	SWPPP must be submitted to MPCA for review if the project size is 50 acres or more and will discharge to special or impaired waters. Application and SWPPP must be submitted at least 30 days before the start of the construction activity.	The General Permit used to develop this matrix expires on 8/1/2018. It will be necessary to verify how any proposed changes in the permit would apply to this project.
Minnesota B3 Guidelines	OMF and park-and-ride buildings in all segments		Match runoff rates for the native soil and vegetation conditions for 2- and 10-year, 24 hr design storms	Remove 80% of post development TSS Remove 60% of post development TP	Retain 1.1 inches from all new or redeveloped impervious	N/A	N/A	Minimize the negative impacts of the project, both on and off site, by maintaining a more natural hydrologic cycle through infiltration, evapotranspiration, and reuse.

Requirements Summary								
Organization	**Applies to**	**Rainfall Data**	**Rate Control**	**Water Quality (1)**	**Volume Control**	**Floodplain/Flood Control Requirements**	**Plan Review Process**	**Comments**
City of Minneapolis Email from Jeremy Strehlo, dated 1/23/15 Minneapolis Floodplain Overlay District Ordinance (Chapter 551.540) Minneapolis Erosion and Sediment Control and Drainage Ordinance (Chapter 52) Minneapolis Stormwater Ordinance (Chapter 54)	Segment M		Maintain discharge rates at or below the existing rates. May be restricted to less than existing rates when the capacity of the downstream conveyance system is limited	Remove 70% TSS	N/A	Linear projects within the floodplain shall be designed to minimize increases in flood elevations and shall be compatible with local comprehensive floodplain development plans. Protection to the RFPE shall be provided where failure or interruption of public facilities would result in danger to public health or safety where facilities are essential to orderly functioning of the area. Conditional uses in Floodway District allowed provided such uses shall have a low flood damage potential, shall not cause an increase in the stage of the regional flood or cause an increase in flood damages in the reach(es) affected.	Must submit application and obtain approval for Storm Water Management Plan from the city engineer. Requirements are included in Chapter 54.70 of City Code.	
City of Golden Valley	Segment GV		Must meet BCWMC standards.	Must meet BCWMC standards.	Must meet BCWMC standards.	Linear projects may be located in the floodplain provided they are designed to minimize increases in flood elevation and are compatible with the BCWMC Management Plan. These uses can cause no increase in stage to the 100-year flood within the floodway and cannot increase the floodplain elevation by more than 1/2 foot in a designated Zone A or AE where a floodway has not been designated. Protection to the RFPE shall be provided where failure or interruption of these public facilities would endanger the public health or safety or where such facilities are essential to the orderly functioning of the area.	See BCWMC plan review process for information on stormwater management review. Floodplain alteration permit will be submitted to the City, which will then submit the information to the DNR Commisssioner and BCWMC for review.	

Requirements Summary								
Organization	**Applies to**	**Rainfall Data**	**Rate Control**	**Water Quality (1)**	**Volume Control**	**Floodplain/Flood Control Requirements**	**Plan Review Process**	**Comments**
City of Robbinsdale Robbinsdale 2030 Comprehensive Plan - Appendix IIIA Storm Water Management Plan	Segment R		Must meet SCWMC and BCWMC standards.	Must meet SCWMC and BCWMC standards.	Must meet SCWMC and BCWMC standards.	No structure, fill (including for roads and levees),..., or other uses may be allowed as a conditional use in the **floodway** that will cause any increase in the stage of the 100-year regional flood or cause an increase in flood damages in the reach(es) affected. Floodplain developments shall not adversely affect the hydraulic capacity of the channel and adjoining floodplain of any tributary watercourse or drainage system where a floodway or other encroachment limit has not been specified on the Official Zoning Map.	See SCWMC and BCWMC plan review process for stormwater management. Floodplain Alteration - must submit application for review to the City's Zoning Administrator and obtain all necessary State and Federal permits.	
City of Crystal 2009 Local Surface Water Management Plan and Land Use and Planning Ordinance	Segment C		Existing rates for 2-, 10-, and 100-year events; accelerated channel erosion will not occur as a result of the proposed land disturbing or development activity.	Detention facilities should have permanent pond surface area = to 2% of impervious area draining to pond, or 1% of entire area draining to pond, whichever is greater; Or as an alternative, the volume of permanent pool shall be equal to or greater than the runoff from a 2.0-inch rainfall for the fully developed site. Sequencing of preferred treatment options: infiltration, flow attenuation by using open space, stormwater retention, stormwater detention	LSWMP includes text that the City's ordinances need to be revised to include volume control standard that is in line with most restrictive between SCWMC and MPCA as it relates to discharge to impaired waters.	No structure, fill (including for roads and levees),..., or other uses may be allowed as a conditional use in the **floodway** that will cause any increase in the stage of the 100-year regional flood or cause an increase in flood damages in the reach(es) affected. Floodplain developments shall not adversely affect the hydraulic capacity of the channel and adjoining floodplain of any tributary watercourse or drainage system where a floodway or other encroachment limit has not been specified on the Official Zoning Map.	SCWMC and BCWMC review projects that fall within the watershed review authority. Crystal forwards development plans to the applicable watershed when received at the City.	
City of Brooklyn Park Email from Kevin Larson (City), dated 2/4/14 Flood Hazard Area Overlay Ordinance (152.510)	Segment BP1 and Segment BP2		Must meet SCWMC standards.	Must meet SCWMC standards.	Must meet SCWMC standards.	Railroad tracks, roads, and bridges must be elevated above the regulatory flood protection elevation where failure of facilities would result in danger to public healthy/safety or where facilities are essential to orderly function of area. None of these uses shall increase flood elevations. No fill, excavation, or storage of materials or equipment that obstruct flows or increase flood elevations will be permitted.	Must submit application to City Manager. SCWMC will review projects that fall within watershed review authority.	

(1) Wet stormwater pond design should follow the guidelines in the MPCA Stormwater Manual for dead storage depth, side slopes, and benches.
(2) Refers to an elevation 1 foot (minimum) above the 100-year flood plus any stage increase due to the designation of flood fringe areas. In Minnesota, the floodplain management ordinances (local regulations) require that the elevation of the surface of the lowest floor of a dwelling be at or above the regulatory flood protection elevation. Local regulations will also require the top of the access road elevations to be within 2 feet of the flood protection elevation.
All regulatory entities will have requirements for erosion and sediment control and at a minimum will refer back to the NPDES requirements.

Connetics Transportation Group

Date: January 29, 2016

Subject: Financial Analysis in Support of the FEIS

1.0 Introduction

The METRO Blue Line Extension (BLRT) project area extends 13 miles northwest from downtown Minneapolis through the neighborhoods of north Minneapolis and into the communities of Golden Valley, Robbinsdale, Crystal, and Brooklyn Park in Hennepin County, Minnesota.

This memo documents the methodology, assumptions and results of the high-level financial analysis undertaken to support the BLRT Project's Final Environmental Impact Statement (FEIS). Costs and revenue estimates presented in this memo for capital, as well as operating and maintenance (O&M), build upon estimates recently prepared for Metropolitan Council's Southwest LRT Project. Primary references used in the development of this memo are:

- Southwest LRT Financial Analysis in Support of the FEIS (Draft) September 15, 2015
- Financial Management Plan, Southwest Light Rail Transit, Revision 02-00, August 2015, Metropolitan Council/Metro Transit Finance
- Blue Line Extension Operating Costs table developed from the BLRT Finance Team (Excel file OperatingCosts20150910_true_JRH_R1.xlsx)

2.0 Capital Plan

2.1 Capital Cost

In Year of Expenditure (YOE) dollars, the BLRT Project's estimated capital cost for the Locally Preferred Alternative (LPA) is $1,496,431,000. This estimate uses the following methodology/assumptions:

- **Schedule:** Base year costs (2015) were inflated to YOE dollars based on the current project schedule. Specifically, 2018 is identified as the start year of heavy construction and 2021 as start year of revenue operations.
- **Standard Cost Categories (SCC):** Capital costs were developed using the Federal Transit Administration's (FTA's) SCCs.
- **Cost Escalation Assumption:** Costs were inflated at 3% per year.

Table 2-1 presents this information by category in base year (2015) dollars and in inflated YOE dollars.

Table 2-1: Capital Cost Estimates of the LPA, by FTA SCC

FTA Standard Cost Category	Base Year Costs 2015$ (millions)	YOE Costs (millions)
10 Guideway & Track Elements	$297.343	$333.775
20 Stations, Stops, Terminals, Intermodal	$65.834	$74.875
30 Support Facilities: Yards, Shops, Administration Buildings	$76.500	$85.865
40 Sitework and Special Conditions	$154.096	$173.267
50 Systems	$166.963	$191.616
60 Right-of-Way, Land, Existing Improvements	$60.312	$66.801
70 Vehicles	$119.779	$136.245
80 Professional Services	$230.009	$245.783
90 Unallocated Contingency	$140.500	$158.204
100 Finance Contingency Charges	$24.778	$30.000
Total	**$1,336.114**	**$1,496.431**

Source: FTA Worksheets dated December 15, 2015 (BLRT Municipal Consent Cost Estimate)

2.2 Sources of Capital Funds

The capital cost of the project is anticipated to be funded from federal, state and local sources, as listed below. The financial analysis applied to projections of the following anticipated sources of capital funds:

- **Federal Funds:** It is anticipated that all Federal funding will come from Section 5309 New Starts. The BLRT Project assumes 49% Section 5309 New Starts funding, with a New Starts Full Funding Grant Agreement signed in 2018.
- **State Funds:** It is anticipated that the State of Minnesota will fund 10% or approximately $149,643,000 of the Project through bonding and supplemental appropriations. Further, to fund the State's share of the capital plan, it is anticipated that the securities will be general obligation debt and the supplemental appropriations will be general fund appropriations to fund its share of the capital plan.
- **Regional Railroad Authorities (RRA):** The Hennepin County Regional Railroad Authority (HCRRA) is anticipated to fund the project from their dedicated property taxes. The amount of their funding is 10% or approximately $149,643,000 of the Project. HCRRA obtains its funds from a property tax levied under the authority of MS 398A plus interest earned on balances. This tax is distinct from the Council's property tax authority.
- **Counties Transit Improvement Board (CTIB):** The CTIB is anticipated to fund 31% or approximately $463,893,000 of the total capital costs. Each of the five counties the CTIB is comprised of is authorized to levy a 0.25% sales tax and a $20 motor vehicle sales tax to provide capital and operating funding for transitway projects. The BLRT Project is eligible for capital and operating funding by the CTIB under its *Transitway Investment Framework*.
- **Other Local Funding Sources:** The BLRT Project Office and Metropolitan Council are working with local cities, MnDOT, and Hennepin County on securing additional necessary contributions as needed through local funding agreements.

Table 2-2 presents capital cost funding by source.

Table 2-2: LPA Capital Cost Funding by Source (YOE $)

Anticipated Funding Source	Share	Contribution ($ millions)
Federal Transit Administration	49%	$733.251
County Transit Improvement Board	31%	$463.894
State of Minnesota	10%	$149.643
Hennepin County Regional Railroad Authority	10%	$149.643
Total	**100%**	**$1,496.431**

3.0 Operating Plan

3.1 BLRT No-Build Alternative O&M Cost Estimates

The BLRT project assumes the Southwest LRT Project is already in operation as part of a "No-Build" scenario. For consistency with the Southwest LRT Project's FEIS, that project's Build Alternative O&M cost estimate is assumed to be the BLRT's No-Build O&M cost estimate (since construction of the Southwest LRT Project is to precede the BLRT Project). The Southwest LRT Project's O&M cost estimates utilized unit costs for Metro Transit bus and LRT based on 2013 actual expenditures. Specific cost methodology used in the Southwest LRT Project, and thus reflected in the BLRT's No-Build cost estimates, are as follows:

- **Metro Transit LRT and Metro Transit/Metropolitan Transportation Services (MTS) Corridor Bus Routes:** Unit O&M costs and service plan statistics were taken from the Southwest LRT Project's *Service Plan Updates and O&M Cost Results for the FEIS Report* (July 21, 2015).
- **Metro Transit/MTS Non-Corridor Bus Routes:** The regional travel demand model was used to estimate service statistics for non-corridor Metro Transit/MTS non-corridor bus routes. These statistics were applied to unit costs in the Southwest LRT Project's *Service Plan Updates and O&M Cost Results for the FEIS Report*.
- **Other Providers Non-Corridor Bus Routes:** Similarly, the regional travel demand model was used to estimate service statistics for other opt-out providers in the Twin Cities region. These statistics were applied to Metro Transit unit costs.
- **Northstar, Metro Mobility and Transit Link:** Finally, to arrive at a total regional transit O&M cost, Northstar, Metro Mobility and Transit Link O&M costs were included. The 2014 Met Council Unified Budget was used to identify an annual O&M cost for each of these services.

An average inflation rate of 3.15% was used to present costs in 2015 and 2040 dollars. Table 3-1 presents projected regional transit O&M costs for the BLRT Project's No-Build Alternative.

Table 3-1: Year 2040 Annual O&M Cost Estimates of the BLRT No-Build Alternative

Operator/Transit Service	Base Year Costs 2015$ (millions)	YOE Costs 2040 $ (millions)
Metro Transit Light Rail Transit	$88.392	$191.931
Metro Transit/MTS/Other Twin Cities opt-out providers	$466.494	$1,012.924
Northstar	$18.357	$39.859

Paratransit (Metro Mobility & Transit Link)	$67.848	$147.322
Total	**$641.091**	**$1,392.036**

Source: Southwest LRT Financial Analysis in Support of the FEIS (Draft) September 15, 2015

3.2 BLRT LPA O&M Cost Estimate

Annual O&M costs for the BLRT Project's LPA are based on corridor service plans developed specifically for use and analysis in this project's FEIS. Metro Transit bus and LRT unit costs used in the Southwest LRT Project were applied to estimates of incremental service statistic changes for BLRT service and corridor bus service. The resulting change from the No-Build Alternative in corridor O&M costs is noted below in Table 3-2.

Table 3-2: Year 2040 Incremental O&M Cost Estimates for BLRT Corridor Service Changes

Operator/Transit Service	Base Year Costs 2015 $ (millions)	YOE Costs 2040 $ (millions)
Metro Transit Light Rail Transit	$21.772	$47.275
Metro Transit/MTS/ Other Twin Cities opt-out providers	$1.351	$2.933
Total	**$23.123**	**$50.208**

Source: OperatingCosts20150910_true_JRH-R1.xlsx and BLRT FEIS O&M Cost Estimates Memo prepared by CTG for Kimley-Horn (Oct. 2015)

Incremental O&M cost estimates from Table 3-1 were added to No-Build Alternative O&M cost estimates (Table 3-2) to arrive at system-wide annual O&M cost estimates for the BLRT LPA, shown below in Table 3-3.

Table 3-3: Year 2040 Annual O&M Cost Estimates of the BLRT LPA

Operator/Transit Service	Base Year Costs 2015 $ (millions)	YOE Costs 2040 $ (millions)
Metro Transit Light Rail Transit	$110.164	$239.206
Metro Transit/MTS/ Other Twin Cities opt-out providers	$467.845	$1,015.857
Northstar	$18.357	$39.859
Paratransit (Metro Mobility & Transit Link)	$67.848	$147.322
Total	**$664.214**	**$1,442.244**

4.0 Regional Transit O&M Revenues

The basis of this project's O&M revenue forecasts is a Financial Management Plan previously prepared for the Southwest LRT Project, which included revenues for the BLRT Project and the Orange Line BRT Project. That document presented revenue forecasts through the Year 2035. For the Southwest LRT Project's FEIS, those forecasts were extended to the Year 2040. Revenue assumptions identified in the Southwest Finance Assumptions Memo are noted below.

4.1 Metro Transit

Revenue assumptions for Metro Transit in the Southwest LRT Project Financial Management Plan are as follows:

- **Fare Revenue:** Fare revenues are based on projected ridership that reacts primarily to increasing population and employment. Established Metropolitan Council fare policy requires a 10% increase in average fares whenever the bus farebox recovery declines to 28.5%.

- **CTIB:** The CTIB has approved a resolution to commit to fund 50% of the Southwest LRT operating deficit (operating cost net of farebox revenue). It is also anticipated to provide 50% of the net operating deficit for the BLRT Project, and 41.95% for Northstar rail services.
- **State General Funding:** State general fund operating subsidies have historically grown more rapidly than inflation in recent years. However, in an attempt to be conservative, the State operating funds in the Southwest LRT financial capacity analysis assumes that the state general fund revenues grow proportionally with inflation (assumed to be 3.15% per year).
- **Motor Vehicle Sales Tax (MVST):** The primary source for non-Southwest LRT operating assistance is the statewide MVST. This financial analysis uses an average annual increase of 4.90% to project MVST revenues between 2015 and 2040.
- **Other Metro Transit Operating Revenues:** Other revenue including advertising revenue for bus and existing light rail transit services will grow at 1.0% per year from 2016 to 2040.
- **FTA Funds:** The 2015 Financial Plan forecasts FTA Section 5307 Urbanized Area Formula Funds at a fixed annual growth rate, which is approximately 2.4% after 2014 and 3.0% after 2024. Other federal revenues included in the Financial Plan include 5337 State of Good Repair, 5339 Bus and Bus Facilities and Congestion Mitigation Air Quality (CMAQ) funds.

4.2 BLRT Revenues vs. Cost Analysis

As noted earlier, O&M revenue forecasts for the Southwest LRT Project's Financial Management Plan already include anticipated revenues for the BLRT Project. Table 4-1 presents a comparison of annual system-wide costs to revenues for the year 2040. Total O&M cost figures for both the No-Build and Build Alternatives are from Section 3.0 of this memo. Revenue figures for the BLRT Build are consistent with those previously developed for the Southwest LRT FEIS, since those figures already took into account Blue Line revenues. For the No-Build Alternative, revenues were reduced, based on documentation in the Southwest LRT Financial Management Plan which presented 2035 BLRT revenues, and 2035 to 2040 revenue growth assumptions used in the Southwest LRT FEIS. As shown in this table, system-wide O&M costs are not anticipated to exceed system-wide revenues.

Table 4-1: Annual System-wide O&M Costs and Revenues in 2040: No-Build and LPA (2040 dollars, in millions $)

Costs/Revenue Source	SW LRT Build / BLRT No-Build	BLRT Build
Total O&M Costs	**$1,392.036**	**$1,442.242**
Revenues		
Fares	$337.998	$354.544
Motor Vehicle Sales Tax	$804.036	$804.036
CTIB	$86.722	$101.813
Other Revenue	$17.112	$17.659
Local Operating Assistance	$5.254	$5.254
Federal Operating Assistance	$15.245	$15.245
State Operating Assistance	$206.460	$221.551
Interest on Operation Balance	$1.133	$1.133
Total Revenues	**$1,473.960**	**$1,521.235**

Sources: Southwest LRT Financial Management Plan, Revision 02-00, August 2015, Southwest LRT Financial Analysis in Support of the FEIS (Draft) September 15, 2015.

4.3 Potential Responses to Operating Shortfalls

Short term shortfalls, forecasted for selected years in the cash flow projections, are covered by the operating reserves. In the longer term, Metro Transit relies on the MVST growth and its fare policy. Presently, nearly 46% of the Metropolitan Council Transportation Division's operating funds are obtained from the statewide MVST revenues. MVST is the Council's single largest source of transit operating funding. The baseline forecast assumes significant real growth over the long run from this source as a result of passage of the November 2006 referendum. The MVST revenues are projected to increase at a rate of 4.90% per year in the long run. This forecast is viewed as conservative for financial planning purposes as historical trended MVST receipts for the period of 1973 to 2014 averaged 5.10%. The fare policy is an even stronger guarantee of sustainability, because it assures that passenger revenue will growth with operating costs. This policy recommends a 10.0% increase in average fares whenever the bus farebox recovery ratio declines to 28.5%. The Metropolitan Council had their last fare increase in 2008.

Several sources of supplemental operating funding could be made available to Metropolitan Council's Transportation Division in the event that MVST revenues do not grow as expected.

These sources include:

- **Metropolitan Council Transportation Division Operating Reserve:** The Metropolitan Council Transportation Division reserve at the end of 2014 is $120.19 million and can be used to cover any deficits that might arise with or without the BLRT Project in place.
- **State General Funds/State Commitments:** The State's commitment to transit in the Metro region, and its specific commitment to developing the BLRT Project, may be regarded as an opportunity for financial risk management of operations. State general fund appropriations for transit operating subsidies have historically grown more rapidly than inflation in recent years. However, in an attempt to be conservative, the State operating funds in the baseline capacity analysis are anticipated to increase slowly from their 2015-2016 level at 3.15% proportionately with inflation.
- **Moderate Additional Fare Increases:** Under the baseline projection by the Metropolitan Council, a fare increase was implemented in 2008. Fare increases could be accelerated if needed. Transit fare increases typically result in increased fare revenues but decreased ridership.
- **Apply New Operating Funding Sources:** New operating funding sources could include the implementation of new or expanded non-farebox revenue sources (e.g., expanded advertising or joint development).
- **Reduce Service:** Reduce the length or number of daily trips, weekend and seasonal/holiday service, or the length of trains.
- **Apply New, Non-Operating Sources:** Apply additional CTIB operating assistance if available and develop supplemental sources of State or other revenues.

The stability of Metropolitan Council's financial environment will permit managing the long-term maintenance and operation of the BLRT Project's service in a well-planned, deliberate and financially prudent manner.

G Guide to the Draft EIS Response to Comments

Appendix G contains the comments received on the proposed METRO Blue Line Light Rail Transit (BLRT) Extension project Draft Environmental Impact Statement (Draft EIS). A total of 191 communications were received during this time. Many of the communications contained multiple comments. For example, a resident in Golden Valley may have written a letter expressing concern about noise from LRT operations, impacts to parks and wildlife, and the need for a park-and-ride serving the proposed BLRT Extension project to be built in the city.

G.1 Draft EIS Comment Period

The Draft EIS comment period began on April 11, 2014, when notice of the availability of the document was published and ended on May 29, 2014. Comments were transmitted in several ways including written communications (letters, e-mail communications, comment cards filled out at public hearings) and by people testifying at public hearings.

All communications received or postmarked by the end of the comment period are included in this appendix. The communication was assigned a unique identifying number (generally corresponding to when it was received) – the communication number is printed in the upper left-hand corner of each communication. Since many of the communications received included multiple comments, the first task was to identify comments within the communication and, after this was done for all communications, to group comments into categories by topic (e.g., purpose and need, alternatives, noise and vibration).

G.2 Comments by Topic

Examples of comments and associated topics include "why is the project needed?" (purpose and need topic); "do the transportation benefits match the cost of the project?" (fiscal effects topic); or "how loud is LRT?" (noise and vibration topic). Using this approach, all similar comments could be grouped together for a response. The topics identified were:

- 1 – Purpose and Need
- 2 – Fiscal Effects and Schedule
- 3 – National Environmental Policy Act (NEPA) Process and Public Involvement
- 4 – Social and Economic Effects
- 5 – Environmental Effects
- 6 – Noise & Vibration Effects
- 7 – Alternatives, Engineering & Design
- 8 – Transportation System Effects

G.3 How to Find a Response to a Comment

A particular comment and the corresponding response can be found in the tables following this introduction to **Appendix G**. The tables of comments and corresponding responses are organized as follows:

- Comment ID Number: A unique comment identification number assigned to each comment
- Commenter's Last Name
- Commenter's First Name
- Organization
- Communication Number: A unique number for each comment in chronological order in which it was received
- Comment Type: e-mail, letter by e-mail, mail, verbal testimony, etc.
- Topic: as described above
- Comment
- Response

All comments received on the Draft EIS have been documented and responded to in the Final EIS.

Comments from agencies and municipalities and their corresponding responses are grouped alphabetically by organization, as follows:

- Bassett Creek Watershed Management Commission
- City of Crystal
- City of Golden Valley
- City of Maple Grove
- City of Minneapolis
- Federal Aviation Administration
- Mille Lacs Band of Ojibwe
- Minnesota Department of Transportation
- Minneapolis Park and Recreation Board (MPRB)
- Minnesota Pollution Control Agency
- Three Rivers Park District
- US Department of the Interior
- US Environmental Protection Agency

Comments from businesses and their corresponding responses are grouped alphabetically by organization, as follows:

- Allina Health
- Crystal Wine and Spirits
- Marr-Don Apartments
- Sawhorse, Inc.
- Target Corporation

Comments from civic and community organizations and their corresponding responses are grouped alphabetically by organization, as follows:

- Alliance for Metropolitan Stability
- Asian Media Access
- CAPI
- City of Lakes Community Land Trust
- Downtown Minneapolis Transportation Management Organization
- Harrison Neighborhood Association
- Heritage Park Neighborhood Association
- Loppet Foundation
- Masjid An-Nur
- North Hennepin Community College
- Saint Margaret Mary Church
- Summit Academy OIC
- Transit for Livable Communities

Comments from the general public and their corresponding responses are listed numerically by the Comment ID. These comments are presented in two summary tables; one table for comments received in writing, and one table for comments received as verbal testimony during public hearings. An index is provided with each of the tables of responses to comments from the general public (see the following sections of this appendix). Each index is grouped alphabetically by the last name of the commenter and their corresponding Comment IDs to make finding a specific individuals comment(s) easier. Locate the name of the individual in each index then look for the Comment ID in the general public comments and responses tables.

G.4 Master Responses to Similar Comments

The Council received a total of 1,252 comments were submitted in the form of letters, emails, public testimony at the public hearings, and comment cards received at the public open houses and public hearings. Comments were received from individuals, businesses, public interest groups, and public agencies, including local communities and regulatory agencies. Many comments were very similar

in nature and the Council has prepared master responses to these comments. Where comments included more specific and detailed questions, detailed responses may be found in Attachments 1 through 3.

G.4.1 General Opposition to or Support for the Proposed BLRT Extension Project

General Comment 1: Opposed to the locally preferred alternative (LPA) identified in the Draft EIS, opposed to the proposed BLRT Extension project, or in favor of another alignment.

Master Response 1: The Metropolitan Council (Council) acknowledges opposition to the LPA identified in the Draft EIS or opposition to the proposed BLRT Extension project. The Council also acknowledges support for another alignment other than the LPA or the proposed BLRT Extension project.

The proposed BLRT Extension project was developed to meet specific transportation needs in the City of Minneapolis and several northern and western suburbs. As outlined in the purpose and need, the proposed BLRT Extension project is needed to effectively address long-term regional transit mobility and local accessibility needs while providing efficient, travel-time competitive transit service that supports economic development goals and objectives of local, regional, and statewide plans. Five factors contribute to the need for the proposed BLRT Extension project:

- Growing travel demand resulting from continuing growth in population and employment
- Increasing traffic congestion and limited federal, state, and local fiscal resources for transportation improvements
- An increase in the number of people who depend on transit to meet their transportation needs
- Limited transit service to suburban destinations (reverse commute opportunities) and time-efficient transit options
- Regional objectives for growth stated in the *Thrive MSP 2040*

The development of the proposed BLRT Extension project started with an Alternatives Analysis that culminated in the selection of the LPA. The following summarizes the selection process for the LPA identified in the Draft EIS.

The LPA is the alternative that the cities in the proposed BLRT Extension project corridor (Minneapolis, Golden Valley, Robbinsdale, Crystal, and Brooklyn Park), Hennepin County, and the Council recommended for detailed study through engineering and environmental review. The LPA specifies both the type of transit that would be used (mode – light rail transit) and the location (alignment – B-C-D1).

The Policy Advisory Committee (PAC) recommended Alignment D1 over Alignment D2 because Alignment D1 would result in significantly less property and neighborhood impacts, improved travel time, greater cost-effectiveness, and less disruption of roadway traffic operations. Discussion focused on the adverse impacts of Alignment D2 and that Alignment D1 better meets the proposed

BLRT Extension project goals. The costs (impacts) of Alignment D2 for the people on Penn Avenue would outweigh the potential benefits.

The PAC recommended Alignment B over Alignment A because Alignment B would provide better service to people who depend on transit and to key civic and educational destinations, and access to greater numbers of new jobs and development.

The LPA meets the purpose of and need for the proposed BLRT Extension project and is the environmentally preferable alternative because it would best protect, preserve, and enhance social, historic, and cultural resources. However, because of the effects of Alternative B-C-D1 (the LPA) would have on biological and natural resources; the LPA would not cause the least damage to the physical environment.

Since the selection of the LPA, the Council has worked closely with regulatory agencies and project stakeholders to refine the LPA in a manner that avoids or minimizes social, economic, and environmental impacts. Where impacts cannot be avoided, mitigation measures have been identified. These avoidance, minimization, and mitigation measures are documented in the Final EIS for the proposed BLRT Extension project.

General Comment 2: Support for the LPA identified in the Draft EIS or the proposed BLRT Extension project.

Master Response 2: The Council acknowledges support for LPA identified in the Draft EIS or the proposed BLRT Extension project. FTA and the Council have determined that the proposed BLRT Extension project best meets the need for transit improvements in the area. Careful analysis and stakeholder coordination resulted in the selection of the LPA; the following summarizes the LPA selection process as identified in the Draft EIS.

The LPA is the alternative that the cities in the proposed BLRT Extension project corridor (Minneapolis, Golden Valley, Robbinsdale, Crystal, and Brooklyn Park), Hennepin County, and the Council recommended for detailed study through engineering and environmental review. The LPA specifies both the type of transit that would be used (mode – light rail transit) and the location (alignment – B-C-D1).

The Policy Advisory Committee (PAC) recommended Alignment D1 over Alignment D2 because Alignment D1 would result in significantly less property and neighborhood impacts, improved travel time, greater cost-effectiveness, and less disruption of roadway traffic operations. Discussion focused on the adverse impacts of Alignment D2 and that Alignment D1 better meets the proposed BLRT Extension project goals. The costs (impacts) of Alignment D2 for the people on Penn Avenue would outweigh the potential benefits.

The PAC recommended Alignment B over Alignment A because Alignment B would provide better service to people who depend on transit and to key civic and educational destinations, and access to greater numbers of new jobs and development.

The LPA meets the purpose of and need for the proposed BLRT Extension project and is the environmentally preferable alternative because it would best protect, preserve, and enhance social,

historic, and cultural resources. However, because of the effects of Alternative B-C-D1 (the LPA) would have on biological and natural resources; the LPA would not cause the least damage to the physical environment.

G.4.2 Purpose and Need

General Comment 3: Why is the proposed BLRT Extension project needed?

Master Response 3: The purpose and need for the proposed BLRT Extension project has been the subject of many studies. The proposed BLRT Extension project includes an alignment that meets the purpose and need most efficiently while minimizing project impacts. The purpose of the proposed BLRT Extension project is to provide transit service that would satisfy the long-term regional mobility and accessibility needs for businesses and the traveling public. The proposed BLRT Extension project is needed to effectively address long-term regional transit mobility and local accessibility needs while providing efficient, travel-time competitive transit service that supports economic development goals and objectives of local, regional, and statewide plans.

G.4.3 Fiscal Effects and Schedule

General Comment 4: Do the transportation benefits match the cost of the proposed BLRT Extension project?

Master Response 4: NEPA does not require monetizing costs and benefits (40 CFR 1502.23). Furthermore, the weighing of the pros and cons of the various alternatives should not be displayed using a monetary cost-benefit analysis when there are important qualitative considerations. A cost-benefit analysis should not be included when costs or benefits can only be qualitatively assessed, without an adequate measure for monetizing the environmental benefits of a project. The proposed BLRT Extension project meets the intended purpose and need for the proposed BLRT Extension project, that is to effectively address long-term regional transit mobility and local accessibility needs while providing efficient, travel-time competitive transit service that supports economic development goals and objectives of local, regional, and statewide plans. Meeting federal cost-effectiveness criteria, which is separate from a cost and benefit analysis, would be an essential part of entering into the Engineering phase for this project. Cost is one of a number of factors in the proposed BLRT Extension project. Purpose and Need is discussed in **Chapter 1** of the Final EIS and a financial analysis of the proposed BLRT Extension project is discussed in **Chapter 10** of the Final EIS. **Table 10.1-1** in **Chapter 10** – **Financial Analysis** of the Final EIS outlines a breakdown of cost for the different elements of the proposed BLRT Extension project totaling $1.496 billion.

G.4.4 NEPA Process and Public Involvement

General Comment 5: Several commenters stated that there was not enough time to review the Draft EIS.

Master Response 5: The notification and comment period followed the legal requirements (minimum requirement is 45 days per 40 CFR Part 1506.10 (c)). The Draft EIS comment period was from April 11 to May 29, 2014 (48 days).

General Comment 6: Several commenters stated that they felt public opinion was being ignored by the Council.

Master Response 6: The Council acknowledges concern about public input into the planning process for the proposed BLRT Extension project. **Chapter 9** of the Final EIS describes the public outreach process used for public and stakeholder outreach. For the proposed BLRT Extension project, the Council has implemented a comprehensive public outreach program that has engaged nearby communities and underrepresented groups in the proposed BLRT Extension project design and engineering process. This includes appointing two voting members to the proposed BLRT Extension project Corridor Management Committee (CMC) that represent the Blue Line Coalition (a community-based group working to advance local and regional equity and community health along the Blue Line Corridor). The proposed BLRT Extension project has also established a Business Advisory Committee and Community Advisory Committee to seek public input and advise the CMC and the Council. The Council will continue to engage community groups directly and via local/ neighborhood-based media to inform on project progress.

G.4.5 Social and Economic Effects

General Comment 7: Concerned about the effect of the proposed BLRT Extension project on property values.

Master Response 7: Research has shown that major transit investments such as light rail generally yield positive effects on property values. There is the potential for an increase in property values in the areas surrounding proposed light rail stations, as light rail access can increase the convenience and desirability of nearby residential, commercial, and office properties. Light rail transit can also contribute to existing market forces that can increase the potential for transit-oriented development or redevelopment. Development and redevelopment is regulated by the cities and is predominantly driven by regional and local economic conditions and allowable land uses as defined in locally adopted comprehensive plans. However, light rail lines can advance the timing and increase the intensity of development, especially in areas near proposed stations, within the limits allowed by local comprehensive plans.

As an example, in 1996, New Jersey Transit introduced "Midtown Direct" service, a one-seat ride to New York Penn Station on the Morris & Essex Lines. The expanded service led directly to an increase in property values of homes within walking distance of stations on the Morris & Essex line by $90,000 more than homes farther away, after direct service to Midtown Manhattan was inaugurated in 1996 (Michaelson, 2004). Houses immediately adjacent to San Francisco's BART (south and northeast of San Francisco) sold for nearly 38 percent more than identical houses in areas not served by BART (Landis and Cervero, 1995). Residential rents decreased by 2.4 percent for every one-tenth mile further from Washington, D.C., Metro stations (Benjamin and Sirmans, 1996). Single-family homes in communities served by Boston's commuter rail were worth 6.7 percent more than similar homes in other communities (Armstrong, 1994). In Chicago, the prices of single-family houses located within 1,000 feet of stations were 20 percent higher than comparable houses located a mile away (Gruen, 1997). Median home prices in the Philadelphia region were 10

percent higher in census tracts served by a PATCO rail line and 4 percent higher in tracts served by a SEPTA rail line (Voith, 1991).

Light rail can have a positive impact on nearby business communities as transitways can provide a new connection for riders to access these businesses, and because pedestrian and vehicular traffic around stations and park-and-ride lots can increase. As an example, since 2009, the year before the Council's Green Line LRT (Central Corridor) construction started, the neighborhoods between the Downtown East Station in Minneapolis and the Union Depot Station in St. Paul have experienced more than $3 billion in commercial and residential development—including new construction, redevelopment, and expansion. In addition, businesses on the corridor prior to the Green Line opening reinvested in their businesses and related community efforts to create distinctive districts around the stations (www.metrocouncil.org/News-Events/Transportation/Newsletters/Connections-ground-businesses,-arts-on-METRO-Green.aspx).

General Comment 8: Concerned about how the proposed BLRT Extension project would affect safety and security.

Master Response 8: Chapter 4 (**Section 4.7**) of the Final EIS addresses safety and security. Adherence to transitway design guidelines and the oversight of security personnel would result in no adverse impacts related to safety and security. Safety for rail users, area residents, local pedestrians and bicyclists, project construction workers, operators and vehicle occupants is an important consideration for the proposed BLRT Extension project. The framework for ensuring the highest level of safety to these groups would be established through conformance with the proposed BLRT Extension project site safety and health plan, construction contingency plan, the Council's Safety and Security Management Plan and the Metro Transit Security and Emergency Preparedness plan. Project operations in conformance with these plans would necessarily be closely and continuously coordinated with local area law enforcement, medical, fire, transportation and other organizations with related emergency responsibilities within the proposed BLRT Extension project corridor.

General Comment 9: Concerned about the effect of the proposed BLRT Extension project on community character and cohesion.

Master Response 9: Chapter 4 (**Section 4.2**) of the Final EIS discusses community facilities/community character and cohesion. Impacts associated with the proposed BLRT Extension project were not severe enough to affect overall community character and cohesion, or the accessibility to and use of community facilities. Hennepin County published the Bottineau Transitway Health Impact Assessment (HIA) in December 2013, and its findings and recommendations for equitable and optimal community health benefits resulting from the proposed BLRT Extension project, which were based on several factors including location affordability, are driving components of the station area plans.

General Comment 10: Concerned in general about the effect of the proposed BLRT Extension project on the loss of homes.

Master Response 10: Chapter 4 (Section 4.3) of the Final EIS summarizes acquisitions and displacements. Impacts to residential property are anticipated, but these impacts would be partial takings and not result in displacement of residents. The acquisition of portions of residential property for the proposed BLRT Extension project will be mitigated by payment of fair market compensation and provision of relocation assistance in accordance with the Uniform Relocation Act and Minnesota Statute 117.

G.4.6 Environmental Effects

General Comment 11: Concerned about how the proposed BLRT Extension project would affect air quality and pollution.

Master Response 11: Chapter 5 (Section 5.10) of the Final Environmental Impact Statement (Final EIS) contains a full evaluation of air quality issues as they pertain to the existing conditions of the proposed BLRT Extension project corridor and the projected future conditions with construction and operation of the proposed BLRT Extension project. The analysis presented in this Final EIS demonstrates that air pollutant concentrations during the operating phase of the proposed BLRT Extension project would not exceed the National Ambient Air Quality Standards; therefore, no mitigation measures are necessary. The State of Minnesota does not require permits related to air quality for projects of this type.

General Comment 12: Concerned about air quality, dust and dirt during construction of the proposed BLRT Extension project

Master Response 12: During construction a series of best management practices (BMPs) would be implemented including the following preventive and mitigation measures:

- Minimize land disturbance during site preparation
- Use watering trucks to minimize dust
- Cover trucks while hauling soil or debris off site or transferring materials
- Stabilize dirt piles if they are not removed immediately
- Use dust suppressants on unpaved areas
- Minimize unnecessary vehicle and machinery idling
- Revegetate any disturbed land post-construction

General Comment 13: Concerned about how the proposed BLRT Extension project would affect wildlife.

Master Response 13: Concerning wildlife: The proposed BLRT Extension project would involve constructing physical barriers that could restrict the crossing of portions of the proposed BLRT Extension project corridor by wildlife. The Council has analyzed design and construction methods that would minimize potential impacts to wildlife. Some culverts that cross the proposed trackage

can be designed to accommodate safe passage of some wildlife. Where effective and feasible, suitable wildlife crossings would be accommodated within proposed culverts to allow some wildlife species to cross from one side of the proposed BLRT Extension project/freight rail tracks to the other. Fencing in key areas can be used to minimize potential wildlife collisions with the LRT.

General Comment 14: Concerned about general impacts to Theodore Wirth Regional Park (TWRP) associated with the proposed BLRT Extension project.

Master Response 14: Chapter 8 of the Final EIS describes the impacts to Theodore Wirth Regional Park under Section 4(f) of the Department of Transportation Act of 1966. The proposed BLRT Extension project would result in the permanent incorporation of approximately 2.1 acres of property from TWRP. In particular, an approximate 1.9 acre portion of designated parkland, located in the southwest corner of the Golden Valley Road and Theodore Wirth Parkway intersection, would be affected with the construction of a transit station and park-and-ride lot. This triangle-shaped portion of TWRP is unimproved with no existing or planned recreational amenities. During construction, approximately 9.2 acres of temporary construction easements would be required within TWRP to grade land around the proposed BLRT Extension project corridor, to provide access during construction, and to provide floodplain and wetland mitigation. The land encompassed by temporary construction easements includes existing open space (e.g., wooded and grassland areas adjacent to the rail corridor and Bassett Creek). In consideration of the permanent and temporary uses of TWRP property, the proposed BLRT Extension project has evaluated park-related enhancements as measures to minimize harm to the park resource. These enhancements include trail improvements near the Plymouth Avenue Station, a new trail connection from Theodore Wirth Regional Park to Sochacki Park, a trailhead at the Golden Valley Road Station park-and-ride, reconstruction of the Theodore Wirth Parkway bridge and the Theodore Wirth Parkway/ Golden Valley Road intersection, and minimization of visual effects.

General Comment 15: Concerned about general impacts to Sochacki Park: Mary Hills Management Unit and Sochacki Park: Sochacki Management Unit associated with the proposed BLRT Extension project.

Master Response 15: The proposed BLRT Extension project would require a temporary occupancy of approximately 0.57 acre along the eastern border of Sochacki Park: Mary Hills Management Unit to facilitate construction activities and stormwater conveyance improvements. The proposed BLRT Extension project would require a temporary occupancy of approximately 5.6 acres of Sochacki Park: Sochacki Management Unit in Robbinsdale in order to provide access and construction staging for the construction of a new LRT bridge structure across Grimes Pond. All non-park construction staging options have been considered and proven to not be feasible.

The proposed temporary occupancy of Sochacki Park involves multiple areas of the park and includes the following components:

- Approximately 5.6 acres of park property would be subject to a temporary easement for staging/laydown areas on both the north and south sides of North Rice Pond, and for a temporary construction access road from the northern border of the park to the northern and

southern staging areas. This road would generally follow the current road/path alignment to minimize additional impacts to park trees and other vegetation. These temporary construction facilities would be used for the construction of the new LRT bridge across Grimes Pond.

- A temporary fence would be erected along both sides of the existing access road and a new pedestrian path would be added to just west of the access road provide a safe north-south connection through the park while construction vehicles utilize the access road during construction of the new LRT bridge.
- Minor improvements to the existing narrow access road would be made in order to accommodate the structural capacity needs of construction vehicles/equipment and to provide several bypass areas to allow two-way traffic an opportunity to safely pass when entering/exiting the park property.

Based on the criteria that are used to determine a temporary occupancy, FTA has determined that there would be no permanent Section 4(f) use of Sochacki Park: Mary Hills Management Unit or Sochacki Park: Sochacki Park Management Unit and that proposed construction activities within the parks would meet the criteria for a Temporary Occupancy Exception described in 23 CFR Part 774.13(d). The portion of the park to be temporarily occupied during construction would be restored to existing conditions or better.

General Comment 16: Concerned about general impacts to wetlands associated with the proposed BLRT Extension project.

Master Response 16: Concerning wetlands: The Final EIS describes in detail several types of impacts to wetlands including direct impacts, indirect impacts, and potential cumulative effects and secondary impacts to wetlands. **Section 5.3** of the Final EIS discusses the wetland impacts for both short and long-term impacts as well as the avoidance, minimization, and mitigation measures. Wetland impacts from the proposed BLRT Extension project would be as presented in **Table G.4-1**.

Table G.4-1. Impacts to Delineated Basins from the Proposed BLRT Extension Project by Wetland Type

Wetland Type		Impacts (acres)				
Circular 39 [1]	Eggers and Reed [2]	Permanent Impacts	Temporary Impacts	Total Impacts	USACE Jurisdictional Impacts	WCA Jurisdictional Impacts
Type 1	Seasonally flooded basin	5.33	1.26	6.59	2.52	4.28
Type 3	Shallow marsh	—	—	—	—	—
Type 4	Deep marsh	2.44	0.05	2.49	1.01	0.10
Type 5	Open water	1.69	1.92	3.61	0.42	1.69
Type 6	Shrub carr	0.50	—	0.50	0.21	0.21
	Total	**9.96**	**3.23**	**13.19**	**4.16**	**6.28**

[1] Plant communities classified based on US Fish and Wildlife Circular 39.

[2] Plant communities classified based on *Wetland Plants and Plant Communities of Minnesota and Wisconsin* by Eggers and Reed (1997) (USACE St. Paul District).

The proposed BLRT Extension project would require coordination and permitting from local, state, and federal water resource agencies. The Council coordinated with the Wetlands Technical Evaluation Panel regarding mitigation strategies prior to submitting the WCA and CWA Section 404 permit applications. The Council's analysis of preliminary mitigation strategies included establishing project-specific permittee-responsible mitigation sites and purchasing wetland mitigation bank credits. Based on this analysis, the Council determined that wetland impacts from the proposed BLRT Extension project will be mitigated through a combination of on-site wetland mitigation and purchases of private wetland credits from existing mitigation banks in suitable major watersheds and Bank Service Areas.

G.4.7 Noise and Vibration Effects

General Comment 17: Concerned about general noise impacts associated with the proposed BLRT Extension project.

Master Response 17: Noise impacts have been assessed at sensitive locations throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. Where impacts have been identified, mitigation measures, consistent with Metro Transit's noise mitigation policy, have been recommended. Noise is discussed in **Chapter 5** (**Section 5.6**) of the Final EIS. Without minimization and mitigation, the proposed BLRT Extension project would result in 366 moderate noise impacts to residential land uses and 618 severe noise impacts. As a part of the proposed BLRT Extension project, Quiet Zones will be implemented at all Federal Railroad Administration (FRA) and light rail transit (LRT) shared at-grade crossings. A Quiet Zone is an FRA-approved section of a freight rail line where freight trains do not sound horns. Public roadway crossings of a Quiet Zone must have certain safety measures in place, which include gates, warning devices, and in some cases other supplemental safety measures, such as concrete medians. The

implementation of Quiet Zones reduces residential land use impacts to 176 moderate noise impacts and 120 severe noise impacts. Additional mitigation measures in the form of noise barriers and wayside devices are proposed for certain locations; interior testing will be performed at various locations to determine the need for additional mitigation. With the incorporation of noise barriers, wayside devices and additional mitigation (if required through interior testing), the proposed BLRT Extension project would result in five residual moderate and two residual severe residential land use noise impacts. See **Table 5.6-7** in the Final EIS for a summary of proposed mitigation measures by location.

General Comment 18: Concerned about general vibration impacts associated with the proposed BLRT Extension project.

Master Response 18: Vibration impacts have been assessed at sensitive locations throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. Where impacts have been identified, mitigation measures have been recommended. Vibration is discussed in **Chapter 5** (**Section 5.7**) of the Final EIS.

G.4.8 Alternatives, Engineering, and Design

General Comment 19: Several comments were received regarding the need for stations at Plymouth Avenue and/or Golden Valley Road.

Master Response 19: Both the Plymouth Avenue and Golden Valley Road stations are included in the proposed BLRT Extension project scope and budget. The proposed BLRT Extension project would improve the transportation system by providing more travel choices and faster travel times between residential areas, major destinations, and employment centers. **Chapter 2** of the Final EIS presents a summary of the alternatives analysis conducted for the proposed BLRT Extension project corridor. This chapter also details the proposed BLRT Extension project including the location of all stations.

General Comment 20: Request for a tunnel option to be evaluated for the proposed BLRT Extension project.

Master Response 20: Capital costs are a consideration when defining reasonable alternatives for evaluation, and there are increased costs associated with a tunnel alignment. Generally speaking, accommodating a travel way (rail or car/truck) in a subsurface tunnel is many times (400 percent and up) more expensive than the same facility at grade because of the extensive structural work required to support the tunnel as well as the perpetual operating costs associated with tunnels (lighting/communication, drainage, ventilation, fire protection, general maintenance, etc.). Additional infrastructure, such as a tunnel, is considered when there is a driving factor or benefit that would outweigh the additional costs. For this project there was not sufficient reason to evaluate a tunnel alignment; therefore, it was not included in the universe of alternatives studied. However, as part of the Section 4(f) of the Department of Transportation Act of 1966 evaluation, tunnel options were developed as avoidance alternatives (see **Chapter 8** of the Final EIS). These avoidance alternatives were not deemed prudent for many of the reasons stated above.

General Comment 21: Opposed to the widening of West Broadway Avenue (County State-Aid Highway 103) and concerned about residential property displacements and noise.

Master Response 21: Hennepin County is developing the West Broadway Avenue Reconstruction project. An Environmental Assessment Worksheet (EAW) for the roadway project was completed and a Negative Declaration finding issued in December 2015. The Final EIS discloses this information in **Chapter 2 – Alternatives**. **Chapter 6 – Indirect Impacts and Cumulative Effects** discloses cumulative effects of the proposed BLRT Extension project which considers the construction of the West Broadway Avenue Reconstruction Project.

Property acquisition and displacement related to the West Broadway Avenue Reconstruction Project is outside of the scope of the proposed BLRT Extension project. The West Broadway Avenue Reconstruction Project EAW would contain the relevant information related to project's impact on acquisition and displacement. Each project has been analyzed for noise in accordance with the appropriate methods and noise mitigation has been evaluated in accordance with the applicable requirements. Since neither the proposed BLRT Extension project nor the West Broadway Avenue Reconstruction project result in noise impacts that require mitigation, there is a low probability of cumulative noise effects from the combination of the two projects.

Appendix G
Response to Draft EIS Comments

1 Response to Comments – Agencies

This page intentionally left blank

City of Maple Grove

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
1A	Opatz	Mike	City of Maple Grove	1	Email	8 - Transportation System Effects	The City of Maple Grove would not alter any of its Maple Grove Transit express routes [reference page 3-7 of the Draft EIS] given the approved Bottineau line alignment/LPA, which does not serve the City of Maple Grove. Furthermore, the Route 787 would not be eliminated. Maple Grove would likely add local feeder service to the Bottineau line as demand and funding allows.	The proposed METRO Blue Line Light Rail Transit (BLRT) Extension project does not include the A alignment; therefore, no modifications to transit routes serving the City of Maple Grove are anticipated or required. Changes to City of Maple Grove transit express routes are at the discretion of the city of Maple Grove.
1B	Opatz	Mike	City of Maple Grove	1	Email	8 - Transportation System Effects	The City of Maple Grove reserves the right to conduct further research on feasibility of Route 732 and be the operator of that route if funded.	The Enhanced Bus/Transportation System Management (TSM) Alternative has been eliminated from further consideration; therefore, Route 732 is not required as a new service to the area as part of the proposed BLRT Extension project. This does not preclude the city of Maple Grove from researching the feasibility of that route and implementing that route if it is determined to be a viable transit option.
1C	Opatz	Mike	City of Maple Grove	1	Email	2 - Fiscal Effects and Schedule	The City of Maple Grove would like to better understand project costs for the different scenarios, especially the LPA.	A financial analysis of the proposed BLRT Extension project is discussed in Chapter 10 of the Final Environmental Impact Statement (EIS). The proposed BLRT Extension project was analyzed further for the Final EIS; however, the other alternatives were not. Costs for the proposed BLRT Extension project were refined based on the Preliminary Engineering Plans and unit costs from local and national sources. Section 10.1.1 discusses the capital cost estimate basis for the proposed BLRT Extension project. Table 10.1-1 of the Final EIS shows a breakdown of the costs. For additional information regarding all alternatives, please review Chapters 2 and 10 of the Draft EIS.
1D	Opatz	Mike	City of Maple Grove	1	Email	8 - Transportation System Effects	The City of Maple Grove notes that the Maple Grove express bus riders would even less likely to give up their bus option for a rail option that is in Brooklyn Park (the LPA option).	The Council understands and appreciates the effectiveness of the City of Maple Grove's express bus service. The effectiveness of this service was part of the reasoning for the selection of the proposed BLRT Extension project on a corridor that does not have an effective express bus service option.

City of Crystal

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
104A	Norris	Anne	City of Crystal	104	Letter via e-mail	6 - Noise & Vibration Effects	Concerned about projected noise impacts along the C Alignment in Crystal, the report indicates that there are a significant number of adjacent noise sensitive land uses that are predicted to experience noise impacts from LRT construction and operation, if unmitigated. A total of approximately 246 dwelling units (single-family, 2-family and apartment units) are assumed to have "severe" impacts from noise. While there are some anticipated impacts associated with construction noise, the DEIS does acknowledge the city's noise ordinance restrictions in that regard, and the construction activity is temporary. City is concerned with noise impact directly associated with the sounding of a train horn in advance of at-grade crossings at Corvallis and West Broadway, because it poses an increase to the baseline noise within what are predominantly residential neighborhoods. Impacts associated with the horn are intensified by the number of train trips. The City contends the establishment of quiet zones will be the most effective method of noise mitigation within Crystal.	Noise impacts have been assessed at sensitive locations throughout the proposed BLRT Extension project corridor consistent with Federal Transit Administration (FTA) methodology and impact criteria. In the City of Crystal, 95 moderate and 204 severe impacts were reported, without mitigation, using FTA's methodology. (See Table 5.6-5 in Section 5.6 of the Final EIS.) With the implementation of Quiet Zones, there would be 10 moderate and 31 severe noise impacts. (See Table 5.6-5 in Section 5.6 of the Final EIS.) Mitigation for residual noise impact will be the use of a wayside device; a 10-foot-high, 1,300-foot-long noise barrier; a 10-foot-high, 1,100-foot-long noise barrier; and interior testing to determine appropriate mitigation (if applicable and feasible) at the remaining residences near grade crossings where noise barriers cannot be constructed.
104B	Norris	Anne	City of Crystal	104	Letter via e-mail	2 - Fiscal Effects and Schedule	All costs associated with quiet zone improvements must be borne by the project and not the City.	The proposed BLRT Extension project assumes all infrastructure costs associated with the implementation of Quiet Zones in the City of Crystal. These costs are included in the proposed BLRT Extension project's budget.
104C	Norris	Anne	City of Crystal	104	Letter via e-mail	8 - Transportation System Effects	The Bottineau project should incorporate this roadway evaluation (whether the West Broadway s-curve crossing of the BNSF tracks at 48th Avenue North either ought to be reconstructed as is, reconfigured, replaced by a crossing in a different location or eliminated) into the FEIS and Project Development phase to determine the feasibility of eliminating the rail crossing at West Broadway, need for roadway evaluation to determine the feasibility of eliminating the rail crossing at West Broadway.	Several design options were considered in coordination with the city of Crystal, Hennepin County, and other stakeholders at the West Broadway Avenue (County State-Aid Highway 103) rail crossing, including the potential of closing the crossing. Ultimately a revised crossing that maintained and improved access to the adjacent neighborhoods while enhancing the safety of the crossing was selected.
104D	Norris	Anne	City of Crystal	104	Letter via e-mail	3 - NEPA Process & Public Involvement	Figure 22: Alignment C Noise Impact Locations, there are two commercial/industrial properties misidentified as residential (the vacant industrial property at 5216 Hanson Ct and the vacant commercial property at 4940 West Broadway), and one commercial property (4947 West Broadway) that as of May 8, 2014, is no longer a church and will be developed for the City's a new Public Works facility. These three properties should no longer be included in the list of properties with potential for severe impacts from noise.	This was verified and corrected in the Final EIS.
104E	Norris	Anne	City of Crystal	104	Letter via e-mail	6 - Noise & Vibration Effects	Four residential properties (classified as "Category 2" uses) in Crystal have been identified as having potential for impacts from vibration (Figure 39 in the Technical Report) in the range of 72-90 VdB, depending on proximity to the track centerline. The Bottineau project should incorporate successful vibration mitigation measures for evaluation in the FEIS and during Project Development.	Vibration impacts have been assessed at sensitive locations throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. Where impacts have been identified, mitigation measures have been recommended. Vibration is discussed in Chapter 5 of the Final EIS. In the Draft EIS, four residences were identified as vibration impacts, all in the area near Fairview Avenue. However, with greater engineering detail available during the Final EIS and changes in the proposed BLRT Extension project, only one residence with vibration impact remains at this location. A 300-foot-long ballast mat will eliminate the impact.
104F	Norris	Anne	City of Crystal	104	Letter via e-mail	8 - Transportation System Effects	The FEIS and Project Development all need to include a detailed analysis that satisfactorily addresses the potential adverse impacts associated with the lack of an off-street drop off or	The Bass Lake Road Station incorporates 170 space park-and-ride and a passenger drop-off area. The Bass Lake Road intersection with Bottineau Boulevard (County Road 81) was studied in the Traffic Operations Technical Memorandum, which is

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
							parking area that can support the Bass Lake Road station without compromising traffic operations.	available in Appendix F of the Final EIS. The intersection at Bass Lake Road and Bottineau Boulevard would operate at level of service (LOS) C with a freight event in the 2040 AM peak, and LOS D in the 2040 PM peak for the proposed BLRT Extension project. This level of service performance does not require mitigation.
104G	Norris	Anne	City of Crystal	104	Letter via e-mail	8 - Transportation System Effects	The City looks forward to participating in the process to ensure that Crystal residents will have safe pedestrian facilities on Bass Lake Road, Corvallis Avenue and West Broadway Avenue to access the station and that connect neighborhoods across the rail corridor.	Section 3.4 of the Final EIS summarizes pedestrian and bicycle improvements as part of the proposed BLRT Extension project. The proposed Bass Lake Road Station area provides improved connections from trails and sidewalks along the south side of Bass Lake Road to reach the station. A grade separated pedestrian crossing of Bottineau Boulevard would be constructed on the south side of Bass Lake Road. In addition, sidewalk connections would be provided or improved in the area of the proposed park-and-ride lot, including improved connections to Lakeland Avenue. The Crystal Lake Regional Trail runs along the east side of Bottineau Boulevard; bicyclists and pedestrians would be able to use the existing crossing facilities or the grade separated pedestrian crossing at the Bass Lake Road intersection to connect to the Bass Lake Road Station. South of Bass Lake Road, the proposed BLRT Extension project also includes improved pedestrian crossings of the light rail transit (LRT) tracks at West Broadway Avenue (about 1 mile south of the Bass Lake Road Station) and Corvallis Avenue (about ⅔ mile south of the Bass Lake Road Station).
104H	Norris	Anne	City of Crystal	104	Letter via e-mail	4 - Social and Economic Effects	The City is concerned that, with the frequency of trains and the regular closing of major crossings such as at Bass Lake Road, there is the potential for adverse impacts to public safety services, such as increased response time, reduced access and increased costs. The pending traffic analysis must address and mitigate these possible impacts.	Section 4.7 of the Final EIS addresses safety and security. The Issue Resolution Team (coordinated between the Council and the city of Crystal) found that traffic operations of the Bass Lake Road and Bottineau Boulevard intersection would function at acceptable levels and does not warrant grade separation. Proposed BLRT Extension project tracks would cross Bass Lake Road at grade. In locations where there would be at-grade light rail crossings of roadways, the potential exists for increases in emergency response time as a result of delay to emergency vehicles while LRVs are in the crossing. During the peak weekday hour, up to 12 light rail trains (six in each direction) would pass through these at-grade crossings, causing approximately 50 seconds of delay per light rail train crossing. These delays could increase fire, emergency medical services, and police response times on routes using the crossings. To help avoid or minimize delays, the Council would coordinate with emergency services providers by providing them with the light rail operating schedule and identification of alternative crossing routes. Additional coordination will occur through the Fire Life Safety and Security Committee, as described in the proposed BLRT Extension project's Safety and Security Management Plan (SSMP) (Council, 2014).
104I	Norris	Anne	City of Crystal	104	Letter via e-mail	8 - Transportation System Effects	The City also is concerned that access to Bottineau Boulevard for residents north of the Canadian Pacific (CP) Rail will be compromised by the gated crossing at Bass Lake Road. Frequently the east-west CP Rail traffic blocks Douglas Drive and West Broadway. This forces residents north of the CP Rail to use Bass Lake Road to access Bottineau Boulevard and points south; and with the gates activated for LRT at the Bass Lake Road crossing, it may impose considerable traffic delays and queuing on Bass Lake Road that may take an inordinate amount of time to clear. The pending traffic analysis must also address and mitigate these possible impacts.	The Bass Lake Road intersection with Bottineau Boulevard was studied in the Traffic Operations Technical Memorandum, which is available as an appendix to the Final EIS (Appendix F). The intersection at Bass Lake Road and Bottineau Boulevard would operate at LOS C with a freight event in the 2040 AM peak, and LOS D in the 2040 PM peak for the proposed BLRT Extension project. This level of service performance does not require mitigation.
104J	Norris	Anne	City of Crystal	104	Letter via e-mail	4 - Social and Economic Effects	The City expects that the FEIS and Project Development phases will be sensitive to any adverse impacts on the Crystal business community that may be caused by construction of the Transitway and that there will be plans and programs in place to mitigate any anticipated adverse impacts.	Impacts related to temporary changes to parking and access will be mitigated by the development of a Construction Mitigation Plan, which will include a Construction Communications Plan, during final design. The plan will detail planned activities during construction, partnerships, and specific programs to assist local businesses and residents affected by construction and methods to minimize adverse impacts during construction of the proposed BLRT Extension project.

Minneapolis Park and Recreation Board (MPRB)

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
119A	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	6 - Noise & Vibration Effects	The eastern portion of Theodore Wirth Regional Park, which abuts the proposed D1 alignment, is known for its especially quiet and natural character and is enjoyed by thousands seeking a more passive recreational experience in the middle of a bustling urban community. Theodore Wirth Regional Park and the Grand Rounds must be separated from visual, noise, functional and other impacts which would significantly change or detract from the natural, quiet and scenic character of the park.	FTA has separately addressed the Grand Rounds Historic District (GRHD) and Theodore Wirth Regional Park (TWRP) in the Final EIS. These resources, although overlapping to some degree, are distinct in terms of their cultural and environmental significance and separating these resources was an important distinction to make for readers of the Final EIS. The GRHD is significant as a historic and cultural resource and information can be found on the GRHD in Section 4.4 of the Final EIS with more detailed technical information made available in Appendix H – Cultural Resources Supporting Information of the Final EIS. TWRP is significant as the largest park in the Minneapolis Park and Recreation Board (MPRB) system, totaling a little over 759 acres in area. As a large park in an urban area, it contains a wealth of active and passive features, including the Eloise Butler Wildflower Garden, a golf course, archery range, sledding hill and many miles of trails for bicyclists and pedestrians. Information on TWRP can be found in Section 4.2 of the Final EIS. Both the GRHD and TWRP are separately addressed, as distinct resources, in Chapter 8 – Amended Draft Section 4(f) and 6(f) Evaluation of the Final EIS. Separating these resources in terms of the land area they include, the features and facilities they contain and convey, and the separate owners with jurisdiction—Minnesota Historic Preservation Office (MnHPO) for the GRHD and MPRB for TWRP—was necessary in order to complete the Section 4(f) Evaluation for the proposed BLRT Extension project. Chapter 8 – Amended Draft Section 4(f) and 6(f) Evaluation of the Final EIS presents the preliminary determination of FTA that the proposed BLRT Extension project would have a *de minimis* use of TWRP; FTA will make a final determination after receiving written concurrence from MPRB regarding this finding. The GRHD, as noted above, is a separate resource that is still subject to protection under Section 4(f), but as a historic resource, and not a park resource. Chapter 8 of the Final EIS also presents FTA's preliminary determination that the proposed BLRT Extension project would have a direct use of the GRHD. This use determination was based on the assessment of adverse effects to the historic district through the Section 106 of the National Historic Preservation Act of 1966 (Section 106) process. MnHPO has concurred with the proposed mitigation measures for the adverse effects to the GRHD, which are also presented in Chapter 8 (see Section 8.7.2.11). A least overall harm analysis was conducted for the proposed BLRT Extension project (see Section 8.7.3) which found that the proposed alignment would have the least overall harm in relation to the magnitude of harm, after reasonable mitigation, to the other resources considered—both Section 4(f) and non–Section 4(f).
119B	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	The MPRB has adopted the outcome that Theodore Wirth Regional Park and adjoining park land remains a quiet, tranquil, serene and natural park destination.	The Final EIS includes an analysis of noise impacts to passive use areas of TWRP at two locations within the park (the Chalet and a location east of Theodore Wirth Parkway between the Plymouth Avenue and Golden Valley Road stations); areas where park visitors may seek a place to linger and be separated from the urban character of the metropolitan area that surrounds the park. No noise impacts to the park were identified, even using the most stringent type of FTA sensitive receptor designation (Category 1 sensitive use) for the park at the locations (see Chapter 5 of the Final EIS for a discussion of potential proposed BLRT Extension project noise). The proposed BLRT Extension project would introduce transportation infrastructure features and remove vegetation from areas adjacent to the park, resulting in a change to the visual setting. However, these changes would not alter the features or attributes that make TWRP a significant and important community and regional park resource. (See Chapter 8 – Amended Draft Section 4(f) and 6(f) Evaluation of the Final EIS for more information on the ability of TWRP to remain a functional park resource with construction of the proposed BLRT Extension project.)The Council will continue to work with MPRB staff to develop aesthetic design concepts (such as selection of landscape treatments) that would reduce the visual impact of the proposed BLRT

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
								Extension project.
119C	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	The MPRB has adopted the outcome that permeable paving materials are incorporated to reduce stormwater impacts to park land when hard surfaces are added by the project.	A stormwater management plan will be developed for the proposed BLRT Extension project to meet the stormwater ordinances, rules, and requirements of the various regulatory entities in the appropriate portions of the proposed BLRT Extension project corridor. Where feasible, low impact development best management practices (BMPs) will be incorporated into facilities associated with the proposed BLRT Extension project. Low-impact development practices can substantially reduce stormwater runoff and may include the use of permeable pavers, pervious concrete, bio-infiltration, tree trenches. Such low impact design allows surface water to slowly infiltrate into the soil and helps to counteract the bounce of receiving waterbodies including Bassett Creek. Low impact design also helps to trap oils and hydrocarbons that may be present in areas with high vehicle use. Feasibility of various low-impact development practices will be determined based on depth to the seasonal high groundwater elevation, soil types, any evidence of contaminated soils, and elevation constraints.
119D	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	The MPRB has adopted the outcome that the portion of Theodore Wirth Regional Park lying adjacent to Segment D1, continues to be used by those who desire a park experience in this natural, quiet setting.	The ability to maintain the attributes of the TWRP, including its setting, features, and facilities, with construction of the proposed BLRT Extension project is an important assessment for FTA in completing a Section 4(f) Evaluation (see Chapter 8 of the Final EIS for a copy of the Amended Draft Section 4(f) and 6(f) Evaluation). As noted in Chapter 8, the Section 4(f) analysis discusses the preliminary determination of the *de minimis* use of TWRP in the vicinity of the Plymouth Avenue and Golden Valley Road stations. In summary, the incorporation of 2.1 acres of TWRP property were found to not alter the features or attributes that make TWRP a significant and important community and regional park resource. Specific to noise, two locations (the Chalet and a location east of Theodore Wirth Parkway between the Plymouth Avenue and Golden Valley Road stations) were analyzed under FTA's Category 1 land use designation and found to have no noise impacts; therefore, the park property adjacent to Alignment D1 can continue to serve the park users who desire a park experience in the natural, quiet setting.
119E	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	The MPRB does not agree with a *de minimis* section 4(f) finding for Theodore Wirth Regional Park due to lack of information in several areas including, location of proposed wetland and floodplain mitigation, lack of category 1 noise analysis, and lack of analysis of constructive uses for Theodore Wirth Regional Park.	FTA and the Council acknowledge MPRB's concern with a *de minimis* Section 4(f) finding for TWRP. The Final EIS clarifies that two Section 4(f) properties were evaluated within the TWRP area—TWRP and the GRHD. Under Section 4(f) regulations, MPRB is the Official with Jurisdiction over the park resource (TWRP) and MnHPO is the Official with Jurisdiction over the GRHD. In the March 2014 Draft Section 4(f) Evaluation (Chapter 8 of the Draft EIS), the GRHD was identified as a direct use in Table 8.3-2 on page 8-13, but was described as a *de minimis* use in the text on page 8-35. The correct preliminary determination in the March 2014 Draft Section 4(f) analysis was a *de minimis* use for the GRHD. The TWRP resource was preliminarily determined to have a direct use, under the March 2014 Draft EIS Section 4(f) evaluation. Since the publication of the Draft EIS, additional information was developed during preliminary design efforts on the proposed BLRT Extension project which has resulted in an updated preliminary Section 4(f) findings. Chapter 8 of the Final EIS (the Amended Draft Section 4(f) and 6(f) Evaluation) presents FTA's preliminary *de minimis* finding for the park resource (TWRP). This preliminary finding has been based on updated information regarding the level of impact to park property, and whether the impact is one that, after taking into account avoidance, minimization, mitigation and enhancement measures, results in no adverse effect to the activities, features, or attributes qualifying the park for protection under Section 4(f). This preliminary finding has also been developed with extensive coordination with MPRB staff. Wetland impacts on TWRP property would be less than one acre; mitigation for the impact is proposed at a site north of Olson Memorial Highway (Trunk Highway 55) and west of the BNSF Railway (BNSF) right-of-way, largely on MPRB property. An

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
								estimated 1.5 acres of wetland credit can be gained from this wetland mitigation site. The proposed BLRT Extension project would have about 16,800 cubic yards (CY) of floodplain impact on or adjacent to MPRB property. Floodplain mitigation is discussed in Section 5.2.5 of the Final EIS. The floodplain mitigation site for this 16,800 cubic yard impact is located west of the BNSF rail corridor and north of Olson Memorial Highway, largely on MPRB property (the same site as the wetland mitigation site discussed above). The site is being designed in coordination with Bassett Creek Water Management Commission (BCWMC) and MPRB staff to ensure that the site fits into the landscape. The Final EIS evaluated the potential for noise impacts to areas within TWRP using a Category 1 classification. The areas evaluated included the Theodore Wirth Chalet and a location between the Plymouth Avenue and Golden Valley Road stations on the east side of Theodore Wirth Parkway. No noise impacts to the park were identified based on this evaluation (see Section 5.6 of the Final EIS for more details on this evaluation). The information presented above was used to help determine that the proposed BLRT Extension project would not alter or impair the overall use or function of TWRP. This informed FTA's preliminary determination of a *de minimis* use, and also informed that there would not be a constructive use. Chapter 8 of the Final EIS also makes a determination of direct use on the GRHD based on an adverse effect finding under Section 106. Through an extensive coordination and consultation process, FTA has identified mitigation measures for the GRHD (as noted in the Section 106 Memorandum of Agreement [MOA]). Final Section 4(f) determinations will be made after consideration the comments received from the Officials with Jurisdictions and the public on Chapter 8 of the Final EIS. As noted above, MPRB is the Official with Jurisdiction for TWRP, and MPRB concurrence will be required prior to finalization of the *de minimis* finding for the park.
Wirth 119F	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	As the design progresses, park lands must be evaluated under Section 4(f) to identify all permanent and temporary uses.	The Amended Draft Section 4(f) and 6(f) Evaluation presents both temporary and permanent impacts to park properties, including impacts to parks purchased by Land and Water Conservation Funds [Section 6(f)]. A total of 9.45 acres of MPRB property would be temporarily occupied for proposed BLRT Extension project construction purposes, and 2.11 acres of MPRB property would be permanently acquired for the proposed BLRT Extension project.
119G	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	As the design progresses, park lands must be re-evaluated under Section 4(f) to determine whether there are constructive uses of park land due to long-term noise, vibration and visual impacts, potential impacts to wetland and floodplains within the park, and potential stormwater impacts.	Constructive use of a property is set forth in 23 CFR Part 774.15(a). It is defined as occurring when the transportation project does not incorporate land from a Section 4(f) property, but the proposed BLRT Extension project's proximity impacts are so severe that the protected activities, features, or attributes that qualify the property for protection under Section 4(f) are substantially impaired. Substantial impairment occurs only when the protected activities, features, or attributes of the property are substantially diminished and rendered unusable to the park users. Chapter 8 – Amended Draft Section 4(f) and 6(f) Evaluation of the Final EIS indicates that there would be no constructive use of MPRB park resources (see Section 8.7.1). Based on the finding of no constructive use, a re-evaluation will not be conducted.
119H	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	As the design progresses, park lands must be re-evaluated under Section 4(f) to determine whether there are constructive uses of park land due to long-term impacts on the cultural characteristics of the parks, with attention focused on those that are considered eligible for the National Register of Historic Places.	Please see response to Comment 119G.
119I	Wielinski	Liz	Minneapolis Park & Recreation	119	Email & US Mail	5 - Environmental Effects	Park land along the corridor is preserved in the same or better condition.	Park land temporarily impacted by construction activities would be restored to as good or better conditions [23 CFR Part 774.13(d)]. In addition, the proposed BLRT

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
			Board					Extension project includes new trail connections and enhancements of existing trails that would provide greater access to and utility of park property.
119J	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Park property is not used permanently as part of LRT development.	The Amended Section 4(f) Evaluation indicates that 2.1 acres of TWRP property would be permanently acquired for the construction of LRT facilities, including the Golden Valley Road Station park-and-ride and the Plymouth Avenue Station. Mitigation for this permanent property impact would be in the form of replacement property of equal or greater value that could be readily incorporated into the park system, or through a negotiated financial settlement.
119K	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	A number of archaeological features within Theodore Wirth Regional Park and adjoining areas were not discussed in the DEIS. Further research is needed to properly document all appropriate structures.	A study to document cultural landscape elements in TWRP (including Theodore Wirth Parkway) has been completed. Archaeological resources within TWRP, including Germania Brewery, were reviewed as part of the study to document the cultural landscape in the park. It is important to note that, in the Draft EIS and in the Final EIS, the Germania Brewery site was identified as an archaeological site that was outside the archaeological area of potential effect (APE) and therefore did not require detailed analysis. The fact that an archaeological site may lie within an architectural APE (which is generally more extensive than an archaeological APE) does not indicate that it must be analyzed for adverse effects. By definition, the APE is the area for potential effect, and a site outside the area for potential effect would therefore not be subject to potential effects. See Appendix H of the Final EIS for additional information.
119L	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	The Section 4(f) and Section 106 review need to evaluate the impacts to the cultural landscape of Theodore Wirth Regional Park and Bassett's Creek.	The proposed BLRT Extension project's potential impacts to the Theodore Wirth Segment of the GRHD was evaluated by FTA and the results of this evaluation are summarized in Section 4.4 of the Final EIS with technical and supporting information included in Appendix H of the Final EIS. The GRHD is significant as a historic resource as it represents a conscious effort to link area of the city into a comprehensive and unified system (the "Grand Rounds"). It is one of the most unique and iconic features of Minneapolis, and continues to draw national attention for its role as a recreational resource that enhances the vitality of a major American city. A study to document cultural landscape elements in TWRP (including Theodore Wirth Parkway) has been completed and includes examining view sheds to and from the proposed BLRT Extension project. Effects to historic property views within the APE were analyzed. All attempts were made to avoid or minimize adverse effects to historical or cultural resources as a part of the Section 106 process. Effects from all project elements, including wetland, floodplain, or stormwater mitigation, on historic properties were analyzed. (See Appendix H of the Final EIS for more detail on the process of assessing the proposed BLRT Extension project's effects on cultural and historic resources.) Boundaries for the GRHD were confirmed. The study to document cultural landscape elements in TWRP includes the area around Bassett Creek. According to information from the MnHPO inventory files, Bassett Creek Park is not identified as individually eligible or contributing to the GRHD; however, the nomination form for the District is currently being reevaluated. FTA published a Section 106 Determination of Effects report for the proposed BLRT Extension project in December 2015, a copy of which is included in Appendix H of the Final EIS. This report did find that the proposed BLRT Extension project would have an adverse effect on the GRHD, including the direct physical effects resulting from construction of the Plymouth Avenue Station, the Golden Valley Road Station, and the park-and-ride facility at Golden Valley Road. Based on this information, FTA has made a preliminary Section 4(f) direct use determination for the GRHD (see Chapter 8 – Amended Draft Section 4(f) and 6(f) Evaluation of the Final EIS).
119M	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	The impacts to the cultural resources within Theodore Wirth Regional Park are underrepresented in the DEIS from a construction and operation perspective. Further research is needed to properly document impacts, especially in terms of noise, impacts on users, and cultural landscapes.	Effects on historic properties within the APE, including potential effects from the design of the proposed BLRT Extension project, noise, vibration, or visual impacts, were analyzed for the Final EIS. To inform the analysis of effects, a study to document cultural landscape elements in TWRP was completed and includes examining any view sheds to and from the proposed BLRT Extension project.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
								A Section 106 MOA has been developed by FTA and MnHPO including the participation of the Council and other parties. The Section 106 MOA sets forth commitments to avoid, minimize, and mitigate the potential adverse effects of the proposed BLRT Extension project on cultural and historic resources (see Section 4.4 of the Final EIS). A copy of the draft Section 106 MOA is included in Appendix H of the Final EIS. An executed copy of this document will be included in the proposed BLRT Extension project's Record of Decision.
119N	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Architecture areas of potential effect include entire park parcels where the intent of the parkland was preservation of a view shed such as in Valley View/Glenview Terrace Park.	The architecture/history APE includes a portion of the Valley View/Glenview Terrace Park parcels. Areas included in the architectural/historical APE are defined in Section 4.4.1.1 of the Final EIS. Areas outside the architectural APE were not evaluated, pursuant to the requirements of 36 CFR Part 800.4(a)(2); therefore, only the portion of Valley View/Glenview Terrace Park which falls within the APE were evaluated for impacts associated with the proposed BLRT Extension project. Effects on historic properties within the APE, including potential effects from visual impacts were analyzed for the Final EIS. To inform the analysis of effects, a study to document cultural landscape elements in TWRP was completed and includes examining any view sheds to and from the proposed BLRT Extension project both within and outside the APE, including from Valley View/Glenview Terrace Park. A copy of this report can be found in Appendix H of the Final EIS. Visibility of the proposed BLRT Extension project may change with the season due to the vegetative cover of deciduous plants and trees. Therefore, field survey was conducted when no snow was present and prior to full leaf-out of deciduous species, in an effort to observe potential viewsheds when the lowest level of natural obstructions would exist. The analysis of viewshed impacts of the proposed BLRT Extension project from Valley View/Glenview Terrace Park resulted in a "No Visibility" finding. While this park (Valley View/Glenview Terrace) is located adjacent to the proposed BLRT Extension project, it has no direct view of the proposed BLRT Extension project and only limited views of TWRP due to dense vegetation and topography.
119O	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	The protection of the entire parkland view shed shall be considered, from sunset hill (at 26th Av. N.) on Theodore Wirth Parkway through Valley View/Glenview Terrace Park.	Effects on historic properties within the APE, including potential effects from visual impacts were analyzed for the Final EIS. To inform the analysis of effects, a study to document cultural landscape elements in TWRP was completed and includes examining any viewsheds to and from the proposed BLRT Extension project both within and outside the APE, including from Sunset Hill through Valley View/Glenview Terrace Park. A copy of this report can be found in Appendix H of the Final EIS. Visibility of the proposed BLRT Extension project may change with the season due to the vegetative cover of deciduous plants and trees. Therefore, field survey was conducted when no snow was present and prior to full leaf-out of deciduous species, in an effort to observe potential viewsheds when the lowest level of natural obstructions would exist. The analysis of viewshed impacts of the proposed BLRT Extension project from Sunset Hill resulted in a "No Visibility" finding. The current extent of parkland and its orientation, as well as adjacent development and dense vegetation in the southwestern corner of Glenview Park, do not afford any views of TWRP or the proposed BLRT Extension project area from Sunset Hill.
119P	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Assessment and prevention of impacts to cultural landscape features of the Grand Rounds Historic District will be done holistically, considering the overlapping of assets to avoid or mitigate impacts.	A study to document cultural landscape elements in TWRP (including Theodore Wirth Parkway) has been completed and included examining any view sheds to and from the proposed BLRT Extension project. Avoidance, minimization, and mitigation strategies have been and will continue to be developed in consideration of the entire resource that is the Theodore Wirth Segment, a contributing element, of the GRHD. This includes developing mitigation strategies in coordination with Section 106 consulting parties, including MPRB. A Section 106 MOA has been developed by FTA and MnHPO including the participation of Council and other parties. The MOA sets forth commitments to avoid, minimize, and mitigate the potential adverse effects of the proposed BLRT Extension project on cultural and historic resources (see Section 4.4 of the Final EIS for a full

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
								discussion of the mitigation measures). The mitigation measures include design elements around cultural landscapes, construction protection plan, vegetation and landscaping to screen and minimize views of the proposed BLRT Extension project. A copy of the draft Section 106 MOA is included in Appendix H of the Final EIS. An executed copy of this document will be included in the proposed BLRT Extension project's Record of Decision.
119Q	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	7 - Alternatives, Engineering & Design	Support and safety structures, as well as final transitway station designs, are harmonious, beautiful, and both historically and context sensitive.	The proposed mitigation for adverse effects to the Theodore Wirth Segment of the GRHD includes designs in accordance with the Secretary of the Interior's (SOI) standards, as identified in the proposed BLRT Extension project's Section 106 MOA. These standards are intended to result in project design elements that are in harmony with the historic setting in which they are built.
119R	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Wetland, floodplain or stormwater mitigation practices applied to the corridor protects the historic cultural landscape of Theodore Wirth Regional Park and Bassett Creek.	There are wetland, floodplain and stormwater mitigation measures planned in TWRP and Bassett Creek. A floodplain mitigation area has been identified in TWRP between the Bassett Creek main stem and the BNSF rail corridor. Mitigation would include excavating adjacent ground below the elevation of the Bassett Creek 100-year floodplain to provide compensatory floodplain storage for the fill placed in the floodplain. A portion of Bassett Creek would be relocated to accommodate the proposed BLRT Extension project. Mitigation will be accomplished through a combination of on-site wetland mitigation and purchases of wetland credits. For water quality and stormwater, long-term mitigation measures will include designing and constructing permanent BMPs, such as detention and infiltration facilities, which would control and treat stormwater runoff caused by an increase in impervious surfaces as a result of the proposed BLRT Extension project.
119S	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	The visual impact of the LRT and related infrastructure is minimized for trail and park users and honors the historic character of the Grand Rounds where it crosses or abuts the Grand Rounds.	The proposed BLRT Extension project's visual impacts on TWRP and the GRHD include views being opened up by grading and vegetation thinning for the transitway. The Final EIS addressed, evaluated, and resolved the potential visual impacts of the proposed BLRT Extension project on all land uses in the study area. Appropriate mitigation measures for visual impacts were discussed in the Final EIS; these include incorporating design elements that allow design features to blend in with their surroundings, or landscape elements that soften the effect of the proposed BLRT Extension project on the surrounding landscape.
119T	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	The train and station area lights have minimal visual impacts on trail and park users.	The Final EIS evaluated the impacts from the addition of lights from the train and the stations. To minimize effects from the lights, appropriate mitigation measures for visual impacts were discussed in the Final EIS. These measures include minimizing operational night lighting where practicable, including shielding of lights and directional lighting to minimize the impact of "spillover" light into visually sensitive areas adjacent to the proposed BLRT Extension project corridor.
119U	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	7 - Alternatives, Engineering & Design	The MPRB concludes that sufficient design and research has not been conducted for it to articulate whether it concurs with the finding that the LPA is also the Environmentally Preferred Alternative.	Since the publication of the Draft EIS, the Council has advanced design of the proposed BLRT Extension project and has reviewed the environmental resources which are affected by the proposed BLRT Extension project. The results of such analysis are reported in the body of the Final EIS. In summary, the proposed BLRT Extension project would have a positive effect on transit services while impacting parking, historic properties, visual resources, floodplains and wetlands, noise and vibration, and biological resources. However, with the mitigation noted for these resources, there will be overall improved transit service, the addition of over 1,600 parking spaces associated with new park-and-rides, new interpretive features for historic properties as well as preservation plans for historic properties, aesthetic treatments incorporated in transit features, noise walls or other mitigation measures, new wetland and floodplain areas, and vegetation restoration. Furthermore, the proposed BLRT Extension project would result in improved connections to park resources and a better pedestrian environment. See the Executive Summary of the Final EIS for a more detailed review of impacts and

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
								mitigation.
119V	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Wetland and floodplain mitigation locations and design options within Theodore Wirth Regional Park need to be identified and evaluated under Section 4(f) and Section 106.	One floodplain mitigation site has been identified as depicted in Figure 5.2-5 of the Final EIS; this site would also be used for wetland mitigation. This site lies partially within MPRB property and partially within Canadian Pacific Railway property. On November 4, 2015, MPRB passed a resolution addressing the proposed BLRT Extension project resolving, amongst other items, to support the floodplain mitigation site identified partially within TWRP (as depicted in Figure 5.2-5). Section 4(f) and Section 106 analysis has considered the temporary impact of constructing floodplain/wetland mitigation in this area. Mitigation designs will be developed to blend in with the surroundings, and no permanent use or adverse effects are anticipated at this site. A copy of the draft US Army Corps of Engineers (USACE) Section 404 permit, which includes wetlands mitigation commitments, including required compensatory mitigation, is included as Appendix I of the Final EIS.
119W	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	The project's stormwater design does not increase the volume of runoff or pollutant loads in water bodies owned and/or managed by the MPRB.	A stormwater management plan will be developed for the proposed BLRT Extension project to meet the stormwater ordinances, rules, and requirements of the various regulatory entities in the appropriate portions of the proposed BLRT Extension project corridor. Where feasible, low impact development BMPs would be incorporated into facilities associated with the proposed BLRT Extension project. Low impact development practices can substantially reduce stormwater runoff and may include the use of permeable pavers, pervious concrete, bio-infiltration, tree trenches. Such low impact design allows surface water to slowly infiltrate into the soil and helps to counteract the bounce of receiving waterbodies including Bassett Creek. Low impact design also helps to trap oils and hydrocarbons such as what may be present in areas with high vehicle use. Feasibility of various low impact development practices would be determined based on depth to the seasonal high groundwater elevation, soil types, any evidence of contaminated soils, and elevation constraints.
119X	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Wetland, floodplain or stormwater mitigation practices applied to the corridor protect water table levels and habitat within the park land that are dependent on those water levels.	Appropriate measures, such as construction of detention and infiltration facilities, to avoid and minimize impacts to surface and groundwater will be implemented during construction and operation/maintenance phases of the proposed BLRT Extension project. Low impact stormwater designs allow surface water to slowly infiltrate into the soil and help to counteract the bounce of receiving waters including Bassett Creek.
119Y	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Wet meadow areas within Theodore Wirth Regional Park are high quality wildlife habitat and provide high quality water filtration benefits.	The Final EIS discusses notable aquatic habitats within and adjacent to the proposed BLRT Extension project limits. Table 6 in the Biological Environment Technical Report specifically identifies Bassett Creek and the surrounding wetlands as an area of notable aquatic habitat. The area adjacent to the proposed BLRT Extension project is estimated at just under 12 acres. The area that would be impacted is estimated at approximately 1.8 acres. Much of this area will be temporarily impacted and restored; some of the impact would be on BNSF right-of-way, and some of the impact is proposed to be mitigated on MPRB property within the same stretch of Bassett Creek. The joint Section 404/Wetland Conservation Act (WCA) permit application (see Appendix I of the Final EIS) provides additional information about proposed mitigation.
119Z	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Any mitigation of wetland on MPRB land shall be type-for-type.	The Section 404/WCA permit application (see Appendix I of the Final EIS) indicates that less than 1 acre of permanent wetland impact would occur on MPRB property. A wetland mitigation site has been identified at the same location as the proposed floodplain mitigation site on MPRB property north of Olson Memorial Highway and west of the BNSF right-of-way. It is anticipated that this mitigation site would yield 1.5 acres of wetland mitigation credit, so there will be no net loss of wetlands on MPRB property, and there will likely be an increase in wetland area and functionality.
119AA	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Any mitigation of floodplain on MPRB land shall use BMPs and will not impair existing recreation activities.	Floodplain mitigation will occur on MPRB land (see Figure 5.2-5 of the Final EIS) and will be designed to maintain or enhance the experience of recreationists through the use of attractive native plantings and, where appropriate, interpretive signage.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
								Appropriate BMPs will be incorporated into the design. Floodplain mitigation strategies have been discussed with the BCWMC, MPRB, and the cities of Minneapolis and Golden Valley, and staffs from those governmental units have approved the final mitigation sites. The Council will continue to coordinate approvals for floodplain impacts and mitigation strategies with the BCWMC, the cities of Minneapolis and Golden Valley, Minnesota Department of Natural Resources (DNR), and Federal Emergency Management Agency (FEMA).
119AB	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	6 - Noise & Vibration Effects	Category 1 is most consistent with the type of park land the MPRB owns or maintains adjacent to or within Segment D1. Noise impacts for these park lands and its users must be re-evaluated under the standards set for Category 1.	Passive use parks are classified as Category 3 land uses in the FTA noise guidance. Category 1 is reserved for the most sensitive locations, such as recording studios, concert halls, memorials and outdoor amphitheaters. It is not intended for park settings with passive uses in some locations, such as TWRP. Active use parks, and locations within parks with active uses are not considered noise sensitive. The Chalet is over 900 feet from the nearest point of the proposed BLRT Extension project right-of-way, and the JD Rivers Garden is over 1,000 feet from the nearest point of the right-of-way. Neither resource would have any impacts associated with LRT operations, evaluated under a Category 3 assessment. Recognizing the concerns expressed by MPRB, FTA conducted an evaluation to identify whether any potential additional noise impacts would result if the evaluation used a Category 1 classification. The Final EIS evaluated the potential for noise impacts at two locations within TWRP using a Category 1 classification. The areas evaluated included the Theodore Wirth Chalet and a location between the Plymouth Avenue and Golden Valley Road stations on the east side of Theodore Wirth Parkway. No noise impacts to the park were identified based on this evaluation (see Section 5.6 of the Final EIS for more details on this evaluation).
119AC	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	6 - Noise & Vibration Effects	Theodore Wirth Regional Park has limited areas of active recreation. Section 5.6.4.1 indicates that the MPRB views the entire park as being meant for active-use and that it is not sensitive to noise impacts. The MPRB disagrees with this statement. Theodore Wirth Regional Park should be considered for sensitive noise impacts.	Please see response to Comment 119AB.
119AD	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	6 - Noise & Vibration Effects	The JD Rivers Garden feature in Theodore Wirth Regional Park is an educational as well as recreational amenity visited regularly by school children and especially at risk for detrimental effects from noise and vibration associated with BLRT.	Vibration associated with LRT operations decreases dramatically based on distance from the source (i.e., the LRT train and tracks). As noted in FTA's Noise and Vibration Impact Assessment Manual, train vibration is most sensitive and detectable by humans at a distance of approximately 350-feet from a light rail guideway. The JD Rivers Garden feature is located over 1,000 feet from the nearest point of the proposed BLRT Extension project right-of-way and the associated vibration levels would be several orders of magnitude below the threshold for human perception. Therefore, there is no ground-borne vibration impacts at the JD Rivers Garden given the distance between the proposed BLRT Extension project and this park feature.
119AE	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	6 - Noise & Vibration Effects	The vibration impacts are minimized for park users.	The 2006 Transit Noise and Vibration Impact Assessment Manual establishes the methodology used by FTA in assessing potential vibration impacts for transit projects. In predicting impacts from train operations, the methodology focuses on the generation of vibration at the source (the train for light rail projects), its path through the ground, and its effect on a receiver (a structure). Vibration is not assessed for outdoor land uses such as parks. Although the motion of the ground may be perceived by a park user, without the effects associated with the shaking of a building, the motion does not provoke the same adverse human reaction.
119AF	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	6 - Noise & Vibration Effects	The noise impacts are minimized for park users and do not exceed the noise standards set for Category 1.	Please see response to Comment 119AB.
119AG	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	6 - Noise & Vibration Effects	Technology that reduces track noise and vibration are incorporated into transitway design and construction.	The LRT and reconstructed freight rail track would be continuously welded rail and would reduce noise and vibration impacts by eliminating the impact of the vehicle wheels hitting joints in the rail.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
119AH	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	8 - Transportation System Effects	Communities on the east side of the LRT safely and easily access the Luce Line Regional Trail at Highway 55.	The proposed BLRT Extension project scope approved by the Corridor Management Committee (CMC) includes the reconstruction of Olson Memorial Highway, including the westbound bridge over the freight rail corridor. This reconstruction includes provisions for pedestrian and bicycle trails that allow for connectivity to TWRP trail systems, and access to the Luce Line Regional Trail.
119AI	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	8 - Transportation System Effects	Communities on the east side of the LRT can access Theodore Wirth Regional Park and the trail that follows the east side of the park along the corridor.	The proposed BLRT Extension project scope approved by the CMC includes the reconstruction of the Plymouth Avenue Bridge, the Theodore Wirth Parkway Bridge, and the Golden Valley Road Bridge. All of these bridges will be improved to include pedestrian/bicycle facilities meeting current design standards. This reconstruction will allow for connectivity to TWRP trail systems. The proposed BLRT Extension project also includes construction of a staircase leading from the Theodore Wirth Trail on the east side of the BNSF rail corridor connecting to Plymouth Avenue, facilitating connections to the Plymouth Avenue Station and to the other trails and park facilities located nearby.
119AJ	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	8 - Transportation System Effects	There is adequate access to the Theodore Wirth Regional Park from the east side of the LRT tracks, and access points are a reasonable walking distance apart.	As part of proposed BLRT Extension project improvements, the trail that runs along the east side of TWRP would be relocated out of BNSF right-of-way and onto MPRB property. In the design plans (located in Appendix E of the Final EIS), a 10-foot trail is shown with reaction space to nearby structures, such as the Plymouth Avenue Bridge. Additional trail accommodations including a connection from the Theodore Wirth Trail to Plymouth Avenue, and a connection between Theodore Wirth Parkway Trail and Sochacki Park, are also being developed for inclusion in the proposed BLRT Extension project. Trails implemented as a part of the proposed BLRT Extension project are being planned in cooperation with local jurisdictions including Hennepin County and the local municipality and designed to applicable local standards including the Minnesota Department of Transportation (MnDOT) Bikeways Facility Design Manual. The design of trail facilities will also be coordinated with MPRB, the Three Rivers Park District, and other park entities to develop a trail design that meets the needs of the intended users.
119AK	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	8 - Transportation System Effects	The trail design meets the needs of current and projected users.	Please see response to Comment 119AJ.
119AL	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	8 - Transportation System Effects	Bicycle and walking trail users have a positive, linear park-like experience, including being free of obstructions, having a 2-foot or greater buffer on each side of all trails, and retaining a sense of connection to open space.	Please see response to Comment 119AJ.
119AM	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	8 - Transportation System Effects	All trail connections are maintained or improved.	Please see response to Comment 119AJ.
119AN	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	8 - Transportation System Effects	At all points along the corridor, and especially at the narrowest locations, sufficient space remains for the Luce Line Regional Trail and the trail that runs along the east side of Theodore Wirth Regional Park, trail users, and year-round maintenance vehicles and crews.	Please see response to Comment 119AJ.
119AO	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Surface and groundwater quality is protected during construction.	Appropriate measures to avoid and minimize impacts to surface and groundwater will be implemented during construction and maintenance phases of the proposed BLRT Extension project. These include construction stormwater BMPs such as silt fences, ditch checks, erosion control mats, temporary mulching and/or seeding, and other appropriate practices to control runoff and sedimentation. Spill control plans will be required of construction contractors to address accidental releases of petroleum products or other controlled substances. As part of proposed BLRT Extension project construction, a National Pollutant Discharge Elimination System (NPDES) permit will be prepared. This permit will establish the measures which the Council and its contractors will implement during construction to protect surface and groundwater

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
								quality and the monitoring activities used to report on implementation of such measures.
119AP	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	8 - Transportation System Effects	Reasonable and safe alternative routes are provided for trail users when sections are closed during construction.	Reasonable and safe routes for trail users will be provided during construction. The Council will develop a Construction Communications Plan which will be used to coordinate trail and roadway closures and detours with the public and with local jurisdictions, including MPRB.
119AQ	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Any flora that is lost to construction of LRT use is replaced with flora that is in accordance with MPRB plans, with monitoring through a plant survey and replacement for five (5) years after construction is complete.	The Council has coordinated with MPRB to plan appropriate vegetation replacement. The Council obtained maps of outstanding stands of trees and coordinated with MPRB to determine an appropriate strategy for preservation or mitigation. The Council will coordinate with MPRB staff on a final revegetation plan for implementation during proposed BLRT Extension project construction.
119AR	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Soils and slopes are stabilized during construction.	As part of mitigation commitments, an NPDES permit will outline the appropriate measures to minimize the potential for slope erosion. These measures will be implemented during construction and maintenance phases of the proposed BLRT Extension project.
119AS	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Construction dewatering protects water table levels and habitat within park lands that is dependent on those water levels.	Construction dewatering would be conducted in accordance with DNR requirements. Dewatering discharge will be redirected to upgradient recharge areas so as to maintain existing water table elevations outside of the area requiring groundwater removal.
119AT	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Construction practices prevent introduction of new invasive species to park lands and waters.	The construction contractor will be required to develop a vegetation management plan that includes provisions for avoiding introduction of invasive species within the proposed BLRT Extension project corridor. Methods may include steam cleaning construction equipment prior to entry to the proposed BLRT Extension project site; quarantining of equipment used in an area of the proposed BLRT Extension project corridor known to contain invasive species, and other appropriate methods. The Council will complete a Construction Mitigation Plan as part of commitments to minimize impacts during the construction phase. This plan will focus on methods of communicating requirements mitigation commitments to contractors and requirements to work with communities and stakeholders.
119AU	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	8 - Transportation System Effects	Users have access to Theodore Wirth Regional Park, Bassett's Creek Park, Luce Line Regional Trail, and other connection recreational opportunities.	Please see responses to Comments 119AH, 119AI, and 119AJ.
119AV	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	The current wildlife habitat character of Theodore Wirth Regional Park, Bassett Creek Park, and Valley View Park is sustained.	The proposed BLRT Extension project includes mitigation commitments to address impacts to terrestrial and aquatic habitat. Terrestrial habitat mitigation will be accomplished through revegetation of areas disturbed but not permanently incorporated into the proposed BLRT Extension project. There are an estimated 9.2 acres of temporary easement in TWRP that would be cleared for construction purposes and revegetated following construction. The BNSF right-of-way and an additional 2.1 acres of permanent easement proposed to be acquired from TWRP would be permanently cleared of existing vegetation. Revegetation criteria (species mix, density, and similar) will be developed in coordination with MPRB staff. The 2.1 acres of permanent easement acquired from TWRP will be replaced with land adjacent to park property that can readily be incorporated into the park landscape, or will be mitigated through a negotiated financial settlement. Section 8.7.1.2 of the Final EIS discusses the park-related enhancements that were evaluated as measures to minimize harm to the park resource. These enhancements include: ■ Relocation of the trail adjacent to Bassett Creek to the west, out of BNSF right-of-way ■ Construction of a stair access from the Plymouth Avenue bridge to the trail adjacent to Bassett Creek ■ Construction of a trail connection from TWRP to the Sochacki Park complex to the north

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
								■ Construction of a new trail head at the Golden Valley Road/Theodore Wirth Parkway intersection ■ Reconstruction of the Theodore Wirth Parkway bridge, which is owned by MPRB ■ Reconstruction of the Golden Valley Road/Theodore Wirth Parkway intersection including intersection features that would enhance pedestrian and bicycle safety ■ Minimization of visual effects through ongoing coordination regarding design of station elements and retaining walls
119AW	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Parkland adjacent to alignment is maintained in its natural open space character for enjoyment and exploration by park visitors.	Temporary parkland occupied during the construction of the proposed BLRT Extension project will be restored to an as good or better condition following construction of the proposed BLRT Extension project. In many cases, adjacent parkland will be enhanced with improved trail facilities and connections that will allow greater access to park resources by park visitors.
119AX	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	No net loss to potential Blanding's turtle habitat in Bassett Creek and adjacent open water.	The potential for impacts to the Blanding's turtle is addressed in Section 5.8 of the Final EIS. This issue has been addressed in consultation with DNR, which has concurred (e-mail correspondence dated February 9, 2016) with the Council's and FTA's assessment that with adherence to DNR guidelines regarding the Blanding's turtle (guidelines which are presented in the DNR Blanding's turtle fact sheet), impacts to the species would be negligible. Impacts to wetland types 2 and 3 (likely turtle habitat) will be avoided in accordance with the DNR guidelines.
119AY	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Oak trees near the proposed Golden Valley Road Station are preserved.	The Council has surveyed stands of trees at Golden Valley Road and will coordinate with MPRB and other stakeholders to determine an appropriate strategy for preservation or mitigation. Coordination efforts will focus on identifying whether any trees that will disturbed during construction can be preserved and, if not, whether those that will be disturbed are good candidates for transplanting elsewhere on MPRB property.
119AZ	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Maintain or improve water quality of Bassett Creek	Please see response to Comment 119AO.
119BA	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	6 - Noise & Vibration Effects	The natural and quiet character of Bassett's Creek Park is not negatively impacted by LRT	Bassett's Creek Park is located over 1,000 feet to the south of the proposed BLRT Extension project alignment. No noise or other impacts are anticipated at Bassett's Creek Park.
119BB	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	6 - Noise & Vibration Effects	Visual and noise impacts do not reduce the quiet natural character of Bassett's Creek Park.	Please see response to Comment 119BA
119BC	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	The planting of dozens of trees in the median of TH 55 in the early 2000s are, in addition to a canopy that emphasizes the green space and character of the drive, are also part of a long term University of Minnesota forestry study, the results of which will be prematurely shortened by the BLRT construction and destruction of the trees. This needs to be reflected in future analysis of the impacts to this corridor.	Trees along the median of Olson Memorial Highway will be mitigated through relocating where feasible or replanting on MPRB or public right-of-way in coordination with MPRB forestry staff. On November 4, 2015, MPRB passed a resolution addressing the proposed BLRT Extension project resolving, amongst other items, to support the removal of trees in the median of Olson Memorial Highway as part of proposed BLRT Extension project, with the continued cooperation between the Council and MPRB forestry staff to identify trees which would be good candidates for re-locating elsewhere on MPRB-owned property. Conversations between the Council, MPRB forestry staff, and the University of Minnesota in the Fall of 2015 yielded the information that the research study of trees planted in the median of Olson Memorial Highway has ended.
119BD	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Replacement trees have similar character and potential for research purposes.	On November 4, 2015, MPRB passed a resolution addressing the proposed BLRT Extension project resolving, amongst other items, to support the removal of trees in the median of Olson Memorial Highway as part of proposed BLRT Extension project construction. This resolution included direction for the continued cooperation between the Council and MPRB forestry staff to identify trees in the median of Olson Memorial Highway that would be good candidates for re-locating elsewhere on MPRB-owned property. With construction of the proposed BLRT Extension project,

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
								there will be limited opportunity to re-plant trees or other landscaping in the median of Olson Memorial Highway due to the need to maintain clear sight lines for LRT operators, passengers and pedestrians crossing Olson Memorial Highway.
119BE	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	8 - Transportation System Effects	Enhance or sustain the ease of access and safe connection for residents in North Minneapolis neighborhoods to recreation opportunities offered within Theodore Wirth Regional Park.	The proposed BLRT Extension project scope approved by the CMC includes the reconstruction of the Plymouth Avenue Bridge, the Theodore Wirth Parkway Bridge, and the Golden Valley Road Bridge—which span the proposed BLRT Extension project corridor into TWRP. All of these bridges will be improved to include a pedestrian/bicycle facilities meeting current design standards. This reconstruction will allow for connectivity to TWRP trail systems for residents in North Minneapolis neighborhoods. MPRB, in a resolution taken November 4, 2015, supported the construction of a Plymouth Avenue station as part of the proposed BLRT Extension project. Later in November 2015, the inclusion of a Plymouth Avenue station in the proposed BLRT Extension project's scope and budget was recommended by the CMC for Council action.
119BF	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Architectural APE should include entire park parcels where the intent of the parkland was preservation of a viewshed as in Valley View/Glenview Terrace Park.	Please see response to Comment 119N.
119BG	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Architectural APE research dates not indicated. Contributing features of the Grand Rounds district not indicated.	The Phase I and II architecture history survey for the proposed BLRT Extension project, which details the architectural APE, was completed in November of 2012. The Final EIS clarifies this matter. Boundaries for the GRHD were confirmed. The GRHD nomination is currently being reevaluated; updates are included in the Final EIS. Please see the response to Comment 119BF for additional information.
119BH	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Archaeological APE research completed in November 2012 should have included the Germania Brewery site approved by SHPO in March 2012 (Two Pines 3-2012)	Please see response to Comment 119K.
119BI	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Visual inspection of archaeological APE on public park land was not addressed. It was not disclosed if the consultant conducted on site pedestrian surveys of park land.	Visual inspection of the archaeology APE was completed primarily from public right-of-way (see page 8 of the Phase IA Archaeology Report in Appendix H of the Final EIS).
119BJ	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Grand Rounds-Theo Wirth section of the historic district boundary is incorrect. Theo Wirth Park NRHP district segment does not extend west of the extension of France Avenue (though there is parkland there it was acquired after the POS).	Boundaries for the GRHD, Theodore Wirth Segment have been updated and match the boundaries depicted in the draft National Register of Historic Places (NRHP) nomination for the GRHD, which is the basis for MnHPO's determination of eligibility for the district. The updated boundary does not extend west of the extension of France Avenue.
119BK	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Grand Rounds-Theo Wirth section of the historic district boundary is incorrect. Theo Wirth Park NRHP district segment includes parcels east of the BN RR corridor both north and south of Plymouth Avenue.	Boundaries for the GRHD, Theodore Wirth Segment have been updated and match the boundaries depicted in the draft NRHP nomination for the GRHD, which is the basis for MnHPO's determination of eligibility for the district. The updated boundary includes parcels east of the BNSF rail corridor both north and south of Plymouth Avenue.
119BL	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	The overall park cultural landscape as well as contributing features within the park are not discussed or evaluated.	Recognizing concerns expressed by MPRB in its Draft EIS comments, the Council and FTA completed a TWRP Cultural Landscape Study in September 2015. The purposes of this study were to 1) provide a historic context for the park; 2) to identify viewsheds where the proposed BLRT Extension project may be visible; 3) to identify the physical characteristics of the landscape; and 4) to identify contributing elements of the GRHD within the APE and viewsheds where properties may be affected by the proposed BLRT Extension project. A copy of this study can be found in Appendix H of the Final EIS. The study was shared in draft form with MPRB staff in its role as a consulting party to the proposed BLRT Extension project Section 106 process.
119BM	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Bassett Creek Park has also been recommended NRHP eligible (Blondo 2-2014)	The study to document cultural landscape elements in TWRP includes the area around Bassett Creek, including Basset Creek Park. According to information from the MnHPO inventory files, Bassett Creek Park is not identified as individually eligible or contributing; however, the GRHD nomination is currently being reevaluated. The status of Bassett Creek Park was confirmed and updates are included in the Final EIS.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
119BN	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Archaeological NHRP eligible site-Germania Brewery (Two Pines 3-2012) is not shown on the figure or included in the research.	Please see response to Comment 119K.
119BO	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	The waterbody named "Bassett Lake" does not exist. Lagoons in Bassett Creek are a cultural landscape feature created in the 1930s. The Lagoon North of Plymouth Ave station is Lagoon E.	References to “Bassett Lake” have been removed from the Final EIS.
119BP	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Description of Bassett Creek meandering through a golf course is incorrect. The creek meanders through a distinct area of the park which contains a series of important natural areas with varied native plan communities including upland oak forest, wet meadow and riparian floodplain forest and meadow. This are [sic] is not part of a "golf course" but is important on its own as a natural habitat area.	The Council understands the importance of the mosaic of habitat types throughout the open space adjacent to Bassett Creek in and around TWRP, and other nearby parks. The reference to the creek “meandering through a golf course” has been removed from the Final EIS.
119BQ	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	The description of Segment D Common does not signify the importance of the median elm trees to the character of this segment as a wide, grand city boulevard. While it is not an official parkway, it has parkway characteristics which make it a distinct landscape type, different from a typical highway, (which it is west of Theodore Wirth Regional Park). These remnant and hybrid elm specimens have been used for the past two decades for research on disease resistance. The median also includes some remnant elms which have natural resistance and may be important for future development of disease resistant cultivars. In addition, future expected loss of ash trees on side boulevard due to EAB [emerald ash borer] will make the loss of middle-aged elms in the central median more pronounced. No trees will buffer or beautify this grand city boulevard.	On November 4, 2015, MPRB passed a resolution addressing the proposed BLRT Extension project resolving, amongst other items, to support the removal of trees in the median of Olson Memorial Highway as part of proposed BLRT Extension project construction. Please see Comment 119BD. This resolution included direction for the continued cooperation between the Council and MPRB forestry staff to identify trees in the median of Olson Memorial Highway that would be good candidates for re-locating elsewhere on MPRB-owned property. With construction of the proposed BLRT Extension project, there would be limited opportunity to re-plant trees or other landscaping in the median of Olson Memorial Highway due to the need to maintain clear sight lines for LRT operators, passengers and pedestrians crossing Olson Memorial Highway. Conversations between the Council, MPRB forestry staff, and the University of Minnesota in the Fall of 2015 yielded the information that the research study of trees planted in the median of Olson Memorial Highway has ended.
119BR	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Glenview Terrace/Valley View Park determination of "minimal effect" is incorrect from MPRB's perspective. This parcel was acquired by Theodore Wirth as part of the Theo Wirth Parkway primarily to preserve its viewshed. The viewshed begins at Sunset Hill overlook at 26th Ave N and the view terminates at the RR corridor. This viewshed will be highly impacted by temporary and permanent effects of the LRT project. High overhead lines will be visible and high frequency trains will be visible and likely be audible from the high vantage point at Sunset Hill.	The analysis of viewshed impacts of the proposed BLRT Extension project from Sunset Hill resulted in a “No Visibility” finding. The current extent of parkland and its orientation, as well as adjacent development and dense vegetation in the southwestern corner of Glenview Park, do not afford any views of TWRP or the proposed BLRT Extension project from Sunset Hill. The results of assessing noise impacts for the proposed BLRT Extension project are included in Chapter 5 of the Final EIS and indicate that there would be no adverse noise impacts associated with proposed BLRT Extension project operations. Please see response to Comment 119AB for a more detailed response to concerns expressed by MPRB regarding potential noise impacts of the proposed BLRT Extension project.
119BS	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Theodore Wirth Regional Park (omit Golf course). Theodore Wirth Regional Park is mischaracterized along the project corridor. This part of the park is not the golf course. It is a consciously preserved natural landscape which serves as an important refuge for park visitors, plants, and animals. It is a quiet buffer to the neighborhood and natural habitat with passive recreation features including a well-used trail. Current rail operation is so infrequent that this character has persisted and been planned since the early 1900s.	The Council understands the importance of the mosaic of habitat types and park visitor experiences throughout the open space adjacent to Bassett Creek in the eastern portion of TWRP. The reference Theodore Wirth Golf Course has been removed from the Final EIS except for where the subject of discussion is the actual golf course. The trail adjacent to the proposed BLRT Extension project corridor will be reconstructed and will remain a resource for park visitors. Please see response to Comment 119AB for a more detailed response to concerns expressed by MPRB regarding potential noise impact of the proposed BLRT Extension project. Please see response to Comment 119BL for a more detailed response to concerns about visual and historic character of the park.
119BT	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Theodore Wirth Parkway impacts as per comments on Glenview Terrace/Valley View Park above. [assumption is that this refers to comment 119BR]	The Council acknowledges that proposed BLRT Extension project elements would be visible to some users of Theodore Wirth Parkway. Proposed BLRT Extension project elements within the Theodore Wirth Segment of the GRHD will be designed in accordance with the SOI standards in order to create transportation infrastructure that appropriately fits into the surrounding landscape. A Section 106 MOA has been

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
								developed by FTA and MnHPO including the participation of Council and other parties. The Section 106 MOA sets forth commitments to avoid, minimize, and mitigate the potential adverse effects of the proposed BLRT Extension project on cultural and historic resources (see Section 4.4 of the Final EIS). A copy of the draft Section 106 MOA is included in Appendix H of the Final EIS. An executed copy of this document will be included in the proposed BLRT Extension project's Record of Decision.
119BU	Wielinski	Liz	Minneapolis Park & Recreation Board	119	Email & US Mail	5 - Environmental Effects	Plymouth Avenue Bridge over Bassett Creek, Theo Wirth Park Trail and BNSF RR, the trail impact is omitted and this is a HIGH IMPACT AREA.	The Council and MPRB have coordinated to address impacts to this trail. The TWRP trail would be relocated and reconstructed as part of the proposed BLRT Extension project. See the Amended Draft Section 4(f) and 6(f) Evaluation (Chapter 8 of the Final EIS) for additional information.

City of Minneapolis

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
121A	Pflaum	Donald	City of Minneapolis	121	Email	7 - Alternatives, Engineering & Design	The City of Minneapolis supports the Locally Preferred Alternative (LPA) route	See Master Response 2.
121B	Pflaum	Donald	City of Minneapolis	121	Email	7 - Alternatives, Engineering & Design	The City of Minneapolis supports the purpose and need for this project.	See Master Response 2.
121C	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Two local north/south streets that currently have median openings on Olson Highway are proposed to be closed, thereby limiting vehicular access to right-in/right-out movement (Russell Avenue North and Elmwood Avenue North). Bicycle and pedestrian crossings must be maintained through the alignment, across LRT tracks and Olson at both intersections.	As documented in Section 3.4.4 of the Final EIS, there are currently nine unmarked, unsignalized mid-block crossings as well as six marked crossings at signalized intersections, several of which are not Americans with Disabilities Act (ADA)–compliant. The proposed BLRT Extension project would provide ADA-compliant crossings at seven signalized crossings, and three ADA-compliant mid-block signalized crossings. The details of these crossings have been developed in coordination with the city of Minneapolis through the issue resolution process. The Council assumes that by "Elmwood" Avenue the city of Minneapolis is referring to either James Avenue or Humboldt Avenue. According to our documentation, Elwood (rather than Elmwood) Avenue does not actually cross Olson Memorial Highway, but connects with James Avenue and Humboldt Avenue. Signalized pedestrian/bicycle crossings at James Avenue and Humboldt Avenue, as well as at Russell Avenue are included in the proposed BLRT Extension project scope and cost estimate.
121D	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Bicycle and pedestrian crossings exist at four additional locations in alignment with streets that do not currently include a vehicle median break (but do have sidewalks) along Olson Highway (Queen Avenue North, Sheridan Avenue North, Newton Avenue North, and Logan Avenue North). Bicycle and pedestrian crossings must be maintained through the alignment, across LRT tracks and Olson at all four intersections.	As documented in Section 3.4.4 of the Final EIS, there are currently nine unmarked, unsignalized mid-block crossings as well as six marked crossings at signalized intersections, several of which are not ADA-compliant. The proposed BLRT Extension project would provide ADA-compliant crossings at seven signalized crossings, and three ADA-compliant mid-block signalized crossings. The details of these crossings have been developed in coordination with the city of Minneapolis through the issue resolution process. This includes agreement on the elimination of the crossings at Queen Avenue North, Sheridan Avenue North, Newton Avenue North, and Logan Avenue North. The Council and the city have agreed on eliminating these crossings because of the improved intersection and mid-block crossings that have been incorporated into the proposed BLRT Extension project.
121E	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Diverted vehicular traffic must be accommodated in a manner that is compatible with the surrounding neighborhood context.	While no significant changes to vehicular traffic circulation is expected with the proposed BLRT Extension project, the Council will coordinate with MnDOT and city of Minneapolis Public Works Department for any changes in vehicular circulation as part of the operations phase of the proposed BLRT Extension project. Vehicular traffic is discussed in Section 3.3 of the Final EIS. Any detours required during construction would be coordinated with the city and communicated to the public, in accordance with the proposed BLRT Extension project Construction Communication Plan.
121F	Pflaum	Donald	City of Minneapolis	121	Email	7 - Alternatives, Engineering & Design	The City of Minneapolis is opposed to the placement of the Operations and Maintenance Facility for this line within the City of Minneapolis.	The Operations and Maintenance Facility (OMF) is not located in the City of Minneapolis. There were two alternative locations identified in the Draft EIS, both in the City of Brooklyn Park. The Final EIS identifies the proposed BLRT Extension project's OMF location in the City of Brooklyn Park near Oak Grove Parkway.
121G	Pflaum	Donald	City of Minneapolis	121	Email	7 - Alternatives, Engineering & Design	Both stations within the corporate boundaries of Minneapolis (Penn and Van White) must be constructed.	Both the Penn Avenue and Van White Boulevard stations are included in the proposed BLRT Extension project scope and cost estimate approved by the Council in December 2015.
121H	Pflaum	Donald	City of Minneapolis	121	Email	7 - Alternatives, Engineering & Design	Construction of both the Golden Valley Road Station and the Plymouth Avenue Station is necessary to adequately serve the corridor travelshed, including a significant portion of North Minneapolis. Though these stations are located outside of Minneapolis corporate boundaries, they are located close	Both the Golden Valley Road and Plymouth Avenue stations are included in the proposed BLRT Extension project scope and cost estimate approved by the Council in December 2015.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
							enough to ensure improved access to the regional fixed rail system for residents in North Minneapolis, and will improve ridership.	
121I	Pflaum	Donald	City of Minneapolis	121	Email	7 - Alternatives, Engineering & Design	Conduct additional study to ensure the narrowing of Olson Highway so that the combination of street and LRT line will help to catalyze a denser, more urban development pattern within the corridor; one that will ensure that new development along the line is truly transit oriented, rather than highway-oriented. The existing highway environment needs to be redesigned and modified in order to provide greater balance. Specifically, the roadway needs to be designed in order to accommodate the necessary vehicular traffic while also accommodating and enhancing connectivity between transit, pedestrian, and bicycle networks. The project office will need to work on this critical topic with Hennepin County Community Works and the City of Minneapolis as station area planning progresses.	Chapter 2 of the Final EIS summarizes the issue resolution process that the BLRT Extension Project Office conducted with the city of Minneapolis after the Draft EIS was published on these two issues: design of Olson Memorial Highway (Technical Issue [TI]-2) and at-grade crossing at 7th St (TI-1). Chapter 3 – Transportation of the Final EIS addresses specific improvements to Olson Memorial Highway. Two stations would provide access to the communities along the highway: Penn Avenue Station and Van White Boulevard Station. While a six-lane roadway would be maintained, the lane widths would be reduced to 11 feet to reduce pedestrian crossing length. The design speed and posted speed limit would be reduced to 35 mph. Existing sidewalks would be replaced with 6-foot-wide sidewalks on the north and south sides of the highway. Pedestrian refuges would be added in the median of the highway. ADA-compliant pedestrian crossings of Olson Memorial Highway would be facilitated by proposed signalized intersections at Bryant Avenue North, Van White Boulevard, Humboldt Avenue, James Avenue, Morgan Avenue; and midblock crossings between Newton Avenue and Oliver Avenue, Penn Avenue, Russell Avenue, and Thomas Avenue. The proposed BLRT Extension project would provide space on the north side of Olson Memorial Highway for a 10-foot two-way cycle track (to be constructed by others) between Thomas Avenue and Van White Memorial Boulevard. The proposed BLRT Extension project would construct a multi-use trail on the north side of the reconstructed westbound Olson Memorial Highway bridge. The 7th Street intersection design resolution process resulted in pedestrian and bicycle improvements to the intersection. The proposed BLRT Extension project would modify the intersection of 7th Street/Olson Memorial Highway by relocating the LRT transition from the center of the intersection to the east of the intersection, eliminating existing and/or proposed lanes for every approach and improving pedestrian crossing movements.
121J	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Specific ridership (not a range) at individual stations must be determined (both boarding and alighting). Further work is needed to determine pedestrian capacity and needed infrastructure improvements at the Downtown Minneapolis stations given that the Bottineau Corridor will be the fourth LRT line to run along the high-volume 5th Street corridor.	Section 3.1 of the Final EIS reports ridership forecasts for boarding and alighting data by station. Infrastructure improvements to the areas surrounding the Minneapolis stations have been developed in coordination with city staff through the issue resolution process.
121K	Pflaum	Donald	City of Minneapolis	121	Email	4 - Social and Economic Effects	Safety and security at station locations and routes to/from stations is critical. It is recommended that measures such as (but not limited to) surveillance cameras and street lighting (per the City of Minneapolis street lighting policy) be installed and that station design allows for visibility at stations.	Section 4.7 of the Final EIS addresses safety and security. Safety for rail users, area residents, local pedestrians and bicyclists, operators and vehicle occupants is an important consideration for the proposed BLRT Extension project. The framework for ensuring the safety of these groups will be established through conformance with the Metropolitan Council's SSMP and the Metro Transit Security and Emergency Preparedness plan. Proposed BLRT Extension project operations in conformance with these plans will necessarily be closely and continuously coordinated with local area law enforcement, medical, fire, transportation and other organizations with related emergency responsibilities within the proposed BLRT Extension project corridor.
121L	Pflaum	Donald	City of Minneapolis	121	Email	5 - Environmental Effects	The City of Minneapolis requires that local stormwater policies and ordinances be adhered to. Stormwater management, wetland and floodplain mitigation must consider not only the specific area of impact, but broader impacts on the local area and regional system.	Proposed BLRT Extension project stormwater designs are being developed in accordance with city and watershed policies and ordinances. Wetland and floodplain mitigation is being coordinated with the Minnesota WCA Local Governmental Unit (LGU) representatives, DNR, and USACE. These agencies require analysis of local and regional effects in permit application documents. Wetland and floodplain mitigation requirements can be found in Sections 5.2 (Floodplains) and 5.3 (Wetlands) of the Final EIS. Appendix I of the Final EIS contains the Section 404 permit application, noting compensatory mitigation requirements for the affected water resources.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
121M	Pflaum	Donald	City of Minneapolis	121	Email	7 - Alternatives, Engineering & Design	The City of Minneapolis does not support park-and-ride facilities within City limits. Vacant lots near the proposed Van White Station are needed for TOD redevelopment, which will help improve density and ridership at that station.	None of the stations within the Minneapolis city limits would include park-and-ride facilities.
121N	Pflaum	Donald	City of Minneapolis	121	Email	5 - Environmental Effects	Traction power substations and signal bungalows must be appropriately placed and the visual impact mitigated. Traction Power Substations should be appropriate for the community context, should be landscaped, should be fenced for safety, and should be designed with architectural fencing instead of chain link fence.	Potential locations for traction power substations (TPSSs) and signal bungalows have been developed in coordination with city staff. Visual impacts of TPSSs and signal bungalows have been considered. Section 4.5 of the Final EIS presents mitigation strategies for these LRT elements, which include fencing and landscaping features for visual screening purposes.
121O	Pflaum	Donald	City of Minneapolis	121	Email	7 - Alternatives, Engineering & Design	Utilities and street infrastructure disrupted as part of the project must be replaced at the project's expense.	Replacement of utilities and street infrastructure that are disturbed as a result of the proposed BLRT Extension project is included in the scope and cost estimate.
121P	Pflaum	Donald	City of Minneapolis	121	Email	5 - Environmental Effects	Noise and vibration from the LRT operations must be mitigated.	Sections 5.6 and 5.7 of the Final EIS describe impacts and proposed mitigation for noise and vibration, respectively. All impacts will be mitigated in accordance with Council mitigation guidelines.
121Q	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	The City of Minneapolis is opposed to LRT pre-emption at signalized crossings.	Transit priority would be used along Olson Memorial Highway into downtown Minneapolis. See Transit/Traffic Signal Operating Schemes Technical Memorandum (December 6, 2011).
121R	Pflaum	Donald	City of Minneapolis	121	Email	5 - Environmental Effects	The City of Minneapolis supports efforts to minimize project impacts on identified historical or cultural resources.	Section 4.4 of the Final EIS presents the adverse effects of the proposed BLRT Extension project on listed and eligible historic properties. The city of Minneapolis and the Minneapolis Historic Preservation Commission are consulting parties in the Section 106 compliance process, and are anticipated to be concurring parties to the Section 106 MOA that provides details regarding minimization and mitigation requirements for historic properties.
121S	Pflaum	Donald	City of Minneapolis	121	Email	5 - Environmental Effects	The project must minimize tree loss; salvage trees where possible and replace tress per the Minneapolis Park and Recreation Board urban tree policy. Boulevard design should be consistent with the Minneapolis Design Guidelines for Streets and Sidewalks.	The Council has coordinated with MPRB on MPRB's tree policy and will continue to adhere to this policy as design advances. Boulevard designs will be coordinated with city staff through the issue and design resolution processes.
121T	Pflaum	Donald	City of Minneapolis	121	Email	4 - Social and Economic Effects	Public art must be integrated into station design.	Review of the current New Starts requirements indicates that public art is not eligible for federal funding. All public art would need to be funded locally. At this time a local funding source for public art has not been identified.
121U	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Pedestrian Level Street Lighting should be evaluated in accordance with the City of Minneapolis Street Lighting Policy. Traffic impacts to the Olson Highway/I-94 bridge need to be mitigated. Any ornamental railings and artwork must be salvaged.	Observance of the city of Minneapolis lighting policies and bridge material salvage requests are so noted and will be incorporated into design documents as appropriate. Traffic impacts to the Olson Memorial Highway/Interstate Highway 94 (I-94) bridge have been assessed through the design process; no adverse traffic impacts would occur as a result of the proposed BLRT Extension project. Additional information about traffic impacts can be found in Section 3.3 of the Final EIS.
121V	Pflaum	Donald	City of Minneapolis	121	Email	7 - Alternatives, Engineering & Design	Catenary poles along Olson Highway should reflect the same style used along University Avenue (painted tapered tubular design).	Design details of the catenary poles will be established in coordination with MnDOT, Hennepin County and the city of Minneapolis through the preliminary and final design phases of the proposed BLRT Extension project.
121W	Pflaum	Donald	City of Minneapolis	121	Email	7 - Alternatives, Engineering & Design	Embedded track should be constructed along the entire length of Olson Highway.	Track along Olson Memorial Highway would generally be ballasted except at stations, street crossings and a segment of roadway between I-94 and 7th Street.
121X	Pflaum	Donald	City of Minneapolis	121	Email	4 - Social and Economic Effects	Best practices for mitigating the construction impacts for local businesses should be implemented.	Impacts to local business during construction activities are largely the result of inaccessibility. A Construction Communication Plan will be developed that includes approaches for advance communication of information regarding roadway closures and access changes. Council staff will work with potentially affected businesses during construction to maintain customer and employee access as practicable.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
121Y	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Traffic impacts along the corridor need to be mitigated, especially traffic impacts to the Olson Highway/I-94 Bridge, the segment east of I-94 into the Interchange, and the at-grade crossing at 7thStreet/10thStreet.	Traffic impacts to the Olson Memorial Highway/I-94 bridge have been assessed and addressed in the proposed BLRT Extension project design details; no adverse traffic impacts would occur as a result of the proposed BLRT Extension project. The segment of Olson Memorial Highway and the 7th Street/10th Street intersection were discussed in detail with city staff during the issue resolution process. City, Hennepin County, MnDOT, and Council staff agreed upon a design solution that results in some reduction in intersection level of service, but enhances the pedestrian and bicycle environment. This design solution includes the elimination of a free right, elimination of one of the through lanes on the eastern leg of the intersection, introduction of dual right turn lanes for the eastbound to southbound movement (the highest frequency movement), improved cross-walks, medians with pedestrian refuges, and shifting the location of the LRT tracks so as to avoid a skewed crossing of bike lanes. Additional information about traffic impacts can be found in Section 3.3 of the Final EIS.
121Z	Pflaum	Donald	City of Minneapolis	121	Email	1 - Purpose and Need	Page 1-10, Section 1.3 – The purpose statement is just about transportation for businesses and people. It should also include reference for serving and creating transit-supportive development opportunities along the line, particularly near station areas. This is inherent in how station areas are designed so should be identified up front as part of the purpose of this project.	Please see the description of the proposed BLRT Extension project need in Chapter 1 of the Final EIS. The project need includes “providing efficient, travel-time competitive transit service that supports economic development goals and objectives of local, regional, and statewide plans.” This need statement was used in the identification and evaluation of the proposed BLRT Extension project, including the station locations.
121AA	Pflaum	Donald	City of Minneapolis	121	Email	1 - Purpose and Need	Page 1-25, Table 1.5-1 – The development section of this table should more specifically reference development near station areas, in addition to the more general language here.	Please see response to Comment 121Z.
121AB	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	The City of Minneapolis concurs that LRT on the D1 alignment is the preferred alternative. For the D1 and D Common portion of the LPA that runs along Olson Memorial Highway (Hwy 55) there are significant impacts to the bike, vehicular, and pedestrian function for the surrounding neighborhoods; there are potential visual impacts; and there is limited development potential. The corridor is currently a barrier between the communities to the north and south of the highway and the addition of the LRT should not further complicate this condition; it should resolve this condition by connecting communities. Decisions about the impacts of the D1 and D Common alignment on Olson Memorial Highway are based on assumptions of traffic operations and do not consider all of the above noted impacts. The future design and function of LRT on Olson Memorial Highway should not be precluded by these traffic assumptions and should be based on a study of the feasibility of, but not limited to, a combination of travel lane reductions, travel lane narrowing, elimination or relocation of frontage roads, and other pedestrian access and safety strategies with the intent of creating developable parcels at station areas and along Olson Memorial Highway. The DEIS, station area planning, and future stages of the project should consider the form, function, and visual impacts of Olson Memorial Highway to mitigate any negative impacts and to create significant development opportunity and pedestrian and bike access and safety. The completed traffic study for Olson Memorial Highway, while acceptable for studying traffic impacts, based on current operating assumptions, does not address the larger issues of development potential, connections between neighborhoods, and the barrier that Olson Memorial Highway creates between neighborhoods and that will be	Chapter 3 – Transportation of the Final EIS addresses improvements to Olson Memorial Highway. Two stations would provide access to the communities along the highway: Penn Avenue Station and Van White Boulevard Station. While a six-lane roadway would be maintained, the lane widths would be reduced to 11 feet to reduce pedestrian crossing length. The design speed and posted speed limit would be reduced to 35 mph. Existing sidewalks would be replaced with 6-foot-wide sidewalks on the north and south sides of the highway. Pedestrian refuges would be added in the median of the highway. ADA-compliant pedestrian crossings of Olson Memorial Highway would be facilitated by proposed signalized intersections at Bryant Avenue North, Van White Sochacki Park:, Humboldt Avenue, James Avenue, Morgan Avenue; and midblock crossings between Newton Avenue and Oliver Avenue, Penn Avenue, Russell Avenue, and Thomas Avenue. The proposed BLRT Extension project would provide space on the north side of Olson Memorial Highway for a 10-foot two-way cycle track (to be constructed by others) between Thomas Avenue and Van White Memorial Boulevard. The proposed BLRT Extension project would construct a multi-use trail on the north side of the reconstructed westbound Olson Memorial Highway bridge. Existing excess MnDOT right-of-way on the south side of Olson Memorial Highway would be left largely intact and available for transit oriented development. These proposed BLRT Extension project elements were developed in coordination with the city of Minneapolis, Hennepin County, MnDOT, and the Council.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
							exacerbated by the addition of LRT without appropriate mitigation or planning. Additional study is needed to consider this issue in relation to station area planning, enhancing TOD opportunities and creating nodes where population and employment density can be increased.	
121AC	Pflaum	Donald	City of Minneapolis	121	Email	7 - Alternatives, Engineering & Design	Page 2-13, Table 2.4-1 – The Golden Valley Rd and Plymouth Avenue stations are needed for reasons beyond the initial forecasted ridership such as access to transit, economic opportunities, access to jobs, and access to Theodore Wirth Regional Park from other parts of the region.	Please see response to Comment 121H.
121AD	Pflaum	Donald	City of Minneapolis	121	Email	7 - Alternatives, Engineering & Design	Page 2-14, Operations and Maintenance Facility – The city supports proposed OMF sites in Brooklyn Park.	Please see response to Comment 121F.
121AE	Pflaum	Donald	City of Minneapolis	121	Email	7 - Alternatives, Engineering & Design	Page 2-18, Traction Power Substations (TPSS) – The DEIS states that TPSS locations are anticipated to be within the existing right-of-way. If in fact private property acquisition is needed, there should be early notification of impacted property owners to ensure time for coordination/negotiation. The City of Minneapolis will also want to review in more detail the location of the TPSS sites as they are refined. It should be a priority to place these in unobtrusive locations, such as under overpasses, and to appropriately screen them from view with architectural fencing and landscaping.	Potential locations for TPSSs have been developed in coordination with city staff. The Council prioritized the use of existing property needed for other proposed BLRT Extension project purposes over the acquisition of private property for TPSS placement. Visual impacts of TPSSs have been considered. Section 4.5 of the Final EIS presents potential mitigation strategies for TPSSs, which include fencing and landscaping features for visual screening purposes.
121AF	Pflaum	Donald	City of Minneapolis	121	Email	7 - Alternatives, Engineering & Design	Page 2-18, Trackway – Embedded track should be utilized on the D1 and D Common portions of the project in the Hwy 55 corridor.	Please see response to Comment 121W.
121AG	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	General Comment - The construction of LRT should be designed and built in a way to enhance connectivity rather than compounding disconnectivity between places and neighborhoods.	Section 4.2 of the Final EIS focuses on issues of community cohesion. In general, improvements to pedestrian crossings along the entire proposed BLRT Extension project corridor coupled with significant trail enhancements would result in better connections across the proposed BLRT Extension project corridor and between communities along the corridor.
121AH	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Page 3.3.5 –More study is needed to look at traffic, pedestrian, and development impacts at Hwy 55 and Penn, Van White, and the 7th St/6th Ave area near Target Field.	The Final EIS and the Transportation Technical Report include information about the traffic and pedestrian environments at Penn Avenue, Van White Boulevard, and the 7th/6th Street area. All three intersections would have improved pedestrian connections—these improvements can be seen in Figures 3.4-1, 3.4-2, and 3.4-4 of the Final EIS. Traffic analyses indicate that the Van White Boulevard and Penn Avenue intersections with Olson Memorial Highway would operate at LOS D or better in 2040 with the proposed BLRT Extension project in place. The level of service at the 7th/6th street area intersection is projected to be LOS E in 2040 with the proposed BLRT Extension project in place, as compared to a projected LOS D in 2040 under the No-Build scenario. This is because of revisions to the intersection geometry that were developed at the request of and in coordination with the city of Minneapolis to achieve a balance between the needs of pedestrian and bicycle traffic and vehicular traffic. The city of Minneapolis is aware of and accepts the reduction in vehicular traffic level of service that would occur under the proposed BLRT Extension project.
121AI	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Page 3-4, Affected Environment – Please analyze the transit service area past the southern edge at Highway 55. For example, Route 9 serves the neighborhood immediately to the south, but is not mentioned here.	The Final EIS provides an updated figure of the existing transit service, including Route 9. See Figure 3.1-1 of the Final EIS.
121AJ	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Page 3-6, Table 3.1.1 – More information is necessary regarding the elimination of route 19H; Consider adding evaluation of	Modifications to bus routes to better serve the proposed BLRT Extension project were considered during the development of the ridership model; however, these

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
							Route 30.	routes are not finalized. The addition, modification, or elimination of any route, including routes 19H and 30, will be subject to a detailed route planning process that will take place as the proposed BLRT Extension project is developed further. Please see response to Comment 121CK.
121AK	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Page 3-15, Footnote – The CCLRT is a good place to start with the process. However, some concerns were raised by the stakeholders along CCLRT in response to perceived deficiencies and limitations in the outreach. It would be better to state it would be the intent to "build upon" what was done along CCLRT rather than to say it would simply be replicated.	While the Council believes that the Central Corridor LRT (CCLRT) transit service study process was successful overall, it acknowledges that there are opportunities to make changes to address specific community needs. The Council will engage the cities along the line, as well as other key stakeholders in the transit service area such as Maple Grove Transit, to design an outreach plan for transit service planning along the proposed BLRT Extension project that builds on the process used for CCLRT and adapts or makes adjustments to address community needs. This effort will start with coordination through the proposed BLRT Extension project Communications Steering Committee, which has representatives from each city along the proposed BLRT Extension project corridor.
121AL	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Page 3-31, Alignment D2 – The restriction of traffic on many cross-streets (cul-de-sacs and right-in/right-out) can have a negative impact on traffic flows in the larger area. Any necessary modifications to the vehicular circulation system must be made in a way that is urban in character, not suburban. Modifications that eliminate vehicular connectivity should not be de facto interruptions to the pedestrian and bicycle networks that currently exist or potentially might be built in order to enhance the urban grid.	Alignment D2 has been eliminated from further consideration.
121AM	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Page 3-31, Table 3.2-2 – More information will be necessary about the bridge modifications to assess their impacts.	All bridge modifications have been discussed in detail with city of Minneapolis staff through the issue resolution process. The city of Minneapolis has reviewed and approved the bridge modification concepts as identified in Appendix E of the Final EIS. The city will continue to be involved in the design review process and will be able to provide input on bridge modification details as the proposed BLRT Extension project design progresses.
121AN	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Page 3-32, Alignment D – The elimination of the pedestrian crossing of TH 55 on the west side of Lyndale is problematic. This crossing connects two residential neighborhoods, and there are few nearby alternatives for those wishing to cross on foot. Removal of a designated crossing may encourage illegal and potentially unsafe crossing in the vicinity. Is there a potential to add a pedestrian actuated signal to ensure it does not interfere with normal signal operations when no pedestrian is present?	Under the current design (Appendix E of the Final EIS), a marked, signalized pedestrian crossing of Olson Memorial Highway on the west side of Lyndale Avenue is included.
121AO	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Page 3-36, Alignment D1 – The closure of pedestrian crossings at three consecutive streets crossing Highway 55 (Queen, Russell, and Sheridan) creates a fairly large gap in the pedestrian network. Will there be any barriers to discourage or prevent crossing? Was there any assessment if a significant number of people currently use these crossings?	As documented in Section 3.4.4 of the Final EIS, there are currently nine unmarked, unsignalized mid-block crossings as well as six marked crossings at signalized intersections, several of which are not ADA-compliant. The proposed BLRT Extension project would provide ADA-compliant crossings at seven signalized crossings, and three ADA-compliant mid-block signalized crossings. The details of these crossings have been developed in coordination with the city of Minneapolis through the issue resolution process. Specific to the elimination of crossings at Queen Avenue North, Russell Avenue North, and Sheridan Avenue North; a signalized pedestrian crossing has been included at Russell Avenue North in the proposed BLRT Extension project design. With the improved pedestrian crossings at Penn Avenue and Thomas Avenue North, there would be signalized pedestrian crossings at every other street along this segment of Olson Memorial Highway. At locations where crossings have been eliminated, there would be some sort of barrier to discourage illegal crossing of the highway and LRT facilities.
121AP	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Page 3-37, Alignment D2 – As with vehicle traffic, this route alignment greatly curtails pedestrian connectivity in this area.	Alignment D2 has been eliminated from further consideration.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
							This is indicated later on p. 4-36.	
121AQ	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Page 3-37, Alignment D - The closure of pedestrian crossings at three consecutive streets crossing Highway 55 (Oliver, Newton, Logan, and James) creates gaps in the pedestrian network. Will there be any barriers to discourage or prevent crossing, and what would those likely be? Was there any assessment if a significant number of people currently use these crossings? How will remaining pedestrian crossings be enhanced?	As documented in Section 3.4.4 of the Final EIS, there are currently nine unmarked, unsignalized mid-block crossings as well as six marked crossings at signalized intersections, several of which are not ADA-compliant. The proposed BLRT Extension project would provide ADA-compliant crossings at seven signalized crossings, and three ADA-compliant mid-block signalized crossings. The details of these crossings have been developed in coordination with the city of Minneapolis through the issue resolution process. Specific to the elimination of crossings at Oliver Avenue North, Newton Avenue North, Logan Avenue North, and James Avenue North; signalized pedestrian crossings have been included at James Avenue North, and between Oliver Avenue North and Newton Avenue North in the proposed BLRT Extension project design. With the improved pedestrian crossings at Penn Avenue and Humboldt Avenue, there would be signalized pedestrian crossings at every other street along this segment of Olson Memorial Highway. At locations where crossings have been eliminated, there would be some sort of barrier to discourage illegal crossing of the highway and LRT facilities.
121AR	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Page 3-45, 3.5.3 Alignment D2 – Removal of parking may negatively impact businesses and residences in the area that depend on on-street parking due to limited off-street parking. It is unclear from later in the text (3-53) if the project would propose funding the construction of off-street parking to mitigate the loss of on street spaces.	Alignment D2 has been eliminated from further consideration.
121AS	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Page 3.36 – Under Alignment D1, the non-signalized pedestrian crossings of TH 55 at the intersections with Sheridan, Russell, and Queen Avenues would be closed. The nearest pedestrian crossings are at Thomas Avenue to the west and Penn Avenue to the east. It is expected that pedestrian crossings will increase at proximate signalized intersections due to diverted traffic from closed crossings and increased activity at and around station areas. Pedestrian safety enhancements should be made at these crossings, especially at the unsignalized intersection of Thomas Avenue. General strategies to improve pedestrian safety and comfort should include, but are not limited to, a combination of the following: travel lane reduction, travel lane narrowing, curb extensions, pedestrian median waiting areas, durable enhanced crosswalk markings, and landscaping.	Please see response to Comment 121AO regarding the number and location of signalized crossings between Penn Avenue and Thomas Avenue. Please see response to Comment 121AB regarding strategies to improve pedestrian safety and comfort.
121AT	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Page 3.37 – Under Alignment D2, pedestrians would be allowed to cross the LRT guideway only at signalized intersections along West Broadway Avenue and along Penn Avenue. Along West Broadway the unmarked pedestrian crossings of 27th Avenue/Thomas Avenue and Sheridan Avenue would be closed. The nearest pedestrian crossings are at 29th Avenue, 26th Avenue, and Penn Avenue. Along Penne Avenue, the unmarked pedestrian crossings of 21st, 17th, 15th, 14th, 12th, and 8th Avenues would be closed. The nearest pedestrian crossings that would remain open are at West Broadway Avenue, Golden Valley Road, 16th Avenue, Plymouth Avenue, Oak Park Avenue, and TH 55. It is expected that pedestrian crossings will increase at proximate signalized intersections due to diverted traffic from closed crossings and increased activity at and around station areas. Pedestrian safety enhancements should be made at these crossings. General strategies to improve pedestrian safety and comfort should include, but are not limited to, a combination of the following: travel lane reduction, travel lane narrowing, curb	Alignment D2 has been eliminated from further consideration.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
							extensions, pedestrian median waiting areas, durable enhanced crosswalk markings, and landscaping.	
121AU	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Page 3.37 – Under Alignment D2, the crossing of West Broadway Avenue at 27th Avenue/Thomas Avenue would be closed. The 2011 Minneapolis Bicycle Master Plan identifies Thomas Avenue as a bicycle boulevard from 42nd Avenue to Oak Park Avenue. This bikeway is planned, but currently unfunded. A closure of 27th Avenue/Thomas Avenue at West Broadway Avenue would create a barrier and disrupt a continuous bicycle boulevard route along Thomas Avenue. The future bikeway would need to be rerouted to cross West Broadway Avenue at 26th or 29th Avenue.	Alignment D2 has been eliminated from further consideration.
121AV	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Page 3.37 – Under Alignment D2, the crossing of Penn Avenue at 8th Avenue would be closed. The 2011 Minneapolis Bicycle Master Plan identifies 8th Avenue as a signed bicycle route from Theodore Wirth Park to Van White Boulevard. This bikeway is planned, but currently unfunded. A closure of 8th Avenue at Penn Avenue would create a barrier and disrupt a continuous bikeway along 8th Avenue. The future bikeway would need to be rerouted to cross Penn Avenue at Oak Park Avenue.	Alignment D2 has been eliminated from further consideration.
121AW	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Page 3.37 – Under Alignment D2, the signalized intersection of Oak Park Avenue at Penn Avenue would remain open. The 2011 Minneapolis Bicycle Master Plan identifies Oak Park Avenue as a bicycle boulevard from Theodore Wirth Park to Irving Avenue. This bikeway is planned, but currently unfunded. Maintaining east-west bicycle access at the intersection of Oak Park Avenue and Penn Avenue would preserve a continuous route for a future bikeway.	Alignment D2 has been eliminated from further consideration.
121AX	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Page 3.37 – Under Alignment D2, bicyclists would share roadway lanes with vehicular traffic on West Broadway and Penn Avenues. There are currently no bicycle facilities on West Broadway and Penn Avenues, so the existing conditions would be maintained. However, future conditions may include a bicycle facility. The 2011 Minneapolis Bicycle Master Plan identifies bike lanes on Penn Avenue between 42nd Avenue and the south I-394 Frontage Road. With the addition of the LRT guideway system along Penn Avenue, it appears that there will not be enough right-of-way to accommodate bike lanes of a minimum standard width. Under Alignment D2, bike lanes on Penn Avenue between West Broadway Avenue and TH 55 would not be feasible. Access Minneapolis, the City of Minneapolis' transportation management plan includes a provision for such cases: If a bikeway identified on the 2011 Minneapolis Bicycle Master Plan cannot be installed on the target street, a parallel bikeway should be installed that serves the same travel shed. Under Alignment D2, this provision would need to be executed.	Alignment D2 has been eliminated from further consideration.
121AY	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Page 3.37 – Under Alignment D Common Section, the non-signalized pedestrian crossings of TH 55 at the intersections of Oliver, Newton, Logan, and James would be closed. It is expected that pedestrian crossings will increase at proximate signalized intersections due to diverted traffic from closed crossings and increased activity at and around station areas. Pedestrian safety enhancements should be made at these	Please see response to Comment 121AQ regarding the number and location of signalized crossings between Penn Avenue and Thomas Avenue. Please see response to Comment 121AB regarding strategies to improve pedestrian safety and comfort.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
							crossings. General strategies to improve pedestrian safety and comfort should include, but are not limited to, a combination of the following: travel lane reduction, travel lane narrowing, curb extensions, pedestrian median waiting areas, durable enhanced crosswalk markings, and landscaping.	
121AZ	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Page 3.37 – The existing marked pedestrian crossing of TH 55 at West Lyndale Avenue would also be closed due to the number of lanes that would need to be crossed, the resulting number of vehicle conflicts, and poor signal operations. It is recommended that two considerations are made with respect to this proposed closure. First, evaluate if the hazards identified can be mitigated through travel lane reduction, lead pedestrian intervals, protected signal phasing, durable and enhanced crosswalk markings, or other pedestrian safety measures. Second, if the crossing is closed, ensure that pedestrian access is physically restricted to ensure that there is no expectation that this is a safe and legal pedestrian crossing.	Under the current design (Appendix E of the Final EIS), the existing marked pedestrian crossing of Olson Memorial Highway at West Lyndale Avenue not be closed, but a marked, signalized pedestrian crossing of Olson Memorial Highway on the west side of Lyndale Avenue is included.
121BA	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	General comments for Section 3.4 Pedestrians and Bicycles. Evaluating the alternatives from the perspective of pedestrian and bicycle impacts, the Locally Preferred Alternative D-D1 has less of a negative impact than Alternative D-D2. Both Alternatives D-D1 and D-D2 significantly impact the urban street grid by closing off local pedestrian and bicycle access at many crossings. The relative severity of impacts is greater for Alterative D-D2 because the urban street grid is more intact along West Broadway Avenue and Penn Avenue than along TH 55. West Broadway Avenue and Penn Avenue currently have narrower street widths, with fewer travel lanes and more pedestrian destinations. TH 55 is currently much wider with a greater number of travel lanes and a limited number of pedestrian destinations. To preserve existing pedestrian environments, it would be better to close crossings along TH 55 where the walkability is quite low, rather than close crossings along West Broadway Avenue and Penn Avenue, where the walkability is relatively higher.	The factors raised by the city of Minneapolis in this comment were considered during the selection of the alternative that has become the proposed BLRT Extension project. While pedestrian impacts on the D1-D Common alignment are less than those on the D2 alignment, the Council has still evaluated pedestrian impacts on the D1-D Common alignment and incorporated design features to mitigate those impacts. Section 3.4 of the Final EIS addresses pedestrian impacts and mitigation.
121BB	Pflaum	Donald	City of Minneapolis	121	Email	4 - Social and Economic Effects	For the entire chapter, it should be kept in mind that the construction of LRT should be designed and built in a way to enhance connectivity rather than compounding disconnectivity between places and neighborhoods.	Section 4.2 of the Final EIS focuses on issues of community cohesion. In general, improvements to pedestrian crossings along the entire proposed BLRT Extension project corridor coupled with significant trail enhancements would result in better connections across the corridor and between communities along the corridor.
121BC	Pflaum	Donald	City of Minneapolis	121	Email	4 - Social and Economic Effects	Page 4.3.4.1–Traction Power Station locations are important, and should be strategically sited/mitigated, especially if one is needed in Theodore Wirth Park.	Please see response to Comment 121AE; also note that no TPSSs would be located within TWRP.
121BD	Pflaum	Donald	City of Minneapolis	121	Email	4 - Social and Economic Effects	Page 4-5, Alignment D – the language about Urban Neighborhoods should be amended to read “Urban Neighborhood is a predominantly residential area with a range of densities that may include other small-scale uses, including neighborhood-serving commercial, and institutional and semi-public uses (for example, schools, community centers, religious institutions, public safety facilities, etc.) scattered throughout. More intensive nonresidential uses may be located in neighborhoods closer to Downtown and around Growth Centers.	The suggested additional language provides a more complete description of urban neighborhoods, and is noted. However, Section 4.1 of the Final EIS presents a summarized version of the information presented in the Draft EIS, and this level of specificity, while accurate, is not required to understand land use compatibility issues for the proposed BLRT Extension project.
121BE	Pflaum	Donald	City of	121	Email	4 - Social and	Page 4-5 – For the D1 Alignment the DEIS states: “As shown in	The Final EIS does not present the language used in the Draft EIS, but does reference

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
			Minneapolis			Economic Effects	Exhibit 4-11, the primary land uses are park and low-density residential uses with no plans for changes in the future. Along TH 55, existing and future planned land uses are primarily low-density residential uses." Language should be added to say that "future land use in the station areas will be evaluated in the station area planning process, which may result in amended land use policy and maps as a part of the adopted station area plans."	*The Minneapolis Plan for Sustainable Growth* and how that plan calls for ongoing investment in and development of corridors served by light rail. See Section 4.1 of the Final EIS.
121BF	Pflaum	Donald	City of Minneapolis	121	Email	4 - Social and Economic Effects	Page 4.6.4.1- Acquisition impacts are small in Minneapolis using the preferred alternative, but the potential redevelopment opportunities are also small, due to station location and the elevation/disconnection with neighbors to the east.	Anticipated acquisitions in the City of Minneapolis are presented in Section 4.3 of the Final EIS. An estimated 2.11 acres of permanent easement and just under 1 acre of temporary easement are anticipated in Minneapolis. The design of the proposed BLRT Extension project along the Olson Memorial Highway segment has preserved excess MnDOT right-of-way along the south side of the proposed BLRT Extension project corridor for potential redevelopment purposes.
121BG	Pflaum	Donald	City of Minneapolis	121	Email	4 - Social and Economic Effects	Page 4-6 – For the D common alignments, add language to say that "future land use in the station areas will be evaluated in the station area planning process." (1) At the Van White Station area there a several large vacant properties that are potential development sites and other underutilized sites that could be intensified with development. Station area planning will evaluate and recommend the most appropriate form and type of transit oriented development for these parcels and the surrounding station area, which may result in amended land use policy and maps with the adoption of the station area plans. (2) At the Penn Avenue/Hwy 55 station area, while there are not large vacant parcels and the area is predominantly single-family homes, station area planning will evaluate and recommend the most appropriate form and type of land use for the surrounding station area. At this station area higher density and intensity land uses will depend on a long-term strategy of parcel assemblage and strategies that could include the narrowing and/or elimination of travel lanes on Hwy 55 and frontage roads along Hwy 55, all which should be studied in the station area planning process. Station area planning will evaluate and recommend the most appropriate form and type of transit oriented development for these parcels and the surrounding station area, which may result in amended land use policy and maps with the adoption of the station area plans.	The Final EIS references *The Minneapolis Plan for Sustainable Growth* and how that plan calls for ongoing investment in and development of corridors served by light rail. See Section 4.1 of the Final EIS. This includes the areas around the Van White Boulevard Station and the Penn Avenue Station. The design of the proposed BLRT Extension project along the Olson Memorial Highway segment has preserved excess MnDOT right-of-way along the south side of the proposed BLRT Extension project corridor for potential redevelopment purposes.
121BH	Pflaum	Donald	City of Minneapolis	121	Email	4 - Social and Economic Effects	Page 4-18, Minneapolis – The section describing the Near-North neighborhood references areas in the Sumner-Glenwood neighborhood. The section should be revised.	This has been corrected in Section 4.2 of the Final EIS.
121BI	Pflaum	Donald	City of Minneapolis	121	Email	4 - Social and Economic Effects	Page 4-33, Alignment D2 – The project would have direct and significant impacts to community character and cohesion that would need to be mitigated.	Alignment D2 has been eliminated from further consideration.
121BJ	Pflaum	Donald	City of Minneapolis	121	Email	4 - Social and Economic Effects	Page 4-39, Table 4.3-3 – Alignment D2 would result in major impacts in terms of property acquisitions, and would involve the displacement of a large number of residents, some of which are low income. This would need to be mitigated.	Alignment D2 has been eliminated from further consideration.
121BK	Pflaum	Donald	City of Minneapolis	121	Email	4 - Social and Economic Effects	Page 4-61, Table 4.4-1 – Alignment D2 would have an adverse effect on the Homewood historic district, as well as significant visual impacts on area resources.	Alignment D2 has been eliminated from further consideration.
121BL	Pflaum	Donald	City of Minneapolis	121	Email	4 - Social and Economic Effects	Page 4-74 – Impacts from Alignment D1 on Wirth Park should be mitigated with additional planting and screening as needed, since the project will involve thinning out the vegetation in the	Mitigation commitments for the proposed BLRT Extension project include restoration of vegetation removed during the course of construction in areas outside the existing BNSF right-of-way. In the area of TWRP, vegetation restoration specifics

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
							area. This is suggested later on p. 4-76. However, vegetation should not be allowed to block station areas and their access points in a way that is unsafe and obscures activity.	will be coordinated with MPRB staff. Vegetative cover in station areas and station access points will be developed in conformance with the Council's SSMP.
121BM	Pflaum	Donald	City of Minneapolis	121	Email	4 - Social and Economic Effects	Page 4-84, Design Elements – Safety and security should be addressed not only in station area design, but along major pedestrian routes leading to the stations (including those within the 0.25 mile radius called out earlier in this section). These should be visible, well lighted, and regularly monitored. This should be true throughout the corridor, including residential areas, parklands, and rail corridors that otherwise might have little traffic and activity, and therefore may result in travelers being more isolated.	Section 4.7 of the Final EIS addresses safety and security. Safety for rail users, area residents, local pedestrians and bicyclists, operators and vehicle occupants is an important consideration for the proposed BLRT Extension project. The framework for ensuring the highest level of safety to these groups will be established through conformance with the Council's SSMP and the Metro Transit Security and Emergency Preparedness plan. Operating the proposed BLRT Extension project in conformance with these plans will necessarily be closely and continuously coordinated with local area law enforcement, medical, fire, transportation and other organizations with related emergency responsibilities within the proposed BLRT Extension project corridor.
121BN	Pflaum	Donald	City of Minneapolis	121	Email	5 - Environmental Effects	City Water Utilities - This comment is to address the large water mains that may be affected by the future Bottineau LRT line as indicated by the current layout shown on the Met Council web page (http://www.metrocouncil.org/Transportation/Projects/Furture-Projects/Bottineau-Transitway/Bottineau-Maps/Bottineau-Transitway-Map-Large.aspx). There are many smaller water mains that cross under the proposed Bottineau line and the final condition of those mains will need to be addressed eventually. The large water mains of concern are as follows: There is a 36-inch water main in Aldrich Avenue North crossing under Olson Memorial, there is a 24-inch water main in Penn Avenue North crossing under Olson Memorial and there is a 48-inch water main crossing under the existing tracks just north of Golden Valley Road at the western border of the City. These mains need to remain in place and at a minimum will need to be cathodically protected under the tracks and isolated on either side of the future track alignment. Concrete encasement of each of these mains may be necessary and if deemed necessary, the existing pipe to be concrete encased shall be removed and replace with new pipe prior to concrete encasement. This work to alter the existing pipe shall only occur during the time frame between the months of October and April inclusive.	Utility location excavations and pre-construction surveys will be performed in general accordance with the MnDOT policy of Subsurface Utility Engineering. These procedures will help minimize the number of unintended disruptions in utility service. Jurisdictions with utilities inside the proposed BLRT Extension project area will be coordinated with for appropriate design and schedule considerations. Utility impacts are presented in Section 5.1 of the Final EIS.
121BO	Pflaum	Donald	City of Minneapolis	121	Email	5 - Environmental Effects	Page 5-9 – Table 5.1-3, Alignment D - In addition to the sanitary sewer line running located on the south side of TH55/ 6th Ave N, there are several sanitary sewers crossing TH 55/ 6th Ave N	Please see response to Comment 121BN.
121BP	Pflaum	Donald	City of Minneapolis	121	Email	5 - Environmental Effects	Page 5-11, Overhead Utilities – More information is needed about the potential need for relocation of overhead utility poles, particularly those requiring relocation outside of transitway right-of-way. Would this require additional land purchases and/or easements, over and above what is already identified? Is there a potential to move some of the power lines underground as part of this project? What are the costs? What models are being used in other metropolitan areas to address and mitigate the conflicts brought about by overhead utilities and urban development? From the engineering drawings, it appears this will result in high voltage transmission lines right on the edge of the BNSF right-of-way that is adjacent to residential areas. Is there accommodation of a needed easement for this outside the ROW, for both maintenance and to account for the fall distance of the poles?	Easements identified in Section 4.3 of the Final EIS include those necessary for relocation of overhead transmission and distribution lines. Details regarding the potential for placement of distribution lines underground will be coordinated with the utility owner. Transmission lines are present within the BNSF rail corridor, and along the northern portion of West Broadway Avenue in Brooklyn Park. Transmission lines would be relocated within existing or proposed transportation rights of way, and would remain overhead utilities. Design and location details of transmission poles would be determined by the utility owner (Xcel Energy).

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
121BQ	Pflaum	Donald	City of Minneapolis	121	Email	5 - Environmental Effects	Page 5-21, Alignment D1 – More information is needed about potential location of floodplain storage mitigation, and its impacts on the surrounding area, including parkland, the golf course, and any nearby residential areas that might be impacted.	Floodplain mitigation is discussed in Section 5.2.5 of the Final EIS. Two mitigation sites are proposed. The first is located west of the BNSF rail corridor and north of Olson Memorial Highway on MPRB and Canadian Pacific Railway property. The other is located in city of Robbinsdale property at the edge of Grimes Pond. The site on MPRB and Canadian Pacific Railway property (16,800 CY of compensatory storage) will be designed in coordination with MPRB staff to ensure that the site fits into the landscape. The mitigation at Grimes Pond is quite small (200 CY of compensatory storage) and will be incorporated into the grading for the LRT bridge over the pond. No floodplain mitigation will affect the golf course or residential property. Floodplain mitigation strategies have been discussed with the BCWMC, MPRB, and the cities of Minneapolis and Golden Valley, and staff from those governmental units have approved the final mitigation sites. The Council will continue to coordinate approvals for floodplain impacts and mitigation strategies with the BCWMC, the City of Minneapolis, DNR, and FEMA. FEMA approval of a Letter of Map Revision (LOMR) will be required if larger mitigation site is constructed in advance of the construction of the proposed BLRT Extension project.
121BR	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Page 5-23, Figure 5.2-6 – The locations identified for potential floodplain mitigation appear to be on land currently being used for a trail loop around the perimeter of Wirth Park that connects with the Luce Line Trail and various park amenities; would this require a trail relocation?	Floodplain mitigation for the proposed BLRT Extension project would be addressed in two locations. 16,800 CY of compensatory floodplain mitigation would be needed in the Bassett Creek reach between Olson Memorial Highway and Golden Valley Road; and 200 CY of compensatory mitigation would be required in the Grimes Pond area. The compensatory floodplain mitigation for impacts in the Bassett Creek area would be constructed at the site identified in Figure 5.2-5 of the Final EIS. The Council has determined that the full 16,800 CY of mitigation can be achieved at this site. The existing trail would be incorporated into the final floodplain mitigation design. The 200 CY of mitigation required for impacts in the Grimes Pond area would be achieved by excavating additional storage at the edge of Grimes Pond.
121BS	Pflaum	Donald	City of Minneapolis	121	Email	5 - Environmental Effects	Page 5-24, Wetlands – There are significant wetland impacts outside the city limits. To mitigate the wetlands new wetlands must be created. It should be noted that there is no room for replacement wetlands within the city. Vacant parcels within the city are needed for redevelopment. The construction of this line should not contribute to the pollution of the Basset Creek Valley watershed; it should continue toward – or at least not complicate – the clean up of this watershed.	Wetland mitigation information is presented in the joint Section 404/WCA permit application; mitigation will be conducted at a 2:1 ratio. Mitigation will be accomplished through a combination of wetland creation and the purchase of wetland bank credits. This mitigation plan has been developed in coordination with USACE and WCA LGU representatives. No wetland mitigation sites have been identified within the City of Minneapolis limits. Section 5.9 of the Final EIS addresses stormwater management and water quality. Stormwater BMPs (including temporary construction measures such as silt fencing, ditch checks, temporary seeding and mulching; and permanent measures such as detention/retention basins, infiltration basins, swales, bio-retention features) will be implemented during the construction and operation of the proposed BLRT Extension project. These measures will not complicate the cleanup of the Bassett Creek watershed, in fact they may help improve water quality.
121BT	Pflaum	Donald	City of Minneapolis	121	Email	6 - Noise & Vibration Effects	Page 5-49, Noise – The project noise levels for D1 and D2 reflect moderate to severe impacts compared with existing ambient noise levels. How will this be mitigated?	Section 5.6 of the Final EIS provides an updated analysis of the noise impacts for the proposed BLRT Extension project. Alignment D2 has been eliminated from further consideration, so only Alignments D1 and D Common have been assessed for noise impacts in the Final EIS. In the City of Minneapolis, there would be 38 moderate impacts (dwelling units) and no severe impacts before mitigation. Twenty-five moderate impacts would not require mitigation under FTA and Council noise mitigation guidelines. Four moderate impacts would require mitigation, and would be addressed through interior testing, with sound insulation being implemented if warranted.
121BU	Pflaum	Donald	City of Minneapolis	121	Email	6 - Noise & Vibration Effects	Page 5-61, Table 5.6-9 – Noise barriers are called out as a potential mitigation strategy for D1 noise impacts. More information is needed regarding the type, placement, and size of these walls. This mitigation measure should also be considered	The updated noise analysis in the Final EIS considered one noise barrier within the City of Minneapolis along the first block of Xerxes Avenue immediately north of Plymouth Avenue. However, this noise barrier did not meet the criteria established in the Council's noise mitigation guidelines. The moderate impacts at these locations

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
							in context of other factors, such as blocking views of the park amenity from adjacent residential communities, likelihood of graffiti/tagging on barriers in less populated areas, and public safety issues associated with areas blocked from view by barriers. These issues should be addressed through a robust and inclusive community engagement process to ascertain community preference. Additionally, more information is needed regarding the potential use of sound insulation along D1 and D2 – how would this be implemented? This could be an environmental justice issue.	do not meet the threshold for mitigation as defined by the Regional Transitways Guidelines (March 2016) (see Appendix F of the Final EIS). Furthermore, this barrier would have partially or completely blocked the view of TWRP from the residences on that block. Therefore this noise barrier is no longer being recommended as a mitigation strategy, and interior testing would be the primary mitigation strategy for the four moderate impacts within the City of Minneapolis requiring mitigation. The need for sound insulation would be determined through interior testing, which assesses the outdoor-indoor transmission loss (i.e., the reduction in noise levels when noise travels from outside a home through the home walls, doors, and windows to the indoor environment). If there is insufficient noise transmission loss (i.e., the indoor environment remains too noisy), sound insulation will be proposed. These outdoor-indoor noise criteria are applied consistently to all homes; therefore, there will be no disproportionately high and adverse effect on environmental justice populations.
121BV	Pflaum	Donald	City of Minneapolis	121	Email	6 - Noise & Vibration Effects	Page 5-71, Table 5.7-6 – The D2 option would need proactive outreach early in the design process to KMOJ and medical care facilities regarding noise and vibration issues early in the process to determine if special mitigation needed. While the analysis suggests this is not the case, this could possibly be disputed.	Alignment D2 has been eliminated from further consideration; therefore, this is no longer an issue.
121BW	Pflaum	Donald	City of Minneapolis	121	Email	5 - Environmental Effects	Page 5-92, 5.8.5 – This section says there will be no impact on the wetland habitat of Blanding's Turtle. However, the floodplain mitigation section says there will be new floodplain storage, likely constructed near to existing wetland areas, required as part of the project, which could impact the wetlands. This should be addressed in more detail. (This is discussed to an extent on p. 8-20)	The potential for impacts to the Blanding's turtle is addressed in Section 5.8 of the Final EIS. This issue has been addressed in consultation with the DNR, which has concurred (e-mail correspondence dated February 9, 2016) with the Council's and FTA's assessment that with adherence to DNR guidelines regarding the Blanding's turtle (guidelines which are presented in the DNR Blanding's turtle fact sheet), impacts to the species would be negligible. The proposed BLRT Extension project avoids all impacts to wetland types 2 and 3 as required by the DNR guidelines.
121BX	Pflaum	Donald	City of Minneapolis	121	Email	5 - Environmental Effects	Page 5-93 – 5.9.1 States that Physical Infrastructure (storm sewer) associated with stormwater management is discussed in Section 5.1, but Section 5.1. (page 5.8) says the existing storm sewers are discussed in detail in the Stormwater Technical Report (Appendix F) which does not discuss storm sewer infrastructure in detail. It just discusses stormwater management and mentioned the need to reconfigure storm sewer utilities. The impacts to Old Basset Creek tunnel crossing in particular should be discussed in more detail.	Section 5.9 of the Final EIS summarizes existing stormwater infrastructure and proposed stormwater improvements. The Preliminary Stormwater Management Plan Technical Memorandum (see Appendix F of the Final EIS) addresses existing stormwater infrastructure in detail, and depicts existing stormwater infrastructure on maps in the appendix section of the technical memorandum. The Old Bassett Creek Tunnel is discussed in Section 4.4.1 of the technical memorandum.
121BY	Pflaum	Donald	City of Minneapolis	121	Email	5 - Environmental Effects	Page 5-97 – Table 5.9-2 – Line MPCA (Cities) indicates that these requirements are also the Cities'. This is not correct. This is a copy of Table 3 from the stormwater technical report, but it does not say Cities under MPCA. Neither table actually lists the City requirements.	The Final EIS lists Minnesota Pollution Control Agency (MPCA) stormwater requirements and the requirements of the cities of Minneapolis, Golden Valley, Robbinsdale, Crystal, and Brooklyn Park separately. See Table 5.9-1 of the Final EIS.
121BZ	Pflaum	Donald	City of Minneapolis	121	Email	5 - Environmental Effects	Page 5-101, Table 5.9-4 – For Alignment D, are the ditches identified for infiltration existing, and do they have adequate size and capacity for what is proposed? Looking at the cross sections provided, ditches do not appear in most of them. For alignments D2 and D, have locations been identified for the proposed pond and infiltration BMPs? This urban environment is fairly constrained, with limited land available for improvements such as these. Maps are shown for locations along Alignments A-C, but not for the others.	Proposed stormwater BMPs are summarized in Section 5.9 of the Final EIS and are presented in detail in the Preliminary Stormwater Management Plan Technical Memorandum, Section 4.4.1. Table 2 in that section indicates that proposed stormwater BMPs along the Minneapolis portion of Segment D include tree trenches, bioretention, wet ponds, underground detention, hydrodynamic separators, and ditches. Details of these BMPs will be developed as the design progresses, and stakeholders, including the city of Minneapolis, will have the opportunity to review and comment on stormwater BMP designs.
121CA	Pflaum	Donald	City of Minneapolis	121	Email	5 - Environmental Effects	Page 5-110, Alignment D – The analysis does not take this into account directly, but the presence of institutions serving vulnerable populations (e.g. youth and elderly), including a day care, school, library, and low income housing, suggests a priority	Section 5.10 of the Final EIS summarizes the air quality analysis conducted for the proposed BLRT Extension project. No air pollutant concentrations during the operating phase of the proposed BLRT Extension project would exceed the National Ambient Air Quality Standards, and no mitigation is required. The State of Minnesota

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
							in finding ways to mitigate air quality impacts. This includes optimizing travel to avoid lengthy queues and idling at intersections. This is also potentially an environmental justice issue, since low income and minority populations are disproportionately impacted. When there are deficiencies in modeling (as noted here), there should be a commitment to following up with adjustments as needed once the project has advanced.	does not require permits related to air quality for the proposed BLRT Extension project. Since there are no impacts, there can be no disproportionate impacts and there is not an environmental justice issue.
121CB	Pflaum	Donald	City of Minneapolis	121	Email	4 - Social and Economic Effects	Page 6-6, Table 6.3-1 – While the text states that the actions listed here are in no way dependent on the completion of the Bottineau transitway, it is possible that some additional development may occur in the Downtown/North Loop station areas of Alignment D at least in part related to improved transit connectivity through this and other projects (although some of it will occur regardless).	The specific issue of land use and development associated with the proposed BLRT Extension project is addressed in Section 6.4.2 of the Draft EIS, and in Section 6.2.2 of the Final EIS. Both documents acknowledge the potential for additional development focused around LRT stations.
121CC	Pflaum	Donald	City of Minneapolis	121	Email	4 - Social and Economic Effects	Additional development is intended and expected along the Olson Highway portion of the project. For the D common alignments, future land use in the station areas will be evaluated in the station area planning process. (1) At the Van White Station area there are several large vacant properties that are potential development sites and other underutilized sites that could be intensified with development. Station area planning will evaluate and recommend the most appropriate form and type of transit oriented development for these parcels and the surrounding station area, which may result in amended land use policy and maps with the adoption of the station area plans. (2) At the Penn Avenue/Hwy 55 station area, while there are not large vacant parcels and the area is predominantly single-family homes, station area planning will evaluate and recommend the most appropriate form and type of land use for the surrounding station area. At this station area higher density and intensity land uses will depend on a long-term strategy of parcel assemblage and strategies that could include the narrowing and/or elimination of travel lanes on Hwy 55 and frontage roads along Hwy 55, all which should be studied in the station area planning process. Station area planning will evaluate and recommend the most appropriate form and type of transit oriented development for these parcels and the surrounding station area, which may result in amended land use policy and maps with the adoption of the station area plans.	FTA and the Council acknowledge that Station Area Planning is a key element of orderly transit-oriented development, and note that Station Area Planning has been completed for the stations in the City of Minneapolis (Van White Memorial Boulevard and Penn Avenue), as well as stations that may influence development in the city (Plymouth Avenue and Golden Valley Road). Station Area Planning has been led by Hennepin County, but Council staff have been involved as well to facilitate coordination between the development of LRT station infrastructure and adjacent land use plans.
121CD	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Page 6-9, 6.4.1 – This section states that bicycle and pedestrian activity is likely to increase as a result of this project. However, the project proposes closing a number of currently active pedestrian crossings. How are these two things being reconciled? Will the project support pedestrian connectivity in other ways? Construction of LRT should be designed and built in a way to enhance connectivity rather than compounding disconnectivity between places and neighborhoods. Any necessary modifications to the vehicular circulation system must be made in a way that is urban in character, not suburban. Modifications that eliminate vehicular connectivity should not be de facto interruptions to the pedestrian and bicycle networks that currently exist or potentially might be built in order to enhance the urban grid.	Please see response to Comment 121I.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
121CE	Pflaum	Donald	City of Minneapolis	121	Email	4 - Social and Economic Effects	Page 6-13, 6.4.10 – The potential to negatively impact lower income populations due to increased property values is called out as an indirect and cumulative impact. No mitigation is identified. However, regional planning for affordable housing specifically prioritizes supporting funding affordable units near transit stations. While this wouldn't be undertaken as part of the Bottineau transitway project itself, it could be considered a form of mitigation. This was a major discussion topic along the CCLRT alignment, and has resulted in significant investment in new affordable housing there.	This issue of impacts to environmental justice populations through increased property values and corresponding property tax rates is discussed in Section 6.2.10 of the Final EIS. This section also provides an overview of the Council's role in addressing affordable housing issues, including review of the housing element of local comprehensive plans, funding affordable housing development, working with local governments to define their share of regional affordable housing needs, administering the state's largest Section 8 Housing Choice Voucher program, and providing technical assistance to local governments. Section 6.4.10 of the Final EIS concludes that because of the Council's affordable housing programs, no additional mitigation is required.
121CF	Pflaum	Donald	City of Minneapolis	121	Email	4 - Social and Economic Effects	Page 7-3, Table 7.3-1 – If available, it would also be interesting to be able to contrast the minority percentages with other transitway corridors in the region, to allow for more ready comparison of the strategies being used in each area. While the methodology focuses on equal treatment of all populations in the study area, it should be noted that Bottineau has a higher overall concentration of low income and minority populations, and environmental justice should take into account not just approaches within the Bottineau corridor but along other comparable corridors as well.	The environmental justice analysis in the Final EIS (Chapter 7) was conducted in accordance with the FTA Circular C4703.1, *Environmental Justice Policy Guidance for Federal Transit Administration Recipients.* The analysis includes a review of proposed BLRT Extension project area demographics coupled with an extensive outreach program to understand the presence or absence of environmental justice populations. The analysis confirmed that there are notable environmental justice populations in the proposed BLRT Extension project corridor, and appropriately addressed the potential for disproportionately high and adverse impacts on those populations.
121CG	Pflaum	Donald	City of Minneapolis	121	Email	4 - Social and Economic Effects	Page 7-21, 7.4.3 – The list of ways that input from the meetings impacted the project and DEIS to date is a good start. It would be helpful to understand if there were any major concerns raised by the community about the project, and how those were addressed.	Information regarding concerns and issues raised at proposed BLRT Extension project–related public meetings is presented in Chapter 9 of the Draft EIS, in Chapter 9 of the Final EIS, and in the response to comments on the Draft EIS, included in Appendix G of the Final EIS.
121CH	Pflaum	Donald	City of Minneapolis	121	Email	4 - Social and Economic Effects	Page 7-23, Safety and Security – This should consider ways to create safe routes to the transit station in addition to the conditions at the stations.	Please see response to Comment 121K. The measures and guidelines discussed in that comment apply to approaches to the station platforms. Furthermore, roadway and sidewalk improvements are included in the proposed BLRT Extension project scope at each station location.
121CI	Pflaum	Donald	City of Minneapolis	121	Email	4 - Social and Economic Effects	Page 7-25, Pedestrian and bicycle facilities – the Hwy 55 corridor will have impacts on bike and pedestrian facilities that need to be mitigated.	Please see response to Comment 121AB.
121CJ	Pflaum	Donald	City of Minneapolis	121	Email	6 - Noise & Vibration Effects	Page 7-27, Visual/Aesthetics – If the noise barriers are constructed as mitigation, this will have some visual impacts on the community (including potentially blocking views of the park); it doesn't appear that this is taken into consideration here; while they are not fully defined, it appears that they will be near to low income communities.	Please see response to Comment 121BU.
121CK	Pflaum	Donald	City of Minneapolis	121	Email	8 - Transportation System Effects	Page 7-33, 7.5.3.1 – As the project advances, it will be important to ensure that overall service levels on connecting bus routes remain at current levels or better. There could be an unintended negative impact on local riders if local bus service is replaced in any way by light rail, resulting in longer headways and station locations that are farther apart. This does not appear to be the plan, but there will no doubt be a route study at some point to look at potential changes to nearby routes.	Section 3.1.3.1 of the Final EIS specifically addresses this issue, and states that: "The alternatives analyzed in the travel demand forecast model include specific network modifications to existing transit service including changes in routing, frequency, and travel time. Network modifications are focused on providing an integrated 'feeder' bus network to connect people to proposed BLRT Extension project stations. Bus networks and transit plans will continue to be refined as the proposed BLRT Extension project progresses; final bus network changes will be subject to a robust public involvement process in accordance with Title VI requirements."
121CL	Pflaum	Donald	City of Minneapolis	121	Email	4 - Social and Economic Effects	Page 7-34, 7.5.3.3 – Will there be an effort to hire DBE/WBE firms and employees during the construction phase? Local employment in the project would be a significant benefit.	The Council will include Disadvantaged Business Enterprises (DBE) participation goals in proposed BLRT Extension project construction contracts. By way of comparison, the Central Corridor (Green Line) LRT project achieved over 16 percent DBE participation in its construction contracts, against an overall DBE goal of 15 percent.

121CM	Pflaum	Donald	City of Minneapolis	121	Email	5 - Environmental Effects	Wetlands in Golden Valley are part of the Basset Creek Valley Watershed (BCV) and these flow into the corporate boundaries of the City of Minneapolis. This line should not contribute to the pollution of the BCV watershed; it should continue toward – or at least not complicate – the clean up of this watershed.	Please see response to Comment 121BS.
121CN	Pflaum	Donald	City of Minneapolis	121	Email	5 - Environmental Effects	The City of Minneapolis recognizes that the Minneapolis Park and Recreation Board is the local park authority responsible for determining parkland impacts.	Comment noted. The Council is working closely with MPRB regarding park impacts.
121CO	Pflaum	Donald	City of Minneapolis	121	Email	5 - Environmental Effects	Page 8-19, 8.4.1.2 – The 4(f) evaluation notes that the project will only take a small amount of land in Wirth Park. However, earlier in the document it makes it clear that it will be removing over 10 acres of wetland with the proposed alternative – while the plan for stormwater is to accommodate it largely within existing ditches. Is this all within railroad right-of-way? And is there an assurance that any potential drainage impacts to the larger area will be taken into account, including those outside the project's construction limits?	Please see response to Comment 121CN.
121CP	Pflaum	Donald	City of Minneapolis	121	Email	4 - Social and Economic Effects	Page 9-1, 9.1.1 – Goals should clearly call out the intention to proactively involve underrepresented groups, including low income populations and communities of color. It appears this was done, but it is not stated up front this was a goal.	Section 9.1.3.5 of the Final EIS addresses this issue; it states: "A variety of electronic and 'traditional' (hard-copy) communication methods were used for the proposed BLRT Extension project. Although electronic communications might appear inappropriate for a project area with a substantial number of low-income residents, area organizers (such as the members of the Blue Line Coalition) advised that electronic media remains an effective method of outreach to low-income communities. Computers at area libraries are well-used, and smartphones are increasingly being used to access websites and other social networking applications. Communication methods are summarized below. Specific outreach efforts to target environmental justice populations are summarized in Chapter 7 – Environmental Justice of this Final EIS."
121CQ	Pflaum	Donald	City of Minneapolis	121	Email	2 - Fiscal Effects and Schedule	Page 10-2, Table 10.1-1 – Does the right-of-way cost estimate for D2 take into account cost of relocation assistance for residents from the homes that would be removed? And does the construction cost of D1 take into account the construction of noise barriers and other noise mitigation features, and the cost of wetlands bank purchases?	Alignment D2 is no longer under consideration; however, the cost estimate did include a relocation assistance allocation. The construction cost estimate for the proposed Blue Line Extension project (which includes Alignment D1) includes the cost of noise and wetland mitigation.
121CR	Pflaum	Donald	City of Minneapolis	121	Email	2 - Fiscal Effects and Schedule	Page 10-3, Construction Costs – Is there a map or graphic to show the limits of construction to demonstrate where improvements included in the cost estimates will be made? This is needed to determine what projects will be identified as mitigation/betterments outside the scope of the main project and therefore needing additional funding to be completed.	Limits of disturbance (LOD) are shown in Appendix E of the Draft EIS and are represented by a red dashed line. Betterments (currently referred to as Locally Requested Capital Improvements or LRCIs) were not considered at the Draft EIS phase of the proposed BLRT Extension project. Revised LOD are shown in the Final EIS engineering drawings (see Appendix E of the Final EIS). The proposed BLRT Extension project does not include any LRCIs.
121CS	Pflaum	Donald	City of Minneapolis	121	Email	5 - Environmental Effects	Page 11-11, Alternative B-C-D1 – The significant wetlands impact is identified as differentiator, but needs to be better qualified as it is a negative for this alternative (i.e. doesn't directly support its status as a preferred alternative).	The Final EIS clarifies in Section 12.2 that, while Alternative B-C-D1 (the proposed BLRT Extension project) is the environmentally preferable alternative, it does not have the least impact to the physical environment. The disproportionately high and adverse impacts of the D2 alignment on environmental justice populations are the primary differentiator between the D2 and D1 alignments.

121CT	Pflaum	Donald	City of Minneapolis	121	Email	5 - Environmental Effects	Wetlands in Golden Valley are part of the Basset Creek Valley Watershed (BCV) and these flow into the corporate boundaries of the City of Minneapolis. This line should not contribute to the pollution of the BCV watershed; it should continue toward – or at least not complicate – the clean up of this watershed.	Please see response to Comment 121BS
121CU	Pflaum	Donald	City of Minneapolis	121	Email	7 - Alternatives, Engineering & Design	Appendix E; Alignment D – The City of Minneapolis is working on a possible art installation, the John Biggers Seed Project, on Bridge 27785 over I-94. City staff has been consulting Hennepin County and MnDOT. Consultation and coordination between the applicable agencies regarding the proposed LRT project and this art installation should continue.	The Council has been coordinating with the city of Minneapolis on proposed BLRT Extension project design issues throughout the Project Development phase of the New Starts process, and will continue to coordinate with the city during final design and construction. Modifications to the I-94 bridge are included in these coordination efforts.

Mille Lacs Band of Ojibwe

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
2A	Klapel	Susan	Mille Lacs Band of Ojibwe	2	US Mail	5 - Environmental Effects	The THPO for the Mille Lacs Band of Ojibwe has reviewed the documentation and determined that the Mille Lacs Band does not have any known recorded sites of religious or cultural importance in these areas.	Section 4.4 of the Final EIS presents a summary of the cultural resource impacts from the proposed BLRT Extension project. FTA and the Council appreciate the confirmation of the absence of known religious or culturally important sites in the proposed BLRT Extension project area.
2B	Klapel	Susan	Mille Lacs Band of Ojibwe	2	US Mail	5 - Environmental Effects	County Sheriff's Office and office of the State Archaeologist should be notified if human remains found; all work shall cease immediately.	Human remains are not anticipated; however, if found, the County Sheriff's Office and the Office of the State Archaeologist will be notified. This requirement will be incorporated in the Construction Mitigation Plan for the proposed BLRT Extension project, and included in the Section 106 MOA.

Bassett Creek Watershed Management Commission

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
106A	de Lambert	Jim	Bassett Creek Watershed Management Commission	106	US Mail	5 - Environmental Effects	BCWMC will not allow filling within the BCWMC-established floodplain without mitigation. Proposals to fill within the floodplain must obtain BCWMC approval and provide compensating storage (1:1 basis) and/or channel modifications so that the flood level is not increased at any point along the creek due to fill. DEIS identifies two areas within Theodore Wirth Regional Park as potential sites to provide compensating floodplain storage. The design of the compensatory storage sites would need to be coordinated with the Minneapolis Park and Recreation Board, appropriate city/cities, and the approving agencies (including the BCWMC). We encourage the Metropolitan Council to contact BCWMC as early in the design process as possible to discuss these storage sites.	The proposed BLRT Extension project impacts approximately 17,000 CY of floodplains, all of which is located within BCWMC. Floodplain mitigation is discussed in Section 5.2.5 of the Final EIS. Two mitigation sites are proposed. The first is located west of the BNSF rail corridor and north of Olson Memorial Highway on MPRB and Canadian Pacific Railway property, and is located within the BCWMC. The other is located in city of Robbinsdale property at the edge of Grimes Pond. The site on MPRB and Canadian Pacific Railway property (16,800 CY of compensatory storage) will be designed in coordination with BCWMC and MPRB staff to ensure that the site fits into the landscape. The mitigation at Grimes Pond is quite small (200 CY of compensatory storage) and will be incorporated into the grading for the LRT bridge over the pond. Floodplain mitigation strategies have been discussed with BCWMC, MPRB, and the cities of Minneapolis and Golden Valley, and staffs from those governmental units have approved the final mitigation sites. The Council will continue to coordinate approvals for floodplain impacts and mitigation strategies with BCWMC, the city of Minneapolis, DNR, and FEMA.
106B	de Lambert	Jim	Bassett Creek Watershed Management Commission	106	US Mail	5 - Environmental Effects	BCWMC must review and approve crossings of the Bassett Creek trunk system, including changes to existing crossings. DEIS notes Alignment D1 will cross a backwater channel of Bassett Creek, just north of TH 55.	Crossings and other potential impacts to the Bassett Creek trunk system have been discussed with BCWMC, the Mississippi Watershed Management Organization, the city of Minneapolis, and MnDOT. The proposed BLRT Extension project proposes the following modifications to the Bassett Creek trunk system: ■ East of I-94 – tree trenches will be used to treat runoff prior to draining to the Bassett Creek tunnels. ■ West of I-94 – two storm sewer trunk lines will extend from approximately Penn Avenue to the old Bassett Creek tunnel where it crosses Olson Memorial Highway near Dupont Avenue North. ■ Additional drainage to the old Bassett Creek tunnel and the east channel of Bassett Creek will be pre-treated through bioretention basins, underground detention BMPs, and the corridor protection ditch between the LRT and freight rail tracks. The modification details are described in Section 4.4.1 of the Preliminary Stormwater Management Plan Technical Memorandum, included in Appendix F of the Final EIS.
106C	de Lambert	Jim	Bassett Creek Watershed Management Commission	106	US Mail	5 - Environmental Effects	Floodplain management policies are listed in Section 5.2.2.2 of the BCWMC's 2004 Watershed Management Plan. Please also see the BCWMC's submittal and design requirements for projects ("Requirements for Improvements and Development Proposals," 2008). These documents can be found on the BCWMC website: www.bassettcreekwmo.org.	The floodplain and stormwater analyses and design requirements used for the proposed BLRT Extension project include the most up-to-date BCWMC policies and requirements. These are listed in Section 2.2.2 of the Preliminary Stormwater Management Plan Technical Memorandum, provided in Appendix F of the Final EIS.
106D	de Lambert	Jim	Bassett Creek Watershed Management Commission	106	US Mail	5 - Environmental Effects	Within the Bassett Creek watershed (Alignment D1), the project will increase the amount of impervious surface by 15 acres, a 40% increase within the Alignment D1 project area. The increased impervious surface will be in close proximity to the creek and will result in increased runoff rates if not controlled. Best management practices must be implemented to ensure flood profiles are not increased along Bassett Creek. BMPs should be implemented to treat runoff to minimize pollutants	The Council is working with BCWMC (the permitting authority as authorized under Minnesota Statute Chapter 103B) to incorporate the appropriate BMPs in the design that will manage volume and rate control throughout the proposed BLRT Extension project area. Such efforts will counteract potential high peaks of stream flow in Bassett Creek and will serve to retain and treat potential pollutants thus preventing them from entering the Creek. BMPs may include bio-infiltration, bio-filtration, stormwater retention and detention, permeable pavements, and tree trenches.
106E	de Lambert	Jim	Bassett Creek Watershed Management Commission	106	US Mail	5 - Environmental Effects	BCWMC strongly encourages the Metropolitan Council to implement best management practices to treat transitway runoff to ensure that the project does not increase pollutant-loading to adjacent water bodies.	The Council is working with BCWMC to design and implement BMPs that will effectively pre-treat runoff from the transitway before reaching Bassett Creek. The pre-treatment strategies will remove pollutants in compliance with applicable local, state, and federal standards.
106F	de Lambert	Jim	Bassett Creek	106	US Mail	5 - Environmental	BCWMC expects the proposed project design to include	Stormwater design throughout the proposed BLRT Extension project area will

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
			Watershed Management Commission			Effects	stormwater treatment and erosion control measures that will reduce the amount of phosphorus and sediment carried by stormwater runoff to Bassett Creek. The BCWMC also expects the Metropolitan Council to consider measures to minimize the amount of increased impervious surfaces resulting from the project.	incorporate BMPs that may include sediment forebays, bio-infiltration, bio-filtration, stormwater retention and detention, permeable pavements, tree trenches, grit chambers and SAFL Baffles. Such structures are effective in allowing sediments laden with phosphorus and other pollutants to be captured and can be effectively cleaned out. Thus, the amount of such contaminants entering Bassett Creek can be greatly reduced with the use of these BMPs. Other techniques such as silt fencing and rapid post-construction revegetation can contribute to effective erosion control. Permeable pavements and the use of ballasted track rather than embedded track will reduce the effect of increases in impervious surfaces.
106G	de Lambert	Jim	Bassett Creek Watershed Management Commission	106	US Mail	5 - Environmental Effects	Permanent and temporary construction BMPs must be implemented to control chlorine, fuels, oils, metals and other construction runoff. Adequate permanent and temporary construction BMPs must be implemented as part of the project.	The Council is working to locate construction staging in areas that would have a low probability of impacting receiving waterbodies. Permanent and temporary BMPs will include pre-treatment of storm runoff. These may include temporary sedimentation basins during construction and other techniques such as vegetated ditches, bio-infiltration, and various configurations of stormwater retention and detention. Hazardous and regulated materials stored on site during construction will be managed in conformance with the NPDES permit requirements and/or the requirements in a contractor-prepared Spill Prevention, Control, and Countermeasures (SPCC) plan. The NPEDS permit will be obtained in advance of construction activities, and an SPCC plan be developed prior to construction activities.
106H	de Lambert	Jim	Bassett Creek Watershed Management Commission	106	US Mail	5 - Environmental Effects	The Draft EIS proposes the construction of infiltration basins in ditches adjacent to the transitway to provide some water quality treatment before runoff is discharged to Bassett Creek. All proposed water quality treatment facilities will be reviewed for conformance to the design requirements outlined in the "Requirements for Improvements and Development Proposals," (2008). The BCWMC is in the process of updating its Watershed Management Plan, which could include significant new standards for stormwater management. We expect approval of the BCWMC Plan sometime in fall 2015, which means the new standards will likely be in place before engineering design begins on the transitway project.	The Council is designing stormwater treatment in accordance with BCWMC requirements that will include infiltration basins in locations appropriate for the site-specific soil and groundwater conditions. BMP designs will conform to the design standards in effect at the time of the design. Pollutant and sediment load modeling will be used to design for compliance with local, state, and federal standards. See also the response to Comment 106C.
106I	de Lambert	Jim	Bassett Creek Watershed Management Commission	106	US Mail	5 - Environmental Effects	The Draft EIS does not appear to include the maintenance measures the Metropolitan Council proposes to undertake to ensure the effectiveness of stormwater management features. The Final EIS should describe the maintenance measures and it should also identify the parties responsible for inspections, the parties responsible for maintenance, and the inspection and maintenance schedules.	The Council acknowledges that many stormwater management BMPs within the proposed BLRT Extension project area would require periodic maintenance and inspection. Maintenance of stormwater BMPs would be determined in coordination with the proposed BLRT Extension project stakeholders including the Council, MnDOT, Hennepin County, and the project cities and other LGUs. Final determinations of responsibility for long-term maintenance of BMPs will be determined prior to the start of construction.
106J	de Lambert	Jim	Bassett Creek Watershed Management Commission	106	US Mail	5 - Environmental Effects	Temporary and permanent best management practices must be implemented to control construction and post-development erosion and runoff from the site. BCWMC is particularly concerned about erosion and sediment control during construction because of the proximity of Alignment D1 to numerous water resources, Alignment D1 is immediately adjacent to Grimes Pond and South Rice Pond, and adjacent to or very near Bassett Creek and its adjacent wetlands. Extra care will need to be taken during construction to avoid sediment and other pollutants from entering these water resources. The EIS should acknowledge the extra difficulty in preventing erosion and sedimentation along the portions of the route with numerous water resources in close proximity, such Alignment D1.	The Council team acknowledges the importance of preventing sediment-laden construction runoff from entering Bassett Creek and the other water resources adjacent to the proposed BLRT Extension project corridor. The construction contractor will be required to meet the additional requirements of the NPDES permit for activities within one mile of impaired waters, which includes Bassett Creek. A Stormwater Pollution Prevention Plan (SWPPP) will be designed that will specify temporary erosion and sediment controls, such as temporary seeding, biorolls, rock logs, rock weepers, erosion control blankets, hydraulic soil stabilizers, silt fence (machine-sliced, heavy-duty, and super-duty), flotation silt curtain, and temporary sedimentation basins. The SWPPP will also include permanent erosion and sediment controls, such as permanent seeding and vegetation establishment, erosion control blankets and or hydraulic soil stabilizers, and permanent stormwater treatment BMPs. This is discussed in Section 5.9.5 of the Final EIS.

106K	de Lambert	Jim	Bassett Creek Watershed Management Commission	106	US Mail	5 - Environmental Effects	In addition to the NPDES Construction Stormwater Permit from the MPCA (as noted in Section 5.9.5 of the Draft EIS), the BCWMC reviews projects for erosion and sediment control. The BCWMC's erosion and sediment control plan requirements are outlined in "Requirements for Improvements and Development Proposals" (2008). The BCWMC's erosion and sediment control policies are also listed in Section 6.2 of the BCWMC Watershed Management Plan.	The proposed BLRT Extension project will incorporate BCWMC requirements in the SWPPP section of the proposed BLRT Extension project plans; the SWPPP will be provided to BCWMC at the same time it is provided to MPCA for review and approval. See also the response to Comment 106H.
106L	de Lambert	Jim	Bassett Creek Watershed Management Commission	106	US Mail	5 - Environmental Effects	The BCWMC wetland goal is to achieve no net loss of wetlands in the Bassett Creek watershed in conformance to the Minnesota Wetland Conservation Act (WCA) and associated rules (Minnesota rules 8420). The portion of the preferred alternative (B-C-Dl) and Alternative B-C-D2 in BCWMC is in Minneapolis, Golden Valley and Robbinsdale. Minneapolis and Golden Valley are the local governmental units (LGUs) responsible for administering the WCA in their cities; BCWMC is the LGU for administering WCA in Robbinsdale. Table 5.3-4 in the Draft EIS shows the total wetland disturbance or fill for Alignment Dl (part of preferred alternative) to be 6.1 acres. All of this wetland disturbance or fill along Alignment D1 is within BCWMC. At least two acres appears to be in Robbinsdale. For the portion of Alignment C within BCWMC, there appears-to be 0.4 acres of wetland disturbance or fill; this is located in Robbinsdale. Alignment D2 includes 0.7 acres of wetland disturbance or fill, all of which is in BCWMC and in Robbinsdale. BCWMC will be responsible for administering WCA for the Robbinsdale portions of the alignments. Wetland management policies are listed in Section 8.0 of the BCWMC Watershed Management Plan. The BCWMC's submittal and design requirements for projects are included in "Requirements for Improvements and Development Proposals" (2008).	The Council is aware of and is developing the proposed BLRT Extension project in accordance with the BCWMC regulations concerning no net loss. Further, the Council is aware of the various WCA LGUs and their jurisdictions throughout the proposed BLRT Extension project area. Coordination meetings with all WCA LGUs as well as USACE, the Minnesota Board of Water and Soil Resources (BWSR), and the Hennepin County Soil and Water Conservation District (SWCD) to discuss wetland delineations, wetland jurisdictions, and wetland impacts and mitigation. Final wetland impact and mitigation areas are presented in the joint Section 404/WCA permit application, including a breakdown of impacts by WCA LGU. Approximately 5.78 acres of total wetland impact are anticipated within the areas under the jurisdiction of BCWMC. Of those 5.78 acres of impact, approximately 3.11 acres will require mitigation at a 2:1 ratio (i.e. approximately 6.22 acres), based on WCA requirements. Note that the proposed BLRT Extension project is Alternative B-C-D1 as presented in the Draft EIS; therefore, the impacts associated with Alignment D2 are no longer germane to this issue.
106M	de Lambert	Jim	Bassett Creek Watershed Management Commission	106	US Mail	5 - Environmental Effects	In late 2014, the City of Minneapolis (through the Minneapolis Park and Recreation Board) will be constructing a BCWMC capital improvement project to stabilize a reach of Bassett Creek between Golden Valley Road and Irving Avenue North at an estimated cost of $856,000. The portion of the creek stabilization project between Golden Valley Road and Highway 55 is adjacent to or very near Alignment Dl. The creek stabilization project will be completed before the Bottineau Transitway project construction would begin. However, the planning, design and construction of the Bottineau Transitway project needs to ensure the integrity of the BCWMC's creek stabilization project. We will provide you with the as-built plans for the creek stabilization project.	The Council recognizes the importance of the Bassett Creek stabilization project in improving water quality and the predictability of the Creek during extreme storm events. The Council's design for the proposed BLRT Extension project will be coordinated with the creek stabilization design. Should disturbance of the creek stabilization elements be required to build the proposed BLRT Extension project, those elements will be restored when construction is completed in that area, and temporary stormwater construction BMPs will be implemented to avoid streambank erosion during construction. To achieve design coordination, the Council will appreciate reviewing the as-built plans for the creek stabilization project.

Federal Aviation Administration

128A	Peek	Andy	Federal Aviation Administration	128	Email & US Mail	3 - NEPA Process & Public Involvement	As a Cooperating Agency for the Bottineau Transitway Project, FAA Minneapolis Airports District Office (ADO) is continuing to seek FAA Regional and Headquarters concurrence on the conclusions of the February 10, 2014 Crystal Airport Runway Protection Zone Alternatives Analysis (RPZ AA). Upon completion of the RPZ AA, we will forward our comments for incorporation into the Final EIS. When the Final EIS is available, the FAA ADO will want to ensure the proposed transportation project is consistent with the findings of the RPZ AA.	The Federal Aviation Administration (FAA) Dakota-Minnesota Airports District Office approved the alignment changes to the February 20, 2014 Runway Protection Zone (RPZ) Alternatives Analysis (AA) in a letter dated December 28, 2015. Section 3.6 of the Final EIS provides additional information on coordination with FAA and permitting requirements.

US Department of the Interior

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
143A	Darby	Valincia	US Department of the Interior	143	Email	5 - Environmental Effects	The Northern long-eared bat (*Myotis septentrionalis*) (NLEB) was proposed for federal listing under the Endangered Species Act on October 2, 2013. At this time, no critical habitat has been proposed for the NLEB. Although species proposed for listing are not afforded protection under the ESA, when a species is listed, the prohibitions against jeopardizing its continued existence and unauthorized "take" are effective immediately, regardless of an action's stage of completion. We recommend adding the NLEB to Section 5.8.3, Endangered Species and addressing potential project impacts to the species. Based on the information provided in this EIS, Alternative D-1 will likely result in the loss of some summer roosting and foraging habitat. We recommend quantifying available summer roost habitat that will be removed as a result of this project and assessing those impacts to the species. We recommend that all tree clearing associated with this project be conducted outside the summer maternity roost season for the NLEB. The summer maternity season in Minnesota is from April 1 through September 30. If tree clearing cannot be accomplished outside of this time period, surveys should be conducted to determine presence/absence of the species and consultation should be initiated with the United States Fish and Wildlife Service's Twin Cities Field Office.	Section 5.8 of the Final EIS describes the preferred habitats of rare, threatened, and endangered species in the study area and the expected impacts to plants and animals and their habitat from the No-Build Alternative and proposed BLRT Extension project. Since the publication of the Draft EIS, the NLEB has been listed as a threatened species under the Environmental Site Assessment (ESA). The US Fish and Wildlife Service (USFWS) has issued a Final 4(d) Rule regarding impacts to the northern long-eared bat (NLEB). Based on the absence of NLEB hibernacula and maternity roost trees in the proposed BLRT Extension project area, FTA has made a determination under Section 7 of the ESA of "May Affect, Incidental Take Not Prohibited" in accordance with the Final 4(d) Rule and guidance. The USFWS concurred with FTA's determination on May 16, 2016. The Final 4(d) Rule regarding the NLEB indicates that as long as a project is more than 0.25 mile from a known hibernaculum and more than 150 feet from any known occupied maternity roost tree, no tree clearing restrictions are required, and no surveys need to be conducted. The proposed BLRT Extension project meets these criteria; therefore, no clearing restrictions and no surveys will be implemented.
143B	Darby	Valincia	US Department of the Interior	143	Email	5 - Environmental Effects	...the analysis of impacts to eligible 4(f) properties is not entirely straightforward, and it seems much of the decision making has been put off waiting for further analysis and consultation. Alternatives are anticipated to result in direct impacts to recreational facilities including the Rush Creek Regional Trail, Theodore Wirth Regional Park, and the Minneapolis Public Schools Athletic Field. Alternatives are anticipated to have direct impacts to two historic properties, the Homewood Historic District and the Grand Rounds Historic District (Theodore Wirth segment). Based upon the existence of an alternative that would avoid direct use of the Minneapolis Public Schools Athletic Field and the Homewood Historic District, the FTA believes that it can avoid a 4(f) use of these properties. Based on measures to minimize harm, the FTA proposes a *de minimis* finding under section 4(f) for the direct impacts to the Rush Creek Regional Trail and the Grand Rounds Historic District (Theodore Wirth segment). Finally, the FTA has determined that its preferred alternative will result in a direct use of the Theodore Wirth Regional Park.	FTA has revised its preliminary use determinations for certain park and historic resources along the proposed BLRT Extension project, and provided a pre-publication copy of the Amended Draft Section 4(f) and 6(f) Evaluation to the US Department of the Interior (USDOI) for review and comment on May 18, 2016. The preliminary use determinations presented by FTA in the Amended Draft Section 4(f) and 6(f) Evaluation included: ■ A *de minimis* use of TWRP ■ A *de minimis* use of Glenview Terrace Park ■ A direct use of the GRHD ■ A direct use of the Osseo Branch historic railroad district In addition, the need for a Section 6(f) conversion of a portion of Sochacki Park: Sochacki Management Unit was identified. USDOI indicated in its response dated [DATE] that [SUMMARIZE RESPONSE]. The Final Section 4(f) Evaluation results will be documented in the proposed BLRT Extension project Record of Decision. The Section 6(f) conversion process will be completed under separate environmental review in accordance with National Park Services guidelines; the conversion process must be completed before construction of the proposed BLRT Extension project can begin.
143C	Darby	Valincia	US Department of the Interior	143	Email	5 - Environmental Effects	The Section 4(f) Evaluation appears rather preliminary in that additional design will be needed to determine the full extent of some impacts to or avoidance of resources, and impacts to the two historic properties will need concurrence from the Minnesota State Historic Preservation Office (SHPO) on a "no adverse effect" determination under section 106 of the National Historic Preservation Act.	Adverse effects to historic properties are presented in the proposed BLRT Extension project Determination of Effects Report, included in Appendix H of the Final EIS. MnHPO has concurred with FTA's adverse effect determinations. The adverse effects have informed the Section 4(f) Evaluation, and the following uses of historic properties have been identified: ■ A direct use of the GRHD ■ A direct use of the Osseo Branch historic railroad district The Section 4(f) analysis considered avoidance alternatives and measures to minimize harm, and found that there was no feasible and prudent alternative to the two Section 4(f) uses, and that all possible planning to minimize harm had been incorporated into the proposed BLRT Extension project. USDOI concurred with FTA's

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
								preliminary determinations of use for these two properties on [DATE]. [LIST THEM].
143D	Darby	Valincia	US Department of the Interior	143	Email	5 - Environmental Effects	Therefore, the Department would concur with the FTA that there were no feasible or prudent avoidance alternatives to the preferred alternative presented which results in impacts to Theodore Wirth Regional Park.	Please see the Amended Draft Section 4(f) and 6(f) Evaluation (Chapter 8 of the Final EIS) which presents FTA's preliminary determination that the proposed BLRT Extension project would constitute a *de minimis* use of TWRP. This preliminary determination was made based on the fact that the proposed BLRT Extension project would require a small portion of park property, and that the acquisition of that property and the implementation of the proposed BLRT Extension project as a whole would not adversely affect the activities, features, or attributes which qualify the park for protection under Section 4(f). FTA will request MPRB's concurrence on the *de minimis* determination for TWRP following the publication of and consideration of comments on the Amended Draft Section 4(f) and 6(f) Evaluation.
143E	Darby	Valincia	US Department of the Interior	143	Email	5 - Environmental Effects	Impact mitigation for all other 4(f) properties is dependent upon additional design information, as well as consultation with the SHPO and other consulting parties. Therefore, the Department cannot concur that all possible planning needed to minimize harm to 4(f) resources has been employed.	The Amended Draft Section 4(f) and 6(f) Evaluation (Chapter 8 of the Final EIS) presents measures to minimize harm that have been developed in coordination with the agencies with jurisdiction. In general, these include enhanced trail connections for park resources, revegetation (including removal of invasive species and replanting with native species) of temporarily disturbed areas, and implementation of designs that meet the SOI standards. The Amended Draft Section 4(f) and 6(f) Evaluation presents FTA's preliminary determination that two properties (the GRHD and the Osseo Branch historic railroad district) would be subject to a direct use by the proposed BLRT Extension project. Sections 8.7.2.10 and 8.7.2.11 present the "all possible planning to minimize harm" analysis for these properties.
143F	Darby	Valincia	US Department of the Interior	143	Email	5 - Environmental Effects	The Department will withhold its final concurrence that there are no feasible or prudent avoidance alternatives and that all possible planning needed to minimize harm to the 4(f) resources have been employed until more information is included in the final evaluation.	The Amended Draft Section 4(f) and 6(f) Evaluation has been published with the Final EIS for the proposed BLRT Extension project (see Chapter 8 of the Final EIS). A copy of the Amended Draft Section 4(f) and 6(f) Evaluation has been provided to the USDOI for review and concurrence. The document presents information regarding the lack of prudent or feasible alternatives to the 4(f) uses discussed, and demonstrates that FTA has implemented the necessary planning to minimize harm.

Minnesota Department of Transportation

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
151A	Corbett	Michael	Minnesota Department of Transportation Metro District	151	Email	3 - NEPA Process & Public Involvement	Partnering with MnDOT is essential during project development, engineering, and construction to help ensure timely and appropriate identification of and resolution to any impacts to MnDOT facilities. As the project progresses, work with MnDOT to ensure that all impacts to State Highway infrastructure (e.g. along TH 55 in Minneapolis, and crossings over TH 100, TH 610, and I-94) are reviewed and approved through the layout approval process, consistent with policy and criteria outlined in the MnDOT Road Design Manual.	The Final EIS provides a list of Cooperating and Participating Agencies in Table 9.3-1. MnDOT is listed as a Cooperating Agency; MnDOT has a seat on the CMC as well as the Technical Project Advisory Committee. Cooperating and Participating Agencies began active participation early in the environmental review process. The proposed BLRT Extension project would have impacts on several MnDOT facilities; therefore, FTA and the Council will continue to coordinate and partner with MnDOT on the development of design details through the preliminary and final design phases of the proposed BLRT Extension project. For those roadways owned by MnDOT, MnDOT design standards will be followed, unless determined otherwise by both MnDOT and the Council. Permits will also be obtained through MnDOT, as required. MnDOT staff (including right-of-way, design, cultural resources, and administrative staff) actively participate on the development of proposed BLRT Extension project and are co-located with Council staff.
151B	Corbett	Michael	Minnesota Department of Transportation Metro District	151	Email	7 - Alternatives, Engineering & Design	MnDOT has expectations that detailed design considerations along the Bottineau corridor where State Highways are impacted will be compatible and coordinated with MnDOT's multimodal objectives. These objectives include extensive collaboration with local partners and residents to achieve an improved transportation corridor that promotes and invites all non-motorized traffic to move along and across the corridor in a safe and convenient manner.	The Council has coordinated extensively with MnDOT, Hennepin County, the city of Minneapolis, and other stakeholders on the design of Olson Memorial Highway (Olson Memorial Highway—the only State Highway along which the proposed BLRT Extension project would traverse) throughout the issue resolution process. The improvements to Olson Memorial Highway address both motorized and non-motorized traffic. Chapter 3 – Transportation of the Final EIS addresses improvements to Olson Memorial Highway. Two stations would provide access to the communities along the highway: the Penn Avenue Station and the Van White Boulevard Station. While a six-lane roadway would be maintained, the lane widths would be reduced to 11 feet to accommodate pedestrian crossing length. The design speed and posted speed limit would be reduced to 35 mph. Existing sidewalks would be replaced with 6-foot-wide sidewalks on the north and south sides of the highway. Pedestrian refuges would be added in the median of the highway. ADA-compliant pedestrian crossings of Olson Memorial Highway would be facilitated by proposed signalized intersections at Bryant Avenue North, Van White Sochacki Park:, Humboldt Avenue, James Avenue, Morgan Avenue, midblock between Newton Avenue and Oliver Avenue, Penn Avenue, Russell Avenue, and Thomas Avenue. The proposed BLRT Extension project would provide space on the north side of Olson Memorial Highway for a 10-foot two-way cycle track (to be constructed by others) between Thomas Avenue and Van White Memorial Boulevard. The proposed BLRT Extension project would construct a multi-use trail on the north side of the reconstructed westbound Olson Memorial Highway bridge. See Appendix E of the Final EIS for design information.
151C	Corbett	Michael	Minnesota Department of Transportation Metro District	151	Email	3 - NEPA Process & Public Involvement	As design work develops, continue to partner and work with MnDOT Metro District staff and functional groups to resolve project development technical issues identified by MnDOT and other key stakeholders.	The Council continues to partner with MnDOT throughout the design process, and MnDOT staff is co-located with Council staff working on the development of the proposed BLRT Extension project (e.g., staff from the MnDOT Cultural Resources Unit, right-of-way staff, design staff, and administrative staff are facilitating project actions during the environmental review process and into construction).
151D	Corbett	Michael	Minnesota Department of Transportation Metro District	151	Email	7 - Alternatives, Engineering & Design	It is anticipated that all trunk highway impacts will be reviewed and approved through the layout approval process and proposed alterations will use the policy and criteria presented in the MnDOT Road Design Manual. Additional information on MnDOT's Geometric Design and Layout Development process can be found at: http://www.dot.state.mn.us/design/geometric/index.html	The Council will develop and submit design plans to MnDOT for review and approval in accordance with MnDOT's Geometric Design and Layout Development Process.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
151E	Corbett	Michael	Minnesota Department of Transportation Metro District	151	Email	5 - Environmental Effects	It appears that drainage permits will be required where the corridor crosses and parallels state roads within MnDOT's right of way. MnDOT expects these determinations will be made when the final design plan is submitted.	Drainage permit requirements are being determined as drainage designs are advanced. The Council anticipates the potential for needing drainage permits from MnDOT, and will coordinate with MnDOT on acquiring these permits as designs are finalized.
151F	Corbett	Michael	Minnesota Department of Transportation Metro District	151	Email	4 - Social and Economic Effects	Any use of or work within or affecting MnDOT right-of-way requires a permit. It is anticipated that more specific impacts to MnDOT right-of-way will be identified during the FEIS and Project Development (Preliminary Engineering) phases.	MnDOT is leading the right-of-way acquisition process for the proposed BLRT Extension project. The Council will follow permitting requirements of MnDOT for work in the right-of-way.

Minnesota Pollution Control Agency

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
152A	Kain	Kevin	Minnesota Pollution Control Agency	152	Email	5 - Environmental Effects	Please be aware that Shingle Creek and Bassett Creek are listed on the MPCA Inventory of Impaired Waters located on the MPCA website at http://www.pca .state .mn.us/water/tmdl/tmdl -303dlist.html. We recommend you utilize the MPCA Special Waters and Impaired Waters Search mapping tool to identify special or impaired waters located near proposed projects. The mapping tool is located on the MPCA website at: http://pca-gis02.pca.state.mn.us/CSW/index.html. Shingle Creek and Bassett Creek are listed as impaired for turbidity and fecal coliform. The impairment will dictate additional increased stormwater treatment during construction and require additional increased permanent treatment post construction. These requirements will be included in the National Pollutant Discharge Elimination System/State Disposal System (NPDES/SDS) Construction Stormwater (CSW) permit. The project proposer should determine that compliance with these increased stormwater water quality treatments can be achieved on the Project site or elsewhere. Information regarding the MPCA's Construction Stormwater Program can be found on the MPCA's website at http://www.pca .state.mn.us/water/stormwater/stormwater -c.html. Questions regarding Construction Stormwater Permit requirements should be directed to Roberta Getman at 507-206-2629.	The Council is aware of the 303(d) listing of Bassett Creek and Shingle Creek, and the implications of this listing on proposed stormwater management. Constraints on this linear transportation project would require a state-of-the-science innovative approach to stormwater management including a treatment train such as infiltration, pervious pavements, cisterns, SAFL Baffles, grit chambers, retention and detention. Impaired waters in the proposed BLRT Extension project area are shown in Figure 5.9-1 of the Final EIS. The specific impairments and Total Maximum Daily Load requirements for each impaired water are listed in Table 5.9-2 of the Final EIS. Stormwater treatment features on the proposed BLRT Extension project are being designed to comply with the treatment requirements for these impaired waters. Permanent stormwater treatment features will be shown on the design plans, and construction stormwater treatment features will be shown on the SWPPP documents which are required to be submitted as part of the NPDES permitting process and reviewed and approved by MPCA.
152B	Kain	Kevin	Minnesota Pollution Control Agency	152	Email	3 - NEPA Process & Public Involvement	The permanent treatment requirements are old - the 2013 CSW permit now requires one inch from the new impervious over one acre added to be retained on site. Table 5.9-2 needs to be updated, and their proposed ponds will need to be reevaluated to meet the new requirement.	The MPCA permit treatment requirements have been updated and are shown in Table 5.9-1 of the Final EIS. Volume control is listed as requiring 1.0 inch of runoff from new impervious surfaces created by the proposed BLRT Extension project to be retained on site. Designs of ponds and other stormwater BMPs have been developed in accordance with this requirement.
152C	Kain	Kevin	Minnesota Pollution Control Agency	152	Email	3 - NEPA Process & Public Involvement	In Section 5.9.5, the statement "Due to the linear nature of the project, BMPs that are compatible with linear corridors would be used to the extent possible without the need to purchase additional right-of-way" would not comply with the 2013 CSW permit. The requirement is to meet the one inch water quality volume unless infeasible. Part of the specific requirements for linear projects: For work on linear projects with lack of right of-way where the Permittee(s) cannot obtain an easement or other permission for property needed to install treatment systems capable of treating the entire water quality volume on site, the Permittee(s) must maximize the water quality volume that can be treated prior to discharge to surface waters. Treatment can be provided through other methods or combination of methods such as grassed swales, filtration systems, smaller ponds, or grit chambers, prior to discharge to surface waters. A reasonable attempt must be made to obtain right-of-way during the project planning process. Documentation of these attempts must be in the Stormwater Pollution Prevention Plan (SWPPP) per Part 111.A.5.m. in the section addressing infeasibility.	As noted in the response to Comment 152B, stormwater BMPs have been designed to meet the 1.0 inch retention standard. In some cases, this can be met through the implementation of BMPs within the existing linear corridor. However, in several cases, new or augmented stormwater treatment features are proposed on right-of-way parcels outside the linear corridor. An overview of major stormwater treatment facilities is shown in Figure 5.9-2 of the Final EIS and summarized in Tables 5.9-5 through 5.9-10. Documentation of the stormwater management planning and design process will be provided in the SWPPP, which will be reviewed and approved by MPCA as part of the NPDES permitting action. Any alteration required to the treatment plan will be coordinated with MPCA, according to the standards required for the NPDES permit.
152D	Kain	Kevin	Minnesota Pollution Control Agency	152	Email	8 - Transportation System Effects	Disruption to traffic operations, including lane closures, short-term intersection and roadway closures, as well as detour will occur during construction of the Project and would cause localized increases in congestion. Therefore, traffic control measures should be developed during subsequent stages of the	Mitigation measures for short-term (construction) impacts to roads and traffic would be implemented by the Council prior to and during construction through the Construction Mitigation Plan, which includes a Construction Communication Plan and a construction staging plan. MnDOT, Hennepin County, and all municipalities affected by construction activities related to the proposed BLRT Extension project

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
							project to address these construction phased-impacts. Traffic flow and access to adjacent development must be maintained throughout the construction period. Construction related impacts must also be minimized within the neighborhoods adjacent to the project area. Amanda Smith (Amanda.smith@state.mn.us) would like to see a copy of the construction phasing plan when it is developed.	would require compliance with applicable state and local regulations related to the closing of roads and the effects of construction activities. Contractors will be required to comply with all guidelines established in the Minnesota Manual on Uniform Traffic Control Devices (2015). Construction staging and mitigation documents will be reviewed by appropriate jurisdictions, and required permits will be secured by construction contractors. Traffic-control plans will be developed by the contractor based on information identified in the construction documents and the Construction Mitigation Plan. Traffic-control plans will be reviewed by appropriate jurisdictions and the Council before construction activities begin. A copy of the Construction Mitigation Plan will be provided to MPCA for review.
152E	Kain	Kevin	Minnesota Pollution Control Agency	152	Email	5 - Environmental Effects	The effects of this Project on air quality were conducted through analysis of predicted impacts on CO concentrations. Analysis was conducted on five intersections in the study area, one representing the worst-case condition along each alignment under consideration. Based on these results, concentrations of CO in the study area would not exceed state one hour or eight hour standards. Therefore, the construction of the Project is not expected to cause any exceedance of the state CO standards. Based on the qualitative assessment presented in the Draft EIS, the Project would not cause exceedances of other criteria pollutants.	The Council concurs with MPCA's statements regarding the analysis of the proposed BLRT Extension project's impact on carbon monoxide concentrations. The analysis in the Final EIS (see Section 5.10.4.1) confirms the results of the analysis presented in the Draft EIS.
152F	Kain	Kevin	Minnesota Pollution Control Agency	152	Email	5 - Environmental Effects	The Draft EIS has provided a detailed qualitative analysis of MSATs. Since the traffic volumes for this project are below the threshold of 140,000 vehicles per day, a quantitative MSAT analysis is not required. Based on the qualitative assessment provided in the Draft EIS, it is not anticipated that this Project will cause a significant increase in MSAT emissions.	The Council concurs with MPCA's statements regarding the analysis of the proposed BLRT Extension project's impact on concentrations of Mobile Source Air Toxics. The analysis in the Final EIS (see Section 5.10.4.1) confirms the results of the analysis presented in the Draft EIS.
152G	Kain	Kevin	Minnesota Pollution Control Agency	152	Email	6 - Noise & Vibration Effects	The Draft EIS includes a detailed noise analysis. However, the noise analysis was conducted using Leq, rather than L10 and L50, which are the applicable state noise standards. The Project must comply with state noise standards and the final noise mitigation plan must address these state standards.	MPCA, the Council, and FTA have developed an approach to addressing the state noise standards. Information regarding this approach and the results are contained in Chapter 5 of the Final EIS. Section 5.6.1.4 discusses MPCA and FTA noise criteria for LRT operations, and demonstrates how compliance with FTA noise criteria are more protective of noise sensitive receptors for transit operations. Section 5.6.4.2 discusses construction-phase noise impacts and the requirements for compliance with MPCA noise rules. A construction Noise Control Plan will be prepared prior to the initiation of construction activities.

Three Rivers Park District

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
160A	Vlaming	Jonathan	Three Rivers Park District	160	Email	5 - Environmental Effects	The DEIS indicates that the FTA is proposing a de minimis determination for Rush Creek Regional Trail for construction of the OMF located in an east/west alignment north of 101st Avenue. The de minimis classification proposal is new information for Three Rivers and the DEIS is incorrect in stating that Three Rivers "provided input regarding potential de minimis use of park property". The de minimis proposal requires additional discussion and collaboration between Three Rivers and the Bottineau Transitway project team as the project advances.	Additional coordination has occurred subsequent to publication of the Draft EIS as well as additional engineering. As described in the Final EIS (Chapter 8 – Amended Draft Section 4(f) and 6(f) Evaluation), through advances in proposed BLRT Extension project design there would be a temporary occupancy of 1.1 acres of park property adjacent to Rush Creek Regional Trail by the proposed BLRT Extension project, and no actual Section 4(f) use of the property. FTA will request Three Rivers Park District concurrence on the temporary occupancy determination following the publication of the Final EIS, and will document that concurrence in the Record of Decision.
160B	Vlaming	Jonathan	Three Rivers Park District	160	Email	5 - Environmental Effects	The Rush Creek Regional Trail corridor is one of a handful of metro regional trail corridors that were acquired prior to development of the surrounding area, and involved a significant investment in land acquisition to provide a natural-resources rich greenway buffer between the trail and future development. Over 250 acres were secured for this trail greenway. The trail meanders through a greenway composed of woodlands, prairie and wetlands, and provides a rare experiential trail setting offering solitude and escape from the sights and sounds of neighboring developments that have risen from the farm fields once adjacent to the trail greenway. Over 372,000 annual visitors now enjoy this trail greenway and the respite from modern life it offers. The success of this trail greenway reflects solid long-range planning and investments starting nearly 30 years ago. Encroachment into the trail greenway by the OMF site threatens to disrupt the experiential setting offered by the trail greenway. The trail greenway offers two trails – a paved trail for bicyclists, in-line skaters and others who prefer a smooth surface, and an unpaved trail – originally designed for horses when the area was rural - and now used by runners and walkers looking for an even more natural setting. The paved trail comes within 400 feet of the OMF site, and the unpaved trail is directly adjacent to the OMF site. The DEIS does not provide enough information (OMF scale, noise impacts, visual impacts, air quality impacts, hours of operation, secondary impacts such as traffic to/from the site, etc.) to accurately determine if the OMF impact on the regional trail greenway corridor is de minimis. Consequently, at this time Three Rivers staff can not recommend to the Three Rivers Board of Commissioners that the direct use of the trail greenway corridor for the OMF site warrants de minimis status. The DEIS does recognize that de minimis resolution of 4(f) property impacts requires agreement by the agency with jurisdiction over that property. Three Rivers will work with the Bottineau Transitway design team to assess the potential impacts of the OMF site on the regional trail and its visitors, and will work collaboratively to find creative solutions that meet the needs of Three Rivers, trail users, and the Bottineau Transitway project.	The Council acknowledges the unique attributes of the Rush Creek Regional Trail corridor and worked with project stakeholders including the Three Rivers Park District to develop an alternative for the OMF that avoids permanent impacts to the corridor. The location and orientation of the OMF has been moved to avoid incorporation of any property from the Rush Creek Regional Trail corridor, and would not impede trail users. Landscaping would be implemented to screen the OMF from trail users; this is discussed in Section 4.5 of the Final EIS. Rush Creek Regional Trail property would no longer be required for the OMF site; therefore, a *de minimis* use is no longer FTA's Section 4(f) determination. FTA considered noise and visual impacts and other proximity impacts, and determined that they would not alter or impact the overall use or function of Rush Creek Regional Trail; therefore, there would be no constructive use of the trail facility. The Council has coordinated with the Three Rivers Park District on identifying an OMF location and configuration that meets the needs of the proposed BLRT Extension project and the park district.

City of Golden Valley

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
181A	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		Greater effort and attention must be given to...The likely impacts on the aesthetic and recreational aspects of Mary Hills Nature Area with an eye on preserving and enhancing the park for future users.	The Final EIS finds that there are no long-term impacts to the recreational attributes caused by the proposed BLRT Extension project on Sochacki Park: Mary Hills Management Unit (see Chapter 8 – Amended Draft Section 4(f) and 6(f) Evaluation of the Final EIS). There would be impacts to Sochacki Park: Mary Hills Management Unit during construction, which are also discussed in Chapter 8 – Amended Draft Section 4(f) and 6(f) Evaluation. Commitments to mitigate for these short-term effects, including commitments to maintain park access for users and for the replacement of trees and other plantings that may need to be removed as part of construction, are included in the Final EIS. These commitments have been developed in coordination with the city. Concurrence from the city of Golden Valley will be requested following the publication of the Final EIS regarding the proposed temporary occupancy. FTA's final Section 4(f) determinations will be documented in the Record of Decision.
181B	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		Greater effort and attention must be given to...Projected traffic impacts (during and after construction) and impacts to infrastructure on Golden Valley Road, Wirth Parkway, and surrounding local streets near each station location, and how those impacts might be addressed. Consideration should be given to a design of Golden Valley Road that incorporates multiple modes of transportation, including transit, bicycles, pedestrians, and the proposed Bassett Creek Regional Trail.	No mitigation measures are warranted for long-term impacts to roads and traffic because the identified avoidance measures would prevent any adverse impacts resulting from construction of the proposed BLRT Extension project. As shown in Table 3.3-2 of the Final EIS, the proposed BLRT Extension project includes a variety of roadway modifications that would avoid new congested intersections. The traffic operations analysis indicates that the Golden Valley Road/Theodore Wirth Parkway intersection would have approximately the same vehicular traffic level of service in 2040 with either the No-Build Alternative or the proposed BLRT Extension project (LOS B in the AM peak, and LOS E in the PM peak). The proposed BLRT Extension project does include improvements on Golden Valley Road (for the extent that would be reconstructed as part of the proposed BLRT Extension project) providing for multi-modal improvements, including construction of the portion of the Bassett Creek Regional Trail that are within the LOD. Additional information can be found in Section 3.3.
181C	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		Highlight impacts of station location(s) on immediately surrounding areas, including the effects of noise, lights, vibration, litter, pollution, and auto and bus traffic. The design of a given station should strive to safeguard the personal safety of transit users as they arrive at, depart from, or wait at the platform.	The proposed BLRT Extension project's environmental impacts are discussed in detail in Chapters 3 through 8 of the Final EIS. Chapter 3 discusses transportation impacts. Chapter 4 presents the community and social analysis. Chapter 5 addresses physical environment impacts. Chapter 6 discusses indirect impacts and cumulative effects. Chapter 7 presents the environmental justice analysis. Chapter 8 is the Amended Draft Section 4(f) and 6(f) Evaluation Chapter 9 presents the agency coordination and public involvement efforts. Chapter 10 summarizes the financial analysis. Chapter 11 presents the analysis of a proposed joint development project, and Chapter 12 is the summary evaluation of the No-Build Alternative and the proposed BLRT Extension project. Specific to noise, and vibration, the impacts discussion for these topic areas can be found in Chapter 5. Roadway and transit discussions are in Chapter 3 of the Final EIS, and visual impacts as well as the safety and security of transit users are discussed in Chapter 4 of the Final EIS.
181D	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		The mitigation of visual impacts from lights and lighting along the Bottineau Transitway and around potential station locations [should be addressed].	Light emissions were evaluated as part of the visual quality impact analysis and mitigation measures, including provisions for shielding lights to avoid "spillover" impacts, are included in the Final EIS.
181E	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		The mitigation of noise impacts for properties where noise barriers were not specifically identified in the Draft EIS. In general the study of noise levels was inadequate and more locations must be examined.	Noise impacts have been assessed at sensitive locations throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. Recognizing concerns expressed by the city of Golden Valley in its comment letter, the Council added an additional noise monitoring site in Golden Valley at Bonnie Lane (just west of the proposed Golden Valley Road Station) as part of the assessment of the proposed BLRT Extension project impacts completed for the Final EIS. (See Section 5.6 of the Final EIS for a discussion of noise impacts and a summary of mitigation commitments.) After the implementation of mitigation measures which include a noise barrier adjacent to Kewanee Way just north of Golden Valley Road,

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
								and interior testing in one home just south of Golden Valley Road, one moderate and one severe impact would remain.
181F	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		The location of mitigation efforts for flood plain impacts along the corridor, especially in areas that may impact parks and natural areas [should be addressed].	Section 5.2 of the Final EIS describes mitigation efforts for floodplain impacts, and lists the agencies with which the Council will work to properly permit the work done on floodplain mitigation. A total of 17,000 CY of floodplain impact have been identified. 16,800 CY of this impact are in the reach of Bassett Creek that lies between Golden Valley Road and Olson Memorial Highway in the City of Golden Valley. Mitigation for this impact will be achieved through the excavation of compensatory flood storage just north of Olson Memorial Highway; this site is shown in Figure 5.2-5 of the Final EIS.
181G	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		Issues of accountability if the mitigation measures fail in the future and ownership and the responsibility for maintenance of infrastructure such as pipes and culverts should be examined.	The Council continues to refine design details and the specifics of how mitigation commitments will be implemented in coordination with city staff from each of the corridor cities. Details regarding items such as ownership and maintenance of pipes and culverts will be addressed during final design and construction phases of project development. Mitigation commitments and responsibility for those commitments will be reported in the anticipated Record of Decision for the proposed BLRT Extension project.
181H	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		Beyond the quantitative measurement of noise and vibration, the City is interested in a qualitative analysis of the impacts the Bottineau Transitway project might generate - especially with Mary Hills Nature Area and Theodore Wirth Park.	The assessment of potential noise and vibration impacts of transit projects is set forth in FTA's 2006 Noise and Vibration Impact Assessment manual. The results of applying this quantitative analysis of impacts is included in Sections 5.6 and 5.7 of the Final EIS. After the implementation of mitigation measures which include a noise barrier adjacent to Kewanee Way just north of Golden Valley Road, and interior testing in one home just south of Golden Valley Road, one moderate and one severe impact would remain. No vibration impacts from proposed BLRT Extension project operations have been identified. Chapter 8 – Amended Draft 4(f) and 6(f) Evaluation of the Final EIS discusses the proposed BLRT Extension project's potential for proximity impacts to Sochacki Park: Mary Hills Management Unit, and presents FTA's preliminary determination that such proximity impacts would not adversely affect the features, attributes, or activities qualifying the property for protection under Section 4(f). The analysis in Chapter 8 for TWRP indicates that the direct use of approximately 2.1 acres of the park by the proposed BLRT Extension project would be considered a *de minimis* use based on FTA's preliminary determination that such use would not adversely affect the features, attributes or activities qualifying the property for protection under Section 4(f).
181I	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		Parking options and passenger drop-off access at the proposed Golden Valley Road station [should be considered]. Consideration should be given to the construction of a park and ride facility at or near the Golden Valley Road station location.	Through the issue resolution process, a park-and-ride lot with 100 surface parking spaces and additional bus and passenger drop-off areas has been incorporated into the proposed BLRT Extension project design to provide direct access to the Golden Valley Road Station. A summary of the issue resolution process, and the impact of this process on defining the proposed BLRT Extension project can be found in Chapter 2 of the Final EIS.
181J	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		A more complete accounting of the impacts to Golden Valley residents, neighborhoods, streets, and the entire transportation system during the lengthy construction period [should be addressed].	Construction-phase impacts on neighborhoods and the transportation system in the City of Golden Valley from the proposed BLRT Extension project would generally occur between 2018 and 2020, with the potential for some construction impacts in late 2017 depending on the timing of proposed BLRT Extension project approvals. Construction-phase impacts may include: ■ Intermittent impacts on bus operations, including temporary stop relocations, route detours, or suspensions of service on streets that are under construction ■ Intermittent impacts on roadways, including lane closures, short-term roadway and intersection closures, and detours ■ Intermittent impacts on bicycle and pedestrian facilities, including temporary closures or detours, and the presence of construction debris such as excess dirt and gravel

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
								■ Temporary removal of on-street parking spaces to facilitate construction vehicle movement, loading, and unloading These impacts will be mitigated through the implementation of a Construction Communication Plan that could include the following strategies to minimize disruptions: ■ Issuing and distributing regular construction updates ■ Providing advance notice of roadway closures, driveway closures, and utility shutoffs ■ Conducting public meetings ■ Establishing a 24-hour construction hotline ■ Preparing materials with information about construction ■ Addressing property access issues ■ Assigning staff to serve as liaisons between the public and contractors during construction
181K	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		Many areas of Golden Valley have substandard soils which are unsuitable for construction with proper correction or engineering. A good portion of the Transitway corridor through Golden Valley is located within floodplain, lowland or wetland areas. In addition, there are areas in Golden Valley that were found to be filled with construction debris in the past. The presences of contaminated materials is likely. A careful and detailed analysis of the soils, including possible contamination, must be included as part of the project. Mitigation measures must be consistent with all applicable laws [and] must be included in the project if contaminated material is discovered.	Extensive soils investigation, including conducting geotechnical borings, was undertaken by the Council in 2015. The results of this analysis are summarized in Sections 5.4 and 5.5 of the Final EIS. The Council is aware of the previous dumping that occurred during the 1960s in this area. A Phase I ESA has been conducted to further evaluate the presence of contamination along the entire proposed BLRT Extension project corridor and the results of this investigation are summarized in Section 5.5 of the Final EIS. Twenty four sites with a high potential for contamination and 135 sites with a medium potential for contamination were identified in the Phase I ESA; this information will be used to develop a Phase II ESA work plan. Information gathered during the Phase II ESA process (currently scheduled for the summer 2016 through mid-2017) will be incorporated into the proposed BLRT Extension project's Response Action Plan (RAP), which will include a Construction Contingency Plan for unidentified contamination. The Phase II ESA and its resultant RAP and Construction Contingency Plan will be completed with the oversight and approval of the MPCA, during final design and engineering and prior to the start of construction.
181L	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		Pedestrian movement throughout Mary Hills Nature Area by users on both sides of the existing rail line constitute an important community connection. The City requests a study of a safe pedestrian-only crossing.	The Final EIS addresses how park and trail user accessibility to potentially affected recreational areas will be maintained. There would be no short- or long-term impacts to trails in Sochacki Park: Mary Hills Management Unit (see Chapter 8 – Amended Draft Section 4(f) and 6(f) Evaluation of the Final EIS for further discussion). With reconstruction of the Golden Valley Road bridge over the BNSF rail corridor, the proposed BLRT Extension project would construct a bicycle/pedestrian facility facilitating a connection to the planned Bassett Creek Regional Trail on the south side of Golden Valley Road. The proposed BLRT Extension project would also construct a trail connection underneath the reconstructed Golden Valley Road Bridge, providing a continuous off-road trail connecting Sochacki Park: Mary Hills Management Unit to TWRP.
181M	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		The proposed alignment for the Bottineau Transitway...is to be located within and adjacent to Theodore Wirth Regional Park, as well as the Mary Hills Nature Area and Glenview Terrace Park. These areas are unique natural and recreational amenities to the City as well as the northwestern Twin Cities region. The Comprehensive Plan for the City establishes clear goals that provide protection of these natural areas. The City shall be involved in all decisions that impact the parks.	The Final EIS finds that there are no ecological, noise, visual, vibration or other aesthetic interferences that would substantially impair the activities, features or attributes of Sochacki Park: Mary Hills Nature Area, Glenview Terrace Park, or TWRP (see Chapter 8 – Amended Draft Section 4(f) and 6(f) Evaluation of the Final EIS). Based on the criteria that are used to determine a temporary occupancy, FTA has determined that there would be short-term needs to be in some limited portions of Sochacki Park: Mary Hills Nature Area. The temporary occupancy of the Mary Hills Nature Area Unit of Sochacki Park was disclosed in an Amended Draft Section 4(f) and 6(f) Evaluation which is published as Chapter 8 of the Final EIS. Concurrence in this temporary occupancy will be requested from the city of Golden Valley following the publication of the Final EIS, and the final Section 4(f) determination will be

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
								included in the Record of Decision. FTA has made preliminary *de minimis* determinations with respect to TWRP and Glenview Terrace Park. Concurrence on these determinations will be requested from MPRB following publication of the Final EIS and review of public comments, and the final Section 4(f) determination will be included in the Record of Decision.
181N	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		Any impacts to the floodway or floodplain must be mitigated in accordance with the laws and policies of the regulating agencies. The City recognizes that mitigation within the existing rail corridor will be challenging; it encourages the County [sic] to work closely with the City of Golden Valley, the Bassett Creek Watershed Management Commission (BCWMC), the Minneapolis Park and Recreation Board, and other BCWMC member cities to identify potential flood storage areas outside of the railroad rights-of-way, if necessary.	The proposed BLRT Extension project would impact approximately 17,000 CY of floodplains, all of which would be located within the BCWMC. Floodplain mitigation is discussed in Section 5.2.5 of the Final EIS. Two mitigation sites are proposed. The first is located west of the BNSF rail corridor and north of Olson Memorial Highway on MPRB and Canadian Pacific Railway property, and is located within the BCWMC. The other is located in City of Robbinsdale property at the edge of Grimes Pond. The site on MPRB and Canadian Pacific Railway property (16,800 CY of compensatory storage) will be designed in coordination with BCWMC and MPRB staff to ensure that the site fits into the landscape. The mitigation at Grimes Pond is quite small (200 CY of compensatory storage) and will be incorporated into the grading for the LRT bridge over the pond. Floodplain mitigation strategies have been discussed with BCWMC, MPRB, and the cities of Minneapolis and Golden Valley, and staffs from those governmental units have approved the final mitigation sites. The Council will continue to coordinate approvals for floodplain impacts and mitigation strategies with BCWMC, the cities of Golden Valley and Minneapolis, DNR, and FEMA.
181O	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		Wetland impacts will need to be mitigated in accordance with the laws and policies of the regulating agencies. The City of Golden Valley is the local government unit responsible for administration of the Wetland Conservation Act. If necessary, the County [sic] should identify potential mitigation solutions outside the railroad right-of-way that are satisfactory to the local partners.	The Final EIS describes in detail several types of impacts to wetlands including direct impacts, indirect impacts, and potential cumulative effects and secondary impacts to wetlands. Section 5.3 discusses the wetland impacts for both short and long-term impacts as well as the avoidance, minimization, and mitigation measures. The proposed BLRT Extension project would require coordination and permitting from local, state, and federal water resource agencies. The Council coordinated with the Wetlands Technical Evaluation Panel (which includes representation from the city of Golden Valley) regarding mitigation strategies prior to submitting the WCA and Clean Water Act Section 404 permit applications. The Council's analysis of preliminary mitigation strategies included establishing project-specific permittee-responsible mitigation sites and purchasing wetland mitigation bank credits. Based on this analysis, the Council determined that wetland impacts from the proposed BLRT Extension project will be mitigated through a combination of on-site wetland mitigation and purchases of private wetland credits from existing mitigation banks in suitable major watersheds and Bank Service Areas. (See Appendix I of the Final EIS, which includes a copy of the USACE Section 404/Minnesota WCA permit application, including mitigation commitments.)
181P	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		The Transitway project will need permits or approvals from all agencies regulating stormwater, including but not limited to the City, BCWMC, and Minnesota Pollution Control Agency. At a minimum, best management practices addressing erosion and sediment control will need to be implemented during construction. It is possible that rate control and stormwater treatment that reduces pollutants and runoff will be required, especially with the development of a transit station, park-and-ride facility, or other impervious surfaces.	Appropriate measures to avoid and minimize impacts to surface and groundwater will be implemented during construction and maintenance phases of the proposed BLRT Extension project. These include construction stormwater BMPs such as silt fences, ditch checks, erosion control mats, temporary mulching and/or seeding, and other appropriate practices to control runoff and sedimentation. Spill control plans will be required of construction contractors to address accidental releases of petroleum products or other controlled substances. As part of construction, an NPDES permit will be obtained from MPCA and subject to approval by the city and BCWMC. This permit will establish the measure which the Council and its contractors will implement during construction to protect surface and groundwater quality and the monitoring activities used to report on implementation of such measures.
181Q	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		The natural areas located within the LPA alignment are home to a vast array of wildlife. Care must be taken to avoid impacts to the habitat and travel ways of all wildlife, including endangered, threatened, or special concern species. The City requests more specific information about the location of fencing along the LPA alignment, as well as what type of fencing would be used. The	Section 5.8 of the Final EIS presents a summary of the assessment of wildlife habitat, impacts to wildlife habitat, and effects on threatened and endangered species. DNR concurred with the Council's assessment that there would be no adverse effects on Blanding's turtle populations with the implementation of DNR's guidelines. A copy of the guidelines is included in Appendix F of the Final EIS. FTA determined that the proposed BLRT Extension project may affect the Northern long-eared bat, but the

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
							movement and safety of wildlife through the natural areas may be impeded by certain types of fencing and the City would like to explore options for waivers from the requirement. In addition, new wildlife surveys may be warranted given the age of the surveys used in the Draft EIS.	potential for impacts was low, and incidental "takes" of the bat would not be prohibited. Locations of fencing will continue to be explored through the design process; decisions regarding fencing locations will likely be finalized between the 30 percent and 60 percent design stages. The Council acknowledges that fencing in areas of notable wildlife habitat may impede wildlife movement. Minimizing the use of fencing in these areas, or the provision of wildlife crossings (dry culverts or other passageways) are potential solutions.
181R	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		As the proposed project has the potential to impact areas within large parks and natural areas, and areas adjacent to Bassett Creek, the corridor has been studied for the presence of historic and cultural resources. Both the bridge over Bassett Creek in Theodore Wirth Regional Park (Bridge No. L9327) and the Grand Rounds Historic District have been identified as architectural resources that are eligible for listing in the National Register of Historic Places. The City shall be involved in all decisions that impact these two resources.	Information on the potential for adverse effects to all NRHP listed and eligible resources within the proposed BLRT Extension project's APE can be found summarized in Section 4.4 of the Final EIS, with detailed information included in Appendix H. There were no adverse effects determined to result for the bridge over Bassett Creek. There were adverse effects determined for the Theodore With Segment of the GRHD. A Section 106 MOA has been developed by FTA and MnHPO including the participation of the Council and other parties, including the city of Golden Valley. The Section 106 MOA sets forth commitments to avoid, minimize, and mitigate the potential adverse effects of the proposed BLRT Extension project on the GRHD (page 18 of the Section 106 MOA). A copy of the draft Section 106 MOA is included in Appendix H of the Final EIS. Should the proposed BLRT Extension project move forward in the environmental review process, an executed copy of this document will be included in the proposed BLRT Extension project's decision document.
181S	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		The Draft EIS has identified two potential station locations in the City of Golden Valley along the LPA and suggests that only one will be chosen for construction. Both of the station locations - at Golden Valley Road near Wirth Parkway and on Plymouth Avenue near Wirth Parkway - would potentially require the acquisition of property owned by the Minneapolis Park and Recreation Board.	Chapter 8 – Amended Draft 4(f) and 6(f) Evaluation of the Final EIS discusses the proposed BLRT Extension project's potential to use property from TWRP and FTA's preliminary determination that such use would not adversely affect the features, attributes or activities qualifying the property for protection under Section 4(f).
181T	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		Prior Draft EIS information indicates that the Golden Valley Road station would serve mostly Golden Valley residents and business and the Plymouth Avenue station would serve mostly Minneapolis residents, businesses, and Wirth Park facilities, Golden Valley businesses in the immediate area include regional destinations (Courage Kenney [sic] Rehabilitation Institute, Minneapolis Clinic of Neurology, Regency Hospital of Minneapolis, Wirth Park) and local destinations (Church of St. Margaret Mary, Unity Christ Church, The Family Partnership). Additional businesses that would likely use the Golden Valley Road station via additional transit connections include Honeywell and General Mills, among others...The City believes overall transit ridership numbers would be maximized with a Golden Valley Road station location.	Constructing a station at Golden Valley Road (and a station at Plymouth Avenue) was included in the proposed BLRT Extension project's scope and budget at the recommendation of the CMC (which included representation by the cities of Minneapolis and Golden Valley, and MPRB). This recommendation was formally acted on by the Council in December 2015. The effects on ridership of constructing a station at Golden Valley Road (and at Plymouth Avenue) are reported in Table 3.1-4 of the Final EIS.
181U	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		As part of Project Development, the City will require more detailed information about how buses would be incorporated into the station areas, including the amount and frequency of feeder buses serving the stations, and information about how bus drop-off and pick-up would function at the stations. The City is also interested in the expected revisions to the bus system as routes are reconfigured to serve the stations and the potential impact these changes would generate in Golden Valley.	Chapter 3 of the Final EIS discusses transit changes that may occur as a result of implementing the proposed BLRT Extension project. According to the draft Bus Feeder Plan, bus routes 7 and 30 would serve the Golden Valley Road Station with drop off areas on Golden Valley Road. Network modifications are focused on providing an integrated "feeder" bus network to connect people to proposed BLRT Extension project stations. Bus networks and transit plans will continue to be refined as the proposed BLRT Extension project progresses; final bus network changes will be subject to a robust public involvement process in accordance with Title VI requirements.
181V	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		As proposed, the parking options at either station location are limited or non-existent. The City needs more detailed	In the early stages of the proposed BLRT Extension project, shortly after entry into the New Starts Project Development phase, the Council worked closely with local

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
							information about how parking would function at the station locations. The number of parking spaces at each location and whether or not ramps are being considered must be determined. The City believes providing adequate parking at the stations is a necessity to avoid undesirable impacts on the surrounding streets and properties. The Draft EIS does not include plans for a park-and-ride facility at either location and land use and zoning controls that are currently in place at the proposed station location sites do not allow parking that is not associated with park uses. To allow for parking to be constructed, changes to land use and zoning controls would need to be made by the City Council. The City requests that funding be made available to allow for planning studies, which include consideration for parking options. Surrounding landowners have expressed concerns about their existing parking conditions so the integration of public and private parking conditions could be an opportunity for further study.	stakeholders to identify parking options in Golden Valley. This included the identification and review of several potential sites that could meet parking needs. The preferred site identified through this process is an approximately 100-space surface park-and-ride lot adjoining the Golden Valley Road Station (see Chapter 2 of the Final EIS for a discussion of park-and-ride facilities associated with the proposed BLRT Extension project). Parking was not considered a viable option for the Plymouth Avenue Station. The city approved the proposed BLRT Extension project 15-percent design plans, including the construction of the Golden Valley Road park-and-ride. As the proposed BLRT Extension project advances, the Council will continue its coordination with the city to secure required permits and other approvals required for proposed BLRT Extension project infrastructure built in the city.
181W	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		The ridership levels and trip generation from the proposed station or a future park-and-ride facility may result in the need to modify, enhance, or expand the nearby transportation system, which includes roads, trails and sidewalk facilities -- specifically, Golden Valley Road as well as its intersection with Theodore Wirth Parkway. It is expected that the Bottineau Transitway Project would partner with the appropriate road authority to address and mitigate any traffic concerns.	As shown in Table 3.3-2 of the Final EIS, the proposed BLRT Extension project includes a variety of roadway modifications that would avoid new congested intersections, and, with one exception, the proposed BLRT Extension project would not worsen conditions at intersections that would be congested with the No-Build Alternative in 2040. The traffic operations analysis indicates that the Golden Valley Road/Theodore Wirth Parkway intersection would have approximately the same vehicular traffic level of service in 2040 with either the No-Build Alternative or the proposed BLRT Extension project (LOS B in the AM peak and LOS E in the PM peak). The Council is continuing coordination with the city of Golden Valley, Hennepin County, and MPRB on roadway modifications to this intersection. Additional information can be found in Section 3.3 of the Final EIS.
181X	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		Sidewalks currently serve both station locations. The existing sidewalk and trail system will require upgrades and/or expansion to meet accessibility design requirements and the needs of the community. It is expected that this would be accomplished as part of the site access evaluation and implementation. The City of Golden Valley owns and maintains concrete sidewalks on both sides of Golden Valley Road at the intersection with the proposed Transitway, though gaps in the sidewalk system exist on the north side of Golden Valley Road to the west. In addition, Three Rivers Park District has identified the Golden Valley Road corridor for the proposed Bassett Creek Regional Trail which would connect French Regional Park and the Medicine Lake Regional Trail to Wirth Regional Park and the trails along the Ground Rounds National Scenic Byway. This network of trails and sidewalks would also require year-round maintenance -- especially for accessibility purposes -- for LRT to succeed in this multi-modal transportation area. Funding for this maintenance should be discussed as part of Project Development.	Chapter 3 – Transportation of the Final EIS describes the proposed BLRT Extension project's impacts to the transportation system, including the pedestrian environment and impacts to trails. As part of construction of the proposed BLRT Extension project, adequate sidewalk and other pedestrian and bicyclist infrastructure would be included to meet current design and ADA standards. At Golden Valley Road, the proposed BLRT Extension project would reconstruct the Golden Valley Road Bridge, including a bicycle/pedestrian facility that would connect to the planned Bassett Creek Regional Trail on the south side of Golden Valley Road. The proposed BLRT Extension project would also construct a trail connection underneath the reconstructed Golden Valley Road Bridge, providing a continuous off-road trail connecting Sochacki Park: Mary Hills Management Unit to TWRP. Maintenance of infrastructure associated with the operations of the proposed BLRT Extension project would be the responsibility of Metro Transit. Maintenance of other infrastructure (e.g., County Road bridges or regional park trails) would continue to be the responsibility of the respective owners of this infrastructure.
181Y	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		The City owns and maintains an asphalt trail in the Mary Hills Nature Area. This trail provides an important north-south connection from Golden Valley Road north into Robbinsdale via Sochacki Park. It is anticipated that a new Transitway may impact this trail and the City must be actively involved with any reconstruction or alignment of this trail. In addition, the City urges that the potential construction of a station at the Golden	The proposed BLRT Extension project would not have any long-term direct effects on the asphalt trail in Sochacki Park: Mary Hills Management Unit. As part of constructing the Golden Valley Road Station and the reconstruction of the Golden Valley Road bridge, the proposed BLRT Extension project would construct a trail providing a connection from an existing trail in TWRP, underneath the new bridge, to the existing trail in Sochacki Park: Mary Hills Management Unit. See Chapter 3 – Transportation of the Final EIS for a discussion of trails in the area of the Golden

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
							Valley Road location be done in a way that provides a trail connection between existing trails in Theodore Wirth Park and the Mary Hills Nature Area.	Valley Road Station and Chapter 8 – Amended Draft Section 4(f) and 6(f) Evaluation of the Final EIS for a discussion of the effects of the proposed BLRT Extension project on Section 4(f) resources, including resources near the Golden Valley Road Station.
181Z	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		The costs to reconstruct Golden Valley Road and the existing multi-modal facilities discussed above, in addition to any facilities deemed necessary to fully meet the anticipated needs, must be considered in the evaluation of the potential station location. The Final EIS should identify and pursue opportunities for a Hennepin County Community Works project related to the possible reconstruction of Hennepin County State Aid Highway (CSAH) 66. The project could work in conjunction with the proposed Bassett Creek Regional Trail, which is identified to be partially located within the CSAH 66 corridor.	Chapter 2 of the Final EIS provides a description of the proposed BLRT Extension project, including elements needed to support the safe and efficient function of the potential station location at Golden Valley Road. Proposed BLRT Extension project costs are summarized in Chapter 10 of the Final EIS and account for all elements of the proposed BLRT Extension project as defined and described in Chapter 2 of the Final EIS. Reconstructing Golden Valley Road is not included; however, the cost estimate does include reconstructing the portion of Golden Valley Road that includes the Golden Valley Road bridge and an extent on either side of the bridge needed to provide adequate connections to the existing roadway (see Appendix E of the Final EIS, which includes a set of proposed BLRT Extension project design plans).
181AA	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		The potential noise and vibration impacts from the Bottineau Transitway are a significant concern. While current and possible future freight rail traffic also create noise, it is different from noise associated with a regional transit system. These effects should be studied in greater detail. The City needs more information about the presences of potential sound walls and other barriers that may cause visual obstructions to surrounding properties.	The proposed BLRT Extension project's impacts on noise are summarized in Section 5.6 of the Final EIS. After the implementation of mitigation measures which include a noise barrier adjacent to Kewanee Way just north of Golden Valley Road, and interior testing in one home just south of Golden Valley Road, one moderate and one severe impact would remain. Vibration impacts are summarized in Section 5.7 of the Final EIS. There are no vibration impacts from proposed BLRT Extension project operations in the City of Golden Valley. The visual quality assessment for the proposed BLRT Extension project is presented in Section 4.5 of the Final EIS. Eight higher quality visual features were identified in the City of Golden Valley; the proposed BLRT Extension project would have a neutral impact on three, a potentially adverse impact on two, and an adverse impact on three. Mitigation for these impacts includes the potential visual screening of proposed BLRT Extension project elements.
181AA	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		Ways to incorporate natural buffers such as trees and other vegetative cover as well as natural boulder retaining walls should be considered.	The visual quality assessment for the proposed BLRT Extension project is presented in Section 4.5 of the Final EIS. Eight higher quality visual features were identified in the City of Golden Valley; the proposed BLRT Extension project would have a neutral impact on three, a potentially adverse impact on two, and an adverse impact on three. Mitigation for these impacts includes the potential visual screening of proposed BLRT Extension project elements. As design advances, the Council will develop visual quality guidelines, which will provide detail regarding visual screening requirements The Council will coordinate with the city of Golden Valley through a Design Resolution Team process to get input on these guidelines and on other proposed BLRT Extension project details, including vegetation restoration plans.
181AC	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		With high frequency transit service, the potential Transitway and transit station will have a visual impact on surrounding properties. Most notably will be the addition of lights and lighting that does not exist with the current freight rail. The effects of lighting must be studied and the screening of adjacent neighborhoods and park areas must be considered as part of this project.	The proposed BLRT Extension project's impacts on visual quality are summarized in Section 4.5 of the Final EIS. Eight higher quality visual features were identified in the City of Golden Valley; the proposed BLRT Extension project would have a neutral impact on three, a potentially adverse impact on two, and an adverse impact on three. Light emissions were included in the visual quality impact analysis and mitigation measures, including provisions for shielding lights to avoid "spillover" impacts, are included in the Final EIS.
181AD	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		The Final EIS should further assess the impacts to properties along the corridor and look for ways for the County and the Metropolitan Council to address any negative impacts, including pursuing funding opportunities for improvements to homes that are negatively impacted or possible acquisition of homes adjacent to the corridor for the purposes of mitigation.	Section 4.3 of the Final EIS summarizes acquisitions and displacements. The proposed BLRT Extension project would not displace any residential properties in the City of Golden Valley.
181AE	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		Additional research should be done in the area of station and corridor noise mitigation. The City requests the study of the option to produce a quiet zone throughout the corridor, including the station stops between 36th Avenue North in	The proposed BLRT Extension project's impacts on noise are summarized in Section 5.6 of the Final EIS. After the implementation of mitigation measures which include a noise barrier adjacent to Kewanee Way just north of Golden Valley Road, and interior testing in one home just south of Golden Valley Road, one moderate and

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
							Robbinsdale and Olson Memorial Highway in Golden Valley. This would include incorporating safe station train operation practices in order to eliminate the use of train bells or whistles while operating along the corridor and approaches into and departures from stations.	one severe impact would remain. The creation of a Quiet Zone is not possible in Golden Valley as there are no at-grade crossings shared by LRT and freight with other traffic. The noise analysis conducted to assess the potential impacts of the proposed BLRT Extension project was done using current Metro Transit operating assumptions, including the sound of audible warning devices at station platforms.
181AF	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		The proposed transitway and transit stations would likely require an increase in community resources, such as police, fire, public works maintenance, and traffic management. Since the proposed transit system is managed by the Metropolitan Council, it is anticipated that Metro Transit Police will be the primary law enforcement agency at the station.	The anticipated economic effects of the proposed BLRT Extension project are summarized in Section 4.6 of the Final EIS. Section 4.7 of the Final EIS addresses safety and security. Safety for rail users, area residents, local pedestrians and bicyclists, project construction workers, operators and vehicle occupants is an important consideration for the proposed BLRT Extension project. The framework for ensuring the highest level of safety to these groups will be established through conformance with the proposed BLRT Extension project site safety and health plan, construction contingency plan, the Council's SSMP and the Metro Transit Security and Emergency Preparedness plan. Transit operations in conformance with these plans will necessarily be closely and continuously coordinated with local area law enforcement, medical, fire, transportation and other organizations with related emergency responsibilities within the proposed BLRT Extension project corridor. However, Metro Transit Police will be the primary law enforcement agency at stations along the proposed BLRT Extension project.
181AG	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		The City of Golden Valley owns water main, sanitary sewer, and storm sewer facilities in the area of the proposed route. Some of these facilities parallel or cross under the existing BNSF Railway. The City requires more information about how these facilities might be impacted by the Transitway. Record drawings and other information are available in the City's engineering office to assist in the planning and design of the project. The City shall be consulted on all design and construction considerations and field decisions involving City-owned utilities. The City of Minneapolis owns a 48-inch water main which passes under the BNSF Railway north of Golden Valley Road and Metropolitan Council Environmental Services owns a large sanitary sewer interceptor which parallels the BNSF railway in Wirth Park. The City shall be consulted along with the custodial agency on all design and construction considerations and field decisions involving these utilities.	The proposed BLRT Extension project's effects on utilities are discussed in Section 5.1 of the Final EIS. Coordination with utility owners will continue throughout future phases of the proposed BLRT Extension project, including engineering, final design, and construction. The Council will coordinate with the city of Golden Valley through a Design Resolution Team process to obtain input on city-owned and other utilities in order to minimize impacts.
181AH	Harris	Mayor Shephard	City of Golden Valley	181	US Mail		It has been estimated that as many as fifteen Xcel Energy transmission line towers may need to be relocated as a result of the proposed Transitway. The City's Right-of-Way Ordinance currently requires that any proposed reconstruction, relocation, or replacement of overhead utility lines over 300 feet be buried underground. The Code requirement may apply to this situation.	The Council has been coordinating with Xcel Energy, whose transmission line towers are currently located on BNSF right-of-way by permit. Xcel would reconstruct these towers as part of the construction of the proposed BLRT Extension project; however, the towers would remain on BNSF right-of-way and would remain overhead lines. As such, they would not be subject to local (Golden Valley) permitting requirements.

Appendix G
Response to Draft EIS Comments

2 Response to Comments – Businesses

This page intentionally left blank

Crystal Wine and Spirits

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
86A	Charlson	Eric	Crystal Wine and Spirits	86	Email	4 – Social and Economic Effects	Their business is either going to be demolished or negatively impacted by the track crossing on Broadway.	Crystal Wine and Spirits has not been identified as a property requiring acquisition and/or displacement. Section 4.3 of the Final EIS summarizes acquisitions and displacements. Access to Crystal Wine and Spirits does not change with implementation of the proposed METRO Blue Line Light Rail Transit (BLRT) Extension project. Temporary access impacts during construction, if any, would be coordinated with business owners through a Construction Mitigation Plan that provides advance notice of closures, detours, alternate routes, and other construction effects.
86B	Charlson	Eric	Crystal Wine and Spirits	86	Email	4 – Social and Economic Effects and 8 – Transportation System Effects	Concerned about loss of traffic and how customers will access parking lot.	The proposed BLRT Extension project would not affect access to Crystal Wine and Spirits parking lot. Access to Crystal Wine and Spirits parking lot would be maintained during and after construction using the same configuration as currently in place.
86C	Charlson	Eric	Crystal Wine and Spirits	86	Email	2 – Fiscal Effects and Schedule	Trains are costly and ineffective mode of transportation because populations may disperse.	Light rail can have a positive impact on nearby business communities as transitways can provide a new connection for riders to access these businesses, and because pedestrian and vehicular traffic around stations and park-and-ride lots can increase. As an example, since 2009, the year before the Metropolitan Council's (Council) Green Line LRT (Central Corridor) construction started, the neighborhoods between the Downtown East Station in Minneapolis and the Union Depot Station in St. Paul have experienced more than $3 billion in commercial and residential development—including new construction, redevelopment, and expansion. In addition, businesses on the corridor prior to the Green Line's opening reinvested in their businesses and related community efforts to create distinctive districts around the stations (www.metrocouncil.org/News-Events/Transportation/Newsletters/Connections-ground-businesses,-arts-on-METRO-Green.aspx). Research has shown that major transit investments such as light rail generally yield positive effects on property values. There is the potential for an increase in property values in the areas surrounding proposed light rail stations, as light rail access can increase the convenience and desirability of nearby residential, commercial, and office properties. Light rail transit can also contribute to existing market forces that can increase the potential for transit-oriented development or redevelopment. Development and redevelopment are regulated by the cities and are predominantly driven by regional and local economic conditions and allowable land uses as defined in locally adopted comprehensive plans. However, light rail lines can advance the timing and increase the intensity of development, especially in areas near proposed stations, within the limits allowed by local comprehensive plans.
86D	Charlson	Eric	Crystal Wine and Spirits	86	Email	7 – Alternatives, Engineering and Design	Would rather see more energy efficient buses.	The Alternatives Analysis (AA) and Draft Environmental Impact Statement (EIS) process examined numerous alignment and mode options detailed in Chapter 2 of the Final EIS. During the AA process, bus and commuter rail modes were considered in addition to light rail transit (LRT). The bus alternative failed to move forward into the environmental review process because the bus mode would not attract as many riders as LRT and would have a worse cost-effectiveness index.

Marr-Don Apartment Building

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
105A	Forberg	Kathy	Marr-Don Apartments	105	Email	6 – Noise and Vibration Effects	Concerned about noise with track 17 to 25 feet from multifamily residential and train frequencies of 7.5 minutes.	The Marr-Don apartment building was assessed as a sensitive noise receptor because of residential use. Noise impacts have been assessed at sensitive locations throughout the proposed BLRT Extension project corridor consistent with Federal Transit Administration (FTA) methodology and impact criteria. Where impacts have been identified, mitigation measures consistent with Metro Transit's Regional Transitways Guidelines (March 2016) have been recommended. Mitigation measures adjacent to the Marr-Don apartment building include implementation of a Federal Railroad Administration (FRA) Quiet Zone and wayside devices at the West Broadway Avenue (County State-Aid Highway 103) crossing. A noise wall will also be constructed on the east side of the proposed BLRT Extension project alignment between West Broadway Avenue and Corvallis Avenue. However, since the noise wall cannot extend through the West Broadway Avenue crossing, there would be residual noise impacts. Nine of the 18 units in the Marr-Don apartment building would still experience severe noise impacts. Therefore, interior testing will be conducted to determine indoor noise levels, and assess the need for additional mitigation such as insulated windows. The proposed BLRT Extension project tracks would be located approximately 55 feet west of the Marr-Don apartment building, and trains are planned to run at 10-minute frequencies. Noise is discussed in Chapter 5 of the Final EIS.
105B	Forberg	Kathy	Marr-Don Apartments	105	Email	6 – Noise and Vibration Effects	Concerned about vibration with track 17 to 25 feet from multifamily residential and train frequencies of 7.5 minutes.	The Marr-Don property would not have any vibration or ground-borne noise impacts from the proposed BLRT Extension project. Vibration impacts have been assessed at sensitive locations throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. Where impacts have been identified, mitigation measures have been recommended. Vibration is discussed in Chapter 5 of the Final EIS.
105C	Forberg	Kathy	Marr-Don Apartments	105	Email	5 – Environmental Effects	Concerned about wind, dust, and pollution with track 17 to 25 feet from multifamily residential and train frequencies of 7.5 minutes.	The air quality analysis conducted for the proposed BLRT Extension project indicates that there would be no long-term air quality impacts from the operation of the proposed BLRT Extension project. During construction, temporary dust impacts could occur in windy, dry conditions. The Council will implement dust-control measures such as use of watering truck to minimize dust, covering truck beds when hauling dirt on or off site, and minimizing truck idling. Section 5.10 of the Final EIS addresses short- and long-term air quality impacts.
105D	Forberg	Kathy	Marr-Don Apartments	105	Email	4 – Social and Economic Effects	Concerned about lack of privacy and comfort of residents with track 17 to 25 feet from multifamily residential and train frequencies of 7.5 minutes.	The proposed BLRT Extension project track would be approximately 55 feet from the Marr-Don apartment building at its closest point. Trains are planned to run at 10-minute frequencies. The proposed noise wall will provide some level of visual screening.
105E	Forberg	Kathy	Marr-Don Apartments	105	Email	8 – Transportation System Effects	Concerned about safety and visibility at planned Broadway crossing near her multifamily property.	All at-grade LRT/freight rail crossings, including the West Broadway Avenue crossing, have been designed to incorporate safety elements including raised medians and gates with flashers. These elements will make it extremely difficult for any vehicles to enter the crossing when a train is approaching. Similar warning signs will be located at pedestrian crossings to warn of approaching trains.
105F	Forberg	Kathy	Marr-Don Apartments	105	Email	3 – NEPA Process and Public Involvement	Requests email updates; similar to #111	Community members can sign up for project email updates by providing an email address to BLRT Extension Project Office staff or by signing up on the website for the proposed BLRT Extension project at www.BlueLineExt.org.
105G	Forberg	Kathy	Marr-Don Apartments	105	US Mail	4 – Social and Economic Effects	Concerned about negative impacts to family business and negative effect on property value of investment	Property values are affected by a variety of market conditions. Research has shown that major transit investments such as light rail generally yield positive effects on property values. There is the potential for an increase in property values in the areas surrounding proposed light rail stations, as light rail access can increase the convenience and desirability of nearby residential, commercial, and office properties. Light rail transit can also contribute to existing market forces that can increase the potential for transit-oriented development or redevelopment. Development and redevelopment are regulated by the cities and are predominantly driven by regional and local economic conditions and allowable land uses as defined in locally adopted comprehensive plans. However, light rail lines can advance the timing and increase the intensity of development, especially in areas near proposed stations, within the limits allowed by local comprehensive plans. Continuing population growth and a strengthening of the local economy within the proposed BLRT Extension

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
								project corridor may contribute to redevelopment and increased property values. Business impacts from the proposed BLRT Extension project are anticipated to largely be temporary, and related to temporary construction closures and detours. These closures/detours will be communicated with business owners in advance of the construction activity. The Council has established a program for affected businesses to obtain relief from financial impacts caused by construction.

Allina Health

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
130A	Pence	Alison	Allina Health	130	Email	7 – Alternatives, Engineering and Design	Supports a station at Golden Valley Road and seeks that the station infrastructure is handicap accessible and friendly to those with complex disabilities.	Both the Plymouth Avenue and Golden Valley Road stations are included in the proposed BLRT Extension project scope and budget. All LRT infrastructure, including the vehicles and stations, will be designed and constructed in accordance with the current Americans with Disabilities Act (ADA) standards as applicable to the associated elements of the BLRT systems. For example, the crosswalks to and from all proposed station platforms (and access to and from park-and-ride facilities where available) will be ADA-compliant as will be the platform elements and the vehicles. Section 3.3 of the Final EIS includes information about pedestrian access to stations. The Council engages the ADA community in design of the pedestrian access, stations, and light rail vehicles. The Community Advisory Committee includes representatives from the ADA community, and the Council will present design elements to the Council's Transportation Accessibility Advisory Committee to seek feedback and provide input into design accessibility issues.

Target Corporation

Target Corporation sent a letter of support for the project. See Communication #159; see also Master Response 2.

Sawhorse, Inc.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
188A	Rothbauer	John	Sawhorse, Inc.	188	US Mail	8 – Transportation System Effects	Page 4-79 of Draft EIS states 17 on-street parking will be lost but this property owners states his business owns the parking spaces.	The statement in the Draft EIS about 17 on-street parking spaces being lost in Robbinsdale at the Sawhorse property was made in error and has been corrected in the Final EIS. Sawhorse is disclosed as a full acquisition and displacement in the Final EIS. See Section 4.3 of the Final EIS for information about acquisitions and displacements.
188B	Rothbauer	John	Sawhorse, Inc.	188	US Mail	4 – Social and Economic Effects	Property owner asked that his entire business be purchased for the project because of loss of adequate parking.	Sawhorse, located in Robbinsdale, is identified as a business displacement in the Final EIS. All property would be acquired in accordance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended. The Council is required to pay fair market value for property. Damages are determined by the appraiser on a parcel-by-parcel basis and will be included in the appraisal with the offer amount.

Response to Draft EIS Comments

3 Response to Comments – Civic and Community Organizations

This page intentionally left blank

Community Organizations: Verbal Testimony

Loppet Foundation

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
28A	Munger	John	Loppet Foundation	28	Verbal Testimony	5 – Environmental Effects	Concerns about the route through the park. They have been working with MPRB staff on these concerns.	The proposed METRO Blue Line Light Rail Transit (BLRT) Extension project would result in the permanent incorporation of approximately 2.1 acres of property from Theodore Wirth Regional Park (TWRP). During construction, approximately 9.2 acres of temporary construction easements would be required within TWRP to grade land around the proposed BLRT Extension project corridor, to provide access during construction, and to provide floodplain and wetland mitigation. A short segment of an existing north-south trail that parallels the west side of the rail corridor (a portion of the trail is located on the private rail corridor right-of-way) would be realigned along with a shift of an approximately 400-foot stretch of Bassett Creek as part of the replacement of the Plymouth Avenue Bridge. Access to the park would remain open throughout construction. All areas of the TWRP property that would be affected by proposed BLRT Extension project's construction activities would be restored to existing conditions or better and restoration plans would be developed and implemented in consultation with the Minneapolis Park and Recreation Board (MPRB). Chapter 8 of the Final Environmental Impact Statement (EIS) provides additional information about the proposed BLRT Extension project's impact to TWRP.
28B	Munger	John	Loppet Foundation	28	Verbal Testimony	5 – Environmental Effects	Concerned about impacts on trails and recreation.	There would be no permanent impacts to trails and recreational use in TWRP. The park would remain open throughout construction. A short segment of an existing north-south trail that parallels the west side of the rail corridor (a portion of the trail is located on the private rail corridor right-of-way) would be realigned along with a shift of an approximately 400-foot stretch of Bassett Creek as part of the replacement of the Plymouth Avenue Bridge. This work would require a temporary disruption to use of the trail during construction. Permanent enhancements to TWRP trails and recreation facilities include (in addition to the trail relocation above): construction of a stair access and bridge over Bassett Creek to connect the TWRP trail to Plymouth Avenue, construction of a trail connection between Theodore Wirth Parkway and Sochacki Park, and construction of a new trailhead incorporated into the Golden Valley Road Station park-and-ride. Chapter 8 of the Final EIS provides additional detail about the proposed enhancements to TWRP.
28C	Munger	John	Loppet Foundation	28	Verbal Testimony	7 – Alternatives, Engineering & Design	Strong opinion that if the line does go the Wirth Park route that we think there's a real opportunity to have a stop at Plymouth.	Both the Plymouth Avenue and Golden Valley Road stations are included in the proposed BLRT Extension project scope and cost estimate. The station at Plymouth Avenue provides an opportunity for North Minneapolis residents to access the light rail. The proposed BLRT Extension project would improve the transportation system by providing the proposed BLRT Extension corridor with more travel choices and faster travel times between residential areas, major destinations, and employment centers. Chapter 2 of the Final EIS presents a summary of the alternatives analysis conducted for the proposed BLRT Extension project and describes the location of all stations throughout the proposed BLRT Extension project corridor.
28D	Munger	John	Loppet Foundation	28	Verbal Testimony	7 – Alternatives, Engineering & Design	Having a station for Wirth Park could help support healthy communities, especially with health disparities in North Minneapolis	See response to Comment 28C.

Alliance for Metropolitan Stability

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
32A	Adams	Russ	Alliance for Metropolitan Stability	32	Verbal Testimony	3 – NEPA Process & Public Involvement	Compliments the staff on the Bottineau Project for improved community engagement strategies.	Chapter 9 of the Final EIS provides a summary of public involvement for the Final EIS, including a summary of open houses held during Final EIS preparation. The Council engages and will continue to engage the public in the preliminary engineering process and into construction. The Council staff will be key in notifying businesses and residents of construction plans, road closures and bus re-routes as well as being a point of contact for construction related emergencies such as power outages. The outreach program provides many avenues for people to submit comments and concerns, which are forwarded to the planners and engineers.
32B	Adams	Russ	Alliance for Metropolitan Stability	32	Verbal Testimony	4 – Social and Economic Effects	The Bottineau Corridor is an environmental justice corridor and connects two significant EJ populations in Minneapolis and Brooklyn Park.	The study area for the environmental justice (EJ) analysis documented 18.70 percent of the population below the poverty level and 48.40 percent of the study area population as minority groups. The proposed BLRT Extension project would benefit both EJ and non-EJ communities with reliable and higher-capacity service for transit riders, improved pedestrian and bicycle connections and access, and no permanent residential property displacements. The full list of community benefits can be found in Section 7.5 of the Final EIS. The Metropolitan Council (Council) engaged members of the Blue Line Coalition during the Final EIS development phase to better understand their concerns based on this comment in the Draft EIS and also conducted public outreach to identify additional EJ populations in the proposed BLRT Extension project corridor. The Council will continue to work with the Blue Line Coalition and conduct direct outreach to EJ populations as design advances. The Council has been has been working with Hennepin County on the Station Area Planning (SAP) efforts at each station, incorporating community input into the considerations of land uses, types of development, and other strategies to address neighborhood concerns and ensure that the investments have benefits to the local communities.
32C	Adams	Russ	Alliance for Metropolitan Stability	32	Verbal Testimony	4 – Social and Economic Effects	Wants to develop a community compact for Bottineau similar to the one that was developed for SW that would have very specific equitable commitments by all governmental parties. Hands out copy of “Equity Commitments for SWRLT Community Compact.”	The Council has developed a comprehensive public engagement process that has proven to be effective at addressing community concerns. The proposed Blue Line Extension project has included the use of advisory committees, including: ■ Corridor Management Committee (CMC) that includes a representatives from each City Council along the alignment, Hennepin County, Business Advisory Committee (BAC) chair, Community Advisory Committee (CAC) chair, and two community organization members. This group meets monthly and provides recommendations to the Council on project decisions. ■ CAC that includes neighborhood and community representatives and discusses topics of concern or interest to the community such as safety, noise impacts, station location and design, and accessibility features. ■ BAC that includes business and chamber representatives and discusses topics of concern or interest to the business community such as access, construction impacts, station location and design. ■ Transportation Accessibility Advisory Committee is a formal advisory committee of the Council that provides input and advice on concerns and interests to the Americans with Disabilities Act (ADA) community including accessibility, station design, and pedestrian features. Members of this advisory committee serve on the CAC and BAC and have also participated in station design workshops to provide feedback on station features to ensure that they take into consideration use by those with limited vision, mobility or hearing. In addition to these formal advisory committees, the Council has conducted outreach and public engagement activities such as open houses, workshops and walking tours to seek public input on the design of the proposed BLRT Extension project. This approach to community engagement has proven effective on other Twin Cities transit projects, including the Blue Line (Hiawatha LRT) and Green Line (Central Corridor); therefore, a community compact was not necessary and was not created.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
32D	Adams	Russ	Alliance for Metropolitan Stability	32	Verbal Testimony	4 – Social and Economic Effects	Wants to raise the goal on hiring for construction to 40% and make it easier for disadvantaged business enterprises to contract; use ZIP code employment goals for North MPLS.	The Council has an established Disadvantaged Businesses Enterprises (DBE) program and includes specific goals in project contracts to increase participation by minority and women owned businesses. The Council has set a 3-year DBE goal of 15.5 percent for federal fiscal years 2013–2016. In addition to the DBE goal, the construction contracts would have a workforce goal for both minority and women workers. An additional equal opportunity (EO) consultant would be assigned to support these efforts when it gets closer to construction. To assist in achieving the DBE and workforce goals, the Council's EO and the Council's outreach and communication staff would hold workshops and networking mixers and attend events to inform people of employment and contracting opportunities. Other communication strategies would be used including social media, the BlueLineExt.org website, newsletters, and articles.

Transit for Livable Communities

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
76A	Thoman	Barb	Transit for Livable Communities	76	Verbal Testimony	7 – Alternatives, Engineering & Design	The Bottineau Project is a really important link in an expanded transit system. The project, along with 2 arterial rapid bus, more express bus service, more local service, and additional rail lines are greatly needed in this region.	See Master Response 2 in Section G.4.1 of Appendix G of the Final EIS.

Community Organizations: Written Comments

North Hennepin Community College

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
108A	Barnier	Richard	Student Senate President, North Hennepin Community College	108	Email	7 – Alternatives, Engineering & Design	Having light rail access or increased access to public transit is something that students feel is very important to the college and the community. With the incredible growth in Brooklyn Park coupled with increasing demand for education, this rail project would be a natural step in improving our community. The final idea I would introduce is the opportunity cost of less transit options. It takes a ton of time to ride the bus, transfer and actually get where you need to be. By having light rail and other expanded transportation options, we increase the opportunity capital of the students using these services. This means more time to work, raise a family or just study. I'm glad that this project continues to be considered and hope we can move from planning to implementation soon. The students, our future, depend on it.	See Master Response 2 in Section G.4.1 of Appendix G of the Final EIS.
108B	Davis	Tarsha	Student, North Hennepin Community College	108	Email	7 – Alternatives, Engineering & Design	wants stop at NHCC.	The proposed BLRT Extension project would include a station at North Hennepin Community College. The 85th Avenue Station in Brooklyn Park would be located immediately to the West of the North Hennepin Community College Campus on West Broadway Avenue (County State-Aid Highway 103). Chapter 2 of the Final EIS describes the proposed BLRT Extension project including the location of all stations.
108C	Pugh	Audua	Student, North Hennepin Community College	108	Email	8 – Transportation System Effects	LRT would be improvement over current bus options to reach the campus. I know some students that have dropped out of school because it's difficult to get to NHCC on public transportation.	See Master Response 2 in Section G.4.1 of Appendix G of the Final EIS.
109A	Larson	Lisa	Interim President, North Hennepin Community College	109	Email	7 – Alternatives, Engineering & Design	Supports the LRT, specifically B-C-D1 alternative. The project provides students access to North Hennepin Community College. Minneapolis residents can consider NHCC to pursue their educational or training needs. We believe this project will provide improved options, travel time and access. The project provides the opportunity for students and staff to take this as a transportation option rather than their own vehicle. The project provides access to employment opportunities for our students.	See Master Response 2 in Section G.4.1 of Appendix G of the Final EIS.

Alliance for Metropolitan Stability

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
131A	Vanhala	Joan	Alliance for Metropolitan Stability	131	Email	4 – Social and Economic Effects	Bottineau LRT corridor is 52% people of color and 14% are transit dependent. Bottineau Corridor connects 2 significant environmental justice communities to our regional transitway system – Brooklyn Park and North Minneapolis. It is Important that the transit investment, the corresponding land use and economic development has community benefits for the low income communities and communities of color in the corridor have formed the Blue Line Coalition to secure community benefits for environmental justice communities in the Bottineau Corridor.	The study area for the EJ analysis documented 18.70 percent of the population below the poverty level and 48.40 percent of the study area population as minority groups. The proposed BLRT Extension project would benefit both EJ and non-EJ communities with reliable and higher-capacity service for transit riders, improved pedestrian and bicycle connections and access, and no permanent residential property displacements. The full list of community benefits can be found in Section 7.5 of the Final EIS. The Council engaged members of the Blue Line Coalition during the Final EIS development phase to better understand their concerns based on this comment in the Draft EIS and also conducted public outreach to identify additional EJ populations in the proposed BLRT Extension project corridor. The Council will continue to work with the Blue Line Coalition and conduct direct outreach to EJ populations as design advances. The Council has been has been working with Hennepin County on the SAP efforts at each station, incorporating community input into the considerations of land uses, types of development, and other strategies to address neighborhood concerns and ensure that the investments have benefits to the local communities.
131B	Vanhala	Joan	Alliance for Metropolitan Stability	131	Email	3 – NEPA Process & Public Involvement	AMS recommends a corridor wide community compact similar to the Red Line Community Compact in Baltimore. The community compact process should model best practices in community engagement and be a partnership between Metro Transit, Hennepin County, the cities, and the environmental justice communities within the Bottineau LRT corridor.	The Council has developed a comprehensive public engagement process that has proven to be effective at addressing community concerns. The Blue Line Extension project has included the use of advisory committees, including: ■ CMC that includes a representatives from each City Council along the alignment, Hennepin County, BAC chair, CAC chair, and two community organization members. This group meets monthly and provides recommendations to the Council on project decisions. ■ CAC that includes neighborhood and community representatives and discusses topics of concern or interest to the community such as safety, noise impacts, station location and design, and accessibility features. ■ BAC that includes business and chamber representatives and discusses topics of concern or interest to the business community such as access, construction impacts, station location and design. ■ Transportation Accessibility Advisory Committee is a formal advisory committee of the Council that provides input and advice on concerns and interests to the ADA community including accessibility, station design, and pedestrian features. Members of this advisory committee serve on the CAC and BAC and have also participated in station design workshops to provide feedback on station features to ensure that they take into consideration use by those with limited vision, mobility or hearing. In addition to these formal advisory committees, the Council has conducted outreach and public engagement activities such as open houses, workshops and walking tours to seek public input on the design of the proposed BLRT Extension project. This approach to community engagement has proven effective on other Twin Cities transit projects, including the Blue Line (Hiawatha LRT) and Green Line (Central Corridor); therefore, a community compact was not necessary and was not created.
131C	Vanhala	Joan	Alliance for Metropolitan Stability	131	Email	4 – Social and Economic Effects	The environmental justice communities' resources have not been adequately documented in the draft environmental impact statement. Just along HWY 55 there are schools, libraries, public housing, and churches. To truly understand the impacts, the corridor environmental justice community resources need to be documented and included in the planning process. This includes businesses, schools, churches, libraries, community centers, social service agencies and non profits.	The framework for the EJ evaluation incorporated in Chapter 7 of the Final EIS is based on Federal Transit Administration (FTA) Circular 4703.1, which outlines a methodology that addresses Executive Order 12898 that includes both a robust public participation process and an analytical process that includes three basic steps: (1) Determine whether there are EJ populations potentially affected by the project; (2) If EJ populations are present, consider the potential effects of the project on the EJ population, including any disproportionate high and adverse effects; (3) Determine whether any adverse effect could be avoided, minimized, or mitigated. Chapter 7 of the Final EIS also lists organizations where outreach efforts were targeted to further identify EJ communities. The Council engaged members of the Blue Line Coalition during the Final EIS development phase to better understand their concerns based on

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
								this comment in the Draft EIS and also conducted public outreach to identify additional EJ populations in the proposed BLRT Extension project corridor. This resulted in adding additional organizations, such as Summit Academy OIC into the Final EIS.
131D	Vanhala	Joan	Alliance for Metropolitan Stability	131	Email	4 – Social and Economic Effects	A very important environmental justice community resource has no mention in the draft environmental impact statement. Located directly adjacent to the Van White Station, Summit Academy OIC is the only community-based vocational training and job placement program in North Minneapolis. Summit Academy OIC should be engaged as a partner for hiring construction workers for the Bottineau LRT project and physical impacts to their site at the Van White Station during construction, station location, infrastructure investments for Summit OIC students access to the Bottineau LRT and the regional system.	The Council has implemented a comprehensive public outreach program that has engaged nearby communities and underrepresented groups, including the Summit Academy OIC. Coordination with these groups, including the Summit Academy OIC will continue throughout the course of the proposed BLRT Extension project. The Council has met with Summit Academy OIC leadership to discuss future construction hiring needs for the proposed BLRT Extension and Green Line LRT Extension projects. The Council engaged members of the Blue Line Coalition during the Final EIS development phase to better understand their concerns based on this comment in the Draft EIS and also conducted public outreach to identify additional EJ populations in the proposed BLRT Extension project corridor. This resulted in adding additional organizations, such as Summit Academy OIC into the Final EIS.
131E	Vanhala	Joan	Alliance for Metropolitan Stability	131	Email	3 – NEPA Process & Public Involvement	Recommends that the Blue Line Extension Community Advisory Committee: a) Be a community driven body with staff support. b) Be a resource and check point for community engagement by reviewing and approving a corridor project community engagement plans. c) Identify issues and assign problem solving teams that include community members and project staff. d) Elect a representative member on the transitway corridor policy advisory committee/management committee. e) Be formed early in the scoping phase of the transitway corridor planning process. f) Membership will be selected by communities they represent. g) Elect a chairperson who represents a grassroots community. h) Have the ability to set their own agenda, pass motions, and make recommendations to the corridor policy advisory committee/management committee. i) Will be combined with Business Advisory Committees ensuring coordinated issues and efforts. j) CE Steering committee will support project staff with connections to underrepresented groups i.e.: Faith communities; Cultural communities; Place based groups; Communities of color ; Small and Ethnic businesses; Community Engagement Steering Committee members; Disability community; New immigrant communities; Low-income communities; Students at high schools, community colleges k) Orientation will include a focus on environmental justice, equitable development, and cultural awareness. l) Construction Communication Committees set up at least one month in advance of construction, with representatives appointed by community groups.	Section 9.2.1.4 of the Final EIS details the establishment of the CAC, which serves as a voice for the community and advises the CMC during the planning and implementation phases of the light rail line. The CAC has met on an approximately monthly basis to advise the proposed BLRT Extension project team. CAC meeting summaries and membership can be found on the website for the proposed BLRT Extension project, www.BlueLineExt.org. The Council formed the CAC by asking each city to designate representatives as well as inviting community based organizations to appoint members. The CAC comprises representatives from the Transportation Accessibility Advisory Committee; Masjid An-Nur; MICAH; the Asian Economic Development Association; the cities of Brooklyn Park, Crystal, Golden Valley, Minneapolis, and Robbinsdale; and MPRB. The first CAC meeting was held jointly with the BAC in April 2015. At that meeting, members were asked about their top concerns and topics that they were most interested in discussing. The BLRT Extension Project Office staff also presented an overview of the outreach plan and types of activities. Another joint meeting with the BAC was held in October to review and recommend a revised project scope. In addition to the CAC, the Council added two grassroots representatives from the Blue Line Coalition as members of the CMC. The Blue Line Coalition is a community-based group working to advance local and regional equity and community health along the Blue Line corridor. The CAC and BAC would transition to smaller Construction Communication Committees for each city when it gets closer to construction.
131F	Vanhala	Joan	Alliance for Metropolitan Stability	131	Email	4 – Social and Economic Effects	Because of the overlapping transitway corridors and planning areas, AMS is recommending coordinated planning across these transit projects by Metro Transit, Hennepin County, and the City of Minneapolis.	Planning for the proposed BLRT Extension project involved extensive outreach and coordination with the affected public, agencies, and key stakeholders. Key stakeholder outreach activities conducted during EIS Scoping and the development of the EIS are summarized in Section 9.2 of the Final EIS. Stakeholder advisory committees included staff from the Council, Hennepin County, Metro Transit, the proposed BLRT Extension project corridor municipalities, and several others.
131G	Vanhala	Joan	Alliance for Metropolitan	131	Email	8 – Transportation	Olson Memorial Highway/HWY 55 is currently not pedestrian friendly or safe. The Bottineau LRT project has the potential to provide the	Chapter 3 – Transportation of the Final EIS addresses improvements to Olson Memorial Highway (Trunk Highway 55). Two stations would provide access to the communities

			Stability			System Effects	opportunity to reconstruct this corridor to be safe and welcoming for pedestrians and bikes with traffic calming strategies. Special attention should be given to redesigning HWY 55 with safe and livable crossing connections for pedestrians and bicycles. HWY 55 currently is a barrier within this environmental justice community. The Bottineau LRT project has the potential to exacerbate this barrier.	along the highway: Penn Avenue Station and Van White Boulevard Station. While a six-lane roadway would be maintained, the lane widths would be reduced to 11 feet to accommodate pedestrian crossing length. The design speed and posted speed limit would be reduced to 35 miles per hour (mph) (from 40 mph). Existing sidewalks would be replaced with 6-foot-wide sidewalks on the north and south sides of the highway. Pedestrian refuges would be added in the median of the highway. ADA-compliant pedestrian crossings of Olson Memorial Highway would be facilitated by proposed signalized intersections at Bryant Avenue North, Van White Boulevard, Humboldt Avenue, James Avenue, Morgan Avenue, midblock between Newton Avenue and Oliver Avenue, Penn Avenue, Russell Avenue, and Thomas Avenue. The proposed BLRT Extension project would provide space on the north side of Olson Memorial Highway for a 10-foot two-way cycle track (to be constructed by others) between Thomas Avenue and Van White Memorial Boulevard. The proposed BLRT Extension project would construct a multi-use trail on the north side of the reconstructed westbound Olson Memorial Highway bridge.
131H	Vanhala	Joan	Alliance for Metropolitan Stability	131	Email	8 – Transportation System Effects	Recommends study on viability of new bus circulator in North Minneapolis and upgrades to bus shelters and transfer stations.	The Draft Feeder Bus Plan for the year 2040 includes a proposed Route 26 that would connect to the Penn Avenue and Van White Boulevard stations, circulating through North Minneapolis. The proposed bus network would be refined with input from the public prior to the proposed BLRT Extension project opening day. Additionally, planning for the C Line, Bus Rapid Transit along Penn Avenue began in 2013. The C Line would connect residents of North Minneapolis, near Penn Avenue, to BLRT stations, METRO Green Line stations, Brooklyn Center, and to downtown Minneapolis. Metro Transit has been working with the community on Better Bus Stops through a Ladders of Opportunity Grant from FTA. The goal is to add up to 150 shelters and improve an additional 75 existing shelters as part of the agency's work. For more information, visit this website: www.metrotransit.org/better-bus-stops.
131I	Vanhala	Joan	Alliance for Metropolitan Stability	131	Email	4 – Social and Economic Effects	Throughout the Bottineau Corridor there are environmental justice small businesses. Every effort should be made to maximize the benefit and minimize the impacts of the project on these entrepreneurs.	Chapter 7 of the Final EIS includes additional discussion and analysis of the benefits of the proposed BLRT Extension project to the EJ communities, in addition to the evaluation of potential impacts. Ten business operations would be displaced as a part of the proposed BLRT Extension project. These businesses would be relocated in accordance with the Uniform Relocation Act and compensated by payment of fair market value for their property. Five of these business operations are considered EJ businesses, either serving EJ populations or are owned by minority or low income people. The Council would also provide information to the communities where businesses would be displaced about the businesses' new locations and/or other options to meet their needs. In addition, the Council has been engaged in an extensive outreach effort with various stakeholders along the proposed BLRT Extension project corridor, including local business operators that may be impacted by the proposed BLRT Extension project to receive insight into daily operations and develop strategies to minimize impacts. To mitigate impacts on businesses during construction, the Council will develop a Construction Mitigation Plan, a Construction Communication Plan, and a construction staging plan. These tools will help the Council notify businesses and patrons in advance about any access issues or closures. The construction staging plan will also help businesses and patrons affected by LRT construction understand when construction would occur in different areas of the proposed BLRT Extension project corridor. Finally, a 24-hour construction hotline will be available for issue resolution and information about LRT construction.
131J	Vanhala	Joan	Alliance for Metropolitan Stability	131	Email	4 – Social and Economic Effects	Displacement is currently a real issue in the Bottineau LRT Corridor. The Northwest suburbs face inevitable displacement of privately owned affordable housing in the station areas. Cities in the corridor, Hennepin County and the Met Council commit to working with local neighborhood associations, private and community nonprofit housing developers to fund the maintenance and preservation of a rich balance of housing choices that are affordable for current and future	Displacement is a significant impact, and the proposed BLRT Extension project has proactively avoided these impacts since the release of the Draft EIS. The evaluation of Alignments D1 and D2 considered several environmental and social issues and impact areas, and the selection of Alignment D1 for the proposed BLRT Extension project avoids impacts to the north Minneapolis neighborhood, including the large number of displacements. Moreover, since publication of the Draft EIS, modifications to the preliminary design have resulted in the avoidance of any residential property

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
							residents and workers. Each city should establish goals to develop mixed-income communities.	displacements with the proposed BLRT Extension project. The Council has been has been working with Hennepin County on the SAP efforts at each station, incorporating community input into the considerations of land uses, types of development, and other strategies to address neighborhood concerns and ensure that the investments promote growth and have benefits to the local communities. Section 4.1 of the Final EIS summarizes land use plan compatibility. The proposed BLRT Extension project would displace five businesses that may serve the EJ community. Therefore, the proposed BLRT Extension project would have a disproportionately high and adverse impact on EJ communities currently served by these businesses in Robbinsdale, Crystal, and Brooklyn Park. Chapter 7 – Environmental Justice of the Final EIS discusses this in more detail. The specific businesses cited that likely have a predominantly minority and/or low-income clientele include: Northside Oriental Market; American Furniture Mart; Unified Staffing, Inc. (tenant of Schrader Building); Hart Custom Homes (owner and tenant of Schrader Building); and Brianna's Hair Studio (tenant of Schrader Building). For impacts to the communities served by the displaced businesses, the Council shall provide notices to the affected EJ community with the business' new location (if a suitable relocation was identified) with transit options to access the new business location, and/or other options to meet their needs.
131K	Vanhala	Joan	Alliance for Metropolitan Stability	131	Email	4 – Social and Economic Effects	AMS recommends that Metro Transit/Hennepin County develop a system that connects job seekers with employment and entrepreneurial opportunities throughout the Bottineau corridor. A system should be developed to ensure people of color have opportunities to secure employment with the Bottineau project.	The Council has an established DBE program and includes specific goals in project contracts to increase participation by minority and women owned businesses. The Office of Equal Opportunity has an EO consultant designated to the proposed BLRT Extension project to conduct outreach and monitor progress towards meeting those goals. The Council has set a 3-year DBE goal of 15.5 percent for federal fiscal years 2013–2016. In addition to the DBE goal, the construction contracts would have a workforce goal for both minority and women workers. An additional EO consultant would be assigned to support these efforts when it gets closer to construction. To assist in achieving the DBE and workforce goals, the Council's EO and the Council's outreach and communication staff would hold workshops and networking mixers and attend events to inform people of employment and contracting opportunities. Other communication strategies would be used including social media, the BlueLineExt.org website, newsletters, and articles.
131L	Vanhala	Joan	Alliance for Metropolitan Stability	131	Email	4 – Social and Economic Effects	Brooklyn Park will have 5 stations on the Bottineau LRT line. The city of Brooklyn Park is 50% people of color. Through the Community Engagement team the Alliance is working with 6 environmental justice community groups in the Northwest suburbs. They will continue to be active partners in the development of the Bottineau Transitway project and corridor.	The Council will continue to work closely with the city of Brooklyn Park, the Blue Line Coalition, and EJ populations located in Brooklyn Park throughout the Engineering phase of the proposed BLRT Extension project. Station design, which would happen during the Engineering phase of the proposed BLRT Extension project, would incorporate pedestrian and bike amenities and would be ADA-compliant. The Council has been has been working with Hennepin County on the SAP efforts at each station, incorporating community input into the considerations of land uses, types of development, and other strategies to address neighborhood concerns and ensure that the investments have benefits to the local communities.

Asian Media Access (and Twin Cities Regional Center)

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
133A	Hwang	Ange	Asian Media Access	133	Email	4 – Social and Economic Effects	Bottineau LRT corridor is 52% people of color and 14% are transit dependent. Bottineau Corridor connects 2 significant environmental justice communities to our regional transitway system – Brooklyn Park and North Minneapolis. It is important that the transit investment, the corresponding land use and economic development has community benefits for the low income communities and communities of color in the corridor. Have formed the Blue Line Coalition to secure community benefits for environmental justice communities in the Bottineau Corridor.	The study area for the EJ analysis documented 18.70 percent of the population below the poverty level and 48.40 percent of the study area population as minority groups. The proposed BLRT Extension project would benefit both EJ and non-EJ communities with reliable and higher-capacity service for transit riders, improved pedestrian and bicycle connections and access, and no permanent residential property displacements. The full list of community benefits can be found in Section 7.5 of the Final EIS. The Council engaged members of the Blue Line Coalition during the Final EIS development phase to better understand their concerns based on this comment in the Draft EIS and also conducted public outreach to identify additional EJ populations in the proposed BLRT Extension project corridor. The Council will continue to work with the Blue Line Coalition and conduct direct outreach to EJ populations as design advances. The Council has been has been working with Hennepin County on the SAP efforts at each station, incorporating community input into the considerations of land uses, types of development, and other strategies to address neighborhood concerns and ensure that the investments have benefits to the local communities.
133B	Hwang	Ange	Asian Media Access	133	Email	4 – Social and Economic Effects	Recommends a corridor wide community compact similar to the Red Line Community Compact in Baltimore. The community compact process should model best practices in community engagement and be a partnership between Metro Transit, Hennepin County, the cities, and the environmental justice communities within the Bottineau LRT corridor.	The Council has developed a comprehensive public engagement process that has proven to be effective at addressing community concerns. The Blue Line Extension project has included the use of advisory committees, including: ■ CMC that includes a representatives from each City Council along the alignment, Hennepin County, BAC chair, CAC chair, and two community organization members. This group meets monthly and provides recommendations to the Council on project decisions. ■ CAC that includes neighborhood and community representatives and discusses topics of concern or interest to the community such as safety, noise impacts, station location and design, and accessibility features. ■ BAC that includes business and chamber representatives and discusses topics of concern or interest to the business community such as access, construction impacts, station location and design. ■ Transportation Accessibility Advisory Committee is a formal advisory committee of the Council that provides input and advice on concerns and interests to the ADA community including accessibility, station design, and pedestrian features. Members of this advisory committee serve on the CAC and BAC and have also participated in station design workshops to provide feedback on station features to ensure that they take into consideration use by those with limited vision, mobility or hearing. In addition to these formal advisory committees, the Council has conducted outreach and public engagement activities such as open houses, workshops and walking tours to seek public input on the design of the proposed BLRT Extension project. This approach to community engagement has proven effective on other Twin Cities transit projects, including the Blue Line (Hiawatha LRT) and Green Line (Central Corridor); therefore, a community compact was not necessary and was not created.
133C	Hwang	Ange	Asian Media Access	133	Email	4 – Social and Economic Effects	The environmental justice communities' resources have not been adequately documented in the draft environmental impact statement. Just along HWY 55 there are schools, libraries, public housing, and churches. To truly understand the impacts, the corridor environmental justice community resources need to be documented and included in the planning process. This includes businesses, schools, churches, libraries, community centers, social service agencies and non profits.	The framework for the EJ evaluation incorporated in Chapter 7 of the Final EIS is based on FTA Circular 4703.1, which outlines a methodology that addresses Executive Order 12898 that includes both a robust public participation process and an analytical process that includes three basic steps: (1) Determine whether there are EJ populations potentially affected by the project; (2) If EJ populations are present, consider the potential effects of the project on the EJ population, including any disproportionate high and adverse effects; (3) Determine whether any adverse effect could be avoided, minimized, or mitigated. Chapter 7 of the Final EIS lists organizations where outreach efforts were targeted to further identify EJ communities. The Council engaged members of the Blue Line Coalition during the Final EIS development phase to better understand their concerns based on this comment in the Draft EIS and also conducted

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
								public outreach to identify additional EJ populations in the proposed BLRT Extension project corridor. This resulted in adding additional organizations, such as Summit Academy OIC into the Final EIS. The proposed BLRT Extension project would displace five businesses that may serve the EJ community. Therefore, the proposed BLRT Extension project would have a disproportionately high and adverse impact on EJ communities currently served by these businesses in Robbinsdale, Crystal, and Brooklyn Park. Chapter 7 of the Final EIS discusses this in more detail. The specific businesses cited that likely have a predominantly minority and/or low-income clientele include: Northside Oriental Market; American Furniture Mart; Unified Staffing, Inc. (tenant of Schrader Building); Hart Custom Homes (owner and tenant of Schrader Building); and Brianna's Hair Studio (tenant of Schrader Building). For impacts to the communities served by the displaced businesses, the Council shall provide notices to the affected EJ community with the business' new location (if a suitable relocation was identified) with transit options to access the new business location, and/or other options to meet their needs. Section 4.2 of the Final EIS summarizes community facilities documented and analyzed as part of the proposed BLRT Extension project. This includes schools, churches, libraries, community centers, social service agencies and non-profits. No mitigation measures are warranted for long-term neighborhood and community impacts, because the effectiveness of mitigation measures identified for specific environmental categories (including but not limited to noise, vibration, visual quality and aesthetics, transit, roadways and traffic, parking, and pedestrian and bicyclist considerations) would prevent adverse impacts.
133D	Hwang	Ange	Asian Media Access	134	Email	5 – Social and Economic Effects	No mention of minorities community-based agencies in North Minneapolis	Asian Media Access was identified in the Draft EIS as an EJ organization. The Final EIS also includes Asian Media Access as an EJ organization. The full list of organizations included in the Final EIS can be found in Chapter 7.
133E	Hwang	Ange	Asian Media Access	135	Email	6 – Social and Economic Effects	Recommend that BLRT Extension project planners contract directly with community groups for future engagement.	For the proposed BLRT Extension project, the Council has implemented a comprehensive public outreach program that has engaged nearby communities and underrepresented groups in the proposed BLRT Extension project design and engineering process. This includes appointing two voting members to the CMC that represent the Blue Line Coalition (a community-based group working to advance local and regional equity and community health along the Blue Line corridor). The Council has also established a BAC and CAC to seek public input and advise the CMC and the Council. The Council will continue to engage community groups directly and via local/ neighborhood-based media to inform on project progress.
133F	Hwang	Ange	Asian Media Access	133	Email	4 – Social and Economic Effects	Because of the overlapping transitway corridors and planning areas, AMS is recommending coordinated planning across these transit projects by Metro Transit, Hennepin County, and the City of Minneapolis.	Planning for the proposed BLRT Extension project involved extensive outreach and coordination with the affected public, agencies, and key stakeholders. Key stakeholder outreach activities conducted during EIS Scoping and the development of the EIS are summarized in Section 9.2 of the Final EIS. Stakeholder advisory committees included staff from the Council, Hennepin County, Metro Transit, the proposed BLRT Extension project corridor municipalities, and several others.
133G	Hwang	Ange	Asian Media Access	133	Email	8 – Transportation System Effects	Olson Memorial Highway/HWY 55 is currently not pedestrian friendly or safe. The Bottineau LRT project has the potential to provide the opportunity to reconstruct this corridor to be safe and welcoming for pedestrians and bikes with traffic calming strategies. Special attention should be given to redesigning HWY 55 with safe and livable crossing connections for pedestrians and bicycles. HWY 55 currently is a barrier within this environmental justice community. The Bottineau LRT project has the potential to exacerbate this barrier.	Chapter 3 – Transportation of the Final EIS addresses improvements to Olson Memorial Highway. Two stations would provide access to the communities along the highway: Penn Avenue Station and Van White Boulevard Station. While a six-lane roadway would be maintained, the lane widths would be reduced to 11 feet to accommodate pedestrian crossing length. The design speed and posted speed limit would be reduced to 35 mph (from 40 mph). Existing sidewalks would be replaced with 6-foot-wide sidewalks on the north and south sides of the highway. Pedestrian refuges would be added in the median of the highway. Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
								(to be constructed by others) between Thomas Avenue and Van White Memorial Boulevard. The proposed BLRT Extension project would construct a multi-use trail on the north side of the reconstructed westbound Olson Memorial Highway bridge, providing connections to the Luce Line Trail and to trails within TWRP.
133H	Hwang	Ange	Asian Media Access	133	Email	4 – Social and Economic Effects	Throughout the Bottineau Corridor there are environmental justice small businesses. Every effort should be made to maximize the benefit and minimize the impacts of the project on these entrepreneurs.	Chapter 7 of the Final EIS includes additional discussion and analysis of the benefits of the proposed BLRT Extension project to the EJ communities, in addition to the evaluation of potential impacts. Ten business operations would be displaced as a part of the proposed BLRT Extension project. These businesses would be relocated in accordance with the Uniform Relocation Act and compensated by payment of fair market value for their property. Five of these business operations are considered EJ businesses, either serving EJ populations or are owned by minority or low income people. The Council would also provide information to the communities where businesses would be displaced about the businesses' new locations and/or other options to meet their needs. In addition, the Council has been engaged in an extensive outreach effort with various stakeholders along the proposed BLRT Extension project corridor, including local business operators that may be impacted by the proposed BLRT Extension project to receive insight into daily operations and develop strategies to minimize impacts. To mitigate impacts on businesses during construction, the Council will develop a Construction Mitigation Plan, a Construction Communication Plan, and a construction staging plan. These tools will help the Council notify businesses and patrons in advance about any access issues or closures. The construction staging plan will also help businesses and patrons affected by LRT construction understand when construction would occur in different areas of the proposed BLRT Extension project corridor. Finally, a 24-hour construction hotline will be available for issue resolution and information about LRT construction.
133I	Hwang	Ange	Asian Media Access	133	Email	4 – Social and Economic Effects	Land use planning and zoning reviews should be conducted with neighbors and business owners.	Local municipalities have land use controls available to them in the form of comprehensive plans guiding land use and city zoning codes guiding development. Overall, the proposed BLRT Extension project would be compatible with the local comprehensive plans, land use and other planning policies of the cities of Minneapolis, Golden Valley, Robbinsdale, Crystal, and Brooklyn Park. Although the city of Golden Valley's comprehensive plan does not specifically mention the proposed BLRT Extension project, LRT would be compatible with the transit goal and objective of the city's comprehensive plan. The Council does not have local land use planning jurisdiction, which is why the compatibility with local jurisdiction land use plans is an important component to the environmental impact analysis. The proposed BLRT Extension project would also be compatible with regional land use planning policies. The Council has been has been working with Hennepin County on the SAP efforts at each station, incorporating community input into the considerations of land uses, types of development, and other strategies to address neighborhood concerns and ensure that the investments promote growth and have benefits to the local communities. Section 4.1 of the Final EIS summarizes land use plan compatibility.
133J	Vang	Penny	Twin Cities Regional Center Collaborative	133	Email	4 – Social and Economic Effects	Call for more balanced development approach that supports small businesses. Three strategies: one block at a time, equitable transit oriented placemaking, and cluster focus.	Economic effects are summarized in Section 4.6 of the Final EIS. Local land use is governed by local municipalities. Hennepin County has led a SAP effort with each community along the proposed BLRT Extension project corridor to create a vision for the area that reflects the community's goals and ensures that LRT infrastructure is effectively integrated with the surrounding community. See www.hennepin.us/residents/transportation/bottineau-community-works for more information about the SAP.

CAPI

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
136A	Racho	Jennifer	CAPI USA	136	Email	3 – NEPA Process & Public Involvement	Most of our CAPI participants reside in Brooklyn Park, Brooklyn Center and North Minneapolis within the areas of the Bottineau Light Rail transit construction and transit line. They will be affected by all light rail developments and CAPI is working to ensure that their voices are heard throughout this entire process.	Chapter 9 of the Final EIS provides a summary of public involvement for the Final EIS, including a summary of open houses held during Final EIS preparation. The Council engages and will continue to engage the public in the preliminary engineering process and into construction. The Council will be key in notifying businesses and residents of construction plans, road closures and bus re-routes as well as being a point of contact for construction related emergencies such as power outages. The outreach program provides many avenues for people to submit comments and concerns, which are forwarded to the planners and engineers. Chapter 7 of the Final EIS describes outreach efforts to EJ communities in Brooklyn Park and corridor-wide.
136B	Racho	Jennifer	CAPI USA	136	Email	4 – Social and Economic Effects	Group that represents EJ communities and wants to create a dialogue with LRT affiliated entities to ensure that processes and policies are changed to authentically and equitable serve needs of public.	Section 9.2.1.4 of the Final EIS details the establishment of the CAC, which serves as a voice for the community and advises the CMC during the planning and implementation phases of the light rail line. The CAC comprises representatives from the Transportation Accessibility Advisory Committee; Masjid An-Nur; MICAH; the Asian Economic Development Association; the cities of Brooklyn Park, Crystal, Golden Valley, Minneapolis, and Robbinsdale; and MPRB. The CAC has met on an approximately monthly basis to advise the Council on the development of the proposed BLRT Extension project . CAC meeting summaries and membership can be found on the website for the proposed BLRT Extension project, BlueLineExt.org. Additionally, there are two voting members on the BLRT CMC that represent the Blue Line Coalition (a community-based group working to advance local and regional equity and community health along the Blue Line corridor).
136C	Racho	Jennifer	CAPI USA	136	Email	7 – Alternatives, Engineering & Design	We prefer that all 4 station stops are implemented because we recognize that residents and participants live all along these 4 stations. However, if only 3 were possible, our surveyed CAPI participants prefer the Golden Valley station.	All four stations—the Penn Avenue, Van White Boulevard, Plymouth Avenue, and Golden Valley Road stations—are included in the proposed BLRT Extension project scope and cost estimate. The proposed BLRT Extension project would improve the transportation system by providing the proposed BLRT Extension project corridor with more travel choices and faster travel times between residential areas, major destinations, and employment centers. Chapter 3 of the Final EIS presents a summary of the stations within the proposed BLRT Extension project corridor.
136D	Racho	Jennifer	CAPI USA	136	Email	7 – Alternatives, Engineering & Design	For all the stations, there needs to be constant lighting, signs in Hmong and other languages, and an emergency call button to talk to multi-lingual transit staff, especially those who speak Hmong, 24 hours a day.	All LRT stations are equipped with lighting, security cameras, and emergency phones. Contact through the emergency phone system is directed to Metro Transit emergency response center or the local police department. Interpretive services are available for Metro Transit Police and local police department. The ticket vending machines on the station platforms have a Hmong, Spanish, and Somali language option. Metro Transit provides a telephone interpretation service called Language Line that allows phone representatives to provide trip plans and transit information in 170 languages, including Hmong, with the help of translators. Language Line is available at 612-373-3333.
136E	Racho	Jennifer	CAPI USA	136	Email	8 – Transportation System Effects	Need ample parking spots for riders who prefer a park and ride option. Want a parking lot for the Van White station.	No park-and-ride facilities would be located in the City of Minneapolis for the proposed BLRT Extension project, the community closest to the Van White Boulevard Station. Chapter 3 of the Final EIS describes each station along the proposed BLRT Extension project corridor. The city of Minneapolis, Hennepin County, and the Council have been working on the SAP efforts at each station, incorporating community input into the considerations of land uses, types of development, and other strategies to address neighborhood concerns and ensure that the investments have benefits to the local communities. The Station Area Plan for the Van White Boulevard Station recommends mixed use residential and medium density residential for future land use.
136F	Racho	Jennifer	CAPI USA	136	Email	4 – Social and Economic Effects	All residents along the West Broadway portion of the line are minimally impacted and if their property is destroyed or impacted in any way, they are equitably financially compensated.	Hennepin County is developing the West Broadway Avenue Reconstruction project from Candlewood to 93rd Avenue in Brooklyn Park. An Environmental Assessment Worksheet for the roadway project was completed in September 2015 and a Negative Declaration finding was issued in December. The Final EIS discloses this information in Chapter 2 – Alternatives of the Final EIS. No residential property displacements are

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
								anticipated as a result of implementing the proposed BLRT Extension project (see Section 4.3 of the Final EIS). Chapter 6 – Indirect Impacts and Cumulative Effects of the Final EIS describes the effects with both the LRT and roadway project together.
136G	Racho	Jennifer	CAPI USA	136	Email	4 – Social and Economic Effects	Construction job quota for people of color, those with English as a second language, immigrants and refugees, and residents within the corridor.	The Council has an established DBE program and includes specific goals in project contracts to increase participation by minority and women owned businesses. The Office of Equal Opportunity has an EO consultant designated to the proposed BLRT Extension project to conduct outreach and monitor progress towards meeting those goals. The Council has set a 3-year DBE goal of 15.5 percent for federal fiscal years 2013–2016. In addition to the DBE goal, the construction contracts would have a workforce goal for both minority and women workers. An additional EO consultant would be assigned to support these efforts when it gets closer to construction.
136H	Racho	Jennifer	CAPI USA	136	Email	7 – Alternatives, Engineering & Design	Clearer signs to find the train stations, louder intercom volume on train, longer train door opening time, and multilingual signange.	Station design, including signage and wayfinding, would designed to be ADA-compliant. Station design would be addressed in the Engineering phase of project development. Community input would be sought on station design during this phase.

City of Lakes Community Land Trust

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
139A	Horwitz	Staci	City of Lakes Community Land Trust	139	Email	5 – Environmental Effects	DEIS lacks evaluation of longer-term impacts to low income neighborhoods as development occurs along the transit corridor. No mitigation for ensuring low income and minority populations are not displaced by being priced out of the market. There is no evaluation of social and economic impact if significant displacement occurs as a result of transit oriented development.	The Draft EIS and Final EIS acknowledge the potential for indirect, growth-inducing impacts of the proposed BLRT Extension project. Hennepin County is advancing Station Area Plans at each proposed BLRT station, and input from each community, including concerns for equity and affordability, is integrated into the planning process. Chapter 7 – Environmental Justice of the Final EIS evaluated the long-term indirect economic impacts to EJ communities. Properties within 0.5 mile of a transit station may experience some level of increase in property value, which would benefit property owners, but negatively impact renters. Of the block 45 block groups within 0.5 mile of a proposed station, 26 block groups (58 percent) have a majority owner-occupied housing units. Since a larger number of units are owner-occupied, more residents would likely perceive an overall benefit to property values with implementation of the proposed BLRT Extension project. All of the residents in these block groups, regardless of occupancy status, would receive the benefit of access to the Blue Line and the potential to reduce their transportation costs.
139B	Horwitz	Staci	City of Lakes Community Land Trust	139	Email	4 – Social and Economic Effects	DEIS should consider issues in comment ID 139A with respect to environmental justice populations.	See response to comment 139A.
139C	Horwitz	Staci	City of Lakes Community Land Trust	139	Email	4 – Social and Economic Effects	An analysis of the economic and neighborhood impact of zoning-related restrictions on land use would be helpful in understanding where policy changes could be beneficial and leveraged to maximize this transit investment. Higher density, mixed-used developments have been identified repeatedly as an element needed to support economic growth in North Minneapolis.	Local municipalities have land use controls available to them in the form of comprehensive plans guiding land use and city zoning codes guiding development. The Council has been has been working with Hennepin County on the SAP efforts at each station, incorporating community input into the considerations of land uses, types of development, and other strategies to address neighborhood concerns and ensure that the investments have benefits to the local communities. The Station Area Plans for North Minneapolis recommend higher density residential and mixed use developments to support transit oriented development.
139D	Horwitz	Staci	City of Lakes Community Land Trust	139	Email	4 – Social and Economic Effects	TH 55 already impacts the overall community character of North Minneapolis by creating an indirect separation of the Harrison Neighborhood from the rest of North Minneapolis. Implementation of the Bottineau LRT [in the BNSF Corridor] may create further segregation of this community with the elimination of the many “illegal” crossing points.	The unauthorized crossings into TWRP across the BNSF Railway (BNSF) tracks at-grade would be fenced off during construction and permanently fenced off once the proposed BLRT Extension project is in operation due to safety concerns related to LRT and freight train operations with unauthorized pedestrian access. However, grade-separated crossings of the BNSF corridor at Golden Valley Road, Theodore Wirth Parkway, Plymouth Avenue, and Olson Memorial Highway would be maintained

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
								permanently and the proposed BLRT Extension project would improve these crossings by reconstructing the bridges with multi-use pedestrian/bicycle facilities. Temporary access impacts during construction will be mitigated by the development of a Construction Communications Plan, which will be used to coordinate with emergency service providers as well as the public. See Section 4.7 of the Final EIS for additional discussion on this topic.
139E	Horwitz	Staci	City of Lakes Community Land Trust	139	Email	8 – Transportation System Effects	Need adequate crossings of TH55; how will the number of crossing areas separate from station stops be determined?	Chapter 3 – Transportation of the Final EIS addresses improvements to Olson Memorial Highway. Two stations would provide access to the communities along the highway: Penn Avenue Station and Van White Boulevard Station. While a six-lane roadway would be maintained, the lane widths would be reduced to 11 feet to accommodate pedestrian crossing length. The design speed and posted speed limit would be reduced to 35 mph. Existing sidewalks would be replaced with 6-foot-wide sidewalks on the north and south sides of the highway. Pedestrian refuges would be added in the median of the highway. ADA-compliant pedestrian crossings of Olson Memorial Highway would be facilitated by proposed signalized intersections at Bryant Avenue North, Van White Boulevard, Humboldt Avenue, James Avenue, Morgan Avenue, midblock between Newton Avenue and Oliver Avenue, Penn Avenue, Russell Avenue, and Thomas Avenue. The proposed BLRT Extension project would provide space on the north side of Olson Memorial Highway for a 10-foot two-way cycle track (to be constructed by others) between Thomas Avenue and Van White Memorial Boulevard. The proposed BLRT Extension project would construct a multi-use trail on the north side of the reconstructed westbound Olson Memorial Highway bridge.

Downtown Minneapolis Transportation Management Organization

142A	Davis	Lee	Downtown Minneapolis Transportation Management Organization	142	Email & US Mail	7 – Alternatives, Engineering & Design	Supports BLRT project. Project will be important for employment and development activity.	See Master Response 2 in Section G.4.1 of Appendix G of the Final EIS

Harrison Neighborhood Association

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
146A	Willis	Kennedy	Harrison Neighborhood Association	146	Email	4 – Social and Economic Effects	EJ needs must be fully considered.	Chapter 7 of the Final EIS summarizes the EJ analysis. The study area for the EJ analysis documented 18.70 percent of the population below the poverty level and 48.40 percent of the study area population as minority groups. The proposed BLRT Extension project would benefit both EJ and non-EJ communities with reliable and higher-capacity service for transit riders, improved pedestrian and bicycle connections and access, and no permanent residential property displacements. The full list of community benefits can be found in Section 7.5 of the Final EIS. The Council engaged members of the Blue Line Coalition during the Final EIS development phase to better understand their concerns based on this comment in the Draft EIS and also conducted public outreach to identify additional EJ populations in the proposed BLRT Extension project corridor. The Council will continue to work with the Blue Line Coalition and conduct direct outreach to EJ populations as design advances. The Council has been has been working with Hennepin County on the SAP efforts at each station, incorporating community input into the considerations of land uses, types of development, and other strategies to address neighborhood concerns and ensure that the investments have benefits to the local communities
146B	Willis	Kennedy	Harrison Neighborhood Association	146	Email	4 – Social and Economic Effects	Believes that the EJ communities are bearing disproportionate weight of development burdens and requests more collaborative and comprehensive plans between different levels of government.	The potential for disproportionately high and adverse effects of the proposed BLRT Extension project to be borne by EJ communities was evaluated by FTA in Chapter 7 – Environmental Justice of the Final EIS. This evaluation also documents how EJ communities were engaged in the proposed BLRT Extension project process and provided the opportunity for input during planning phases. Planning for the proposed BLRT Extension project involved extensive outreach and coordination with the affected public, agencies, and key stakeholders. Key stakeholder outreach activities conducted during EIS Scoping and the development of the EIS are summarized in Section 9.2 of the Final EIS. Stakeholder advisory committees included staff from the Council, Hennepin County, Metro Transit, the proposed BLRT Extension project corridor municipalities, and several others.
146H	Willis	Kennedy	Harrison Neighborhood Association	146	Email	4 – Social and Economic Effects	Pedestrian safety across Olson to LRT should be considered.	Chapter 3 – Transportation of the Final EIS addresses improvements to Olson Memorial Highway. Two stations would provide access to the communities along the highway: Penn Avenue Station and Van White Boulevard Station. While a six-lane roadway would be maintained, the lane widths would be reduced to 11 feet to accommodate pedestrian crossing length. The design speed and posted speed limit would be reduced to 35 mph. Existing sidewalks would be replaced with 6-foot-wide sidewalks on the north and south sides of the highway. Pedestrian refuges would be added in the median of the highway. ADA-compliant pedestrian crossings of Olson Memorial Highway would be facilitated by proposed signalized intersections at Bryant Avenue North, Van White Boulevard, Humboldt Avenue, James Avenue, Morgan Avenue, midblock between Newton Avenue and Oliver Avenue, Penn Avenue, Russell Avenue, and Thomas Avenue. The proposed BLRT Extension project would provide space on the north side of Olson Memorial Highway for a 10-foot two-way cycle track (to be constructed by others) between Thomas Avenue and Van White Memorial Boulevard. The proposed BLRT Extension project would construct a multi-use trail on the north side of the reconstructed westbound Olson Memorial Highway bridge.
146J	Willis	Kennedy	Harrison Neighborhood Association	146	Email	8 – Transportation System Effects	There is a need for rapid connection between the Blue Line and the SWLRT along Penn Avenue.	The Southwest Green Line Extension and proposed BLRT Extension project Draft Feeder Bus Plan includes a proposed Route 26, which would connect stations on both lines. The proposed bus network would be refined with input from the public prior to the proposed BLRT Extension project opening day. Additionally, planning for the C Line, Bus Rapid Transit along Penn Avenue began in 2013. The proposed BLRT Extension project is anticipated to begin detailed design and engineering in 2016 and start construction in 2017 pending full project funding. The C Line would connect to the Southwest LRT at the Royalston Station.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
146C	Willis	Kennedy	Harrison Neighborhood Association	146	Email	7 – Alternatives, Engineering & Design	supportive of LRT	See Master Response 2 in Section G.4.1 of Appendix G of the Final EIS
146D	Willis	Kennedy	Harrison Neighborhood Association	146	Email	4 – Social and Economic Effects	Supportive of LRT if there will be development along Olson Memorial Hwy.	Local land use is governed by local municipalities. Hennepin County has led a SAP effort with each community along the proposed BLRT Extension project corridor to create a vision for the area that reflects the community's goals and ensures that LRT infrastructure is effectively integrated with the surrounding community. The Minneapolis Station Area Plan along Olson Memorial Highway recommends mixed use residential and medium density residential to support transit oriented development. See www.hennepin.us/residents/transportation/bottineau-community-works for more information about the SAP.
146E	Willis	Kennedy	Harrison Neighborhood Association	146	Email	7 – Alternatives, Engineering & Design	Request action to mitigate harm created in efforts to site OMF facilities in surrounding communities.	The Final EIS describes the location of the 140,000-square-foot Operations and Maintenance Facility (OMF), which is proposed at the north end of the proposed BLRT Extension project in Brooklyn Park. This area today is largely undeveloped, but through SAP efforts, the city of Brooklyn Park and Hennepin County have developed a master plan for the area, integrating the OMF with mixed use commercial and office development, and greenspace. See Chapter 2 of the Final EIS for a more detailed description of the OMF. The OMF site requires acquisition of two undeveloped parcels owned by the city of Brooklyn Park, however no displacements would be required to construct the OMF. The OMF would be an adverse impact on the surrounding area. The OMF and related project elements, including landscaping and visual screening, would be designed in coordination with the city of Brooklyn Park and the Three Rivers Park District and in accordance with local zoning ordinances.
146F	Willis	Kennedy	Harrison Neighborhood Association	146	Email	5 – Environmental Effects	Concern that the Draft EIS does not consider other ongoing community and public works projects such as Penn Ave Community Works, the North Minneapolis Greenway project, the Penn Avenue BRT project and the Great Streets Initiative.	The Final EIS incorporates the ongoing planning of the Penn Avenue BRT project (C Line) and other transit projects. See Chapter 3 of the Final EIS for more information about how other planned transit projects were incorporated into the analysis for the Final EIS. Hennepin County has been doing extensive bike planning work focusing on connecting bikes and transit. The Council has used the 2040 Bicycle Transportation Plan (2015) as a guide for ongoing design of bike facilities. The plan is available at this website: www.hennepin.us/residents/transportation/biking. The city of Minneapolis is also a project partner in the proposed BLRT Extension project planning and has provided input on other ongoing projects so the Council can better coordinate with other planned projects.
146G	Willis	Kennedy	Harrison Neighborhood Association	146	Email	4 – Social and Economic Effects	Omission of community resources that are important to EJ communities.	The Council has implemented a comprehensive public outreach program that has engaged nearby communities and underrepresented groups, including the Summit Academy OIC and Wayman AME Church. Coordination with these groups will continue throughout the course of the proposed BLRT Extension project. Project staff have met with leadership at these organizations to discuss future construction needs for the proposed BLRT Extension and Green Line LRT Extension projects. The Council engaged members of the Blue Line Coalition during the Final EIS development phase to better understand their concerns based on this comment in the Draft EIS and also conducted public outreach to identify additional EJ populations in the proposed BLRT Extension project corridor. This resulted in documenting additional organizations into the Final EIS. The proposed BLRT Extension project would displace five businesses that may serve the EJ community. Therefore, the proposed BLRT Extension project would have a disproportionately high and adverse impact on EJ communities currently served by these businesses in Robbinsdale, Crystal, and Brooklyn Park. Chapter 7 – Environmental Justice of the Final EIS discusses this in more detail. The specific businesses cited that likely have a predominantly minority and/or low-income clientele include: Northside Oriental Market; American Furniture Mart; Unified Staffing, Inc. (tenant of Schrader Building); Hart Custom Homes (owner and tenant of Schrader

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
								Building); and Brianna's Hair Studio (tenant of Schrader Building). For impacts to the communities served by the displaced businesses, the Council shall provide notices to the affected EJ community with the business' new location (if a suitable relocation was identified) with transit options to access the new business location, and/or other options to meet their needs. Section 4.2 of the Final EIS summarizes community facilities documented and analyzed as part of the proposed BLRT Extension project. This includes schools, churches, libraries, community centers, social service agencies and non-profits. No mitigation measures are warranted for long-term neighborhood and community impacts, because the effectiveness of mitigation measures identified for specific environmental categories (including but not limited to noise, vibration, visual quality and aesthetics, transit, roadways and traffic, parking, and pedestrian and bicyclist considerations) would prevent adverse impacts.
146K	Willis	Kennedy	Harrison Neighborhood Association	146	Email	4 – Social and Economic Effects	Station area development that facilitates health equity and wealth development of the community	A Health Impact Assessment was published by Hennepin County in 2013, prior to the Draft EIS publishing. The Council has been has been working with Hennepin County on the SAP efforts at each station, incorporating community input into the considerations of land uses, types of development, and other strategies to address neighborhood concerns and ensure that the investments have benefits to the local communities. The SAP effort and the ongoing design for the proposed BLRT Extension project have health equity and economic development goals.
146L	Willis	Kennedy	Harrison Neighborhood Association	146	Email	4 – Social and Economic Effects	Equity commitments that Harrison has contributed to and that have been circulated in relation to the Green Line extension/SWLRT, especially where the commitment requests apply to the Blue Line planning and development	The Council recognizes the need to address equity in planning and development of new transit development and *Thrive 2040 MSP* outlines strategies to work toward a more equitable region. For the proposed BLRT Extension project, the Council has developed a comprehensive public engagement process that has proven to be effective at addressing community concerns. The proposed Blue Line Extension project has included the use of advisory committees, giving a voice to citizens, EJ organizations and neighborhood groups. These include: ■ CMC that includes a representatives from each City Council along the alignment, Hennepin County, BAC chair, CAC chair, and two community organization members. This group meets monthly and provides recommendations to the Council on project decisions. ■ CAC that includes neighborhood and community representatives (including Harrison) and discusses topics of concern or interest to the community such as safety, noise impacts, station location and design, and accessibility features. ■ BAC that includes business and chamber representatives and discusses topics of concern or interest to the business community such as access, construction impacts, station location and design. ■ Transportation Accessibility Advisory Committee is a formal advisory committee of the Council that provides input and advice on concerns and interests to the ADA community including accessibility, station design, and pedestrian features. Members of this advisory committee serve on the CAC and BAC and have also participated in station design workshops to provide feedback on station features to ensure that they take into consideration use by those with limited vision, mobility or hearing. In addition to these formal advisory committees, the Council has conducted outreach and public engagement activities such as open houses, workshops and walking tours to seek public input on the design of the proposed BLRT Extension project. This approach to community engagement has proven effective on other Twin Cities transit projects, including the Blue Line (Hiawatha LRT) and Green Line (Central Corridor); therefore, a community compact was not necessary and was not created.

Heritage Park Neighborhood Association

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
148A	Cole	Terra	Heritage Park Neighborhood Association	148	Email	4 – Social and Economic Effects	Important to ensure economic, racial and age cohesion of the Heritage Park/Sumner-Glenwood neighborhood. Bifurcation of the neighborhood separating the neighborhood into two districts: the "White and affluent" southside 55405 "good zip code" with its businesses, high income housing and lion's share of neighborhood amenities and the "Colored" northside 55411 "bad zip code" with 90% rental, low income housing, no economic amenities and continued perception of being the "new projects. Due diligence must be served as to not leave current residents at a disadvantage or return to the days prior to the Holman Decree by creating a concentrated area of race and poverty.	Hennepin County is advancing Station Area Plans at each proposed BLRT station, which include housing considerations, based on the communities' concerns for equity and affordability. The proposed BLRT Extension project would directly serve residents in the 55411 ZIP code with stations at Van White Boulevard, Penn Avenue, Plymouth Avenue, and Golden Valley Road. It would also serve the residents in the 55405 ZIP code neighborhood. The improvements proposed for Olson Memorial Highway would create a better pedestrian environment to improve community cohesion between the communities north and south of the highway. See Response 148B on specific design improvements on Olson Memorial Highway. Local land use is governed by local municipalities. Hennepin County has led a SAP effort with each community along the proposed BLRT Extension project corridor to create a vision for the area that reflects the community's goals and ensures that LRT infra-structure is effectively integrated with the surrounding community. The Minneapolis Station Area Plan recommends mixed use residential and medium density residential to support transit oriented development. They also envision a mixed income neighbor-hood with new market-rate housing to stabilize the already existing affordable housing and catalyze new development in the neighborhood. See www.hennepin.us/residents/transportation/bottineau-community-works for more information about the SAP. Furthermore, the Council has established programs to encourage affordable housing planning and implementation that may offset potential indirect impacts to low-income persons. See Section 7.4.6 of the Final EIS for a discussion on indirect impacts and cumulative effects on EJ populations. The findings from the Fair Housing equity assessment (FHEA) identified a need to address equity in affordable housing and the policies to address this issue are included in the *Thrive MSP 2040*, Housing Policy Plan (www.metrocouncil.org/Housing/Planning/2040-Housing-Policy-Plan.aspx). The Council's role is to: ■ Work with communities to create a mix of housing affordability, including subsidies to strategically locate market-rate housing in areas that lack such options as well as affordable housing in areas that lack affordability. ■ Use Livable Communities Act resources to both catalyze private investment in areas of concentrated poverty and attract affordable housing to higher-income areas. ■ Work with our partners and stakeholders to identify indicators to measure how projects, supported with Council resources, advance equity, including providing opportunities to residents of areas of concentrated poverty, lower-income households, and people with disabilities. ■ Identify and address institutional challenges and barriers, including a lack of funding, to affordable housing development in Suburban, Suburban Edge, and Emerging Suburban Edge locations. ■ Encourage private market interest in these targeted areas through transit investments, education, and marketing support to local communities. To comply with the Metropolitan Land Planning Act and remain consistent with the Housing Policy Plan, the Council requires cities to demonstrate how affordable housing needs can be met in their local comprehensive plan updates. Cities must demonstrate how their comprehensive plan: ■ Addresses the future housing need for forecasted growth. ■ Acknowledges its allocation for future affordable housing need. ■ Guides sufficient land at minimum residential densities of 8 units/acre to support the city's total allocation of affordable housing need.

148B	Cole	Terra	Heritage Park Neighborhood Association	148	Email	8 – Transportation System Effects	The need to provide safe, viable pathways for pedestrians, bikers and those who are visually and physically disabled by creating sustainable pathways to existing & future amenities, on the southside of Olson Highway.	Chapter 3 – Transportation of the Final EIS addresses improvements to Olson Memorial Highway. Two stations would provide access to the communities along the highway: Penn Avenue Station and Van White Boulevard Station. While a six-lane roadway would be maintained, the lane widths would be reduced to 11 feet to accommodate pedestrian crossing length. The design speed and posted speed limit would be reduced to 35 mph. Existing sidewalks would be replaced with 6-foot-wide sidewalks on the north and south sides of the highway. Pedestrian refuges would be added in the median of the highway. ADA-compliant pedestrian crossings of Olson Memorial Highway would be facilitated by proposed signalized intersections at Bryant Avenue North, Van White Boulevard, Humboldt Avenue, James Avenue, Morgan Avenue, midblock between Newton Avenue and Oliver Avenue, Penn Avenue, Russell Avenue, and Thomas Avenue. The proposed BLRT Extension project would provide space on the north side of Olson Memorial Highway for a 10-foot two-way cycle track (to be constructed by others) between Thomas Avenue and Van White Memorial Boulevard. The proposed BLRT Extension project would construct a multi-use trail on the north side of the reconstructed westbound Olson Memorial Highway bridge.
148C	Cole	Terra	Heritage Park Neighborhood Association	148	Email	4 – Social and Economic Effects	There is a lack of a significant plan to create economic development opportunities on both sides of station stops for residents who live on northside of Olson.	Economic effects are summarized in Section 4.6 of the Final EIS. Local land use is governed by local municipalities. Hennepin County has led a SAP effort with each community along the proposed BLRT Extension project corridor to create a vision for the area that reflects the community's goals and ensures that LRT infrastructure is effectively integrated with the surrounding community. The Minneapolis Station Area Plan recommends mixed use residential and medium density residential to support transit oriented development. See www.hennepin.us/residents/transportation/bottineau-community-works for more information about the SAP.
148D	Cole	Terra	Heritage Park Neighborhood Association	148	Email	4 – Social and Economic Effects	The historical and continued isolation the neighborhood and its residents experience because area parks, trails and pedestrian pathways are not connected to downtown, the Kenwood/Walker Art Center and the proposed North Minneapolis Greenway.	See response to 148B.
148E	Cole	Terra	Heritage Park Neighborhood Association	148	Email	4 – Social and Economic Effects	Gentrification; in that those with "money" will be white and those "without" and "on assistance" will be of color. With over 80% of current residents hailing from Somali, African American, Ethiopian, Asian, Hispanic, descent, it is imperative that a transit/stationary stop plan takes into consideration an even split in housing unit density on both sides of the stationary stop that provides pathways for ownership to current residents as well as new.	See response to 148A.

Masjid An-Nur

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
156A	Shabazz	Aasim	Masjid An-Nur	156	Email	8 – Transportation System Effects	Bottineau LRT corridor is 52% people of color and 14% are transit dependent. Bottineau Corridor. connects 2 significant environmental justice communities to our regional transitway system – Brooklyn Park and North Minneapolis. It is Important that the transit investment, the corresponding land use and economic development has community benefits for the low income communities and communities of color in the corridor. Have formed the Blue Line Coalition to secure community benefits for environmental justice communities in the Bottineau Corridor.	The study area for the EJ analysis documented 18.70 percent of the population below the poverty level and 48.40 percent of the study area population as minority groups. The proposed BLRT Extension project would benefit both EJ and non-EJ communities with reliable and higher-capacity service for transit riders, improved pedestrian and bicycle connections and access, and no permanent residential property displacements. The full list of community benefits can be found in Section 7.5 of the Final EIS. The Council engaged members of the Blue Line Coalition during the Final EIS development phase to better understand their concerns based on this comment in the Draft EIS and also conducted public outreach to identify additional EJ populations in the proposed BLRT Extension project corridor. The Council will continue to work with the Blue Line Coalition and conduct direct outreach to EJ populations as design advances. The Council has been has been working with Hennepin County on the SAP efforts at each station, incorporating community input into the considerations of land uses, types of development, and other strategies to address neighborhood concerns and ensure that the investments have benefits to the local communities.
156B	Shabazz	Aasim	Masjid An-Nur	156	Email	8 – Transportation System Effects	Recommends a corridor wide community compact similar to the Red Line Community Compact in Baltimore. The community compact process should model best practices in community engagement and be a partnership between Metro Transit, Hennepin County, the cities, and the environmental justice communities within the Bottineau LRT corridor.	The Council has developed a comprehensive public engagement process that has proven to be effective at addressing community concerns. The Blue Line Extension project has included the use of advisory committees, including: ■ CMC that includes a representatives from each City Council along the alignment, Hennepin County, BAC chair, CAC chair, and two community organization members. This group meets monthly and provides recommendations to the Council on project decisions. ■ CAC that includes neighborhood and community representatives and discusses topics of concern or interest to the community such as safety, noise impacts, station location and design, and accessibility features. ■ BAC that includes business and chamber representatives and discusses topics of concern or interest to the business community such as access, construction impacts, station location and design. ■ Transportation Accessibility Advisory Committee is a formal advisory committee of the Council that provides input and advice on concerns and interests to the ADA community including accessibility, station design, and pedestrian features. Members of this advisory committee serve on the CAC and BAC and have also participated in station design workshops to provide feedback on station features to ensure that they take into consideration use by those with limited vision, mobility or hearing. In addition to these formal advisory committees, the Council has conducted outreach and public engagement activities such as open houses, workshops and walking tours to seek public input on the design of the proposed BLRT Extension project. This approach to community engagement has proven effective on other Twin Cities transit projects, including the Blue Line (Hiawatha LRT) and Green Line (Central Corridor); therefore, a community compact was not necessary and was not created.
156C	Shabazz	Aasim	Masjid An-Nur	156	Email	4 – Social and Economic Effects	EJ community resources have not be adequately documented	The Council has implemented a comprehensive public outreach program that has engaged nearby communities and underrepresented groups, including the Summit Academy OIC and Wayman AME Church. Coordination with these groups will continue throughout the course of the proposed BLRT Extension project. Project staff have met with leadership at these organizations to discuss future construction needs for the proposed BLRT Extension project and Green Line LRT Extension projects. The Council engaged members of the Blue Line Coalition during the Final EIS development phase to better understand their concerns based on this comment in the Draft EIS and also conducted public outreach to identify additional EJ populations in the proposed BLRT Extension project corridor. This resulted in adding additional organizations into the Final EIS.

								The proposed BLRT Extension project would displace five businesses that may serve the EJ community. Therefore, the proposed BLRT Extension project would have a disproportionately high and adverse impact on EJ communities currently served by these businesses in Robbinsdale, Crystal, and Brooklyn Park. Chapter 7 – Environmental Justice of the Final EIS discusses this in more detail. The specific businesses cited that likely have a predominantly minority and/or low-income clientele include: Northside Oriental Market; American Furniture Mart; Unified Staffing, Inc. (tenant of Schrader Building); Hart Custom Homes (owner and tenant of Schrader Building); and Brianna's Hair Studio (tenant of Schrader Building). For impacts to the communities served by the displaced businesses, the Council shall provide notices to the affected EJ community with the business' new location (if a suitable relocation was identified) with transit options to access the new business location, and/or other options to meet their needs. Section 4.2 of the Final EIS summarizes community facilities documented and analyzed as part of the proposed BLRT Extension project. This includes schools, churches, libraries, community centers, social service agencies and non-profits. No mitigation measures are warranted for long-term neighborhood and community impacts, because the effectiveness of mitigation measures identified for specific environmental categories (including but not limited to noise, vibration, visual quality and aesthetics, transit, roadways and traffic, parking, and pedestrian and bicyclist considerations) would prevent adverse impacts.
156D	Shabazz	Aasim	Masjid An-Nur	156	Email	3 – NEPA Process & Public Involvement	Recommends that the Blue Line Extension Community Advisory Committee: a) Be a community driven body with staff support. b) Be a resource and check point for community engagement by reviewing and approving a corridor project community engagement plans. c) Identify issues and assign problem solving teams that include community members and project staff. d) Elect a representative member on the transitway corridor policy advisory committee/management committee. e) Be formed early in the scoping phase of the transitway corridor planning process. f) Membership will be selected by communities they represent. g) Elect a chairperson who represents a grassroots community. h) Have the ability to set their own agenda, pass motions, and make recommendations to the corridor policy advisory committee/management committee. i) Will be combined with Business Advisory Committees ensuring coordinated issues and efforts. j) CE Steering committee will support project staff with connections to underrepresented groups i.e.: Faith communities; Cultural communities; Place based groups; Communities of color ; Small and Ethnic businesses; Community Engagement Steering Committee members; Disability community; New immigrant communities; Low-income communities; Students at high schools, community colleges k) Orientation will include a focus on environmental justice, equitable development, and cultural awareness. l) Construction Communication Committees set up at least one month in advance of construction, with representatives appointed by community groups.	Section 9.2.1.4 of the Final EIS details the establishment of the CAC, which serves as a voice for the community and advises the CMC during the planning and implementation phases of the light rail line. The CAC has met on an approximately monthly basis to advise the proposed BLRT Extension project team. CAC meeting summaries and membership can be found on the website for the proposed BLRT Extension project, www.BlueLineExt.org. The Council formed the CAC by asking each city to designate representatives as well as inviting community based organizations to appoint members. The CAC comprises representatives from the Transportation Accessibility Advisory Committee; Masjid An-Nur; MICAH; the Asian Economic Development Association; the cities of Brooklyn Park, Crystal, Golden Valley, Minneapolis, and Robbinsdale; and MPRB. The first CAC meeting was held jointly with the BAC in April 2015. At that meeting, members were asked about their top concerns and topics that they were most interested in discussing. The Counil staff also presented an overview of the outreach plan and types of activities. Another joint meeting with the BAC was held in October to review and recommend a revised project scope. In addition to the CAC, the Council added two grassroots representatives from the Blue Line Coalition as members of the CMC. The Blue Line Coalition is a community-based group working to advance local and regional equity and community health along the Blue Line corridor. The CAC and BAC would transition to smaller Construction Communication Committees for each city when it gets closer to construction.
156E	Shabazz	Aasim	Masjid An-Nur	156	Email	3 – NEPA Process & Public	Recommends coordinated planning across Metro Transit, Hennepin County, and the City of MPLS.	Planning for the proposed BLRT Extension project involved extensive outreach and coordination with the affected public, agencies, and key stakeholder

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
						Involvement		outreach activities conducted during EIS Scoping and the development of the EIS are summarized in Section 9.2 of the Final EIS. Stakeholder advisory committees included staff from Council, Hennepin County, Metro Transit, the proposed BLRT Extension project corridor municipalities, and several others.
156F	Shabazz	Aasim	Masjid An-Nur	156	Email	4 – Social and Economic Effects	Land use planning should promote growth along corridor.	Overall, the proposed BLRT Extension project would be compatible with the local comprehensive plans, land use and other planning policies of the cities of Minneapolis, Golden Valley, Robbinsdale, Crystal, and Brooklyn Park. Although the city of Golden Valley's comprehensive plan does not specifically mention the proposed BLRT Extension project, LRT would be compatible with the transit goal and objective of the city's comprehensive plan. The proposed BLRT Extension project would also be compatible with regional land use planning policies. Hennepin County, in partnership with the Bottineau Boulevard Partnership, also prepared the Bottineau Land Use Planning Framework (2012). While the Framework is unlike the aforementioned local comprehensive planning documents because the County does not have land use planning administrative authority, it clearly states the County and Partnership's priority for increased development along the Bottineau Transitway. Section 4.1 of the Final EIS summarizes land use plan compatibility.
156G	Shabazz	Aasim	Masjid An-Nur	156	Email	8 – Transportation System Effects	Special attention should be given to redesigning Hwy 55 with safe and livable crossing connections for pedestrians and cyclists; recommends bus shelter improvements.	Chapter 3 – Transportation of the Final EIS addresses improvements to Olson Memorial Highway. Two stations would provide access to the communities along the highway: Penn Avenue Station and Van White Boulevard Station. While a six-lane roadway would be maintained, the lane widths would be reduced to 11 feet to accommodate pedestrian crossing length. The design speed and posted speed limit would be reduced to 35 mph. Existing sidewalks would be replaced with 6-foot-wide sidewalks on the north and south sides of the highway. Pedestrian refuges would be added in the median of the highway. ADA-compliant pedestrian crossings of Olson Memorial Highway would be facilitated by proposed signalized intersections at Bryant Avenue North, Van White Boulevard, Humboldt Avenue, James Avenue, Morgan Avenue, midblock between Newton Avenue and Oliver Avenue, Penn Avenue, Russell Avenue, and Thomas Avenue. The proposed BLRT Extension project would provide space on the north side of Olson Memorial Highway for a 10-foot two-way cycle track (to be constructed by others) between Thomas Avenue and Van White Memorial Boulevard. The proposed BLRT Extension project would construct a multi-use trail on the north side of the reconstructed westbound Olson Memorial Highway bridge.
156H	Shabazz	Aasim	Masjid An-Nur	156	Email	8 – Transportation System Effects	Recommends study on viability of new bus circulator in North Minneapolis and upgrades to bus shelters and transfer stations.	The Draft Feeder Bus Plan for the year 2040 includes a proposed Route 26 that would connect to Penn Avenue and Van White Boulevard stations, circulating through North Minneapolis. The proposed bus network would be refined with input from the public prior to BLRT opening day. Additionally, planning for the C Line, Bus Rapid Transit along Penn Avenue began in 2013. The C Line would connect residents of North Minneapolis, near Penn Avenue, to BLRT stations, METRO Green Line stations, Brooklyn Center, and to downtown Minneapolis. Metro Transit has been working with the community on Better Bus Stops through a Ladders of Opportunity Grant from FTA. The goal is to add up to 150 shelters and improve an additional 75 existing shelters as part of the agency's work. For more information, visit this website: www.metrotransit.org/better-bus-stops.
156I	Shabazz	Aasim	Masjid An-Nur	156	Email	4 – Social and Economic Effects	Throughout the Bottineau Corridor there are environmental justice small businesses. Every effort should be made to maximize the benefit and minimize the impacts of the project on these entrepreneurs.	Chapter 7 of the Final EIS includes additional discussion and analysis of the benefits of the proposed BLRT Extension project to the EJ communities, in addition to the evaluation of potential impacts. Ten business operations would be displaced as a part of the proposed BLRT Extension project. These businesses would be relocated in accordance with the Uniform Relocation Act and compensated by payment of fair market value for their property. Five of these business operations are considered EJ businesses, either serving EJ populations or are owned by minority or low income people. Therefore, the proposed BLRT Extension project would have a disproportionately high and adverse impact on EJ communities currently served by these businesses in Robbinsdale, Crystal, and Brooklyn Park. The specific businesses cited that likely have a predominantly minority and/or low-income clientele include:

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
								Northside Oriental Market; American Furniture Mart; Unified Staffing, Inc. (tenant of Schrader Building); Hart Custom Homes (owner and tenant of Schrader Building); and Brianna's Hair Studio (tenant of Schrader Building). The Council would also provide information to the communities where businesses would be displaced about the businesses' new locations and/or other options to meet their needs. In addition, the Council has been engaged in an extensive outreach effort with various stakeholders along the proposed BLRT Extension project corridor, including local business operators that may be impacted by the proposed BLRT Extension project to receive insight into daily operations and develop strategies to minimize impacts. To mitigate impacts on businesses during construction, the Council will develop a Construction Mitigation Plan, a Construction Communication Plan, and a construction staging plan. These tools will help the Council notify businesses and patrons in advance about any access issues or closures. The construction staging plan will also help businesses and patrons affected by LRT construction understand when construction would occur in different areas of the proposed BLRT Extension project corridor. Finally, a 24-hour construction hotline will be available for issue resolution and information about LRT construction. Section 3.4 of the Final EIS summarizes construction-phase mitigation measures.
156J	Shabazz	Aasim	Masjid An-Nur	156	Email	4 – Social and Economic Effects	Recommends strategy to prevent involuntary displacement and expanding affordable housing options.	Displacement is a significant impact, and the proposed BLRT Extension project has proactively avoided these impacts since the release of the Draft EIS. The evaluation of Alignments D1 and D2 considered several environmental and social issues and impact areas, and the selection of Alignment D1 for the proposed BLRT Extension project avoids impacts to the north Minneapolis neighborhood, including the large number of displacements. Moreover, since publication of the Draft EIS, modifications to the preliminary design have resulted in the avoidance of any residential property displacements with the proposed BLRT Extension project. The Council has been has been working with Hennepin County on the SAP efforts at each station, incorporating community input into the considerations of land uses, types of development, and other strategies to address neighborhood concerns and ensure that the investments promote growth and have benefits to the local communities. Section 4.1 of the Final EIS summarizes land use plan compatibility.
156K	Shabazz	Aasim	Masjid An-Nur	156	Email	4 – Social and Economic Effects	Recommends creating employment and entrepreneurial opportunities.	The Council has an established DBE program and includes specific goals in project contracts to increase participation by minority and women owned businesses. The Office of Equal Opportunity has an EO consultant designated to the Blue Line Project to conduct outreach and monitor progress towards meeting those goals. The Council has set a 3-year DBE goal of 15.5 percent for federal fiscal years 2013–2016. In addition to the DBE goal, the construction contracts would have a workforce goal for both minority and women workers. An additional EO consultant would be assigned to support these efforts when it gets closer to construction. To assist in achieving the DBE and workforce goals, the Council's EO and the Council's outreach and communication staff would hold workshops and networking mixers and attend events to inform people of employment and contracting opportunities. Other communication strategies would be used including social media, the BlueLineExt.org website, newsletters, and articles.
156L	Shabazz	Aasim	Masjid An-Nur	156	Email	4 – Social and Economic Effects	Brooklyn Park will have 5 stations on the Bottineau LRT line. The city of Brooklyn Park is 50% people of color. Through the Community Engagement team the Alliance is working with 6 environmental justice community groups in the Northwest suburbs. They will continue to be active partners in the development of the Bottineau Transitway project and corridor.	The Council will continue to work closely with the city of Brooklyn Park, the Blue Line Coalition, and EJ populations located in Brooklyn Park throughout the Engineering phase of the proposed BLRT Extension project. Station design, which would happen during the Engineering phase of the proposed BLRT Extension project, would incorporate pedestrian and bike amenities and would be ADA-compliant. The Council has been has been working with Hennepin County on the SAP efforts at each station, incorporating community input into the considerations of land uses, types of development, and other strategies to address neighborhood concerns and ensure that the investments have benefits to the local communities.

Summit Academy OIC

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
158A	Garnett	George	Summit Academy OIC	158	Email	4 – Social and Economic Effects	Summitt Academy OIC was completely omitted in assessment of impacts	The Council has implemented a comprehensive public outreach program that has engaged nearby communities and underrepresented groups, including the Summit Academy OIC. Coordination with these groups, including the Summit Academy OIC will continue throughout the course of the proposed BLRT Extension project. Council staff have met with Summit Academy OIC leadership to discuss future construction needs for the proposed Blue Line LRT Extension and Green Line LRT Extension projects.
158B	Garnett	George	Summit Academy OIC	158	Email	4 – Social and Economic Effects	Organization trains low income minority and female construction workers and hopes that there are aggressive employment quotas for this project.	The Council has an established DBE program and includes specific goals in project contracts to increase participation by minority and women owned businesses. The Office of Equal Opportunity has an EO consultant designated to the Blue Line Project to conduct outreach and monitor progress towards meeting those goals. The Council has set a 3-year DBE goal of 15.5 percent for federal fiscal years 2013–2016. In addition to the DBE goal, the construction contracts would have a workforce goal for both minority and women workers. An additional EO consultant would be assigned to support these efforts when it gets closer to construction. To assist in achieving the DBE and workforce goals, the Council's EO and the Council outreach and communication staff would hold workshops and networking mixers and attend events to inform people of employment and contracting opportunities. Other communication strategies would be used including social media, the BlueLineExt.org website, newsletters, and articles.

West Broadway Business and Area Coalition (WBC)

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
162A	Heelan	Erin	West Broadway Business and Area Coalition (WBC)	162	Email	4 – Social and Economic Effects	Concerned about how project will impact other commercial corridors and what steps need to be taken to mitigate or leverage funding to assure that all corridors continue to be a priority for our local governments not just the ones with rail.	Long-range transportation plans and the fiscally constrained investment plans that are derived from them are the primary mechanisms for making regional transit investments. This comment is outside the scope of the Final EIS.

Saint Margaret Mary Church

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
186A	Moudry	Fr. Paul	Saint Margaret Mary Church	186	US Mail	7 – Alternatives, Engineering & Design	Supports public transportation.	See Master Response 2 in Section G.4.1 of Appendix G of the Final EIS.
186B	Moudry	Fr. Paul	Saint Margaret Mary Church	186	US Mail	6 – Noise & Vibration Effects	Concerned about station being across the street from our church – noise.	No noise impacts were identified at Saint Margaret Mary Church. It is far enough away from the proposed alignment that noise from BLRT operations would not rise to a level requiring mitigation (see Section 5.6 of the Final EIS, which summarizes noise impacts at institutional land uses [Table 5.6-6]).
186C	Moudry	Fr. Paul	Saint Margaret Mary Church	186	US Mail	4 – Social and Economic Effects	Concerned about station being across the street from our church – safety.	Section 4.7 of the Final EIS addresses safety and security. Safety for rail users, area residents, local pedestrians and bicyclists, project construction workers, operators and vehicle occupants is an important consideration for the proposed BLRT Extension project. The framework for ensuring the highest level of safety to these groups would be established through conformance with the proposed BLRT Extension project site safety and health plan, construction contingency plan, the Council's Safety and Security Management Plan and the Metro Transit Security and Emergency Preparedness plan. Project operations in conformance with these plans would necessarily be closely and continuously coordinated with local area law enforcement, medical, fire, transportation and other organizations with related emergency responsibilities within the proposed BLRT Extension project corridor. Stations would include emergency equipment, public address systems, video cameras, emergency telephones, and closed-circuit television. The public address system, with both speakers and signs, would convey information to people with disabilities in compliance with ADA requirements. Lighting for proposed station areas and park-and-ride lots, as well as vehicular and pedestrian circulation areas, would be consistent with the Metro Light Rail Transit Design Criteria (Council, 2015). Emergency lighting would be provided in all public areas, including platforms, pedestrian facilities, vehicular traffic areas, bus loading zones, and park-and-ride lots.
186D	Moudry	Fr. Paul	Saint Margaret Mary Church	186	US Mail	5 – Environmental Effects	Concerned about parkland, to be treasured.	The Final EIS and the Amended Draft Section 4(f)/6(f) Evaluation (Chapter 8 of the Final EIS) address the effects of the proposed BLRT Extension project on parklands as well as other Section 4(f) resources. This evaluation was accomplished in coordination with MPRB, the Three Rivers Park District, municipalities, and other governmental entities. These efforts included consideration of project sequencing (avoidance, minimization, and mitigation measures) to minimize harm to Section 4(f)/6(f) resources. The proposed BLRT Extension project would result in the permanent incorporation of approximately 2.1 acres of property from TWRP. During construction, approximately 9.2 acres of temporary construction easements would be required within TWRP to grade land around the proposed BLRT Extension project corridor, to provide access during construction, and to provide floodplain and wetland mitigation. A short segment of an existing north-south trail that parallels the west side of the rail corridor (a portion of the trail is located on the private rail corridor right-of-way) would be realigned along with a shift of an approximately 400-foot stretch of Bassett Creek as part of the replacement of the Plymouth Avenue Bridge. Access to the park would remain open throughout construction. All areas of the TWRP property that would be affected by proposed BLRT Extension project's construction activities would be restored to existing conditions or better and restoration plans would be developed and implemented in consultation with MPRB. Chapter 8 of the Final EIS provides additional information about the proposed BLRT Extension project's impact to TWRP.
186E	Moudry	Fr. Paul	Saint Margaret Mary Church	186	US Mail	8 – Transportation System Effects	Ridership comes from outside of Golden Valley.	The Council used its regional travel demand forecasting model to develop the transit ridership forecasts for the proposed BLRT Extension project. Blue Line LRT Expansion Project ridership modeling is discussed in Section 3.1 of the Final EIS. The Golden Valley Road Station would have a total of 905 riders daily arriving via walking, transferring from another bus, or driving/passenger drop off.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Response
186F	Moudry	Fr. Paul	Saint Margaret Mary Church	186	US Mail	7 – Alternatives, Engineering & Design	NIMBY is involved. Riders from suburbs and downtown are saying "not in your back yard meaning not North Minneapolis".	The proposed BLRT Extension project would improve the transportation system by providing the proposed BLRT Extension project corridor with more travel choices and faster travel times between residential areas, major destinations, and employment centers. Residents of North Minneapolis would have access to four adjacent stations: Van White Boulevard, Penn Avenue, Plymouth Avenue, and Golden Valley Road.
186G	Moudry	Fr. Paul	Saint Margaret Mary Church	186	US Mail	4 – Social and Economic Effects	Need to consider long range development.	Section 4.1 of the Final EIS describes the methodology used to assess compatibility with local comprehensive plans. Comprehensive plans address long-term growth. While there would be temporary impacts due to construction, the long-term benefit of the proposed BLRT Extension project would provide economic development opportunities, improved mobility, and access to more destinations.
186H	Moudry	Fr. Paul	Saint Margaret Mary Church	186	US Mail	4 – Social and Economic Effects	Need to consider impact on property values.	Property values are affected by a variety of market conditions. Impacts of an LRT project on property values are difficult to assess conclusively. Continuing population growth and a strengthening of the local economy within the proposed BLRT Extension project corridor may contribute to redevelopment and increased property values. Studies have shown that LRT transit around the country has been an impetus for increased property values near station locations. Chapter 7 – Environmental Justice of the Final EIS addresses property values from an EJ perspective.
186I	Moudry	Fr. Paul	Saint Margaret Mary Church	186	US Mail	4 – Social and Economic Effects	Need to consider neighborhood improvement.	Increased access brought by transit improvements may act as a catalyst for new investment in the area surrounding stations. Land development and property taxation policies are principally the responsibility of the cities of Minneapolis, Robbinsdale, Golden Valley, Crystal, and Brooklyn Park; but the Council has taken every effort to minimize adverse impacts of the proposed BLRT Extension project while maintaining the positive benefits this project would deliver.

3A	Balfour	Andrew	None provided	3	Email	7 – Alternatives, Engineering and Design	In favor of A-C-D2 alignment. Thinks connecting the Maple Grove transit center, downtown Robbinsdale, going through the neighborhoods (not the park) in North Minneapolis, and finally connecting to the interchange is the best placement.	Please see MASTER RESPONSE #1.
3B	Balfour	Andrew	None provided	3	Email	7 – Alternatives, Engineering and Design	D1 should not be considered. Ridership and convenience are what is important, not scenic (sparsely populated) views of a park.	The Alternatives Analysis (AA)/Draft Environmental Impact Statement (Draft EIS) and Final Environmental Impact Statement (Final EIS) process examined numerous alignment options detailed in Chapter 2 of both documents. The proposed METRO Blue Line Light Rail Transit (BLRT) Extension project includes an alignment that meets the purpose and need most efficiently and minimizes project impacts. The ridership forecasts are as follows: B-C-D1 – 27,000 boardings per day B-C-D2 – 26,000 boardings per day
4A	Schaper	Paul	None provided	4	Email	2 – Fiscal Effects and Schedule	Light rail waste of time and money. One billion dollars can go a lot farther fixing and expanding roads that we have now. Examples on the west metro, 494 between county road 6 and the split is still only 2 lanes each way. Highway 394 from Plymouth to downtown is already outdated. That took 10 years to build. Heavy traffic at 10:00 pm. Interstate 94 from the split to Monticello is a mess. Basically the state wants to keep people from driving their own cars. This will not happen.	The purpose and need for the project has been the subject of many studies. The proposed BLRT Extension project includes an alignment that meets the purpose and need most efficiently and minimizes project impacts. The purpose of the proposed BLRT Extension project is to provide transit service which would satisfy the long-term regional mobility and accessibility needs for businesses and the traveling public. The proposed BLRT Extension project is needed to effectively address long-term regional transit mobility and local accessibility needs while providing efficient, travel-time competitive transit service that supports economic development goals and objectives of local, regional, and statewide plans. The current design of the proposed BLRT Extension project and how it affects other transportation facilities is discussed in Chapter 3 of the Final EIS. Meeting federal cost-effectiveness criteria would be an essential part of entering into the Engineering phase for this project. However, cost is not the only criteria. The Purpose and Need is discussed in Chapter 1 of the Final EIS and a financial analysis of the project is discussed in Chapter 10 of the Final EIS. The proposed BLRT Extension project would improve the transportation system by providing the proposed BLRT Extension project corridor with more travel choices and faster travel times between residential areas, major destinations, and employment centers.
4B	Schaper	Paul	None provided	4	Email	2 – Fiscal Effects and Schedule	Anyone figure cost benefit?	Please see MASTER RESPONSE #4.
5	Runke	Dale	None provided	5	US Mail		Same comments as Pat Jordan, co-signed letter	
5A	Jordan	Pat	None provided	5	US Mail	5 – Environmental Effects	I care about wildlife in the park. All of that will change.	Section 5.8 of the Final EIS presents a summary of the assessment of wildlife habitat, impacts to wildlife habitat, and effects on threatened and endangered species. The Minnesota Department of Natural Resources (DNR) concurred with the Council's assessment that there would be no adverse effects on Blanding's turtle populations with the implementation of DNR's guidelines. A copy of the guidelines is included in Appendix F of the Final EIS. The Federal Transit Administration (FTA) determined that the proposed BLRT Extension project may affect the Northern long-eared bat, but the potential for impacts was low, and incidental "takes" of the bat would not be prohibited. Locations of fencing will continue to be explored through the design process; decisions regarding fencing locations will likely be finalized between the 30 percent and 60 percent design stages. The Council acknowledges that fencing in areas of notable wildlife habitat may impede wildlife movement. Minimizing the use of fencing in these areas, or the provision of wildlife crossings (dry culverts or other passageways) are potential solutions.
5B	Jordan	Pat	None provided	5	US Mail	6 – Noise and Vibration Effects	The noise pollution is a big factor.	Noise is discussed in Chapter 5 (Section 5.6) of the Final EIS. Noise impacts have been assessed at parks throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. Active use parks are not considered noise sensitive receptors and are not included in the noise analysis. A park may be considered a noise sensitive land use depending upon the recreation activities within the park. Theodore Wirth Regional Park was assessed in the noise

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
								analysis as a Category 1 land use. As reported in Table 5.6-6 of the Final EIS, neither Theodore Wirth Regional Park nor The Chalet would have moderate or severe noise impacts from the proposed BLRT Extension project. Theodore Wirth Regional Park – noise level with the proposed BLRT Extension project would be 44 dBA (A-weighted decibels) with a moderate noise impact criterion of 53 dBA and a severe noise impact criterion of 59 dBA. The Chalet – noise level with the proposed BLRT Extension project would be 31 dBA with a moderate noise impact criterion of 56 dBA and a severe noise impact criterion of 61 dBA.
5C	Jordan	Pat	None provided	5	US Mail	7 – Alternatives, Engineering and Design	Having a station on G.V. Road will alter access to Minneapolis and the parkway. The station there is a poor decision.	Please see MASTER RESPONSE #19.
19	Adair	Richard	Bryn Mawr Neighborhood	19	Written	7 – Alternatives, Engineering and Design	I support the Locally Preferred Alternative. There will always be the "not in my back yard" concerns. Keep your eyes on the prize – a functioning integrated transit system that moves people around and knit us together, especially transit-dependent people in high poverty areas. We are building a future for generations to come.	Please see MASTER RESPONSE #2.
20A	Johnson	Wesley D	None provided	20	Written	5 – Environmental Effects	The ditch next to the tracks is the storm runoff and storm water storage for all of Kewanee Way. Their house has been flooded before and the now have a sump pump. Any changes to the storm drainage through the ditch to the swamp would effect the viability of housing on Kewanee Way if it affects the storm drainage. Currently it is something we have to watch and worry about with every major storm.	As part of the proposed BLRT Extension project, the existing BNSF Railway (BNSF) track would be shifted to the western 50 feet of the existing 100-foot rail corridor. This would result in impacts to the Bassett Creek floodplain. The total proposed floodplain fill within the Bassett Creek floodplain, is 16,800 cubic yards. The floodplain mitigation area between the main stem of Bassett Creek and the light rail transit (LRT) and BNSF rail corridor (partially in Theodore Wirth Regional Park and partially on private property; initially identified in the Draft EIS) has been further refined. The mitigation would include excavating adjacent ground below the 100-year floodplain elevation to provide compensatory floodplain storage for the fill placed in the floodplain.
20B	Johnson	Wesley D	None provided	20	Written	8 – Transportation System Effects	Many residents of Kewanee Way and the streets above use a pathway to access the tracks to the fire station to catch buses on Golden Valley Road and to vote. Cutting off this access more than inconvenient. Most people will not be able to walk around as it is 3 or 4 times longer and has steep hills. Cutting off access across the tracks would isolate this part of Golden Valley from the parks, fire station, and the rest of Golden Valley as regards to walking or bicycle usage.	The informal and unauthorized crossings across BNSF property from Kewanee Way near Sochacki Park and Sochacki Park: Mary Hills Nature Area would be eliminated as a result of the proposed BLRT Extension project. Crossings at Golden Valley Road and Plymouth Avenue would be the primary points of access for pedestrians traveling from Kewanee Way.
20C	Johnson	Wesley D	None provided	20	Written	5 – Environmental Effects	There is heavy deer and animal traffic across the tracks. Blocking this will force them onto the roadways, probably golden valley road bridge.	Please see MASTER RESPONSE #13.
21A	Jordan	Pat	None provided	21	Written	7 – Alternatives, Engineering and Design	LRT in Golden Valley does not serve the public who would be using it.	Please see MASTER RESPONSE #1.
21B	Jordan	Pat	None provided	21	Written	5 – Environmental Effects	The wildlife, environment, pollution, noise, air quality, traffic – all are going to see big changes. (responses are broken up to cover each element of comment).	Concerning wildlife: Please see MASTER RESPONSE #13.
21C	Jordan	Pat	None provided	21	Written	5 – Environmental Effects	The wildlife, environment, pollution, noise, air quality, traffic – all are going to see big changes. (responses are broken up to cover each element of comment).	Concerning environmental impacts: At the time of publication, the Draft EIS included a discussion of all known environmental issues and impacts.
21D	Jordan	Pat	None provided	21	Written	5 – Environmental Effects	The wildlife, environment, pollution, noise, air quality, traffic – all are going to see big changes. (responses are broken up to cover each element of comment).	Concerning pollution: Please see MASTER RESPONSE #12.
21E	Jordan	Pat	None provided	21	Written	6 – Noise and Vibration Effects	The wildlife, environment, pollution, noise, air quality, traffic – all are going to see big changes. (responses are broken up to cover each	Concerning noise: Please see response to Comment 5B.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
							element of comment).	
21F	Jordan	Pat	None provided	21	Written	5 – Environmental Effects	The wildlife, environment, pollution, noise, air quality, traffic – all are going to see big changes. (responses are broken up to cover each element of comment).	Concerning air quality: Please see MASTER RESPONSE #12.
21G	Jordan	Pat	None provided	21	Written	8 – Transportation System Effects	The wildlife, environment, pollution, noise, air quality, traffic – all are going to see big changes. (responses are broken up to cover each element of comment).	Concerning traffic: The traffic operations analysis indicates that the Golden Valley Road/Theodore Wirth Parkway intersection would operate at a level of service E in 2040 with either the No-Build Alternative or the proposed BLRT Extension project. See Table 3.3-3 in the Final EIS.
21H	Jordan	Pat	None provided	21	Written	5 – Environmental Effects	Do you realize the land by Golden Valley Road and where the tracks are located is a dump underneath the top layer? It's a flood zone there. The old Hwy 100 concrete, etc was dumped there.	The Council is aware of the previous dumping that had occurred during the 1960s in Sochacki Park. A Phase I Environmental Site Assessment (ESA) has been conducted and a Phase II ESA will be done to further evaluate the presence of contamination along the entire proposed BLRT Extension project corridor and proposed areas of construction. Information gathered from the Phase I and II ESA will be incorporated into the proposed BLRT Extension project's Response Action Plan (RAP) (which includes a Construction Contingency Plan for unidentified contamination) to properly handle, treat, store, and dispose of solid wastes, hazardous materials, petroleum products, and other regulated materials that could not be avoided during construction. Coordination with the Minnesota Pollution Control Agency, cities of Robbinsdale and Golden Valley, and the Three Rivers Park District will also be arranged. The Council reviewed Federal Emergency Management Agency (FEMA) 100-year floodplains and FEMA floodways as part of the evaluation for the proposed BLRT Extension project. The floodplains and floodways were identified and evaluated based on current FEMA Flood Insurance Rate Maps (FIRM) and ancillary information. The data relied upon for floodplain analysis are based on the information in the Preliminary Floodplain Impacts and Mitigation Strategies Technical Memorandum (January 2016), or Floodplain Technical Memorandum. The Council conducted the analysis in coordination with US Army Corps of Engineers, Minnesota Department of Natural Resources, and local watershed organizations (Bassett Creek Water Management Commission, Shingle Creek Watershed Management Commission, West Mississippi Water Management Commission, and Mississippi Watershed Management Organization) as described in the Floodplain Technical Memorandum.
22A	Jeska	Joan	None provided	22	Written	2 – Fiscal Effects and Schedule	Where is the money for this – won't pay for itself.	A breakdown of funding sources is located in Table 10.1-2 of Chapter 10 – Financial Analysis of the Final EIS totaling $1.496 billion. The Council assumes the following capital funding breakdown: ■ Capital Investment Grant (CIG) Program funding from FTA – 49 percent ■ State of Minnesota – 10 percent ■ County Transit Improvement Board – 31 percent ■ Hennepin County Regional Railroad Authority – 10 percent FTA must evaluate and rate proposed projects seeking funding from the CIG Program under a set of project justification and local financial commitment criteria specified in law. The criteria evaluate the merits of the project and the project sponsor's ability to build and operate it as well as the existing transit system. Also, please see MASTER RESPONSE #4.
22B	Jeska	Joan	None provided	22	Written	5 – Environmental Effects	Theodore Wirth Park is the main feature of our quality of life and the intent was to protect it. BOT would destroy the principle law of that (try planting a tree on Hiawatha line – none).	Please see MASTER RESPONSE #14.
22C	Jeska	Joan	None provided	22	Written	4 – Social and Economic Effects	Our lake system puts us on the map for quality of life – reroute Bottineau – use more buses.	The Draft EIS considered an Enhanced Bus/Transportation System Management (TSM) Alternative to serve comparable travel markets (Route 731/732). While the Enhanced Bus/TSM Alternative provides additional transit service, it does not meet the proposed BLRT Extension project goals of enhancing access to regional activity centers, enhancing the effectiveness of transit services within the proposed BLRT

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
								Extension project corridor, or promoting sustainable development patterns. In the Draft EIS travel time was estimated at approximately 48–50 minutes for the Enhanced Bus/TSM Alternative, whereas the proposed BLRT Extension project estimated approximately 33 minutes. Chapter 11 of the Draft EIS compares the various alternatives.
22D	Jeska	Joan	None provided	22	Written	4 – Social and Economic Effects	Doesn't serve people who need public transportation. Minimum population along the T.W vs Bottineau.	The proposed BLRT Extension project would improve the transportation system by providing the proposed BLRT Extension project corridor with more travel choices and faster travel times between residential areas, major destinations, and employment centers. The Final EIS includes an evaluation of potential disproportionately high and adverse impacts on minority and low-income populations along the proposed BLRT Extension project. The evaluation considers proximity of low-income populations and transit-dependent households to proposed stations as well as access to other enhanced transit options. Section 7.5 of the Final EIS discusses how the project would "prevent the denial of, reduction in, or significant delay in the receipt of benefits by minority and low-income populations" and improve transit for those most dependent upon it as part of an integrated system.
22E	Jeska	Joan	None provided	22	Written	7 – Alternatives, Engineering and Design	If this was right for the people there would not be such strong opposition. Citizens are against. What is our voice?	Please see MASTER RESPONSE #6.
22F	Jeska	Joan	None provided	22	Written	4 – Social and Economic Effects	My home is adjacent to the tracks and has major structural issues. Any construction could cause my house to collapse.	Section 5.7 of the Final EIS summarizes vibration impacts. Vibration impacts to residential properties have been identified in Robbinsdale and Crystal, along with the proposed mitigation for those impacts: ■ 36th Avenue North to 38th Avenue North: 700-foot-long ballast mat ■ 38th Avenue North to 40½ Avenue North: 300-foot-long ballast mat ■ 47th Avenue North to BNSF freight tracks: 300-foot-long ballast mat For these impacts, the proposed ballast mats will eliminate long-term vibration impacts at these locations. The most effective methods for reducing the impact from construction vibration are to limit the use of high-vibration activities, such as impact pile driving and vibratory rolling, and to include vibration limits in the construction specifications.
22G	Jeska	Joan	None provided	22	Written	7 – Alternatives, Engineering and Design	Public transit is for people who need it.	Please see response to Comment 22D.
23A	Overby	Amy	None provided	23	Written	4 – Social and Economic Effects	How will safety be provided for commuters? Specifically, when individuals leave the visibility and relative safety of street level (Golden Valley Road, particularly), who will ensure safety and peace of mind at a station located under a bridge, near a woodland occasionally inhabited by transients?	Please see MASTER RESPONSE #8.
23B	Overby	Amy	None provided	23	Written	4 – Social and Economic Effects	In both of those locations (Golden Valley Road and Plymouth Ave), I am unwilling to walk alone or with my dog when it is dark, those areas do not feel safe, because of the isolation and the highly/deeply wooded locations. If the goal of a station at those locations is to increase business/commuter traffic and usage, the isolated, invisible nature of those locations will actually discourage commuter usage.	Chapter 3 – Transportation addresses ridership and connectivity of the Golden Valley Road and Plymouth Avenue stations by car, bus, and walk up. A park-and-ride would provide 100 parking spaces for users of the Golden Valley Road Station. Approximately 905 daily boardings would occur at the Golden Valley Road Station and 229 at the Plymouth Avenue Station. Also, please see MASTER RESPONSE #8.
24A	Price	Robin	Bassett Creek Neighborhood	24	Written	3 – NEPA Process and Public Involvement	30 days has not been enough time to review the DEIS before this meeting.	The notification and comment period followed the legal requirements (minimum requirement is 45 days). The Draft EIS comment period was from April 11 to May 29, 2014 (48 days).
24B	Price	Robin	Bassett Creek Neighborhood	24	Written	5 – Environmental Effects	Continued concerns about health and integrity of Bassett Creek.	Bassett Creek is an iconic water resource. Good community work has already been implemented in the restoration of reaches of this important stream. Though Bassett Creek is currently listed on the 303(d) List of Impaired Waters, conditions within the Creek are improving. Per the federal Clean Water Act, an impaired water cannot be made worse by a proposed action. Thus, the Council is obligated to implement best

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
								management practices that would be compliant with the Clean Water Act and that would likely exceed compliance and improve the water quality and habitat value of the creek.
24C	Price	Robin	Bassett Creek Neighborhood	24	Written	6 – Noise and Vibration Effects	Concern over lack of access to quiet space in this corner of Golden Valley	Noise is discussed in Chapter 5 (Section 5.6) of the Final EIS. Noise impacts have been assessed at parks throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. As reported in Table 5.6-5 of the Final EIS the following noise level with the proposed BLRT Extension project would be: ■ Plymouth Avenue North to 16th Avenue North – 9 moderate noise impacts and no severe noise impacts ■ 16th Avenue North to Golden Valley Road – 1 moderate noise impact and no severe noise impacts ■ Golden Valley Road to 26th Avenue North – 9 moderate noise impacts and 14 severe noise impacts For the first two locations, after the implementation of interior testing to determine the appropriate mitigation measure, no residual noise impacts are anticipated. For the third location with mitigation in the form of a noise barrier, 1 moderate and 1 severe noise impacts would remain.
24D	Price	Robin	Bassett Creek Neighborhood	24	Written	7 – Alternatives, Engineering and Design	I want to see the rail go down Highway 55 or Broadway.	Please see MASTER RESPONSE #1.
24E	Price	Robin	Bassett Creek Neighborhood	24	Written	7 – Alternatives, Engineering and Design	If there needs to be a light rail stop, it should serve downtown Golden Valley and encourage business growth.	Please see MASTER RESPONSES #1 and #19.
24F	Price	Robin	Bassett Creek Neighborhood	24	Written	7 – Alternatives, Engineering and Design	Many Golden Valley residents are opposed to this route.	Please see MASTER RESPONSE #1.
24G	Price	Robin	Bassett Creek Neighborhood	24	Written	7 – Alternatives, Engineering and Design	This is not MY preferred route.	Please see MASTER RESPONSE #1.
24H	Price	Robin	Bassett Creek Neighborhood	24	Written	5 – Environmental Effects	Please keep Theodore Wirth Park pristine and on the historical register.	Effects to historic properties within the Area of Potential Effects (APE) were analyzed and documented in the Final EIS. All attempts would be made to avoid or minimize adverse effects to historical or cultural resources, including to Theodore Wirth Regional Park, as the Section 106 of the National Historic Preservation Act process moves forward. See Chapter 4 (Section 4.4) of the Final EIS for additional information regarding the Theodore Wirth Segment of the Grand Rounds Historic District. FTA has determined that the project undertaking would have an adverse effect on this historic resource; however, it remains eligible for listing on the National Register of Historic Places (NRHP). Mitigation measures can be found in the Section 106 Memorandum of Agreement in Appendix H of the Final EIS including designing to *The Secretary of the Interior's Standards for the Treatment of Historic Properties* (*SOI's Standards*; 36 CFR Part 68), developing a Construction Protection Plan to avoid and minimize adverse construction effects, preparing a preservation plan and a treatment plan in accordance with *SOI's Standards,* and incorporating interpretation of the Theodore Wirth Segment into the design of the proposed BLRT Extension project in the Grand Rounds Historic District.
24I	Price	Robin	Bassett Creek Neighborhood	24	Written	5 – Environmental Effects	Currently Bassett Creek floods near the homes on Bassett Creek Drive – it could get worse with 100 feet of development around the rail.	Development associated with or resulting from the proposed BLRT Extension project is guided by local ordinances and watershed rules that dictate the amount of runoff that would be permitted from proposed developments and infrastructure. These rules are in place to help mitigate potential flooding effects on Bassett Creek and other waterbodies. As part of the proposed BLRT Extension project, the existing BNSF track would be

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
								shifted to the western 50 feet of the existing 100-foot rail corridor. This would result in impacts to the Bassett Creek floodplain. The total proposed floodplain fill within the Bassett Creek floodplain, is 16,800 cubic yards. The floodplain mitigation area between the main stem of Bassett Creek and the LRT and BNSF rail corridor (partially in Theodore Wirth Regional Park and partially on private property; initially identified in the Draft EIS) has been further refined. The mitigation would include excavating adjacent ground below the 100-year floodplain elevation to provide compensatory floodplain storage for the fill placed in the floodplain.
24J	Price	Robin	Bassett Creek Neighborhood	24	Written	8 – Transportation System Effects	Parking or drop off spots will be dangerous on Golden Valley Road	Chapter 3 – Transportation of the Final EIS discusses the Golden Valley Road Station. A 100-space park-and-ride and pedestrian and bicycle improvements would be included at the Golden Valley Road Station. The station would include bus drop off locations on Golden Valley Road and a crosswalk for riders to access westbound buses on Golden Valley Road from the station. At the intersection at Theodore Wirth Parkway and Golden Valley Road a traffic signal is included in the proposed BLRT Extension project.
25A	Steinberg	Dan	None provided	25	Written	7 – Alternatives, Engineering and Design	Would like to see tunnel study from Golden Valley Rd to Abbot Dr. underground then zigzag the rail through Robbinsdale. All I am asking for is a study before track is laid down.	Please see MASTER RESPONSE #20.
26A	Wildung	Cathy	None provided	26	Written	5 – Environmental Effects	Impacts on floodplains, wetlands, water sources for drinking and wells – private and public. (answers broken into three parts to answer each topic).	Concerning floodplains: The Council reviewed FEMA 100-year floodplains and FEMA floodways as part of the evaluation for the proposed BLRT Extension project. The floodplains and floodways were identified and evaluated based on current FEMA FIRM and ancillary information. The data in this section are based on the information in the Preliminary Floodplain Impacts and Mitigation Strategies Technical Memorandum (January 2016), or Floodplain Technical Memorandum. The Council conducted the analysis in coordination with the US Army Corps of Engineers (USACE), DNR, and local watershed organizations (Bassett Creek Water Management Commission, Shingle Creek Watershed Management Commission, West Mississippi Water Management Commission, and Mississippi Watershed Management Organization) as described in the Floodplain Technical Memorandum.
26B	Wildung	Cathy	None provided	26	Written	5 – Environmental Effects	Impacts on floodplains, wetlands, water sources for drinking and wells – private and public. (answers broken into three parts to answer each topic).	Concerning wetlands: Please see MASTER RESPONSE #16.
26C	Wildung	Cathy	None provided	26	Written	5 – Environmental Effects	Impacts on floodplains, wetlands, water sources for drinking and wells – private and public. (answer broken into three parts to answer each topic).	Concerning water sources: The Final EIS addresses drinking water in Section 5.1 dealing with utilities. Private and public wells within the proposed BLRT Extension project corridor are identified and the potential effects of the proposed BLRT Extension project are described. The construction and maintenance phases of the project would also incorporate appropriate measures to avoid and minimize potential impacts to drinking water from public and private wells.
26D	Wildung	Cathy	None provided	26	Written	5 – Environmental Effects	The possibility of uncovering hazardous materials – 790 recorded sites in B-C-D1 Preferred Alternative area.	Chapter 5 (Section 5.5) of the Final EIS discusses the potential for encountering contamination. A Phase I ESA has been conducted, and a Phase II ESA is being conducted to further evaluate the presence of contamination along the entire proposed BLRT Extension project corridor and proposed areas of construction. Information gathered from the Phase I and II ESA will be incorporated into the proposed BLRT Extension project's RAP (which includes a Construction Contingency Plan for unidentified contamination) to properly handle, treat, store, and dispose of solid wastes, hazardous materials, petroleum products, and other regulated materials that could not be avoided during construction. Coordination with the Minnesota Pollution Control Agency, cities of Robbinsdale and Golden Valley, and the Three Rivers Park District will also be arranged.
26E	Wildung	Cathy	None provided	26	Written	6 – Noise and	Noise – both during construction phase in which noise decibel levels will exceed recommended levels for residential use – and the rail	An assessment of the impacts of construction noise was included in the Draft EIS and has been included in more detail in Chapter 5 (Section 5.6) of the Final EIS.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
						Vibration Effects	noise, which, between 80-100 decibels equates to a concrete mixer, jack hammer and a rock drill. This is from the report on Page 5-39.	Construction noise levels are subject to local noise ordinances and noise rules administered by the Minnesota Pollution Control Agency (MPCA; Minnesota Rules, Chapter 7030). The primary means of mitigating noise from construction activities is to require the contractor to prepare a detailed Noise Control Plan. A noise control engineer or acoustician will work with the contractor to prepare a Noise Control Plan in conjunction with the contractor's specific equipment and methods of construction. Also, please see MASTER RESPONSE #17.
26F	Wildung	Cathy	None provided	26	Written	6 – Noise and Vibration Effects	The constant operating hours and service frequencies of the light rail, especially during early morning and late evening hours. Bells, horns, rail noise, will impact everyone nearby.	Please see MASTER RESPONSE #17.
27A	Bonniwell	Constance	None provided	27	US Mail	7 – Alternatives, Engineering and Design	I walked a ring around our woods from 27th Avenue North and the BN rail line to Golden Valley Road, then down the east side of the BN line to Highway 55, a 100+ acre expanse of wild life habitat your Draft EIS makes no reference about. I knocked only on the doors of properties abutting the BN line or abuting the wooded parkland that abuts the BN line (many of those owners have maintained private wild life habitat bordering park woods for decades) with some owners living directly across the street from park or BN wild life habitat. The owners on the front lines. Here are 96 of the 102 addresses I have collected so far. 4 of them are not on the front lines but I wasn't telling anyone that they couldn't sign a petition for no LRT in their woods. My biggest problem is people not answering doors. I have listened to many property owners and I can say with assurance that the true local preference is NO BUILD. A petition was attached as well. (This is the same correspondence as #27 sent to a different person)	Please see MASTER RESPONSE #1.
43A	Boyce	Kim	None provided	43	Written	7 – Alternatives, Engineering and Design	I am very supportive of the proposed transitway. Providing easier access to public transit for residents and visitors to the northwestern suburbs, as well as North Minneapolis, could prove to be a substation asset to this region.	Please see MASTER RESPONSE #2.
43B	Boyce	Kim	None provided	43	Written	7 – Alternatives, Engineering and Design	As I did a quick review of the reasoning and rationale outlined in the Executive Summary of the EIS, I have a much better understanding of why the D1 option was selected over the D2 option. The potential displacement of so many residents in the D2 option does create a significant negative impact on that portion of the community.	Please see MASTER RESPONSE #2.
43C	Boyce	Kim	None provided	43	Written	8 – Transportation System Effects	Having adequate traffic control and drop-off spaces at proposed stations at Golden Valley and Theodore Wirth Park are important considerations. Not everyone will be able to easily walk to these locations.	Chapter 3 – Transportation of the Final EIS discusses the Golden Valley Road Station. A 100-space park-and-ride and pedestrian and bicycle improvements would be included at the Golden Valley Road Station. The station would include bus drop off locations on Golden Valley Road and a crosswalk for riders to access westbound buses on Golden Valley Road from the station. At the intersection at Theodore Wirth Parkway and Golden Valley Road a traffic signal is included in the proposed BLRT Extension project.
44A	Smith	Marietta	Resident	44	Written	3 – NEPA Process and Public Involvement	We need more time to review this voluminous report. I still need to review chapters 2, 3, 4, 6, 7 and 11. How do we get additional review time?	Please see response to Comment 24A.
45A	Smith	Marietta	Resident	45	Written	5 – Environmental Effects	I don't believe that the conclusions of the DEIS implying that the D1 Plymouth Station location is the best alternative were made taking into consideration the permanent detriment impact it will have on this urban ecological area. The natural urban wetland and wildlife habitat refuge provided by the area proposed for the Plymouth Station is unique. There is no way to mitigate the damage it will impose by any mitigation means. I'm told	Section 5.8 of the Final EIS summarizes impacts to wildlife habitat and endangered species. Theodore Wirth Regional Park has notable terrestrial and aquatic habitat that would be impacted by the proposed BLRT Extension project. Because of the urban setting of the proposed BLRT Extension project, the wildlife that inhabits these areas are generalist species adapted to urban conditions. These species are generally more tolerant of human presence and activities, including traffic (pedestrian, rail, and vehicle) and have demonstrated by their presence that they adapt readily to the human environment. Unavoidable impacts to aquatic habitat would be mitigated by

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
							that the mitigation does not need to be -- and likely won't be -- in the damaged areas. One reason many of us purchased our homes in this area is because we loved the rural feel and aspect of that strip of land from Plymouth northward.	a combination of on-site wetland mitigation and purchasing suitable wetland credits from an established wetland mitigation bank. Unavoidable impacts to notable terrestrial habitat would be mitigated by restoring vegetation in and around Theodore Wirth Regional Park and other notable habitats to be determined during design efforts. Where effective and feasible, suitable wildlife crossings would be accommodated within proposed culverts to allow wildlife species to cross from one side of the LRT/freight rail tracks to the other.
45B	Smith	Marietta	Resident	45	Written	3 – NEPA Process and Public Involvement	Because those of us who live in Xerxes Avenue North – -just across from the proposed LRT station -- live on the Minneapolis side of the street we were not included in the initial findings -- which, coincidentally, originally did not envision a station in the Theodore Wirth BNSF corridor. It was completely short-sided and unfair to ignore our input and impact it would have on our area. The proposed project is virtually in our FRONT YARDS and BACK YARDS! As I understand it, the station is proposed to be constructed to the north of the Plymouth Avenue bridge. That area is just a narrow strip of land that can barely accommodate two additional sets of tracks, not even considering LRT Station. The existing BNSF railroad tracks have been a part of the landscape and were built decades before the current residential development of this area.	Please see MASTER RESPONSES #6, #14 and #19.
45C	Smith	Marietta	Resident	45	Written	5 – Environmental Effects	The damage that will be done by the heavy equipment and heavy construction cannot be repaired enough to restore the current ecological environment of that narrow strip of land. Forcing it to accommodate the proposed station by filling in the wetlands and marsh areas doesn't appear to be a good solution.	Please see MASTER RESPONSE #14 and #16.
45D	Smith	Marietta	Resident	45	Written	6 – Noise and Vibration Effects	The reality of the years of noise, dirt, dust, additional traffic, loss of neighborhood safety -- just to mention a few detrimental environmental impacts -- in a decades old residential and urban ecological area is just devastating.	Concerning noise: Please see MASTER RESPONSE #17. Interior testing to determine the appropriate mitigation measure of impacted homes from Oak Park Avenue North to Golden Valley Road is the proposed mitigation measure. See Table 5.6-7 in the Final EIS for a summary of proposed mitigation measures by location. Concerning dirt and dust: Please see MASTER RESPONSE #12. Concerning additional traffic: The traffic operations analysis indicates that the Golden Valley Road/Theodore Wirth Parkway intersection would operate at a level of service E in 2040 with either the No-Build Alternative or the proposed BLRT Extension project. See Table 3.3-3 in the Final EIS. Concerning loss of neighborhood safety: No mitigation measures are warranted for long-term impacts to safety and security because there would be no adverse impacts to safety and security. Safety and security oversight for the proposed BLRT Extension project would be achieved through implementation of the proposed BLRT Extension project's Safety and Security Management Plan and the Metro Light Rail Transit Design Criteria. Concerning detrimental environmental impacts: Please see responses to Comments 45A, 45B, and 45C.
45E	Smith	Marietta	Resident	45	Written	3 – NEPA Process and Public Involvement	Also, the 45-day comment period for such a comprehensive report and its referenced reports and studies is unconscionable.	Please see response to Comment 24A.
46A	Smith	Marietta	Resident	46	Written	7 – Alternatives, Engineering and Design	Despite the DEIS indicating the D1 (the LPA) is the best alternative of the routes being considered, I disagree. The negative impacts outweigh the benefits to this part of North Minneapolis -- which is further from Penn Avenue area surroundings that would most benefit from this project.	Please see MASTER RESPONSE #1.
46B	Smith	Marietta	Resident	46	Written	4 – Social and Economic Effects	I understand Penn Avenue was dropped due to the number of houses that would need to be razed.	The Policy Advisory Committee (PAC) recommended Alignment D1 over Alignment D2 because Alignment D1 would result in significantly less property and

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
								neighborhood impacts, improved travel time, greater cost-effectiveness, and less disruption of roadway traffic operations. Discussion focused on the adverse impacts of Alignment D2 and that Alignment D1 better meets the project goals. The costs (impacts) of Alignment D2 for the people on Penn Avenue would outweigh the potential benefits.
46C	Smith	Marietta	Resident	46	Written	7 – Alternatives, Engineering and Design	However, there should be a better alternative -- what about Olson Highway. Granted the Plymouth Avenue is closer to the Chalet but this alternative is more costly	Please see MASTER RESPONSE #1.
46D	Smith	Marietta	Resident	46	Written	5 – Environmental Effects	(I'm sure there will be soil "surprises" once construction begins but that will be a bit late to make any substantive changes) and disruptive.	Chapter 5 (Section 5.4) of the Final EIS discusses poor or substandard soils. Detailed geotechnical analysis, including boring tests, has been conducted and the findings from those analyses are reflected in the Final EIS and project design. Chapter 5 (Section 5.5) of the Final EIS discusses hazardous and contaminated materials, which indicates a medium risk of contamination around the Plymouth Avenue Station.
46E	Smith	Marietta	Resident	46	Written	8 – Transportation System Effects	There are already transportation routes that culminate at Olson Highway and could easily tie into a station there.	Chapter 3 of the Final EIS discusses existing and future bus routes that would connect with stations. The existing route 7 would connect with the Plymouth Avenue Station.
47A	Lewis	Shaun	Urban League	47	Written	7 – Alternatives, Engineering and Design	The community need both Golden Valley Road Station and Plymouth Station.	Please see MASTER RESPONSE #19.
48A	Lehman	Karen	None provided	48	Written	7 – Alternatives, Engineering and Design	Thank for the opportunity to share my comments on May 7 with all of you. My property is at… I have since submitted written comments to the Bottineau Transitway team at the Metropolitan Council. I have some additional thoughts I would like to share with all of you, given your interest in protecting Golden Valley's interests without standing in opposition to larger regional interests. It is clear that Golden Valley is in an adaptation and mitigation situation all around. As a stand-alone community, we would be better served by better bus transit than by light rail. However, it appears that the D1 option is the only truly viable option for the outlying communities. So we must adapt as best we can. I am in favor of only one station in Golden Valley, preferably at Golden Valley Road, largely to decrease environmental disruption. I say that, even though I am likely to suffer the negative noise, parking, and decreased security consequences on Zephyr Place. If I am not mistaken, the impacts on wetlands will be greater at the Plymouth stop. Let's not do that. However, if the priority is Plymouth, then I think we should not develop Golden Valley Road. We only truly need one stop in Golden Valley, if we are thinking about people getting out of our community to places they want to go.	Concerning the Golden Valley Road Station: Please see MASTER RESPONSE #19.
48B	Lehman	Karen	None provided	48	Written	5 – Environmental Effects	I now understand that no matter what, the line will be fenced, and that it will only be lit at the stations: one bad thing for the natural areas, and one good thing. Fencing will cut the wildlife corridor connecting Theodore Wirth Park and the east side of the line for the four-legged animals. Fortunately, birds will not be as affected. And the majority of the area will be unlit, which is great. I support that.	Please see MASTER RESPONSE #13. Locations of fencing will continue to be explored through the design process; decisions regarding fencing locations will likely be finalized between the 30 percent and 60 percent design stages.
48C	Lehman	Karen	None provided	48	Written	6 – Noise and Vibration Effects	So I am now focused on how to reduce the impact on those of us living on York and Zephyr Place whose homes hang out over the rail line, particularly for noise and visual pollution. Given that the line will be fenced regardless, I request that you advocate for a sound barrier below York and Zephyr Place, adequate to address the fact that sound travels up. The engineering study would need to address this unique aspect of above-grade housing. The barrier may require more height,	Noise impacts have been assessed at sensitive locations throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. Where impacts have been identified, mitigation measures, consistent with Metro Transit's noise mitigation policy, have been recommended. Impacts were identified in the Draft EIS in this area. An additional noise measurement was conducted in this area for the Final EIS and the results of the assessment and mitigation recommendations are included in Chapter 5 (Section 5.6) of the Final EIS.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
							or different placement (for example, on the informal path that currently exists on the east side of the line). It would be a plus that it might also provide a sight barrier so that we would continue to see trees and a neutral static wall, rather than seeing trains whizzing by every 10 minutes. This would allow this area to maintain some of its unique character and reduce impacts that might encourage me, and perhaps others, to sell our homes.	Interior testing to determine the appropriate mitigation measure is recommended for the location of 16th Avenue North to Golden Valley Road in Golden Valley, near Zephyr Place and York resulting in no residual noise impacts. See Table 5.6-7 in the Final EIS for a summary of proposed mitigation measures by location. Also, please see MASTER RESPONSE #17.
48D	Lehman	Karen	None provided	48	Written	4 – Social and Economic Effects	For security reasons, I also request that you not develop a path along the east side of the line. I have already had one attempted break-in from someone using the informal path, and making it easier for people to have this “back door” out of the neighborhood with no eyes on the street would be detrimental to the community. People might think that a lighted path is safe. If no one is looking, it doesn’t matter, and then we just deal with light pollution in a currently blessedly dark place. Wirth Park has good paths. Making sure that there are good sidewalks on Golden Valley Road should be adequate.	No new trails would be developed along the east side of the BNSF right-of-way as a part of the proposed BLRT Extension project. There would be improvements to existing pedestrian and bicycle facilities. Chapter 3 of the Final EIS provides additional detail on bicycle and pedestrian facilities as a part of the proposed BLRT Extension project.
48E	Lehman	Karen	None provided	48	Written	4 – Social and Economic Effects	As I said to Commissioner Higgins and Council Member Clausen after the meeting, what you heard at the meeting was not resistance to change, but expression of loss. Golden Valley will be a different place once the line goes through, and people know that. Many will choose to leave to seek a place that has the qualities that Golden Valley currently possesses, and new people will come in who are more interested in getting to work easily. For those leaving, Golden Valley will be a worse place, and for those arriving, it will look better. My goal is not to leave, to protect as much of Golden Valley’s current natural character as possible. If I can tolerate the change in the environment, I will stay. At this point, tolerable is all I’m aiming for.	The Council has worked with the public and stakeholders to avoid, minimize, and mitigate impacts to the environment since the publication of the Draft EIS. Impacts to floodplains were reduced from the Draft EIS (18,700 cubic yards) to the Final EIS (17,000 cubic yards). Impacts to wetlands increased slightly from 10.2 acres in the Draft EIS to 13.21 acres in the Final EIS. Permanent impacts to park resources were reduced to 2.11 acres. The visual character of the proposed BLRT Extension project corridor as a whole would not be substantially changed. Noise effects from the proposed BLRT Extension project would result in no severe or moderate impacts with mitigation. Vibration impacts for residential land uses would be eliminated with mitigation. For additional information, please review Chapter 12 of the Final EIS.
63A	Davis	Denis F.	None provided	63	Written	7 – Alternatives, Engineering and Design	No lite rail whatsoever, no where. Dissolve the met council. Opposes all LRT.	Please see MASTER RESPONSE #1.
63B	Davis	Denis F.	None provided	63	Written	2 – Fiscal Effects and Schedule	Not cost effective, do any rail systems operate in the red? 90 million per mile for LRT, 10 million to add a lane of road.	Please see MASTER RESPONSE #4.
64A	Davis	Sharon	None provided	64	Written	3 – NEPA Process and Public Involvement	Get rid of Met Council. People should vote on this.	Please see response to Comment 24A. Chapter 9 of the Final EIS provides a summary of public involvement for the Final EIS, including a summary of open houses held during Final EIS preparation. The Council has hosted numerous events for public input in the City of Robbinsdale. Open houses, public hearings, and city council work sessions have all been organized to provide information about the proposed BLRT Extension project and to solicit feedback from community members. The Council also attends community events and presents to local organizations.
64B	Davis	Sharon	None provided	64	Written	2 – Fiscal Effects and Schedule	Project is a waste of money.	Please see MASTER RESPONSE #4.
64C	Davis	Sharon	None provided	64	Written	7 – Alternatives, Engineering and Design	People do not want this. Stop now. Opposes project.	Please see MASTER RESPONSE #1.
65A	Dougherty	Rebecca	None provided	65	Written	7 – Alternatives, Engineering and Design	I support the light rail coming to Brooklyn Park 100%	Please see MASTER RESPONSE #2.
65B	Dougherty	Rebecca	None provided	65	Written	4 – Social and Economic Effects	If any of the issues of access or loss of property [along West Broadway Avenue in Brooklyn Park] can be addressed that would be great. I know they all can’t be satisfied, but any is better than none.	Moving from an undivided configuration that allows full access into and out of every driveway along the West Broadway Avenue (County State-Aid Highway 103) corridor to a divided configuration is expected to increase traffic capacity, improve traffic operations, and lower the rate of incidents (crashes). Multiple studies have documented the capacity, mobility, and safety improvements that can be achieved

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
								with this type of roadway design. By directing traffic to designated median openings, the proposed West Broadway Avenue corridor design would allow businesses and other private driveways full access to one direction of travel, with right-in/right-out access. Also, please see MASTER RESPONSE #21.
65C	Dougherty	Rebecca	None provided	65	Written	7 – Alternatives, Engineering and Design	Thank you for the work on this project. We do need light rail to Brooklyn Park.	Please see MASTER RESPONSE #2.
65D	Dougherty	Rebecca	None provided	65	Written	7 – Alternatives, Engineering and Design	Living near the LR not on the LR is a valid comment but people need to consider the extra expense of a tunnel or elevated train.	Please see MASTER RESPONSE #20.
65E	Dougherty	Rebecca	None provided	65	Written	3 – NEPA Process and Public Involvement	Informing the public more on access to college and businesses and how that is positive is so important.	Please see MASTER RESPONSE #6.
66A	Jonas	Brian	None provided	66	Written	7 – Alternatives, Engineering and Design	I am against the proposed LRT route along West Broadway to Brooklyn Park.	Please see MASTER RESPONSE #1.
66B	Jonas	Brian	None provided	66	Written	8 – Transportation System Effects	I live nearby and am greatly concerned about traffic disruptions going both in and out of my property. Turning restrictions along West Broadway would prevent him from being able to turn left onto Maplebrook Parkway to enter Maplebrook Estates and would prevent him from turning left exiting Maplebrook Parkway to go north on West Broadway.	Hennepin County is developing the West Broadway Avenue Reconstruction project. An Environmental Assessment Worksheet for the roadway project was completed and a Negative Declaration finding issued. The Final EIS discloses this information in Chapter 2 – Alternatives and in Chapter 6 – Indirect Impacts and Cumulative Effects. Moving from an undivided configuration that allows full access into and out of every driveway along the West Broadway Avenue corridor to a divided configuration is expected to increase traffic capacity, improve traffic operations, and lower the rate of incidents (crashes). Multiple studies have documented the capacity, mobility, and safety improvements that can be achieved with this type of roadway design. By directing traffic to designated median openings, the proposed West Broadway Avenue corridor design would allow businesses and other private driveways full access to one direction of travel, with right-in/right-out access. The proposed BLRT Extension project includes a variety of roadway modifications that would avoid new congested intersections, and, with one exception, the proposed BLRT Extension project would not worsen conditions at intersections that would be congested with the No-Build Alternative in 2040. Additional information can be found in Section 3.3 of the Final EIS.
66C	Jonas	Brian	None provided	66	Written	8 – Transportation System Effects	I also work in Brooklyn Park and the construction would impact route to work, possibly sending him miles out of the way.	To mitigate impacts during construction, the Council will develop a Construction Mitigation Plan, a Construction Communication Plan, and a construction staging plan. These tools will help the Council notify people in advance about any access issues or closures. The construction staging plan would also help businesses and patrons affected by LRT construction understand when construction would occur in different areas of the proposed BLRT Extension project corridor. Finally, a 24-hour construction hotline will be available for issue resolution and information about LRT construction. Section 3.4 of the Final EIS (Pedestrians and Bicyclists) summarizes construction-phase mitigation measures. During construction, the Council will require the contractor to comply with appropriate state and local requirements concerning the closing of roadways. The mitigation measures required by the city for roadway access and traffic control also apply.
66D	Jonas	Brian	None provided	66	Written	8 – Transportation System Effects	Turning restrictions along West Broadway would affect my access to Brooklyn Park businesses causing me to take my business to other cities.	Hennepin County is developing the West Broadway Avenue Reconstruction project. An Environmental Assessment Worksheet for the roadway project was completed and a Negative Declaration finding issued. The Final EIS discloses this information in Chapter 2 – Alternatives and in Chapter 6 – Indirect Impacts and Cumulative Effects. Moving from an undivided configuration that allows full access into and out of every driveway along the West Broadway Avenue corridor to a divided configuration is expected to increase traffic capacity, improve traffic operations, and lower the rate of incidents (crashes). Multiple studies have documented the capacity, mobility, and

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
								safety improvements that can be achieved with this type of roadway design. By directing traffic to designated median openings, the proposed West Broadway Avenue corridor design would allow businesses and other private driveways full access to one direction of travel, with right-in/right-out access. The proposed BLRT Extension project includes a variety of roadway modifications that would avoid new congested intersections, and, with one exception, the proposed BLRT Extension project would not worsen conditions at intersections that would be congested with the No-Build Alternative in 2040. Additional information can be found in Section 3.3 of the Final EIS.
66E	Jonas	Brian	None provided	66	Written	4 – Social and Economic Effects	I am also concerned about loss of homes due to LRT and West Broadway construction.	Please see MASTER RESPONSE #21.
66F	Jonas	Brian	None provided	66	Written	6 – Noise and Vibration Effects	I am concerned about increased noise from the LRT, the roadway and the LRT station proposed at 85th Ave which I live by. Please reconsider the current plan and send it to Maple Grove instead of disrupting home owners.	Please see MASTER RESPONSE #17 and #1. Five moderate noise impacts have been identified between Shingle Creek and 85th Avenue North in Brooklyn Park. The moderate impacts at these locations do not meet the decibel threshold to warrant mitigation as defined by the Metro Transit noise mitigation approach.
67A	Olson	Leslie	None provided	67	Written	4 – Social and Economic Effects	Declining house values – up to $20,000 depreciation per Realtor meeting.	Please see MASTER RESPONSE #7.
67B	Olson	Leslie	None provided	67	Written	4 – Social and Economic Effects	Difficulty in selling townhouse during each phase (being in limbo as final decision is being made by county and city/road expansion project construction/LRT construction). Need to disclose county plans for road/LRT. Maplebrook sellers are all looking for the exact same buyer.	Section 4.3 of the Final EIS summarizes acquisitions and displacements. The proposed BLRT Extension project would not displace any residential properties. All property would be acquired in accordance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended and Minnesota Statute (Minn. Stat.) 117. The Council is required to pay fair market value for property. Damages are determined by the appraiser on a parcel by parcel basis and would be included in the appraisal with the offer amount. Hennepin County is developing the West Broadway Avenue widening project. An Environmental Assessment Worksheet for the roadway project was completed and a Negative Declaration finding issued. The Final EIS discloses this information in Chapter 2 – Alternatives and in Chapter 6 – Indirect Impacts and Cumulative Effects.
67C	Olson	Leslie	None provided	67	Written	8 – Transportation System Effects	Double lane Road (possible 45-50 mph). More traffic (trucks/semis going to warehouses, rush hour, emergency vehicles), significant increase in noise levels, 45-50 mph roads turn into 55-60 mph with speed of traffic.	Please see MASTER RESPONSE #21.
67D	Olson	Leslie	None provided	67	Written	8 – Transportation System Effects	Need wide biking/walking paths. There will be more foot traffic and less privacy.	Sidewalks are proposed on the east side of West Broadway Avenue from 74th Avenue to the 93rd Avenue park-and-ride station. Review of the LRT station locations with respect to pedestrians and bicyclists can be found in Chapter 3 (Section 3.4) of the Final EIS. Also, new or improved sidewalk crossing would be provided in the final design of West Broadway Avenue. See Hennepin County's Environmental Assessment Worksheet on the widening of West Broadway Avenue.
67E	Olson	Leslie	None provided	67	Written	5 – Environmental Effects	Loss of berm/three evergreens to accommodate paths/roadway meaning less privacy and less appealing (look directly at traffic), increase noise due to loss of barrier, no barrier to stop cars that swerved off road in accidents (direct access to townhouse unit).	Please see response to Comment 66B.
67F	Olson	Leslie	None provided	67	Written	5 – Environmental Effects	Loss of mature trees/bushes/grassy area in association (loss of nature) – more cement/pavement.	Much of the forested area in the project is severely degraded from infestation of European buckthorn. Dense growth of European buckthorn limits regeneration of desirable tree species and with time eliminates any native herbaceous cover. Some of the areas disturbed from construction that lie outside of the trackage would be revegetated with a diverse complement of tree and herbaceous species.
67G	Olson	Leslie	None provided	67	Written	4 – Social and Economic Effects	Closer proximity to utility poles and power lines will be visually unappealing for townhomes.	Section 5.1 of the Final EIS summarizes utilities. In Brooklyn Park, the Xcel transmission towers north of Trunk Highway (TH) 610 would be relocated to the center of the proposed West Broadway Avenue Boulevard, east of the proposed BLRT Extension project corridor. The horizontal and vertical locations of overhead electric and communication lines would be adjusted to provide adequate vertical

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
								and horizontal clearance for LRT vehicles and the overhead catenary system. The majority of views in the Brooklyn Park landscape unit would have moderate impacts as a result of the proposed BLRT Extension project. To the extent feasible, project facilities have been sited to avoid locations in proximity to residences, parks, or other sensitive visual receptors. Where avoidance is not feasible, or where greater visual or privacy effects are anticipated to result from the introduction of new physical features of the proposed BLRT Extension project, such as where the elevation of the LRT alignment would be higher than adjacent residences, efforts would be made to screen or soften the view using landscaping or walls where adequate space permits. Landscape treatments would be selected for consistency with applicable local policies, consideration for agency maintenance budgets and staffing, and compatibility with the character of the parks and surrounding neighborhoods.
67H	Olson	Leslie	None provided	67	Written	4 – Social and Economic Effects	Higher association dues likely to occur as a result of loss of acquired townhouses. Lose neighborhood feel to the community and lose townhouses in association/whole look to association (less appealing).	Association dues are affected by a variety of market conditions. Impacts of an LRT project on association dues are difficult to assess conclusively.
67I	Olson	Leslie	None provided	67	Written	4 – Social and Economic Effects	Likely to be higher crime rate due to more foot traffic/road traffic.	Please see MASTER RESPONSE #8.
67J	Olson	Leslie	None provided	67	Written	8 – Transportation System Effects	Restricted access to W. Broadway (lose ability to turn north from N. Maplebrook Circle), limits ease of access to Hwy 610/169.	Hennepin County is developing the West Broadway Avenue widening project. An Environmental Assessment Worksheet for the roadway project was completed and a Negative Declaration finding issued. The Final EIS discloses this information in Chapter 2 – Alternatives and in Chapter 6 – Indirect Impacts and Cumulative Effects. Moving from an undivided configuration that allows full access into and out of every driveway along the West Broadway Avenue corridor to a divided configuration is expected to increase traffic capacity, improve traffic operations, and lower the rate of incidents (crashes). Multiple studies have documented the capacity, mobility, and safety improvements that can be achieved with this type of roadway design. By directing traffic to designated median openings, the proposed West Broadway Avenue corridor design would allow businesses and other private driveways full access to one direction of travel, with right-in/right-out access.
67K	Olson	Leslie	None provided	67	Written	4 – Social and Economic Effects	Addition of county library increases car/foot traffic/noise.	The proposed BLRT Extension project is not associated with the addition of a new county library; however, the analyses conducted for roadway traffic and station ridership take into account the planned development in the area.
67L	Olson	Leslie	None provided	67	Written	6 – Noise and Vibration Effects	Construction phase – widening of West Broadway (long duration construction). Concerned about vibration.	Hennepin County is developing the West Broadway Avenue widening project. An Environmental Assessment Worksheet for the roadway project was completed and a Negative Declaration finding issued. The Final EIS discloses this information in Chapter 2 – Alternatives and in Chapter 6 – Indirect Impacts and Cumulative Effects.
67M	Olson	Leslie	None provided	67	Written	6 – Noise and Vibration Effects	Concerned about noise from LRT which includes station announcements, bell, train.	Noise impacts have been assessed at sensitive locations throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. Where impacts have been identified and mitigation measures, consistent with Metro Transit's noise mitigation policy, have been recommended. Noise is discussed in Chapter 5 (Section 5.6) of the Final EIS. Table 5.6-7 summarizes the residential noise mitigation measures. There are no severe residential noise impacts anticipated in Brooklyn Park. Therefore, no mitigation measures for this area are proposed.
67N	Olson	Leslie	None provided	67	Written	6 – Noise and Vibration Effects	Concerned about vibration from LRT.	Vibration impacts have been assessed at sensitive locations throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. Where impacts have been identified, mitigation measures have been recommended. Vibration is discussed in Chapter 5 (Section 5.7) of the Final EIS. No vibration impacts have been identified in Brooklyn Park.
67O	Olson	Leslie	None provided	67	Written	8 – Transportation	Concerned about frequency of trains.	The Final EIS assumes that trains would operate at 10-minute frequencies for weekday operations. Travel times and operating assumptions for the proposed BLRT

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
						System Effects		Extension project are discussed in Section 2.6.2.3 of the Final EIS.
67P	Olson	Leslie	None provided	67	Written	4 – Social and Economic Effects	If I was a new buyer, would I have ever considered a unit with these conditions/negative variables? ABSOLUTELY NOT.	Comment Noted. Please see response to Comment 67L.
68A	Spence	Sharyn	None provided	68	Written	8 – Transportation System Effects	How many transit trains are expected to run along West Broadway and what will the time intervals be?	The Final EIS assumes that trains would operate at 10-minute frequencies for weekday operations. Travel times and operating assumptions for the proposed BLRT Extension Project are discussed in Section 2.5.2.3 of the Final EIS.
68B	Spence	Sharyn	None provided	68	Written	4 – Social and Economic Effects	How many families will lose their homes due to the widening of West Broadway?	Please see MASTER RESPONSE #21.
68C	Spence	Sharyn	None provided	68	Written	6 – Noise and Vibration Effects	How much traffic noise can be expected from the proposed project?	The West Broadway Avenue Reconstruction project would result in significantly lower speeds on the roadway (see the Environmental Assessment Worksheet [EAW] for the Hennepin County West Broadway Avenue Reconstruction project, September 2015). Since highway noise is very dependent on traffic speed (higher speeds mean more noise) there would be lower noise levels after the West Broadway Avenue Reconstruction project is implemented than there are today. Noise impacts for the Proposed BLRT Extension project were prepared consistent with FTA's 2006 Transit Noise and Vibration Impact Assessment methodology (see Section 5.6 of the Final EIS). This methodology is based on existing ambient noise data and the calculated effect of introducing a transit project. Since the proposed BLRT noise assessment was based on existing conditions, which include higher-speed present day traffic on West Broadway Avenue, the cumulative effects of implementing both projects (with future lower speeds on West Broadway Avenue) is predicted to be slightly lower noise than would result from the Proposed BLRT Extension project by itself. The cumulative effects identified would be primarily due to the presence of a crossover near the North Hennepin Community College.
68D	Spence	Sharyn	None provided	68	Written	7 – Alternatives, Engineering and Design	What caused the West Broadway improvement project to increase from 107 feet to 178 feet.	Hennepin County is developing the West Broadway Avenue Reconstruction project. An Environmental Assessment Worksheet for the roadway project was completed and a Negative Declaration finding issued. The Final EIS discloses this information in Chapter 2 – Alternatives and in Chapter 6 – Indirect Impacts and Cumulative Effects.
69A	Swanson	Randy	None provided	69	Written	4 – Social and Economic Effects	I own the property that is being impacted at 73rd and Hwy 81. I object and am frustrated by this project taking control over my property for the past two years and for the next several years. I cannot sell or expand or improve this property since it will eventually be taken. This also applies to all homeowners along the corridor. We are frozen in place until this project runs its inevitable mind numbing pace to eventual construction. The confiscation during this period doesn't cost the government entities a dime but will cause us who are affected potential extreme hardships. I had a benefited buyer for my property in November 2014 who was serious enough to bring his architect for plan approval and was told no by the city of BP because it would be eventually acquired for LRT. I am at retirement age and would like to sell – what are my options? None according to Hennepin County until the project reaches property acquisition status in 2-3 years from today.	Section 4.3 of the Final EIS summarizes acquisitions and displacements. Two businesses at Bottineau Boulevard (County Road 81) and 73rd Avenue would be displaced as part of the proposed BLRT Extension project: American Furniture Mart at 7308 Lakeland Avenue North, Brooklyn Park and Modern Dental Studio at 7300 Lakeland Avenue North, Brooklyn Park. All property would be acquired in accordance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended and Minn. Stat. 117. The Council is required to pay fair market value for property.
70A	Weiske	Jeanne	None provided	70	Written	6 – Noise and Vibration Effects	The so called "environmental impact statement" totally ignored the impact of the noise and vibration of the LRT on the residents along the proposed corridor. I, and many others, are extremely sensitive to infrasound vibrations. Especially deep bass, or, the rumble of wheels on tracks. This is not, in any way, an enhancement to our area. That vibration is easily carried by the bedrock or sub soil. We are NOT stupid. We do not want to live in an urban area, that's why we are here, not in the cities. This is another case of political confusion. A little honesty, clarity would go a lot farther.	Noise and vibration impacts have been assessed at sensitive locations throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. Where impacts have been identified, mitigation measures, consistent with Metro Transit's noise mitigation policy, have been recommended. Noise and vibration are discussed in Chapter 5 of the Final EIS. The impact assessment methodology is discussed in the Noise and Vibration Technical Report, which provides detailed information about what inputs were considered as sources of noise and vibration for the project. These inputs include, but are not limited to, light rail train speeds, operating hours, LRT bells, LRT horns, crossing bells, type of track, crossovers, and elevated structures. Please see also MASTER RESPONSES #17

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
								and #18.
71A	Wilson	Mary	None provided	71	Written	4 – Social and Economic Effects	We are concerned about our property value, safety, noise is our main issue. Not wise for us??	Concerning property value: Please see MASTER RESPONSE #7. Concerning safety: Please see MASTER RESPONSE #8. Concerning noise: Please see MASTER RESPONSE #17.
72A	Bellward	Paul	None provided	72	Email	7 – Alternatives, Engineering and Design	I would like to share my excitement at the idea of light rail coming to Brooklyn Park and being part of the Bottineau Transitway. I am originally from Britain where public transport is far more widespread and would love to see the same sort of access to an affordable far reaching transit system here. I see light rail as a big way to keep the Twin Cities moving forward and being part of the solution to of mass transit problem for many years to come. The thought of being able to walk out of my door to a nearby station and being able to ride to downtown Minneapolis, MOA, airport St Paul or other cities is fantastic. This is a much needed addition to Brooklyn Park. I would hate to think of our city losing out and not being connected to the rest of the Twin cities in this way. I do own a property relatively close to the planned rail line, I am sure that I will be able to hear the bells as the train pulls into the closest station but this small disadvantage is far outweighed by the benefits. Please bring light rail to Brooklyn Park!	Please see MASTER RESPONSE #2.
73A		Randy	None provided	73	Email	7 – Alternatives, Engineering and Design	I support these projects being proposed for my neighborhood. As a resident of the west Broadway area, I believe this will enhance our property values and make my neighborhood a more livable place.	Please see MASTER RESPONSE #2.
74A	Milstein	Bernie	None provided	74	US Mail	7 – Alternatives, Engineering and Design	We of Hearthbrook Neighborhood Association, Hidden Lakes Neighborhood Association, Bassett Creek Neighborhood Association, Sweeney Lake Neighborhood Association, are absolutely opposed to this project station at Golden Valley Road, next to the Fire Station, west of St. Margaret Mary Church, South of Theodore worth Parkway and Golden Valley Rd., Golden Valley.	Please see MASTER RESPONSE #1.
74B	Milstein	Bernie	None provided	74	US Mail	5 – Environmental Effects	Golden Valley Road station will cause irreparable harm to the natural environment.	The Golden Valley Road Station is included in the proposed BLRT Extension scope and budget. The station's impacts were evaluated, addressed, resolved, and mitigated in the Final EIS. (See Chapter 5 of the Final EIS.) Please see also MASTER RESPONSE #19.
74C	Milstein	Bernie	None provided	74	US Mail	7 – Alternatives, Engineering and Design	The station should be rerouted to the tracks and central area of Downtown Golden Valley near the City Hall. It would serve the greater population and greater good of Golden Valley by being there.	Please see MASTER RESPONSE #1.
74D	Milstein	Bernie	None provided	74	US Mail	8 – Transportation System Effects	Being at the station on Golden Valley road would create excess noise, traffic, pollution, crime and noise along that road, neighborhoods and corridor. (see also comments 74D through 74G for comment responses)	Concerning traffic: The traffic operations analysis indicates that the Golden Valley Road/Theodore Wirth Parkway intersection would operate at a level of service E in 2040 with either the No-Build Alternative or the proposed BLRT Extension project. See Table 3.3-3 in the Final EIS.
74E	Milstein	Bernie	None provided	74	US Mail	6 – Noise and Vibration Effects	Being at the station on Golden Valley road would create excess noise, traffic, pollution, crime and noise along that road, neighborhoods and corridor. (see comments 74D through 74G for comment responses)	Concerning noise: Noise impacts have been assessed at sensitive locations throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. Where impacts have been identified, mitigation measures, consistent with Metro Transit's noise mitigation policy, have been recommended. Noise is discussed in Chapter 5 of the Final EIS. The park-and-ride at Golden Valley Road was included in the noise analysis in the Final EIS. Interior to determine the appropriate mitigation measure testing is proposed at the location from 16th Avenue to Golden Valley Road. A noise barrier is proposed at the location from Golden Valley Road to 26th Avenue North. See Table 5.6-7 in the Final EIS for additional information about proposed mitigation measures for residential properties.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
74F	Milstein	Bernie	None provided	74	US Mail	5 – Environmental Effects	Being at the station on Golden Valley road would create excess noise, traffic, pollution, crime and noise along that road, neighborhoods and corridor. (see comments 74D through 74G for comment responses)	Concerning pollution: Please see MASTER RESPONSE #11.
74G	Milstein	Bernie	None provided	74	US Mail	4 – Social and Economic Effects	Being at the station on Golden Valley road would create excess noise, traffic, pollution, crime and noise along that road, neighborhoods and corridor. (see comments 74D through 74G for comment responses)	Concerning crime: Please see MASTER RESPONSE #8.
74H	Milstein	Bernie	None provided	74	US Mail	4 – Social and Economic Effects	Putting the station and transportation along Golden Valley Rd and Wirth Parkway will detrimentally affect the property values in our neighborhoods, because of noise, pollution, dirt, excess traffic, crime, over amount of traffic on light rail.	Concerning property values: Please see MASTER RESPONSE #7.
74I	Milstein	Bernie	None provided	74	US Mail	4 – Social and Economic Effects	Our properties are sacrosanct, they are our refuge, as are great amount of environmental refuges in the area. And, this light rail that you are trying to roll over our neighborhoods is going to be harmful to our health and mental and physical well being.	Please see MASTER RESPONSE #9.
74J	Milstein	Bernie	None provided	74	US Mail	6 – Noise and Vibration Effects	You have not provided us with actual noise decibel study, a projected dirt and air quality study.	Concerning noise: Noise impacts have been assessed at sensitive locations throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. Where impacts have been identified, mitigation measures, consistent with Metro Transit's noise mitigation policy, have been recommended. Impacts were identified in the Draft EIS in this area. An additional noise measurement was conducted in this area for the Final EIS and the results of the assessment and mitigation recommendations are included in Chapter 5 (Section 5.6) of the Final EIS. Existing noise levels at the location of 16th Avenue North to Golden Valley Road in Golden Valley, near Kewanee Way are 54 dBA. Noise levels with the proposed BLRT Extension project would be 64 dBA. Interior testing to determine the appropriate mitigation measure is the recommended mitigation for the location of 16th Avenue North to Golden Valley Road in Golden Valley, near Kewanee Way. With mitigation no residual residential noise impacts are anticipated from the proposed BLRT Extension project. See Table 5.6-7 in the Final EIS for a summary of proposed mitigation measures by location. Concerning dirt and dust: Please see MASTER RESPONSE #12. Concerning air quality: Please see MASTER RESPONSE #11.
74K	Milstein	Bernie	None provided	74	US Mail	4 – Social and Economic Effects	You have written flawed and amateurish Health projection affects. So we plead with you to reroute this light rail project to downtown Golden Valley and certainly cease and desist the current plan which will greatly harm our neighborhoods.	Please see MASTER RESPONSE #9.
83A	Bonniwell	Constance	None provided	83	Written	3 – NEPA Process and Public Involvement	I went to the Golden Valley public hearing and was cut off at 3 minutes, so I returned to the Crystal meeting, gave some comments to the transcribers so I wasn't cut off again, but I was, and what were the remarks I could not make to the public at a public meeting?	Please see MASTER RESPONSE #6.
83B	Bonniwell	Constance	None provided	83	Written	3 – NEPA Process and Public Involvement	Met Council and Hennepin County come up with over 15 pounds of scoping, Draft EIS and health reports and we are given three minutes to respond. Many of us attending these meetings want to hear what our fellow citizens have to say about your project, but half the people in Golden Valley and Crystal were cut off. So while you limit how much you have to listen to us, you also limit our opportunity to hear our fellow citizens. You go through the cost and effort of holding these public meetings and the actual public hearing lasts in Golden Valley 40 minutes and Crystal's 20 minutes. I have never been to one that's gone over 47 minutes. Since some people have already experienced being cut off they don't speak and file written comments. These are people who have waded through much of your reports and	Please see MASTER RESPONSE #6.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
							we don't get to hear from them at all. There's a great response about BRT that's getting filed via computer. We have no reason to trust Met Council and Hennepin County with our 100+ acre expanse of woods down the BN Line. Bot No!	
84A	Anderson	Brian	None provided	84	Email	4 – Social and Economic Effects	A large concern I have is for the southern half of the Willard Hay neighborhood. We are already cut off from Theodore Wirth Park, this project has the ability to make connecting even harder. We currently have two ways to get there, cross the six lanes of traffic at Highway 55 to a sidewalk on the Southside or go up to the Plymouth Avenue bridge, but no close or easy access to the trail under the bridge due to the golf course and archery range.	The following pedestrian enhancements in the vicinity of Olson Memorial Highway (TH 55) and Thomas Avenue include: ■ Provision of a protected pedestrian crossing at a new signalized intersection at Olson Memorial Highway and Thomas Avenue ■ Provision of a protected pedestrian crossing at a new signalized intersection at Olson Memorial Highway and Thomas Avenue ■ Accommodation for a cycle track on the north side of the roadway. The cycle track cross-section would consist of a 10-foot boulevard, 10-foot-wide bicycle path, two-foot buffer area, and a six-foot sidewalk ■ Provision of a multi-use trail on the north side of the reconstructed westbound Olson Memorial Highway bridge.
84B	Anderson	Brian	None provided	84	Email	8 – Transportation System Effects	I hope the trail connections from the area of Thomas North to Washburn North are being looked at. Along the Northside of Hwy 55 sidewalk/trail connection over the rail road tracks to connect to the walking/bike trails on the west side of the rail road trench would be very appreciated. Also, a flyover walking/bike trail bridge at 8th or Oak Park at Washburn would also help connect the neighborhood to a park that is hard to get to.	Please see response to Comment 84A.
84C	Anderson	Brian	None provided	84	Email	8 – Transportation System Effects	A city issue, I know, but we are also missing sidewalks in my neighborhood. With light rail, I expect walking to become more common and sidewalks will be needed instead of people walking down the middle of the street. Areas of concern are: 900 block of Washburn, 8th street between Washburn and Upton and Oak Park between Xerxes and Vincent. Upton to Thomas Service Road just north of Highway 55.	Please see response to Comment 84A.
85A	Burakowski	Mike	None provided	85	Email	7 – Alternatives, Engineering and Design	My son and I live on Kewanee Way so this project has been a regular topic of discussion with neighbors and friends. We have attended previous meetings at the Wirth chalet and Golden Valley city hall and have read just about every document, email and update that has been provided. When interacting with our council members prior to third, strategically scheduled Golden Valley vote, the message was clear that they were voting to add Golden Valley's support to the EIS. They were also clear that if the project was not in the best interest of the city of Golden Valley, the council members would withdraw their support and suggest an alternative route. The majority of Golden Valley residents in attendance were not in favor of this preferred route, but I believed the word of our representatives and watched the long awaited EIS report. Having reviewed the document, I am not convinced that the alternative route is best for Golden Valley and all prospective users. I am also not at all convinced that Golden Valley or any other represented body will object to this route and demand an alternate. Subsequent emails about station planning also tells me that this is moving forward and that this email is futile.	Please see MASTER RESPONSE #1.
85B	Burakowski	Mike	None provided	85	Email	7 – Alternatives, Engineering and Design	This route appears to be "preferred" due to the least amount of impact on private property and associated costs. While a route down Bottineau Blvd/Broadway would result in more displacement, it would broaden transportation options, provide easier access to North Minneapolis businesses and North Memorial Hospital and support	Please see MASTER RESPONSE #1.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
							growth like that seen along Hiawatha and Green lines.	
85C	Burakowski	Mike	None provided	85	Email	1 – Purpose and Need	I object to the data that suggests more riders and development as a result of the "preferred" route. The BNSF corridor takes the Bottineau line through well-established areas of Robbinsdale, woodlands and wetlands in Golden Valley and the Theodore Wirth Park. I'm at a loss to explain how those areas would support housing and business growth and increased ridership when compared to a route through North Minneapolis.	The Council used its regional travel demand forecasting model to develop the transit ridership forecasts for the proposed BLRT Extension project. BLRT Extension project ridership modeling is discussed in Section 3.1 of the Final EIS. Approximately 27,000 daily riders are forecast for 2040. Section 4.6 of the Final EIS discusses economic effects of the proposed BLRT Extension project. The evaluation of Alignments D1 and D2 considered several environmental and social issues and impact areas. While each alternative has a number of benefits and impacts to the surrounding area and residents, the social and environmental justice impacts associated with the displacement of many homes and disruption of community cohesion with Alignment D2 would be disproportionately adverse. With Alignment D1, the north Minneapolis community would not have proposed BLRT Extension project stations on Penn Avenue; however, Metro Transit has been advancing the planning and design of an enhanced transit service for the Penn Avenue corridor. A network of arterial bus rapid transit (BRT) lines is planned for the Minneapolis–St. Paul area, including the C Line along Penn Avenue. BRT is an enhanced transit service providing 25–30 percent faster trips and an improved experience for transit riders. This new BRT line would provide enhanced transit for this community, as well as opportunities for economic development, without the significantly adverse impacts associated with the proposed BLRT Extension project.
85D	Burakowski	Mike	None provided	85	Email	4 – Social and Economic Effects	I have to admit that I am one of the "trespassers" who regularly crosses the BNSF tracks in front of my house to get to Mary Hills and Sochaki parks. I haven't dwelled on the illegality of our actions, focusing on the ease of access that we have enjoyed for 10+ years from the Kewanee Way. With that being said, our neighborhood has also been the caretakers of the surrounding property that appears to be a "no man's land" for Excel Energy, BNSF, and the City of Golden Valley. Neighbors cut the grass while Excel dispatches the Asplundh tree service periodically to haphazardly provide "preventive" service to the area, ignoring trees and brush in problem areas and laying bare other areas that appear to pose no threat to overhead power lines. Buckthorn and fallen trees area a problem that neither BNSF and Golden Valley will claim. Our care of these areas doesn't trump our "trespassing" over the tracks, but you need to be aware of commitment to these soon-to-be-off-limits areas for our neighborhood.	The informal and unauthorized crossings across BNSF property from Kewanee Way near Sochacki Park and Sochacki Park: Mary Hills Nature Area would be eliminated as a result of the proposed BLRT Extension project. Crossings at Golden Valley Road and Plymouth Avenue would be the primary points of access for pedestrians traveling from Kewanee Way. With freight and LRT operating in the same corridor the proposed BLRT Extension project would include corridor protection treatments for safety precautions. Corridor protection treatments include a ditch, a retained fill option where the LRT tracks would be at a higher grade than freight rail tracks, or a wall. Section 3.2 of the Final EIS provides additional detail about freight rail conditions and safety requirements.
85E	Burakowski	Mike	None provided	85	Email	3 – NEPA Process and Public Involvement	I had a totally different understanding of the EIS and patiently waited for someone to knock on my door to interview me to determine how this project would impact us; I even emailed the Bottineau team to inquire about the lack of contact with our neighborhood. The data provided in the report is simply scientific – noise and vibration levels recorded at the top of our street. The impact to our street and others along the line cannot simply be measured in decibels and important details are missing: the deer in my backyard this morning, sleeping with the windows open and hearing only crickets and our 4:45 cardinal wake up, the visual impact of three lines of tracks and overhead wires in place of trees and shrubs. I do not negate the impact of a rail line down the middle of Penn Ave N to the city residents, but the quality of life on Kewanee Way enjoyed since the mid-60's will change forever. Yet the reports suggests "minimal impact" to me and my neighbors, a gap in reporting that is made worse by the assertion that only five houses at the top of Kewanee Way would be sufficiently affected by noise and vibration to warrant mitigation efforts. Really? Sit with me in my office in St. Paul along the	Concerning public involvement: Please see MASTER RESPONSE #6. Also the Council has hosted numerous events for public input in the City of Golden Valley. Open houses, public hearings, and city council work sessions have all been organized to provide information about the proposed BLRT Extension project and to solicit feedback from community members. The Council also attends community events and presents to local organizations. Noise impacts have been assessed at sensitive locations throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. Where impacts have been identified, mitigation measures, consistent with Metro Transit's noise mitigation policy, have been recommended. Impacts were identified in the Draft EIS in this area. An additional noise measurement was conducted in this area for the Final EIS and the results of the assessment and mitigation recommendations are included in Chapter 5 (Section 5.6) of the Final EIS. Existing noise levels at the location of Golden Valley Road to 26th Avenue North in Golden Valley, near Kewanee Way are 50 dBA. Noise levels with the proposed BLRT Extension project would be 65 dBA. A noise barrier is the recommended mitigation for the location of Golden Valley Road to 26th Avenue North in Golden Valley, near Kewanee Way. With mitigation one moderate and one severe residual residential

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
							Green Line – listen to the trains (about 10 times the distance from my front window at home), listen to the bells and whistles, feel the vibration and then tell me that we won't be impacted by trains 100 feet from my front door.	noise impacts are anticipated from the proposed BLRT Extension project in this area. See Table 5.6-7 in the Final EIS for a summary of proposed mitigation measures by location.
85F	Burakowski	Mike	None provided	85	Email	8 – Transportation System Effects	Speaking solely as a Golden Valley resident, this line does not benefit our city. If the Golden Valley station is chosen in your already-planned-meetings, I see few GV residents having easy access to the line. There will be no parking, so connector bus lines will bring riders to the station. I will have to traverse the woods at the end of the street for access in order to avoid a 1.5 miles walk down Byrd and Zenith. I'm not sure if the Theodore Wirth station would technically be in Minneapolis or Golden Valley, but that option decreases the likelihood of Golden Valley residents using the line. The Bottineau Blvd/Broadway option would not benefit Golden Valley resident access, but I can't help but think that ridership would increase in a more populated area. I am a proponent of light rail and will use the line where ever it ends up, but I don't feel that the preferred route is the best overall plan for the region and strongly encourage that Golden Valley and Met Council move the Bottineau line to the Bottineau/Broadway corridor.	A 100-space park-and-ride would be located at the Golden Valley Road Station as part of the proposed BLRT Extension project. This would provide parking for Golden Valley residents accessing the station.
87A	Duggan	Mary Ann	None provided	87	US Mail	7 – Alternatives, Engineering and Design	I feel that the Light Rail is a good thing but I do not feel that coming up Broadway Avenue is the way to go with it. There will be so many homes and people impacted if this decision is made. The noise and confusion of it all will hurt all of us in the area. Please consider an alternative way to go with the rail. I bought my home in Maplebrook 19 years ago and love it here. If the light rail comes down Broadway Ave., it will change everything to something that does not benefit anyone in the area. I'm 69 years old and my plan is to stay here for a lot of years yet. I want my retirement to be an enjoyable one not one with noise and confusion.	Noise impacts have been assessed at sensitive locations throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. Where impacts have been identified, mitigation measures, consistent with Metro Transit's noise mitigation policy, have been recommended. No moderate or severe noise impacts are anticipated along West Broadway Avenue between 85th Avenue North and 89th Avenue North. Section 4.3 of the Final EIS summarizes acquisitions and displacements. The proposed BLRT Extension project would not displace any residential properties. Loss of private residential property would be mitigated by payment of fair market compensation and provision of relocation assistance in accordance with the Uniform Relocation Act and Minn. Stat. 117. Please see also MASTER RESPONSE #21.
88A	Lambert	Terry	None provided	88	US Mail	7 – Alternatives, Engineering and Design	Where is the study for the 85th to 93rd on West Broadway? Impact on loss of homes – many immigrant families. Noise, loss of home property values. North Minneapolis will not allow it – why is Brooklyn Park considering this? Where is the environmental impact statement for West Broadway expansion project? Very low I know – kill the West Broadway Expansion project – bad deal for all residents on or near west Broadway.	Hennepin County is developing the West Broadway Avenue Reconstruction project. An Environmental Assessment Worksheet for the roadway project was completed and a Negative Declaration finding issued. The Final EIS discloses this information in Chapter 2 – Alternatives and in Chapter 6 – Indirect Impacts and Cumulative Effects. Please see also MASTER RESPONSE #21.
89A	Weiske	Jeanne	None provided	89	US Mail	4 – Social and Economic Effects	This is an integrated community of retirees, middle class working families, and immigrants looking for the "American Dream". I worked 46 years, bought the home I want to retire in. Now that I'm retired, the wheels of government are rolling across our homes and you offer what? market values? that's about half of the present value and half of what those of us still with a mortgage are paying. I've seen this way too often in a city council, rolls over an established community, drives out the settled residents, all for the "greater good". Whose "greater good"? Yours? The future? WE pay your salaries. We the tax payers, the ones you wish to drive out. For a change, listen to the people.	Since publication of the Draft EIS, modifications to the preliminary design have resulted in the avoidance of several anticipated property acquisitions and resulting displacements with the proposed BLRT Extension project. No residential property displacements are anticipated as a result of the proposed BLRT Extension project. Section 4.3 of the Final EIS summarizes acquisitions and displacements. Loss of private residential property would be mitigated by payment of fair market compensation and provision of relocation assistance in accordance with the Uniform Relocation Act and Minn. Stat. 117. Section 7.5.1 of the Final EIS provides a detailed analysis of the potentially disproportionately high and adverse impacts of the proposed BLRT Extension project in regards to displacements of environmental justice communities. Avoidance, minimization and mitigation measures were taken to reduce impacts to minority and low-income populations. The proposed BLRT Extension project has the potential to indirectly spur development in the proposed BLRT Extension project corridor particularly around stations. This creates the

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
								potential for changes in property values as described above, which can be perceived as either an impact (generally for renters) or a benefit (generally for owners). These potential "pricing-out" impacts (that is, increased rents and decreased affordability for existing residents) can be offset by the decrease in transportation costs. The Health Impact Assessment suggests that cities, communities and developers work together to keep housing options affordable in station areas to ensure that neighborhoods near the transit stations continue to be affordable for low-income households (Myslajek, 2013). Additionally, Hennepin County is proactively considering strategies to minimize impacts on housing values with their station area planning effort, which seeks input from the public, including environmental justice (EJ) populations, to create a framework for any potential development that aligns with the community's goals and preferences. Furthermore, the Metropolitan Council (Council) has established programs to encourage affordable housing planning and implementation that may offset potential indirect impacts to low-income persons. Please see also MASTER RESPONSE #6.
90A	Bellward	Stacy	None provided	90	US Mail	7 – Alternatives, Engineering and Design	Love light rail, love that it is coming to our neighborhood!! The faster it gets here the better!	Please see MASTER RESPONSE #2.
91A	Giles	Patricia	None provided	91	US Mail	8 – Transportation System Effects	West Broadway has been an easy way of catching the buses and connecting with other bus lines and being able to walk to any of the businesses along 85th to Brooklyn Blvd.	The proposed BLRT Extension project is consistent with and supports the Purpose and Need outlined in Chapter 1 of in the Final EIS. The proposed BLRT Extension project would improve the transportation system by providing more travel choices and faster travel times between residential areas, major destinations, and employment centers.
91B	Giles	Patricia	None provided	91	US Mail	5 – Environmental Effects	Why would you want to take away the beauty and the peaceful tranquility from these locations, where people are out taking walks, walking their dogs, meeting and greeting one another along the way.	Chapter 4 (Section 4.5) of the Final EIS describes the process for determining visual impacts to natural areas. The visual impacts of the proposed BLRT Extension project were determined by evaluating the changes to existing visual resources that would occur as a result of project implementation, and assessing the anticipated viewer response to those changes. Visual impact assessment was based on direct field observation from multiple vantage points, including from neighboring properties and roadways; evaluation of existing visual character; and review of proposed BLRT Extension project plans and features. Visual impact assessment was also based on photographic documentation of existing conditions for several key views of the proposed BLRT Extension project corridor. Adverse effects to visual quality would occur in some areas, such as areas where recreational and residential uses are located along or in the vicinity of the proposed BLRT Extension project corridor. At locations where adverse visual effects are anticipated, project elements added to the rail corridor may be visually screened or softened using landscaping where adequate space permits, and the loss of existing vegetation on side slopes for grading or access purposes would be replaced to the extent feasible. Several local plans address aesthetic and visual resources in the proposed BLRT Extension project area, and applicable policies include the establishment of design and landscape guidelines.
91C	Giles	Patricia	None provided	91	US Mail	6 – Noise and Vibration Effects	Have you really stop and pictured it, where the sound and the noise will take place?	Please see MASTER RESPONSE #17.
91D	Giles	Patricia	None provided	91	US Mail	4 – Social and Economic Effects	Have you really considered how this effects peoples homes and their privacy or how things will be for driving, how they get to places that didn't take them as long, now they will get in longer time. If effects everything.	No mitigation measures are warranted for long-term impacts to roads and traffic because the identified avoidance measures would prevent any adverse impacts as a result of roadway modifications. As shown in Table 3.3-2 of the Final EIS, the proposed BLRT Extension project includes a variety of roadway modifications that would avoid new congested intersections, and, with one exception, the proposed BLRT Extension project would not worsen conditions at intersections that would be congested with the No-Build Alternative in 2040. Since publication of the Draft EIS, modifications to the preliminary design have resulted in the avoidance of several anticipated property acquisitions and resulting displacements with the proposed

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
								BLRT Extension project. No residential property displacements are anticipated as a result of the proposed BLRT Extension project. Section 4.3 of the Final EIS summarizes acquisitions and displacements. Loss of private residential property would be mitigated by payment of fair market compensation and provision of relocation assistance in accordance with the Uniform Relocation Act and Minn. Stat. 117.
92A	Unknown		None provided	92	Email	3 – NEPA Process and Public Involvement	Though I have attended numerous planning and public input meetings, which have shown an overwhelming lack of public support for the "preferred" and proposed, formerly known as D1 route, it is frustrating to observe that these efforts and voices are largely ignored.	Comments from public meetings are recorded and posted on the proposed BLRT Extension project website (BlueLineExt.org) within 1 week of the meeting taking place. Comments are also brought forward by project staff for consideration at meetings regarding relevant issues. Chapter 9 of the Final EIS provides a summary of public involvement for the Final EIS, including a summary of open houses held during Final EIS preparation. Please see also MASTER RESPONSE #6.
92B	Unknown		None provided	92	Email	3 – NEPA Process and Public Involvement	The EIS, Environmental Impact Study, while enormously expensive, is disappointing in that while it provides pages of data and mitigation proposals, it misses the point entirely.	The Draft EIS discusses numerous alternatives that were analyzed as a part of the environmental review process. Key issues or changes to the locally preferred alternative (LPA) occurring since publication of the AA were identified and analyzed in the Draft EIS and are summarized Chapter 2 of the Final EIS. The process included a public comment period which provided the public a forum to raise concerns with respect to environmental issues.
92C	Unknown		None provided	92	Email	5 – Environmental Effects	Yesterday, I took a walk in the Mary Hill and Sochacki parks near my home. I stopped and closed my eyes and listened. By sound alone, I could identify chickadees, cardinals, a red winged black bird, baby hawks, sparrows, frogs, ducks, and geese and the lovely sound of moving water. Lest I get labeled just another tree hugger, I would point out that the city planning greats of yesteryear, like Francis Gross, Charles M. Loring, Eloise Butler, and Theodore Wirth, showed great foresight in preserving these wetlands and green spaces and some form of park access to every neighborhood throughout the city. They understood well, just as anyone who has travelled to NYC, and stepped into Central Park, the value of a quiet green space open to the public for refreshment and respite from the frenetic pace and noise of the city. It is a shame that after all these years, and the will to preserve these valuable places for the well being and health of all, that we would at this juncture make such a huge mistake as to ruin the aesthetic of not one, but three beautiful parks every seven minutes. These parks are Theodore Wirth, Mary Hill and Walter Sochacki Parks. Once you ruin the peaceful, tranquil aesthetic of these parks, there is no turning back. This would be a travesty: especially in regard to Theodore Wirth Park, a treasure to the Twin Cities of inestimable value.	Please see MASTER RESPONSES #14 and #15.
92D	Unknown		None provided	92	Email	4 – Social and Economic Effects	If the LRT is for commuters, it should be accessible to the commuters, promote not only jobs during construction, but also neighborhood revitalization and long term business opportunities. All three of the other previously proposed routes achieve these goals to a far greater degree than the so called "preferred route". Preferred by who? BNSF? Perhaps it can be instructive to look at the recent LRT projects. What was the reasoning of running Green Line down University Avenue? And how has this enhanced the revitalization of business along that route? Why is the Southwest route so heavily opposed and mired in legal battles?	The proposed BLRT Extension project is expected to have positive effects on the commercial and residential areas along the proposed BLRT Extension project corridor. It is anticipated that the proposed BLRT Extension project would contribute economic benefits by encouraging and supporting higher-density residential and commercial land uses around transit stations, including those in environmental justice neighborhoods consistent with local planning efforts. Increased mobility to both residents and business patrons within the proposed BLRT Extension project corridor is expected to support existing businesses and allow for their future growth. Hennepin County is leading the Station Area Planning effort, which seeks input from the public, including EJ populations, to create a framework for any potential development that aligns with the community's goals and preferences. Please see also MASTER RESPONSE #1.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
93A	Lawrence	Tyree	None provided	93	Email	4 – Social and Economic Effects	The City of Brooklyn Park has a mission statement "…*a Thriving Community, Inspire Pride, Where Opportunities Exist for ALL*." Our community and City Council stood by this statement and went on to declare that no projects would be considered unless they were in direct alignment with our mission, vision, and purpose. In order to remain consistent with building a thriving community, this project has to invest its resources where opportunities exist for us ALL. These opportunities MUST be transparent, authentic, and very tangible. Here are some suggestions: (see next four comment/answers (93B-93E) for the three suggestions and comment responses). These are some initial suggestions to get things moving in the right direction. These suggestions will drastically improve the quality of life in our community and counteract the negatives associated with LRT projects in general. I will be happy to personally get involved and lend any type of direction as needed from the perspective of a community stakeholder. Thank you for considering my comments and suggestions.	Local and regional policies were reviewed to determine their compatibility with the proposed BLRT Extension project. The Brooklyn Park 2030 Comprehensive Plan was reviewed to evaluate the land use compatibility of the proposed BLRT Extension project with the City of Brooklyn Park. See Chapter 4 (Section 4.1.4) of the Final EIS. Additionally, the multi-step process to formally recommend and select the locally preferred alternative (LPA) for the proposed BLRT Extension project began following technical analysis and Scoping decisions. At the June 26, 2012, meeting of the Hennepin County Regional Railroad Authority (HCRRA), following public hearings and recommendation, and passage of resolutions of support from the cities of Minneapolis, Robbinsdale, Crystal, and Brooklyn Park, HCRRA selected Alternative B-C-D1 as the LPA. See Chapter 2 (Section 2.5) of the Final EIS.
93B	Lawrence	Tyree	None provided	93	Email	4 – Social and Economic Effects	1. Invest in the economic development initiated by the community for the community. A business hub that will cultivate aspiring entrepreneurs who desire to start a business. Fund the land and development space where people come together and feel a sense of pride, where currently, there is a void as the majority flock to other cities to satisfy the lack. Invest in support of small businesses by identifying the struggles of their current environment fueling an opportunity for REAL success vs standardized programs that only large companies qualify for.	The Hennepin County Community Works department has engaged the corridor cities and their communities in a station area planning effort. This effort includes a series of goals, two of which are: ■ Maximize and strategically align public and private investments in the proposed BLRT Extension project corridor to support transit oriented development through catalytic investments in life-cycle housing, commercial development, and public infrastructure. ■ Promote economic opportunity by improving access to jobs and supporting business recruitment and expansion along the proposed BLRT Extension project corridor. See www.hennepin.us/residents/transportation/bottineau-community-works for more information.
93C	Lawrence	Tyree	None provided	93	Email	4 – Social and Economic Effects	2. Invest in LOCAL talent, goods, and services that will provide sustenance and capacity growth organically vs. OUTSOURCING and/or MAINSTREAMING to the "highly favored" benefactors.	The Council has an established Disadvantaged Businesses Enterprises (DBE) program and includes specific goals in project contracts to increase participation by minority and women owned businesses. The Office of Equal Opportunity has an equal opportunity (EO) consultant designated to the proposed BLRT Extension project to conduct outreach and monitor progress towards meeting those goals. In addition to the DBE goal, the construction contracts would have a workforce goal for both minority and women workers. An additional EO consultant would be assigned to support these efforts when it gets closer to construction. To assist in achieving the DBE and workforce goals, the Council's EO and Project Office outreach and communication staff would hold workshops and networking mixers and attend events to inform people of employment and contracting opportunities. Other communication strategies would be used including social media, the BlueLineExt.org website, newsletters and articles.
93D	Lawrence	Tyree	None provided	93	Email	4 – Social and Economic Effects	3. Invest in our YOUTH projects. Contribute to the development of a pool or slash pad, so our families can bond with their children. Focus on youth related transit issues to they remain connected to opportunities, program, jobs, and internships.	Youth projects have not been identified as mitigation for effects from the proposed BLRT Extension project. Youth have been engaged at fairs and other outreach activities, such as North Hennepin Community College and Zanewood Recreation Center in Brooklyn Park. Continued outreach and coordination during engineering and construction would target youth and adults and organizations such as schools, churches, and non-profits.
93E	Lawrence	Tyree	None provided	93	Email	3 – NEPA Process and Public Involvement	4. Invest in grass-roots efforts and genuine engagement of community members… Upgrade communications so people feel connected to the projects vs rejection on both sides. Support our leaders as an extension to the hard to reach demographics.	Chapter 9 of the Final EIS provides a summary of public involvement for the Final EIS, including a summary of open houses held during Final EIS preparation. The Council has hosted numerous events for public input in the City of Robbinsdale. Open houses, public hearings, and city council work sessions have all been organized to provide information about the proposed BLRT Extension project and to solicit

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
								feedback from community members. The Council also attends community events and presents to local organizations.
94A	Bladine	Debbie	None provided	94	US Mail	7 – Alternatives, Engineering and Design	I am opposed to the Bottineau Line it its current form.	Please see MASTER RESPONSE #1.
94B	Bladine	Debbie	None provided	94	US Mail	6 – Noise and Vibration Effects	Noise issues.	Noise impacts have been assessed at sensitive locations throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. Where impacts have been identified, mitigation measures, consistent with Metro Transit's noise mitigation policy, have been recommended. Noise is discussed in Chapter 5 (Section 5.6) of the Final EIS.
94C	Bladine	Debbie	None provided	94	US Mail	4 – Social and Economic Effects	Loss of private homes	Chapter 4 (Section 4.3) of the Final EIS summarizes acquisitions and displacements. The proposed BLRT Extension project would not displace any residential properties. Loss of private residential property would be mitigated by payment of fair market compensation and provision of relocation assistance in accordance with the Uniform Relocation Act and Minn. Stat. 117.
94D	Bladine	Debbie	None provided	94	US Mail	4 – Social and Economic Effects	Crime concerns	Please see MASTER RESPONSE #8.
94E	Bladine	Debbie	None provided	94	US Mail	7 – Alternatives, Engineering and Design	Alternate routes were not given sufficient consideration.	The Draft EIS discusses numerous alternatives that were analyzed as a part of the environmental review process. Key issues or changes to the LPA occurring since publication of the AA were identified and analyzed in the Draft EIS and are summarized Chapter 2 of the Final EIS. The process included a public comment period which provided the public a forum to raise concerns with respect to environmental issues. Please see also MASTER RESPONSE #1.
94F	Bladine	Debbie	None provided	94	US Mail	7 – Alternatives, Engineering and Design	Want to see ridership surveys done.	The Draft and Final EIS process examined ridership potential for numerous alignment options detailed in Chapter 3 of both documents. The Draft EIS disclosed similar ridership forecasts among the build alternatives ranging from 26,000 to 27,600 daily boardings. See Table 3.1-5 in Chapter 3 of the Draft EIS for more information on ridership between alternatives considered. The proposed BLRT Extension project in the Final EIS includes an alignment that meets the purpose and need most efficiently and minimizes project impacts. The proposed BLRT Extension project anticipates approximately 27,000 daily boardings. See Chapter 3 (Section 3.1) of the Final EIS for more information on ridership.
94G	Bladine	Debbie	None provided	94	US Mail	3 – NEPA Process and Public Involvement	Believes route chosen to appease Target – they have not been a good community steward.	Although the proposed BLRT Extension project terminates in Brooklyn Park in the vicinity of the Target campus, the purpose and need for the project does not include subsidizing Target. The proposed BLRT Extension project meets the intended purpose and need for the project, to effectively address long-term regional transit mobility and local accessibility needs while providing efficient, travel-time competitive transit service that supports economic development goals and objectives of local, regional, and statewide plans. Chapter 1 of the Final EIS also describes the purpose and need for the project.
95A	Lokken	Barbara	None provided	95	US Mail	4 – Social and Economic Effects	I am a very concerned resident of Brooklyn Park over the plan for light rail to go down West Broadway. Why would you even put it so close to houses and disrupt entire neighborhoods when you could run down 81 and cut over towards the school and target? This is not in the best interest of home owners nor the quality of life for those whose homes will be very close.	The Council seeks to develop the proposed BLRT Extension project while avoiding disruptions to neighborhoods as much as possible. The Council strives to avoid and minimize impacts to environmentally sensitive areas. However, for those impacts that are unavoidable, the Council has developed mitigation measures that comply with appropriate local, state, and federal regulations. Where displacements cannot be avoided, mitigation measures required by the Federal Uniform Relocation Act, as well as any other state (Minn. Stat. 117) and local policies would be followed. Chapter 4 of the Final EIS summarizes the community and social analysis, which includes Community Facilities/Community Character and Cohesion (4.2), and Acquisitions and Displacements (4.3). Please see also MASTER RESPONSE #1.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
95B	Lokken	Barbara	None provided	95	US Mail	4 – Social and Economic Effects	I'm also concerned about crime, the kinds of people that will have easy access to our neighborhoods, the noise, impact, property value loss, and the disregard for the opinions and voice of the people. (see comments 95D through 95G for responses to access, noise, property loss and public opinion).	Please see MASTER RESPONSE #8.
95C	Lokken	Barbara	None provided	95	US Mail	6 – Noise and Vibration Effects	I'm also concerned about crime, the kinds of people that will have easy access to our neighborhoods, the noise, impact, property value loss, and the disregard for the opinions and voice of the people. (see comments 95D through 95G for responses to access, noise, property loss and public opinion).	Concerning noise: Please see MASTER RESPONSE #17.
95D	Lokken	Barbara	None provided	95	US Mail	4 – Social and Economic Effects	I'm also concerned about crime, the kinds of people that will have easy access to our neighborhoods, the noise, impact, property value loss, and the disregard for the opinions and voice of the people. (see comments 95D through 95G for responses to access, noise, property loss and public opinion).	Concerning property values: Please see MASTER RESPONSE #7.
95E	Lokken	Barbara	None provided	95	US Mail	4 – Social and Economic Effects	I'm also concerned about crime, the kinds of people that will have easy access to our neighborhoods, the noise, impact, property value loss, and the disregard for the opinions and voice of the people. (see comments 95D through 95G for responses to access, noise, property loss and public opinion).	Concerning public input: Please see MASTER RESPONSE #6. Also the Council has hosted numerous events for public input in the City of Brooklyn Park. Open houses, public hearings, and city council work sessions have all been organized to provide information about the proposed BLRT Extension project and to solicit feedback from community members. The Council also attends community events and presents to local organizations.
95F	Lokken	Barbara	None provided	95	US Mail	4 – Social and Economic Effects	It appears this decision is based solely on business interests. Unless the path is resolved, I will be putting my home up for sale. Brooklyn Park already has terrible reputation for crime. As people put their homes up for sale and homes depreciate, it will continue to flood people into the area that can afford low cost housing. For the life of me, I cannot understand why you would sacrifice the rights of an entire community. Let the people vote. Reconsider this plan. Take a step back and reconsider. If this were your home on the line, you would never, ever approve this plan.	The purpose of the proposed BLRT Extension project is to provide transit service which would satisfy the long-term regional mobility and accessibility needs for businesses and the traveling public. The proposed BLRT Extension project has the potential to indirectly spur development in the proposed BLRT Extension project corridor particularly around stations. This creates the potential for changes in property values as described above, which can be perceived as either an impact (generally for renters) or a benefit (generally for owners). These potential "pricing-out" impacts (that is, increased rents and decreased affordability for existing residents) can be offset by the decrease in transportation costs. The Health Impact Assessment suggests that cities, communities and developers work together to keep housing options affordable in station areas to ensure that neighborhoods near the transit stations continue to be affordable for low-income households (Myslajek, 2013). Additionally, Hennepin County is proactively considering strategies to minimize impacts on housing values with their Station Area Planning effort, which seeks input from the public, including EJ populations, to create a framework for any potential development that aligns with the community's goals and preferences. Furthermore, the Council has established programs to encourage affordable housing planning and implementation that may offset potential indirect impacts to low-income persons. Please see also MASTER RESPONSE #7 and #8.
96A	Olson	Randy	None provided	96	US Mail	4 – Social and Economic Effects	I need to be able to vote on this issue. I didn't get to vote on the twins or Vikings stadiums for which I will never enter either one, but I 'm paying for both of them. I won't be using the LRT line as well. Further more it sounds like I just might be losing my home due to the misplacement of the line going down the middle of West Broadway in Brooklyn Park. This is not the place for this line, it's too congested as it is. I believe in the LRT for the future, but not here. Running down 81, no homes need to be torn down. Please don't ramrod this thing at us.	Section 4.3 of the Final EIS summarizes acquisitions and displacements. The proposed BLRT Extension project is not anticipated to displace any residential properties. Loss of private residential property would be mitigated by payment of fair market compensation and provision of relocation assistance in accordance with the Uniform Relocation Act and Minn. Stat. 117. Hennepin County is developing the West Broadway Avenue Reconstruction project. An Environmental Assessment Worksheet for the roadway project was completed and a Negative Declaration finding issued. The Final EIS discloses this information in Chapter 2 – Alternatives and in Chapter 6 – Indirect Impacts and Cumulative Effects. Please see also MASTER RESPONSE #1.
97A	Sanoski	Lori	None provided	97	US Mail	1 – Purpose and	Where do I start this conversation? When will the government at all	Concerning widening of West Broadway: Hennepin County is developing the West

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
						Need	levels start to do the right thing for people? When will the government stop wasting tax payer money and time? When will the government be accountable for their actions? When will the government actually work for the people of this country rather than big corporations? When will the government use common sense? When will the government stop lying to the people? When will the government stop taking bribes from rich people? When will the government do what is right for the majority of the people? Because status quo is to do what everyone else does rather than stepping up and doing the right thing it can be hard to do and is scary too. For those of us who lived here all our lives and had grandparents and great grandparents and great grandparents that also lived here we are the least listened too and least benefited from this government. When our government starts to do the right thing(s), make ethical and moral choices America again will be a great place to live. We are settling for behaviors and actions less than stellar of our government. With that being said, stop the widening of West Broadway as it is a neighborhood that should not be disturbed nor do we need a train disrupting our quiet safe neighborhood with noise, congestion, accidents, crime, vandalism, tax increases, and association dues increases. At the town hall meeting people shared so many reasons including that this train should go down Co Rd. 81 where there is already a track, and the city government flip flops its rules to fit the needs of the government or big corporations. Let's be honest here, if the board members who want this road widening and train going through owned and lived where I do, they would be fighting tooth and nail to stop this entire process from being approved. I would be willing to trade ownership of my home for the ownership of any board member that wants this road and train process to pass and see how they like it.	Broadway Avenue Reconstruction project. An Environmental Assessment Worksheet for the roadway project was completed and a Negative Declaration finding issued. The Final EIS discloses this information in Chapter 2 – Alternatives and in Chapter 6 – Indirect Impacts and Cumulative Effects. Please see also MASTER RESPONSE #21. Concerning safety, crime, and vandalism: Please see MASTER RESPONSE #8. Concerning noise: Noise impacts have been assessed at sensitive locations throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. Where impacts have been identified, mitigation measures, consistent with Metro Transit's noise mitigation policy, have been recommended. No moderate or severe noise impacts are anticipated along West Broadway Avenue between 85th Avenue North and 89th Avenue North. Please see also MASTER RESPONSE #17. Concerning congestion and accidents: Moving from an undivided configuration that allows full access into and out of every driveway along the West Broadway Avenue corridor to a divided configuration is expected to increase traffic capacity, improve traffic operations, and lower the rate of incidents (crashes). Multiple studies have documented the capacity, mobility, and safety improvements that can be achieved with this type of roadway design. By directing traffic to designated median openings, the proposed West Broadway Avenue corridor design would allow businesses and other private driveways full access to one direction of travel, with right-in/right-out access. Concerning tax increases and association dues increases: Association dues and tax increases are affected by a variety of market conditions. Impacts of an LRT project on association dues and taxes are difficult to assess conclusively.
98A	Schiestl	Lee	None provided	98	US Mail	7 – Alternatives, Engineering and Design	Location 30 feet from the track – no to Bottineau Transitway because of noise, property values, flood plain destruction, neighbor congestion. Would require buy out at reasonable terms.	Concerning noise: Noise impacts have been assessed at sensitive locations throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. Where impacts have been identified, mitigation measures, consistent with Metro Transit's noise mitigation policy, have been recommended. No moderate or severe noise impacts are anticipated along West Broadway Avenue between 85th Avenue North and 89th Avenue North. Please see also MASTER RESPONSE #17. Concerning property values: Please see MASTER RESPONSE #7. Concerning floodplain destruction: no floodplain destruction is anticipated in this section of the proposed BLRT Extension project. Concerning congestion: Moving from an undivided configuration that allows full access into and out of every driveway along the West Broadway Avenue corridor to a divided configuration is expected to increase traffic capacity, improve traffic operations, and lower the rate of incidents (crashes). Multiple studies have documented the capacity, mobility, and safety improvements that can be achieved with this type of roadway design. By directing traffic to designated median openings, the proposed West Broadway Avenue corridor design would allow businesses and other private driveways full access to one direction of travel, with right-in/right-out access. Concerning "buy out at reasonable terms": Section 4.3 of the Final EIS summarizes acquisitions and displacements. The proposed BLRT Extension project would not displace any residential properties. All property would be acquired in accordance with the Uniform Relocation Assistance and Minn. Stat. 117. The Council would pay fair market value for the property.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
99A	Simmons	Susan	None provided	99	US Mail	7 – Alternatives, Engineering and Design	No one wants to take the long way around to 610.	Appropriate access to West Broadway Avenue will be maintained, and the reconstructed roadway will adequately handle projected traffic flows. West Broadway Avenue will remain a viable route to access TH 610.
99B	Simmons	Susan	None provided	99	US Mail	6 – Noise and Vibration Effects	Doesn't need to hear the bells and announcements all day long.	Noise impacts have been assessed at sensitive locations throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. Where impacts have been identified, mitigation measures, consistent with Metro Transit's noise mitigation policy, have been recommended. Noise is discussed in Chapter 5 of the Final EIS. Quiet Zones would be implemented at Federal Railroad Administration shared at-grade crossings. A Quiet Zone is an FRA-approved section of a freight rail line where freight trains do not sound horns. Public roadway crossings of a Quiet Zone must have certain safety measures in place, which include gates, warning devices, and in some cases other supplemental safety measures, such as concrete medians. The implementation of a Quiet Zone reduces residential land use impacts to 176 moderate noise impacts and 120 severe noise impacts. Additional mitigation measures such as noise barriers, wayside devices, and interior testing to determine the appropriate mitigation measure to further reduce the residential land use noise impacts to 5 moderate noise impacts and 2 severe noise impacts. See Table 5.6-7 in the Final EIS for a summary of proposed mitigation measures by location.
99C	Simmons	Susan	None provided	99	US Mail	4 – Social and Economic Effects	Safety of kids in the area.	Please see MASTER RESPONSES #8.
99D	Simmons	Susan	None provided	99	US Mail	4 – Social and Economic Effects	Emergency crews getting in and out of complex.	Chapter 4 (Section 4.7) of the Final EIS addresses safety and security. In locations where there would be at-grade light rail crossings of roadways, the potential exists for increases in emergency response time as a result of delay to emergency vehicles while LRVs are in the crossing. During the peak weekday hour, up to 12 light rail trains (six in each direction) would pass through these at-grade crossings, causing approximately 50 seconds of delay per light rail train crossing. These delays could increase fire, emergency medical services, and police response times on routes using the crossings. To help avoid or minimize delays, the Council would coordinate with emergency services providers by providing them with the light rail operating schedule and identification of alternative crossing routes. Additional coordination would occur through the Fire Life Safety and Security Committee (FLSSC), as described in the proposed BLRT Extension project's *Safety and Security Management Plan* (*SSMP*) (Council, 2014).
100A	Toftum	D.J.	None provided	100	US Mail	7 – Alternatives, Engineering and Design	My take on this new rail line is that the proposed line is just not needed. I am in full support of the light rail expanding into the north metro and Brooklyn Park in general. Running along County Rd 81 (Bottineau) makes perfect sense to me. Plenty of room, existing rail tracks and even a new parking ramp at 63rd avenue makes this the ideal spot for it.	Please see MASTER RESPONSE #1.
100B	Toftum	D.J.	None provided	100	US Mail	4 – Social and Economic Effects	The proposed line to me would destroy a neighborhood by widening West Broadway, and construction/congestion nightmares, and be a general eye sore and increase noise pollution for the whole area. Living in Brooklyn Park for over 17 years, I want a good, solid public transportation for the entire community. This plan seems to ignore public interest while serving only corporate (Target) best interest. Please do not allow this plan to continue.	Hennepin County is developing the West Broadway Avenue Reconstruction project. An Environmental Assessment Worksheet for the roadway project was completed and a Negative Declaration finding issued. The Final EIS discloses this information in Chapter 2 – Alternatives and in Chapter 6 – Indirect Impacts and Cumulative Effects. Noise impacts have been assessed at sensitive locations throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. Where impacts have been identified, mitigation measures, consistent with Metro Transit's noise mitigation policy, have been recommended. No moderate or severe noise impacts are anticipated along West Broadway Avenue between 85th Avenue North and 89th Avenue North. See Table 5.6-7 in the Final EIS for a summary of proposed mitigation measures by location.
101A	Kester	Troy	None provided	101	US Mail	4 – Social and Economic Effects	Routing LRT through the trees in Golden Valley, effectively bypassing North Minneapolis will perpetuate systematic obstacles to investment	The evaluation of Alignments D1 (part of the proposed BLRT Extension project) and D2 (located along Penn Avenue in north Minneapolis) considered several

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
							in our community. Investment in housing and infrastructure will follow the LRT line. This form of institutional racism that should not be perpetuated in 2014.	environmental and social issues and impact areas. While each alternative has a number of benefits and impacts the surrounding area and residents, the social and environmental justice impacts associated with the displacement of many homes and disruption of community cohesion with Alignment D2 would be disproportionately adverse. With Alignment D1, the north Minneapolis community would not have the proposed BLRT Extension project stations on Penn Avenue; however, Metro Transit has been advancing the planning and design of an enhanced transit service for the Penn Avenue corridor to serve the transit-dependent populations. A network of arterial BRT lines is planned for the Minneapolis–St. Paul area, including the C Line along Penn Avenue. BRT is an enhanced transit service providing 25–30 percent faster trips and an improved experience for transit riders. This new BRT line would provide enhanced transit for this community, as well as opportunities for economic development, without the significantly adverse impacts associated with the proposed BLRT Extension project. The Council acknowledges your concern about public input into the planning process for the proposed BLRT Extension Project. Also please see MASTER RESPONSES #6.
102A	Wilson	Jane	None provided	102	US Mail	7 – Alternatives, Engineering and Design	As a 37-year resident of Brooklyn Park and as a dean at North Hennepin Community College, I am in full support of the Bottineau light rail line. I'm excited by the prospect of using it as my transportation option to the airport, the train depot, events in downtown Minneapolis or St. Paul, or even to go to Robbinsdale.	Please see MASTER RESPONSE #2.
102B	Wilson	Jane	None provided	102	US Mail	7 – Alternatives, Engineering and Design	Our students will benefit greatly from the transit line; it has the potential to make North Hennepin a premier destination for Metro area students, a potential that brings revenue and growth not just to the college, but to the greater Brooklyn Park community.	Please see MASTER RESPONSE #2.
103A	Fischer	Dolores	None provided	103	US Mail	8 – Transportation System Effects	Do not like proposed Bottineau Transitway project because it would not allow left turns on to Broadway.	Moving from an undivided configuration that allows full access into and out of every driveway along the West Broadway Avenue corridor to a divided configuration is expected to increase traffic capacity, improve traffic operations, and lower the rate of incidents (crashes). Multiple studies have documented the capacity, mobility, and safety improvements that can be achieved with this type of roadway design. By directing traffic to designated median openings, the proposed West Broadway Avenue corridor design would allow businesses and other private driveways full access to one direction of travel, with right-in/right-out access.
103B	Fischer	Dolores	None provided	103	US Mail	4 – Social and Economic Effects	It would also cause considerable land and building loss.	Chapter 4 (Section 4.3) of the Final EIS summarizes acquisitions and displacements. The proposed BLRT Extension project would not displace any residential properties. A total of 46.66 acres of permanent acquisition is anticipated for the proposed BLRT Extension project. Ten commercial displacements are anticipated. Loss of private property would be mitigated by payment of fair market compensation and provision of relocation assistance in accordance with the Uniform Relocation Act and Minn. Stat. 117.
103C	Fischer	Dolores	None provided	103	US Mail	7 – Alternatives, Engineering and Design	If other options are available, pursue that alternative.	Please see MASTER RESPONSE #1.
107A	Peters	Pamela	None provided	107	US Mail	7 – Alternatives, Engineering and Design	I am in favor of improving transportation for our state, city and most important Harrison neighborhood. I have seen mass transit lessen for people that use it in our neighborhood.	Please see MASTER RESPONSE #2.
107B	Peters	Pamela	None provided	107	US Mail	7 – Alternatives, Engineering and Design	The Wirth Coop definitely needs a stop in Girard and Van White.	The Van White Boulevard Station is sited immediately east of Van White Boulevard, one block north of the terminus of Girard Terrace, aligned in the middle of Olson Memorial Highway. Access to the Van White Boulevard Station is from Van White Boulevard or Bryant Avenue. Chapter 2 of the Final EIS details the proposed BLRT Extension project including the location of all stations.
107C	Peters	Pamela	None provided	107	US Mail	4 – Social and	The Wirth Coop needs a spot on the advisory board.	The Council worked with each city along the community, including the city of

						Economic Effects		Minneapolis, to identify business representatives for the proposed BLRT Extension project Business Advisory Committee.
107D	Peters	Pamela	None provided	107	US Mail	4 – Social and Economic Effects	I am also concerned about continuing to have affordable housing in my neighborhood.	Hennepin County is advancing Station Area Plans at each proposed BLRT Extension project stations, which include housing considerations, based on the communities' concerns for equity and affordability. Chapter 7 – Environmental Justice of the Final EIS discusses indirect economic, which includes effects on property values, and Station Area Planning. The Council has an active affordable housing program to help cities maintain a viable proportion of affordable housing in Metro Area cities.
110A	Dube	Diane Marie	None provided	110	US Mail	7 – Alternatives, Engineering and Design	These comments are made to address the impact of construction on small businesses located in Robbinsdale and near the construction zone. Of particular concern are the business nodes in the Robbinsdale (42nd Avenue) station area, the Bass Lake Road station area, and the Brooklyn Boulevard Station Area. These comments relate to the following section of the DEIS: Section 4.6.4.2, Table 4.6-5, Section 4.6.5,	Chapter 7 of the Final EIS includes additional discussion and analysis of the benefits of the proposed BLRT Extension project to the environmental justice communities, in addition to the evaluation of potential impacts. Ten business operations would be displaced as a part of the proposed BLRT Extension project. These businesses would be relocated in accordance with the Uniform Relocation Act and Minn. Stat. 117, and compensated by payment of fair market value for their property. Five of these business operations are considered EJ businesses, either serving EJ populations or are owned by minority or low income people. The Council would also provide information to the communities where businesses would be displaced about the businesses' new locations and/or other options to meet their needs. In addition, the Council has been engaged in an extensive outreach effort with various stakeholders along the proposed BLRT Extension project corridor, including local business operators that may be impacted by the project to receive insight into daily operations and develop strategies to minimize impacts. To mitigate impacts on businesses during construction, the Council would develop a Construction Mitigation Plan, a Construction Communication Plan, and a construction staging plan. These tools would help the Council notify businesses and patrons in advance about any access issues or closures. The construction staging plan would also help businesses and patrons affected by LRT construction understand when construction would occur in different areas of the proposed BLRT Extension project corridor. Finally, a 24-hour construction hotline would be available for issue resolution and information about LRT construction. Section 3.4 of the Final EIS (Pedestrians and Bicyclists) summarizes construction-phase mitigation measures.
110B	Dube	Diane Marie	None provided	110	US Mail	7 – Alternatives, Engineering and Design	The Minnesota Department of Transportation has identified seven impacts to be examined in determine the impact of construction on businesses: pedestrian access, traffic and vehicle access, temporary loss of parking, utility shut off, noise and vibrations, increase dirt and dust, and visual impacts (Minn DOT, Report on Mitigation of Transportation Construction Impacts, prepared for the Legislature of the State of Minnesota, prepared by CH2MHill (February 2009)	Chapter 7 of the Final EIS includes additional discussion and analysis of the benefits of the proposed BLRT Extension project to the environmental justice communities, in addition to the evaluation of potential impacts. Ten business operations would be displaced as a part of the project. These businesses will be relocated in accordance with the Uniform Relocation Act and Minn. Stat. 117, and compensated by payment of fair market value for their property. Five of these business operations are considered EJ businesses, either serving EJ populations or are owned by minority or low income people. The Council will also provide information to the communities where businesses would be displaced about the businesses' new locations and/or other options to meet their needs. In addition, the Council has been engaged in an extensive outreach effort with various stakeholders along the proposed BLRT Extension project corridor, including local business operators that may be impacted by the project to receive insight into daily operations and develop strategies to minimize impacts. Finally, a 24-hour construction hotline will be available for issue resolution and information about LRT construction. Section 3.4 of the Final EIS (Pedestrians and Bicyclists) summarizes construction-phase mitigation measures. The Council will be key in notifying businesses and residents of

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
								construction plans, road closures and bus re-routes as well as being a point of contact for construction related emergencies such as power outages. The outreach program provides many avenues for people to submit comments and concerns, which are forwarded to the planners and engineers.
110C	Dube	Diane Marie	None provided	110	US Mail	7 – Alternatives, Engineering and Design	Variations of intensity of these impacts – particularly noise, vibrations, dirt, dust and visual impacts – may occur due to such things as multiple types of machinery; pile driving and pavement breaking; jackhammers and hoe rams; heavy tracked equipment such as bulldozers and backhoes; increased emissions due to construction operations or traffic back-ups; and smells from sewer grates or gas leaks. Temporary fencing, equipment placement and materials storage may obstruct views, leading customers to erroneously assume a business is not open. Debris and rubble may be unsightly, pose access problems or cause injuries to customers and employees. Traffic and pedestrian access may be disrupted or even prohibited during the construction phase. The temporary removal of pedestrian lighting, sidewalks, parking and roadbeds, restrictions to turning patterns, closure of cross streets and unregulated intersections will impact accessibility.	Project construction would result in temporary partial or full closures of existing streets as well as material and equipment deliveries, worker arrivals and departures, and hauling of excavation and borrow materials. Mitigation measures for short-term (construction) impacts to roads and traffic will be implemented by the Council prior to and during construction through the Construction Mitigation Plan, which includes a Construction Communication Plan and a construction staging plan. The Minnesota Department of Transportation (MnDOT), Hennepin County, and all municipalities affected by construction activities related to the proposed BLRT Extension project will be require to comply with applicable state and local regulations related to the closing of roads and the effects of construction activities. Contractors will be required to comply with all guidelines established in the *Minnesota Manual on Uniform Traffic Control Devices* (2015). Construction staging and mitigation documents will be reviewed by appropriate jurisdictions, and required permits would be secured by construction contractors. Traffic-control plans will be developed by the contractor based on information identified in the construction documents and the Construction Mitigation Plan. Traffic-control plans will be reviewed by appropriate jurisdictions and the Council before construction activities begin. For the proposed BLRT Extension project, the Council anticipates that temporary closures or detours would affect existing bicycle and pedestrian facilities. Construction traffic and debris such as excess dirt and gravel can also pose obstacles or issues for pedestrians and bicyclists. Maintaining safe access for non-motorized users as a result of detours, closures, and other inconveniences during the construction phase will be included by the Council in phasing plans. For visual effects during construction the Council will adhere to local jurisdiction construction requirements (if applicable) regarding construction-related visual disruption. In order to minimize visual disruption, construction activities will include the following measures: ■ Use construction methods that minimize the need to remove vegetation to accommodate construction activities ■ When possible, preserve existing vegetation, particularly along the edge of construction areas, to help screen views ■ Restore areas disturbed during construction After construction is completed, regrade and revegetate areas disturbed by construction and staging to pre-project conditions, with an allowance to address survival of revegetation, to the extent feasible. Locate construction staging areas in places where their visibility would be minimal and, to the extent required, provide temporary visual screening to limit views into them from nearby residential areas, trails, streets, or other places from which they would be seen by visually sensitive viewers. Where construction lighting is required, the construction contractor will, to the extent practical, shield such lighting and direct it downward in such a manner that the light source visibility from offsite views would be limited as much as possible and would not fall outside the boundaries of the proposed BLRT Extension project site.
110D	Dube	Diane Marie	None provided	110	US Mail	8 – Transportation System Effects	Disruptions – particularly traffic congestion – will impact not only the business next to the areas under construction, but also the businesses that rely on pedestrian and vehicular traffic that comes from the opposite side of the construction zone.	Project construction would result in temporary partial or full closures of existing streets as well as material and equipment deliveries, worker arrivals and departures, and hauling of excavation and borrow materials. Mitigation measures for short-term (construction) impacts to roads and traffic will be implemented by the Council prior to and during construction through the

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
								Construction Mitigation Plan, which includes a Construction Communication Plan and a construction staging plan. MnDOT, Hennepin County, and all municipalities affected by construction activities related to the proposed BLRT Extension project will require compliance with applicable state and local regulations related to the closing of roads and the effects of construction activities. Contractors will be required to comply with all guidelines established in the *Minnesota Manual on Uniform Traffic Control Devices* (2015). Construction staging and mitigation documents will be reviewed by appropriate jurisdictions, and required permits would be secured by construction contractors. Traffic-control plans will be developed by the contractor based on information identified in the construction documents and the Construction Mitigation Plan. Traffic-control plans would be reviewed by appropriate jurisdictions and the Council before construction activities begin. For the proposed BLRT Extension project, the Council anticipates that temporary closures or detours would affect existing bicycle and pedestrian facilities. Construction traffic and debris such as excess dirt and gravel can also pose obstacles or issues for pedestrians and bicyclists. Maintaining safe access for non-motorized users as a result of detours, closures, and other inconveniences during the construction phase will be included by the Council in phasing plans.
110E	Dube	Diane Marie	None provided	110	US Mail	4 – Social and Economic Effects	The duration of the construction project, construction sequencing, hours of construction and even trash removal will all have an impact on the operation of a business.	See response to 110A.
110F	Dube	Diane Marie	None provided	110	US Mail	4 – Social and Economic Effects	Utilities – hot and cold running water, fiber optic communications, and sewer, electricity, natural gas, telephone services – are the lifeline of any business.	Utility conflicts are identified in the Final EIS in Chapter 5 (Section 5.1). No long-term impacts to utilities are anticipated, since the relocation and reconstruction of utilities that would be conducted as part of the proposed BLRT Extension project would maintain current service levels. Short-term construction impacts may occur, but the Council would require the utility contractor to notify businesses and residents prior to any disruption of service.
110G	Dube	Diane Marie	None provided	110	US Mail	4 – Social and Economic Effects	In order to minimize the loss of business revenue expected to be experienced by small businesses, the mitigation measures must address each of the seven impacts identified by MnDOT and these specific impacts. Attention to the details of mitigation measures to address these impacts is critical to the survival of small businesses. It isn't enough to maintain traffic corridors and access points; congestion must be minimized or potential customers will find other businesses to patronize. Business signage must be erected before construction begins and must provide information to both vehicular traffic and pedestrians. What constitutes "advance communication" of construction activities depends on the type of business. Businesses should be consulted long before construction begins as to the mechanism for communication (e.g. telephone, flyers, email. etc.) and the notice period desired.	Project construction would result in temporary partial or full closures of existing streets as well as material and equipment deliveries, worker arrivals and departures, and hauling of excavation and borrow materials. Mitigation measures for short-term (construction) impacts to roads and traffic will be implemented by the Council prior to and during construction through the Construction Mitigation Plan, which includes a Construction Communication Plan and a construction staging plan. MnDOT, Hennepin County, and all municipalities affected by construction activities related to the proposed BLRT Extension project will be required to comply with applicable state and local regulations related to the closing of roads and the effects of construction activities. Contractors will be required to comply with all guidelines established in the *Minnesota Manual on Uniform Traffic Control Devices* (2015). Construction staging and mitigation documents will be reviewed by appropriate jurisdictions, and required permits would be secured by construction contractors. Traffic-control plans will be developed by the contractor based on information identified in the construction documents and the Construction Mitigation Plan. Traffic-control plans will be reviewed by appropriate jurisdictions and the Council before construction activities begin. For the proposed BLRT Extension project, the Council anticipates that temporary closures or detours would affect existing bicycle and pedestrian facilities. Construction traffic and debris such as excess dirt and gravel can also pose obstacles or issues for pedestrians and bicyclists. Maintaining safe access for non-motorized users as a result of detours, closures, and other inconveniences during the construction phase would be included by the Council in phasing plans.
110H	Dube	Diane Marie	None provided	110	US Mail	4 – Social and Economic Effects	In addition, mitigation measures should also address not only the intentional and planned interruption of utilities but also the unintentional and unplanned disruptive service.	Utility location excavations and pre-construction surveys will be performed in general accordance with the MnDOT policy of Subsurface Utility Engineering. These procedures would help minimize the number of unintended disruptions in utility

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
								service. If utilities are discovered during construction that are not identified in the contract documents, the appropriate utility companies and agencies will be contacted to identify the line(s) and will be consulted on appropriate actions. Additional information may be found in the construction-phase impacts section 5.1 Utilities of the Final EIS.
110I	Dube	Diane Marie	None provided	110	US Mail	4 – Social and Economic Effects	The actions of the contractor and subcontractors can minimize impacts to businesses by limiting the magnitude of construction. Therefore, the construction contract should contain terms such as regulating days and hours of construction, mandating access requirements, requiring clean-up measures, prohibiting portable toilets within a specified zone around grocery stores and eating establishments, setting communication requirements and other measures to mitigate these impacts.	To mitigate impacts on businesses during construction, the Council will develop a Construction Mitigation Plan, a Construction Communication Plan, and a construction staging plan. These tools would help the Council notify businesses and patrons in advance about any access issues or closures. The construction staging plan would also help businesses and patrons affected by LRT construction understand when construction would occur in different areas of the proposed BLRT Extension project corridor. Finally, a 24-hour construction hotline will be available for issue resolution and information about LRT construction.
112A	Mulla	Hassanali	None provided	112	US Mail	4 – Social and Economic Effects	Please save our homes and our neighborhood.	Hennepin County is developing the West Broadway Avenue Reconstruction project. An Environmental Assessment Worksheet for the roadway project was completed and a Negative Declaration finding issued. The Final EIS discloses this information in Chapter 2 – Alternatives and in Chapter 6 – Indirect Impacts and Cumulative Effects. Section 4.3 of the Final EIS discusses displacements anticipated with the proposed BLRT Extension project. No residential property displacements are anticipated as a result of the proposed BLRT Extension project.
113A	Mulla	Masuma	None provided	113	US Mail	4 – Social and Economic Effects	Please save our homes and our neighborhood.	Hennepin County is developing the West Broadway Avenue Reconstruction project. An Environmental Assessment Worksheet for the roadway project was completed and a Negative Declaration finding issued. The Final EIS discloses this information in Chapter 2 – Alternatives. Reference to West Broadway Avenue tech memos in Chapter 2 and in Chapter 6 – Indirect Impacts and Cumulative Effects. Section 4.3 of the Final EIS discusses displacements anticipated with the proposed BLRT Extension project. No residential property displacements are anticipated as a result of the proposed BLRT Extension project.
114A	Weiske	Jeanne	None provided	114	US Mail	6 – Noise and Vibration Effects	The EIS does not consider the impact of the noise and announcements.	Noise impacts have been assessed at sensitive locations throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. Where impacts have been identified, mitigation measures, consistent with Metro Transit's noise mitigation policy, have been recommended. Noise impacts have been assessed for both the LRT and the West Broadway Avenue Reconstruction project. The combined effects of both projects are included in Chapter 6 of the Final EIS. Noise effects for the LRT project only are summarized in Chapter 5 (Section 5.6) of the Final EIS. There are nine moderate noise impacts anticipated from the proposed BLRT Extension project. These impacts do not require mitigation.
114B	Weiske	Jeanne	None provided	114	US Mail	3 – NEPA Process and Public Involvement	Residents are being ignored.	The Council acknowledges your concern about public input into the planning process for the proposed BLRT Extension project. Also, please see MASTER RESPONSES #6.
115A	Fairbanks	Mary Ann	None provided	115	Email	4 – Social and Economic Effects	I moved to Brooklyn Park in 1970 when it was about nothing but potato and corn fields. I watched it deteriorate to a point to where people were embarrassed to say they were from Brooklyn Park. It is starting to make a comeback. I moved into Maplewood Estates townhomes in 1973. Pretty much like the city, it was a wonderful place to live, great neighborhood. Again, like the city, it went through some not so good times when the housing market took a huge downfall. Some homes are under water. From about 2008, our property values for tax purposes dropped each year – dropping by about 50%. Finally, the 2014 value for taxes payable in 2015 showed a slight increase. Light rail going through a residential area is going to drop the value of our homes again. Many homes will be lost, retired homeowners with mortgages paid off will be forced to move and	Please see MASTER RESPONSE #21. Since publication of the Draft EIS, modifications to the preliminary design have resulted in the avoidance of several anticipated property acquisitions and resulting displacements with the proposed BLRT Extension project. No residential property displacements would occur as a result of the proposed BLRT Extension project. Section 4.3 of the Final EIS summarizes acquisitions and displacements. Loss of private residential property would be mitigated by payment of fair market compensation and provision of relocation assistance in accordance with the Uniform Relocation Act and Minn. Stat. 117. Section 7.5.1 of the Final EIS provides a detailed analysis of the potentially disproportionately high and adverse impacts of the proposed BLRT Extension project in regards to displacements of environmental justice communities. Avoidance, minimization and mitigation measures were taken to reduce impacts to minority and low-income populations. The proposed BLRT Extension project has the potential to

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
							enter into another mortgage, children will be forced to relocate and change schools. That homes that are not totally lost will be harmed dramatically – from the noise, the vibration, the loss of neighborhood. Even MPR and the Star Tribune have negative comments about light rail. After going through some rough times, Maplebrook Estates has remained a great neighborhood. With hard work by homeowners and the association, the area always looks clean and nice. It is a quiet neighborhood. Walk through the area. It is a neighborhood full of proud homeowners where a retired couple or a family can take a walk at night. Now we have people who know nothing about Brooklyn Park, nothing about Maplebrook Estates, and live nowhere close making decision to run light rail through the residential area and force people out of their homes. The original draft EIS did not have the light rail running down West Broadway. Hennepin County do not seem to be at all interested. If your retired parents lived in Maplebrook Estates, would you approve light rail in their living room? I really don't see any reason that light rail is needed in Brooklyn Park, but if it is to come, an alternate route should be chosen where people are not forced out of their homes. Putting a train down the middle of a residential road and disrupting families is wrong. It's dangerous, it's noisy, it's disruptive. All one has to do is drive down Hiawatha in South Minneapolis to see how the train takes over the road and makes life difficult for those in cars, on bikes or pedestrians. PLEASE choose an alternate route – not West Broadway.	indirectly spur development in the proposed BLRT Extension project corridor particularly around stations. This creates the potential for changes in property values, which can be perceived as either an impact (generally for renters) or a benefit (generally for owners). These potential "pricing-out" impacts (that is, increased rents and decreased affordability for existing residents) can be offset by the decrease in transportation costs. The Health Impact Assessment suggests that cities, communities and developers work together to keep housing options affordable in station areas to ensure that neighborhoods near the transit stations continue to be affordable for low-income households (Myslajek, 2013). Additionally, Hennepin County is proactively considering strategies to minimize impacts on housing values with their station area planning effort, which seeks input from the public, including EJ populations, to create a framework for any potential development that aligns with the community's goals and preferences. Furthermore, the Council has established programs to encourage affordable housing planning and implementation that may offset potential indirect impacts to low-income persons.
116A	Nerud	Amanda	None provided	116	Email	4 – Social and Economic Effects	I became a resident of the Maplebrook Estates association a little under a year ago. Having just recently become aware of the intended expansion of West Broadway, with the intent to include the possible addition of the Metro Light Rail at a later time, some more informed parties indicated that the existing Bottineau Transitway Impact Study only lists minimal impact to the Maplebrook Estates community. In the city's most recent estimate, there would be as many as 38 impacted homes. 7 buildings are a 4-corners design with half the homes affected (so the city would have to acquire all 4 corners/homes), and one building is consisting of 6 townhomes. So in the broad view, it may appear that only 8 buildings are impacted, but it becomes a much larger impact when the multi-familyaspect of the building is taken into account. It was indicated at the most recent public meeting that your Impact Statement indicated a smaller list of homes to be acquired than what the city is indicating, and therefore this route was more highly preferred than others. And this is only considering the impacted homes in the Maplebrook Estates community; south there are additional homes (some twin homes) and other businesses (including a church) that are foreseen to be acquired to make room for the road's expansion to accommodate the 'green space' for the possible future expansion for the LRT. I would strongly urge your team to reevaluate your study information and ensure your impact study takes into account the appropriate amount of affected homes and families when deciding which route the LRT will ultimately follow. I appreciate your time and diligence that went into these projects already and want to make sure my opinion is posted on this matter.	Please see MASTER RESPONSE #21. Section 4.3 of the Final EIS summarizes acquisitions and displacements. Loss of private residential property would be mitigated by payment of fair market compensation and provision of relocation assistance in accordance with the Uniform Relocation Act and Minn. Stat. 117.
117A	Thorsen	Madge	None provided	117	Email	3 – NEPA Process and Public Involvement	The DEIS is inadequate. The following discussion of inadequacies concentrates on alignment D-1 as it crosses Golden Valley and parts of Robbinsdale. This commentator is opposed to D-1.	The Draft EIS was prepared and published in accordance with National Environmental Policy Act (NEPA) and Minnesota Environmental Policy Act requirements.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
117AA	Thorsen	Madge	None provided	117	Email	5 – Environmental Effects	The DEIS does not adequately address impacts to wildlife in and along the parks. Wildlife inhabiting the parks is not accurately inventoried or catalogued. Wildlife movement, behavior, corridors and habitat are not thoroughly analyzed.	Section 5.8.3 of the Final EIS details the protected flora and fauna that potentially could be present in the proposed BLRT Extension project corridor. Also, please see MASTER RESPONSE #13.
117AB	Thorsen	Madge	None provided	117	Email	3 – NEPA Process and Public Involvement	The report is self-contradictory. On the one hand, it states that "deer will be able to cross where they do today" and on the other hand, it says that the track will be fenced where humans cross. Since humans cross at every point along the railroad ROW, the report apparently means to suggest the entire line between 36th Avenue and Golden Valley road will be fenced; deer and other animals would have no access to their typical crossings, feeding or resting grounds if that is the case. Which is it?	Strategically placed fencing would be necessary to minimize collisions between the train and pedestrians and animals. Wildlife crossings are mentioned in the Final EIS under Unavoidable Impacts and Mitigation for wildlife environments (Chapter 5 [Section 5.8.5.5]): "Where effective and feasible, suitable wildlife crossings would be accommodated within proposed culverts to allow wildlife species to cross from one side of the LRT/freight rail tracks to the other."
117AC	Thorsen	Madge	None provided	117	Email	4 – Social and Economic Effects	If the entire track is fenced, humans could not cross either, as they do regularly today. It is no answer to say humans are crossing illegally. First, they have done that since the invention of tracks, here and everywhere in the world (it was shocking that the Scoping Document reported officials were "first learning" of trespass on the tracks! Really?!). Second, closing crossings to humans is infeasible because in these communities, accustomed as people are to free travel between parts of town, people are going to figure out a way to cross even if fences are erected to keep deer out. Safety and connectivity demands that if the alignment were to be built, alternative human crossings (like tunnels?) between east and west would be required.	Please see MASTER RESPONSE #8.
117AD	Thorsen	Madge	None provided	117	Email	5 – Environmental Effects	The DEIS fails to analyze thoroughly hazardous waste dangers that could arise from disturbing the parks. Although waste sites are mentioned, they are not detailed and more importantly the question of concrete is inadequately addressed. (Chapter 5). These two parks were once a site of construction debris, including WPA-era concrete from Highway 100. Nature has reclaimed the areas and transformed them into beautiful park land, but conducting construction activities with heavy equipment and running heavy trains on a new corridor relocated to the west and rebuilt on the east may disturb the soil and uncover asbestos-containing concrete, both during construction and every day thereafter. Oral history indicates that decades ago, a locomotive derailed along the tracks and sank into the bog near and around Grimes Pond (Source: members, Robbinsdale Historical Society). Reportedly, it has never been recovered. Whether the history is true or urban legend is unknown, but the DEIS should address it in the event there may be any environmental impact (hazardous conditions or instability).	The Council is aware of the previous dumping that had occurred during the 1960s in Sochacki Park/Mary Hills Nature Center/Rice Lake Park. A Phase I ESA has been conducted to further evaluate the presence of contamination along the entire proposed BLRT Extension project corridor and proposed areas of construction. A Phase II ESA is currently being conducted to obtain more specific data on contamination. Information gathered from the Phase I and II ESA would be incorporated into the proposed BLRT Extension project's RAP (which includes a Construction Contingency Plan for unidentified contamination) to properly handle, treat, store, and dispose of solid wastes, hazardous materials, petroleum products, and other regulated materials that could not be avoided during construction. Coordination with the Minnesota Pollution Control Agency, cities of Robbinsdale and Golden Valley, and the Three Rivers Park District would also be arranged.
117AE	Thorsen	Madge	None provided	117	Email	6 – Noise and Vibration Effects	Other Parks: South Halifax, Rice Lake, Triangle, Lee, Wirth Impacts on other parks are inadequately addressed (Chapter 4). Similar inadequacies plague the purported treatment of other D-1 parks. Lee and Triangle are said to be basically impacted because they have metal fences between the children and the extremely close tracks. (Triangle park users will "experience the effects of increased noise" (Chapter 4), but apparently, it doesn't matter since nothing else is said about it.)	Please see response to Comment 5B.
117AF	Thorsen	Madge	None provided	117	Email	5 – Environmental Effects	Visual impacts on other parks – South Halifax, Rice Lake, Triangle, Lee, Wirth – are inadequately addressed.	Please see response to Comment 91B.
117AG	Thorsen	Madge	None provided	117	Email	4 – Social and Economic Effects	Safety impacts on other parks – South Halifax, Rice Lake, Triangle, Lee, Wirth – are inadequately addressed.	Chapter 4 (Section 4.7) of the Final EIS addresses safety and security. In locations where there would be at-grade light rail crossings of roadways, the potential exists

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
								for increases in emergency response time as a result of delay to emergency vehicles while LRVs are in the crossing. During the peak weekday hour, up to 12 light rail trains (six in each direction) would pass through these at-grade crossings, causing approximately 50 seconds of delay per light rail train crossing. These delays could increase fire, emergency medical services, and police response times on routes using the crossings. To help avoid or minimize delays, the Council would coordinate with emergency services providers by providing them with the light rail operating schedule and identification of alternative crossing routes. Additional coordination would occur through the FLSSC, as described in the proposed BLRT Extension project's *SSMP* (Council, 2014). Please see also MASTER RESPONSE #8
117AH	Thorsen	Madge	None provided	117	Email	4 – Social and Economic Effects	No analysis of impacts based on new uses at Lee has been done.	The Council assumes "Lee" is referring to Lee Park. Chapter 8 – Amended Draft Section 4(f) and 6(f) Evaluation of the Final EIS addresses the project impact to all parklands in the proposed BLRT Extension project corridor. Lee Park would not be impacted.
117AI	Thorsen	Madge	None provided	117	Email	5 – Environmental Effects	The Section 4(f) analysis is legally inadequate and does not afford a sufficient basis for decision. The DEIS offers a confusing discussion that purports to find a temporary occupancy of Mary Hills and Sochacki during construction, but implies that the temporary occupancy is not a "use" under law because all five required conditions that make temporary occupancy not a use would be met. But in its conclusion, the DEIS recites the five conditions inaccurately. In its list of the five conditions, the DEIS recites that there would be no "permanent adverse physical impact" on the parks. Chapter 8, p. 8-42. But this is a truncated statement; the regulations actually describe this condition as: "no interference with the protected activities, features, or attributes of the property on a temporary or permanent basis." (emphasis added). That is not the same as "adverse physical impact" alone. So did the DEIS silently analyze "interference with activities, features and attributes" and conclude there was none, even on a temporary basis, and so the temporary occupancy is not a use? Or does it conclude that there is at least temporary interference with the activities, features and attributes of the property and so the temporary occupancy is a use? The DEIS is less than clear in this regard.	Please see MASTER RESPONSE #15.
117AJ	Thorsen	Madge	None provided	117	Email	5 – Environmental Effects	Whatever it meant to say about temporary occupancy, the DEIS omits constructive use assessment of these two parks altogether. Constructive use occurs when the "project's proximity results in impacts so severe that the protected activities, features, or attributes that qualify the property for protection under Section 4(f) are substantially impaired. Substantial impairment occurs only if the protected activities, features, or attributes of the resource are substantially diminished." As courts have said, a project which respects a park's territorial integrity may still, by means of noise, air pollution and general unsightliness, "dissipate its aesthetic value, crush its wildlife, defoliate its vegetation and "take it" in every practical sense." DC Federation of Civil Association v. Volpe, 459 F. 2d 1231, cert. denied. March 27 1972. The DEIS does not report on any study of the parks' activities, features or attributes or the whether the impacts of noisome transit disturbances amount to constructive use. It does not discuss the fact that noise which interferes with quiet uses is by definition a constructive use. 23 CFR 774.15 (e)(iv). No objective empirical evidence is presented that could support conclusions or decisions about 4(f) constructive use. This in turn means that the rest	The Final EIS finds that there are no ecological, noise, visual, vibration or other aesthetic interferences that would substantially impair the activities, features or attributes of Sochacki Park: Mary Hills Management Unit or Sochacki Park: Sochacki Management Unit. Therefore, the proposed BLRT Extension project would not result in a constructive use, as defined under 23 CFR Part 771.135 on these park properties. Also please see MASTER RESPONSE #15.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
							of the 4(f) analyses, such as fairly evaluating feasible and prudent alternatives, cannot reasonably be done.	
117AK	Thorsen	Madge	None provided	117	Email	4 – Social and Economic Effects	The DEIS acknowledges a change in setting and a diminution of both parks (Mary Hills and Sochacki) and then concludes the proposed project would not "change the community character." Trains will split the parks in half; transit operations will reduce walkability. Connectivity between Robbinsdale, Golden Valley and Wirth Park will be impeded and connectedness among these three communities impaired. The DEIS inadequately addresses these points. A change in community character could hardly seem more obvious than in and adjacent to these parks. Sochacki in particular is a rare resource for Robbinsdale. It represents one-third of all of the cities' park acreage. Residents and visitors view it as an enchantment and place of wonder, see above. Mary Hills is likewise unusual and treasured. Introducing LRT levels of noise, vibration and all the rest seems so clearly likely to destroy these resources.	Sochacki Park: Sochacki Management Unit and Sochacki Park: Mary Hills Nature Area would be restored and enhanced following the completion of construction and continued coordination with the Sochacki Park Joint Powers Agreement partners (the Three Rivers Park District, the city of Golden Valley, and the city of Robbinsdale). Additional supporting data and explanation have been added to the Final EIS and Amended Draft Section 4(f) and 6(f) Evaluation. One mitigation measure is for the proposed BLRT Extension project to construct a paved trail that would connect Theodore Wirth Parkway trail to Sochacki Park. At the Golden Valley Road Station, both the Theodore Wirth Parkway bridge and the Golden Valley Road bridge would be reconstructed, including the existing pedestrian and bicycle facilities. A trailhead would be constructed at the eastern corner of the proposed Golden Valley Road Station park-and-ride. This trailhead would provide access to the existing Minneapolis Park and Recreation Board trail system and access to the proposed Bassett Creek Regional Trail that would be constructed by the Three Rivers Park District along Golden Valley Road. The proximity of bicycle and pedestrian facilities and the addition of new trail connections with the proposed BLRT Extension project could require improving the intersection to enhance the safety of pedestrians and bicyclists. The Council would coordinate such improvements with the Minneapolis Park and Recreation Board, the city of Golden Valley, and Hennepin County, along with other stakeholders. See Section 3.4 of the Final EIS for more discussion about planned bicycle and pedestrian accommodations at the proposed Golden Valley Road Station area.
117AL	Thorsen	Madge	None provided	117	Email	4 – Social and Economic Effects	The DEIS does not adequately answer the question: how is permanent change in noise, vibration, visual aesthetics, wildlife, and uses of parks, in effect their destruction as natural preserves, not a severe impact on community character?	No mitigation measures are warranted for long-term neighborhood and community impacts, because the effectiveness of mitigation measures that have been identified and would be implemented for specific environmental categories (including but not limited to noise, vibration, visual quality and aesthetics, transit, roadways and traffic, parking, and pedestrian and bicyclist considerations) would prevent adverse impacts. Specific mitigation for the long-term impacts such as property acquisitions and displacements, visual quality, and noise are discussed in other sections of this Final EIS. Also, please see MASTER RESPONSE #9.
117AM	Thorsen	Madge	None provided	117	Email	2 – Fiscal Effects and Schedule	Knowing how much the "preferred route" and all alternatives will cost rests on accurately reporting what the government will have to spend on acquiring land for the Project. Yet, reports on those costs have not been made public. Upon inquiry, this commentator was told that copies of or further information about these reports, calculations and methodologies, are not available to the public. Thus: 1) the review of tax-assessed values and the identification of "each of the impacted properties" are unavailable to the public; 2) the "appraisal" said to have been conducted in 2012 is unavailable to the public; 3) whatever these figures may be, they must be at least two years out of date; 4) the analyses apparently do not include constructive takings. The data should immediately be made publicly available.	Table 10.1-1 in Chapter 10 – Financial Analysis of the Final EIS outlines a breakdown of cost for the different elements of the proposed BLRT Extension project totaling $1.496 billion. The right-of-way cost estimate was developed by a licensed appraiser using: (1) a preliminary appraisal of the BNSF rail corridor done by the Council in 2015; (2) a parcel by parcel assessment of proposed damages; and (3) an analysis of the current real estate market. Right-of-way cost estimates and appraisals developed by government entities on individual properties are confidential before an offer is made, per Minn. Stat. 13.44, subd. 3.
117AN	Thorsen	Madge	None provided	117	Email	4 – Social and Economic Effects	Under the Minnesota Constitution and case law since Alevizos v. Metropolitan Airports Commission, private property cannot be constructively taken for public use without payment of just compensation. While not every inconvenience, annoyance or loss of peace and quiet caused by noise and other serious nuisance gives rise to inverse condemnation claims, where a property is deprived of its practical enjoyment and a definite and measurable loss in market value occurs which the property-owning public in general does not	Please see response to Comment 94C.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
							suffer, compensation must be paid.	
117AO	Thorsen	Madge	None provided	117	Email	4 – Social and Economic Effects	Along D-1, park property is being converted into a highly traveled rail corridor. Residences in turn will experience a change from rural silence, views, seclusion, serenity and clear air to the blight of LRT noise, vibration, visual effects and pollution (light, noise, air). The impact on this small segment is more profound (Bassett Creek Drive, Bonnie Lane, Dresden Lane, June, Kyle, Halifax, Kewanee Way, Xerxes and others) than anywhere else in the Project. Hundreds of parcels along the parks would be disproportionately damaged for the benefit of other citizens elsewhere. These owners are the most likely to bring and win inverse condemnation lawsuits if compensation is not paid for the diminution of their property values. The true cost of this alignment must therefore take into account these expenses, which could amount to millions in damages and legal fees. Failure to account for constructive takings understates the ROW and other build costs of D-1 in particular.	Concerning visual: Please see response to Comment 91B. Concerning noise: Noise is discussed in Chapter 5 (Section 5.6) of the Final EIS. Noise impacts have been assessed at parks throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. As reported in Table 5.6-5 of the Final EIS, the following noise level with the proposed BLRT Extension project would be: ■ Plymouth Avenue North to 16th Avenue North – 9 moderate noise impact and no severe noise impacts ■ 16th Avenue North to Golden Valley Road – 1 moderate noise impact and no severe noise impacts ■ Golden Valley Road to 26th Avenue North – 9 moderate noise impacts and 14 severe noise impacts For the first two locations with mitigation in the form of interior testing to determine the appropriate mitigation measure, no residual noise impacts are anticipated. For the third location with mitigation in the form of a noise barrier, 1 moderate and 1 severe noise impacts would remain. Concerning vibration: Vibration impacts to residential properties have been identified in the cities of Robbinsdale and Crystal but not in the City of Golden Valley. The Final EIS finds that there are no ecological, noise, visual, vibration or other aesthetic interferences that would substantially impair the activities, features or attributes of Sochacki Park: Mary Hills Management Unit or Sochacki Park: Sochacki Management Unit. Therefore, the proposed BLRT Extension project would not result in a constructive use, as defined under 23 CFR Part 771.135 on these park properties.
117AP	Thorsen	Madge	None provided	117	Email	3 – NEPA Process and Public Involvement	The DEIS therefore artificially promotes D-1 over other potentially cheaper choices. Alignment D-1 may in fact prove more expensive than any other alternatives if all the data were analyzed. Analysis before and not after the “30%” engineering step should be done.	Many elements go into deciding the LPA including cost, social elements and environmental impacts, among others. Table 10.1-1 in Chapter 10 – Financial Analysis of the Final EIS outlines a breakdown of cost for the different project elements totaling $1.496 billion. Cost reviews would continue throughout the design process to further refine the cost.
117AQ	Thorsen	Madge	None provided	117	Email	4 – Social and Economic Effects	The DEIS relies on generalized studies of LRT effects on community property values but does not come to grips with individual diminution of property value. Both sound walls and power lines can negatively impact property values.	Please see MASTER RESPONSE #7.
117AR	Thorsen	Madge	None provided	117	Email	6 – Noise and Vibration Effects	No noise measurements were made at numerous clusters of houses along the parks and tracks, presumably (it is not clear) because they were more than 350 feet away. No moderate or severe impacts were identified on the west side of D-1, even though homes are currently at rural ambient noise levels.	Noise measurements were conducted in both the Draft EIS and Final EIS at noise sensitive locations within the appropriate screening distances for potential impacts from the project. Typically, impacts are limited to within 100 to 150 feet of the tracks. Noise is discussed in Chapter 5 (Section 5.6) of the Final EIS.
117AS	Thorsen	Madge	None provided	117	Email	4 – Social and Economic Effects	The report concludes that D-2 should be rejected as an alternative to D-1 primarily because D-2 would experience more takes and partial takes of property. But it does no projections or estimates of constructive takes of high value parkway property and other residences adjacent to the proposed expanded tracks and so understates the effects and costs of D-1.	Please see response to Comment 94C.
117AT	Thorsen	Madge	None provided	117	Email	3 – NEPA Process and Public Involvement	Without that thorough analysis of constructive takes, alignment D-2 and other alternatives cannot be accurately compared to D-1 and a “preference” can only be based on speculation. D-1 may in fact be the most expensive and least prudent and feasible of all alternative choices, but the DEIS does not enable the public or decision-makers to accurately conduct that analysis.	Please see response to Comment 94C and Comment 117AM.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
117AU	Thorsen	Madge	None provided	117	Email	2 – Fiscal Effects and Schedule	No economic impact analysis of park loss has been done. Economic impact analysis of park loss must be done to make fair financial assessments possible. Research confirms that park amenities, especially passive use amenities, increase property values, often throughout the whole community. See e.g., Crompton, The Impact of Parks and Open Space on Property Values, http://www.cprs.org/membersonly/winter07_propertyvalues.htm. Loss of such park amenities correspondingly decrease property values, especially proximate properties. In urban locations, LRT may not have significant negative economic impacts and may in fact improve the economics for places like North Minneapolis. But ruining Sochacki and Mary Hills may decrease property values substantially in those cities substantially, especially of homes in close proximity but also for property blocks away. This damage may not amount to constitutional takings, but may sufficiently reduce home values such that the tax bases of both Robbinsdale and Golden Valley would suffer to the tunes of millions in assessed valuations.	A review of park properties that would be impacted by the proposed BLRT Extension project is discussed in the Final EIS and Amended Draft Section 4(f) and 6(f) Evaluation. Two parks have a *de minimis* use. Five parks have a temporary occupancy finding.
117AV	Thorsen	Madge	None provided	117	Email	8 – Transportation System Effects	Anticipated ridership appears to be overstated and overly optimistic based on the data presented. Didn't the Hiawatha line lose riders in 2013; why are Bottineau projections so robust?	The Council used its regional travel demand forecasting model to develop the transit ridership forecasts for the proposed BLRT Extension project. Ridership modeling is discussed in Chapter 3 (Section 3.1) of the Final EIS. Approximately 27,000 daily riders are forecasted for 2040.
117AW	Thorsen	Madge	None provided	117	Email	7 – Alternatives, Engineering and Design	RBT is cheaper, less impactful, and more consistent with realistic ridership expectations, isn't it?	The Council is developing bus rapid transit routes within its service area; however, light rail was selected as the preferred technology for the proposed BLRT Extension project corridor. Please see also MASTER RESPONSE #1.
117AX	Thorsen	Madge	None provided	117	Email	5 – Environmental Effects	What does the City of Golden Valley get for its citizens in return for giving up its parks?	Sochacki Park: Sochacki Management Unit and Sochacki Park: Mary Hills Management Unit would be restored and enhanced following the completion of construction and continued coordination with the Sochacki Park Joint Powers Agreement partners (the Three Rivers Park District, the city of Golden Valley, and the city of Robbinsdale). Additional supporting data and explanation have been added to the Final EIS and Amended Draft Section 4(f) and 6(f) Evaluation (Chapter 8). The park will remain open to recreational use during construction. One mitigation measure is for the project to construct a paved trail that would connect Theodore Wirth Parkway trail to Sochacki Park. Additional mitigation measures include environmental remediation, a revegetation plan, and prep for a future off-leash dog park. Additional measures can be found in the Amended Draft Section 4(f) and 6(f) Evaluation.
117AY	Thorsen	Madge	None provided	117	Email	2 – Fiscal Effects and Schedule	Where is the cost-benefit analysis that incorporates the fact that an average mile of light-rail line costs two to five times as much as one mile of an urban freeway lane? In Portland, the light rail carries one percent of the city's travelers but cost 2.3 billion. How does that make sense, as opposed to a more comprehensive approach to travel in general: electric buses, go cars, better highways and street repair, integrating other green transportation like segways, pedal cabs, bikes, whatever. More jobs, more development, less pain.	Please see MASTER RESPONSE #4.
117AZ	Thorsen	Madge	None provided	117	Email	7 – Alternatives, Engineering and Design	North Minneapolis is in deep need of urban transit and of the hoped-for accompanying development opportunities. Yet it is excluded as a preferred alternative. North Minneapolis is already a busy urban corridor that would be far more appropriate for light rail or for RBT or a more modern and green comprehensive treatment of mass transit. Residents actually need it; Golden Valley does not. Ways to avoid the concerns expressed about D-2 in North Minneapolis have been inadequately explored (what about tunnels and subways? what about	Please see MASTER RESPONSE #20.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
							moving homes rather than removing them; what about revisiting a path other than Penn Avenue?)	
117B	Thorsen	Madge	None provided	117	Email	5 – Environmental Effects	Sochacki and Mary Hills Nature Preserve will be irreversibly damaged. The DEIS inappropriately downplays the damage to Sochacki and Mary Hills (and other) parks and says they are not being converted to transportation use. The DEIS is in error with respect to its conclusions about impact and FTA Section 4(f).	Please see MASTER RESPONSE #15.
117BA	Thorsen	Madge	None provided	117	Email	2 – Fiscal Effects and Schedule	How much is BNSF paying toward the costs of the DEIS, EIS and related procedures? How much will it pay for construction? 2. How much is BNSF to be paid for the prospective use of its ROW all along the "preferred alternative" versus other alternatives studied?	The Council continues discussions with BNSF for the use/purchase of 50 feet of their right-of-way. To date, BNSF has not agreed to any participation in the cost of the proposed BLRT Extension project. See response to Comment 117AM regarding cost estimate for BNSF right-of-way.
117BB	Thorsen	Madge	None provided	117	Email	7 – Alternatives, Engineering and Design	Is there anything about this project that enables BNSF to significantly change its freight traffic along the "preferred alignment" especially D-1? In other words, does the colocation, new proposed tracks or type of tracks, building of an access road, shift in the location of the current tracks, total and partial and constructive takings of private land, permitting and zoning processes – does any of that enable BNSF to increase its own use over what it could have otherwise done independently without the LRT? For example, is it going to be easier to transport hazardous products like frac sand or frac sand oils because of public cooperation? What are its plans for its future freight traffic along D-1 in particular? Who are BNSF's lobbyists for this project and is there any record of their activities? Planners at open houses repeatedly justified the choice of D-1 and the impact on the parks by saying that BNSF could use its right of way however it wanted, anyway, so the cities might as well have some degree of control. First, does BNSF really have carte blanche and second, what did BNSF indicate it planned to do if planners did not choose alignment D-1 in particular? Why is everybody so eager to recite unknown future activity of BNSF to justify D-1? Help the public understand what pressures, if any, were brought to bear.	BNSF is a private railroad company over which the Council has no jurisdiction to control freight traffic frequency. The proposed BLRT Extension project would relocate the BNSF tracks to the west of their present location to accommodate the LRT project elements. Chapter 3 (Section 3.2) of the Final EIS provides additional detail about the design of freight rail in the proposed BLRT Extension project corridor.
117BC	Thorsen	Madge	None provided	117	Email	2 – Fiscal Effects and Schedule	The Gateway Project is now ahead of Bottineau in terms of preference for federal funding. What impact does that have on projected time frames? Does that mean we have more time to start all over again and get this right, choosing other more sensible alternatives than an already obsolete technology along an alignment that destroys public parks and benefits so few?	The Gateway (Gold Line) Project is identified in the County Transit Improvement Board's (CTIB) Program of Projects Investment Strategy. As of July 15, 2015, the proposed BLRT Extension project and Gateway Exclusive BRT were included in Program of Projects Phase 1. The proposed BLRT Extension project is further along in the process with publication of the Draft EIS and initiation of the Project Development phase in 2014. It is the Council's intent to request to enter the Engineering phase in 2016. The Gateway Project will be requesting entry into project development from FTA following publication of that project's Draft EIS.
117BD	Thorsen	Madge	None provided	117	Email	6 – Noise and Vibration Effects	What empirical support is there for the idea that the art gallery and historical museum in the Robbinsdale Library Building would not be disturbed by three tracks, 50 feet closer at an open intersection with bells and whistles and wheel squeal?	There would be a severe noise impact at the museum resulting from the proposed BLRT Extension project. However, with the inclusion of a Quiet Zone at 42nd Avenue, the noise impact would be eliminated at this location. Additionally, based on the vehicle and soil characteristics at this location, there would be no vibration impact. Noise and Vibration is discussed in Chapter 5 (Sections 5.6 and 5.7) of the Final EIS.
117BE	Thorsen	Madge	None provided	117	Email	4 – Social and Economic Effects	Where is the discussion of impacts on the Golden Valley fire station?	Section 4.7 of the Final EIS addresses safety and security. In locations where there would be at-grade light rail crossings of roadways, the potential exists for increases in emergency response time as a result of delay to emergency vehicles while LRVs are in the crossing. During the peak weekday hour, up to 12 light rail trains (six in each direction) would pass through these at-grade crossings, causing approximately 50 seconds of delay per light rail train crossing. These delays could increase fire, emergency medical services, and police response times on routes using the crossings. To help avoid or minimize delays, the Council would coordinate with emergency services providers by providing them with the light rail operating

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
								schedule and identification of alternative crossing routes. Additional coordination would occur through the FLSSC, as described in the proposed BLRT Extension project's *SSMP* (Council, 2014). However, Golden Valley Fire Station 3 (3700 Golden Valley Road) is at a location where no delays due to the passage of LRT vehicles are anticipated, since Golden Valley Road is grade separated from the proposed BLRT Extension project alignment.
117BF	Thorsen	Madge	None provided	117	Email	6 – Noise and Vibration Effects	A station at Saint Mary Margaret's would interfere with learning for the children at this school. The DEIS inadequately addresses these problems.	Noise impacts have been assessed at sensitive locations throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. No noise impacts were identified at St. Margaret Mary Church. Table 5.6-6 in the Final EIS summarizes noise impacts at institutional land uses. Where impacts have been identified, mitigation measures, consistent with Metro Transit's noise mitigation policy, have been recommended.
117BG	Thorsen	Madge	None provided	117	Email	4 – Social and Economic Effects	Minneapolis wants to see intensive commercialization and development along the LRT route. That is not appropriate for Wirth Park, Mary Hills, and Sochacki and the adjoining quiet residential neighborhoods.	See Section 4.1 of the Final EIS for a discussion of proposed BLRT Extension project compatibility with the corridor cities' Comprehensive Plans. Also see Section 4.2 for the discussion of development along the proposed BLRT Extension project.
117BH	Thorsen	Madge	None provided	117	Email	3 – NEPA Process and Public Involvement	Throughout this process, the public has been told that answers will come later – during initial phases, the Scoping Process would be the answer; after the Scoping Process, we were assured that the DEIS would be the answer; now, we will probably be told that answers will come at the 30 percent engineering phase or in the final EIS. Why not answer questions quicker, faster and cheaper rather than continually postponing responses to legitimate inquiry?	The Draft EIS discusses numerous alternatives that were analyzed as a part of the environmental review process. Key issues or changes to the proposed BLRT Extension project occurring since publication of the Draft EIS were identified, analyzed, and are summarized in Chapter 2 of the Final EIS. The process included a public comment period on the Draft EIS which provided the public a forum to raise concerns with respect to environmental issues. A revised cost estimate and updated project scope was adopted by the Council in December of 2015. Also in December 2015, 15-percent design plans were released to all corridor cities and Hennepin County. Each of these milestones has provided more information to the public regarding the development of the proposed BLRT Extension project.
117BI	Thorsen	Madge	None provided	117	Email	3 – NEPA Process and Public Involvement	The DEIS is 834 pages long, full of technical jargon. The comment period is too short to enable the public to fully assimilate, study, organize and comment on the complex issues covered (or not covered) in the report. This is especially true when supporting information for the DEIS was withheld, see above.	Please see response to Comment 24A and MASTER RESPONSE #5.
117BJ	Thorsen	Madge	None provided	117	Email	3 – NEPA Process and Public Involvement	Efforts to inform the public of the release of the report were inadequate. Low tech methods of notification like leafleting and posters in public places, as well as higher tech mechanisms like television, radio and social media, were all underutilized. The process has been handled almost exclusively with website notifications, which do not reach everyone. Local residents have expressed surprise that the process was even happening right now. A few evening and afternoon public meetings was not enough. The comment period should be extended or reopened and better notice given. The DEIS is highly technical and difficult for any non-engineer, non-acoustic expert, non-biologist, etc. to understand, so if any of these comments are flat-out in error, it is unintentional. We can only do our best! Many people no doubt worked in good faith on the DEIS and so to them, thanks.	Please see response to Comment 24A and MASTER RESPONSE #5.
117C	Thorsen	Madge	None provided	117	Email	4 – Social and Economic Effects	The community character of D-1 will be severely impacted. Alignment D-1 contains acres of land with mature forests, ponds, wetlands, wildlife, and a quietude that merits classification as rural. High speed transit running every seven to ten minutes 24 hours a day in such a setting is a fundamental and extremely negative change to the land and to community character. The DEIS inadequately explains any reason for concluding otherwise.	Section 4.2 of the Final EIS describes each of the communities along the proposed BLRT Extension project (the cities of Minneapolis, Golden Valley, Robbinsdale, Crystal, and Brooklyn Park) including park resources along the proposed BLRT Extension project corridor. The analysis of long-term and short-term direct neighborhood and community effects is based on the following three criteria: changes to community facilities access; changes to community character; and changes to community cohesion. No direct impacts are anticipated for the community facilities along the D1 alignment. Please see also MASTER RESPONSE #9.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
117D	Thorsen	Madge	None provided	117	Email	2 – Fiscal Effects and Schedule	Cost assessment of D-1 appears understated which means comparisons among alternatives cannot be accurately made. The real cost for D-1 appears understated because the Report makes no reference to or analysis of "constructive takings" of properties through noise and other intense transit disturbances. All of the homes adjacent to parks along D-1 are especially vulnerable and likely to experience diminution in value because of the LRT; yet such takings and damages are apparently not accounted for. It also appears that no economic analysis of the impact of loss of parkland on property values and therefore on city tax bases was done.	The project cost estimates for each of the alternatives considered as reported in the Draft EIS were developed with the same underlying assumptions for each project element. The cost estimates represent an "apples-to-apples" comparison of the alternatives. Many elements go into deciding the LPA including cost, social elements and environmental impacts, among others. Table 10.1-1 in Chapter 10 – Financial Analysis of the Final EIS outlines a breakdown of cost for the different project elements totaling $1.496 billion. Cost reviews would continue throughout the design process to further refine the cost.
117E	Thorsen	Madge	None provided	117	Email	3 – NEPA Process and Public Involvement	The DEIS inadequately addresses numerous additional open questions.	Please see response to Comment 21C.
117F	Thorsen	Madge	None provided	117	Email	3 – NEPA Process and Public Involvement	Notification about the DEIS and the comment period have been insufficient.	Please see response to Comment 24A and MASTER RESPONSE #5.
117G	Thorsen	Madge	None provided	117	Email	5 – Environmental Effects	Parks along Alignment D-1 are Passive and Natural Settings. The most telling single word in the DEIS about alignment D-1 is a punctuation mark. When the Report refers to the character of Sochacki, Mary Hills, South Halifax, Rice Lake (and even Wirth) parks, it puts quotation marks around the word "natural." Like this: the "natural" character of the parks (Chapter 4). Is it suggesting that the parks are "fake" or "unnatural?" Or unworthy of serious consideration? This disrespect for community attitudes and concerns about these important neighborhood resources reflects a biased rather than objective assessment.	Please see MASTER RESPONSES #14 and #15.
117H	Thorsen	Madge	None provided	117	Email	4 – Social and Economic Effects	The same bias shows at page 1 where the DEIS recites that the character of the Bottineau Transitway project area "transitions from a moderately dense urban setting in north Minneapolis to a less dense suburban setting starting in Robbinsdale, Golden Valley, and Crystal, and extending through Brooklyn Park and Maple Grove at the north end of the corridor." It should state that "in the area from Golden Valley Road to 36th Avenue, the setting is light residential density enhanced by natural parks and rural ambient sound levels."	Please see response to Comment 117C.
117I	Thorsen	Madge	None provided	117	Email	4 – Social and Economic Effects	Altering the land from natural forests and wetlands to a very active rail and freight corridor has serious community and economic consequences unrecognized in the DEIS.	Please see MASTER RESPONSE #13 and #16.
117J	Thorsen	Madge	None provided	117	Email	6 – Noise and Vibration Effects	The DEIS apparently does not treat Sochacki Park or Mary Hills Nature Preserve as noise sensitive. They are not specifically listed as category 1 receptors nor identified as passive use. See Technical Report, Noise and Vibration, Appendix. The report recites FTA guidelines which state that parks in general are not noise sensitive, Chapter 8. However, the report omits the rest of the guideline which instructs: "some parks---even some in dense urban areas–‒are used for passive recreation like reading, conversation, meditation, etc. These places are valued as havens from the noise and pace of everyday city life and they should be treated as noise sensitive. The noise sensitivity of parks should be determined on a case-by-case basis after carefully considering how each facility is used." FTA Transit Noise and Vibration Impact Assessment FTA-VA-90-1003-06 May 2006 (emphasis added). The DEIS neither mentions this language, conducts a "case by case"	Please see response to Comment 5B.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
							study, delves into the actual character of the parks, nor explains why this guideline was not followed.	
117K	Thorsen	Madge	None provided	117	Email	4 – Social and Economic Effects	The DEIS does not offer any explanation for how and whether the proposed Project is consistent with city comprehensive plans regarding the parks. DEIS Chapter 4 talks about comprehensive plans in general, but does not address the chapters of those plans that specifically cover parks. a. The City of Robbinsdale' s Comprehensive Plan Update 2030, Chapter 6 designates Sochacki as a "conservancy community park" intended for passive uses such as nature identification. b. Mary Hills Nature Preserve is identified in the City of Golden Valley's Comprehensive Plan Chapter 6 as "Nature and Open Space" and described as a nature area intended for visual aesthetics/buffering and preservation of natural resources, walking and "other passive uses." The DEIS does not appear to treat Sochacki as a passive use or conservancy property and does not treat Mary Hills Nature Preserve as "nature and open space" intended for passive use.	Section 4.1 – Land Use Plan Compatibility of the Final EIS describes the methodology used to assess compatibility with local comprehensive plans. The Council has worked collaboratively with the local municipalities and Three Rivers Park District on park specific issues throughout the design issue resolution process. Sochacki Park: Sochacki Management Unit and Sochacki Park: Mary Hills Management Unit are characterized in Chapter 8 – Amended Draft Section 4(f) and 6(f) Evaluation in the Final EIS. The proposed BLRT Extension project would require a temporary occupancy of approximately 0.57 acre along the eastern border of Sochacki Park: Mary Hills Management Unit to facilitate construction activities and stormwater conveyance improvements. It has been determined that temporary occupancy of portions of Sochacki Park: Sochacki Management in Robbinsdale is needed in order to provide access and construction staging for the construction of a new LRT bridge structure across Grimes Pond. All non-park construction staging options have been considered and proven to not be feasible. Also, please see MASTER RESPONSE #15.
117L	Thorsen	Madge	None provided	117	Email	6 – Noise and Vibration Effects	The DEIS does it explain how high decibel transit every 7-10 minutes day and night promotes or is consistent with each cities' (Robbinsdale and Golden Valley) plans and uses for these properties as serene natural havens.	Please see response to Comment 5B.
117M	Thorsen	Madge	None provided	117	Email	5 – Environmental Effects	The DEIS does not accurately catalogue the activities, features or attributes of the parks which omission in turn affects every other conclusory statement throughout the report about the purported lack of impact of the Project on the parks, see Chapters 4, 5, 6, 8 and 10. Yet, information about park activities, features and attributes on a case by case basis is readily available: a. Current. If residents and park visitors, who come from all around the two host communities, were asked how they use the parks, the answers would be: hiking, dog-walking, cross-country skiing, snow-shoeing, biking, running, photography, bird and wildlife observation, quiet contemplation, solitude – these uses are the heart of the parks' existence. Users are so adamant about the importance of these park features that in May 2009, for example, community testimony defeated a proposition to allow as mild an activity as disc golf in Sochacki Park. A typical comment at the public hearing back then explains the park's use: "[the user] has found Sochacki Park to be a jewel and a place to escape and to commune with nature. It is secluded and beautiful and he finds spirituality and peace of mind at the park. He sees dogs, kids, and older people out walking getting exercise. The park gives the City of Robbinsdale a sense of wonderment and elation." City Council Meeting Minutes, City of Robbinsdale, May 12 2009. See also, Reuse, "Robbinsdale Gem Sacrificed for Disc Golf and Chump Change," Star Tribune, May 10, 2009, http://www.startribune.com/featuredColumns/44646172.html. The park has always been used in that passive way. For uses of Mary Hills as a quiet getaway in a wetland woodland, see e.g., http://goldenvalley.patch.com/listings/mary-hills-nature-area; City of Golden Valley Comprehensive Plan, Chapter 6.	Please see response to Comment 21C and MASTER RESPONSE #15. Section 4.2 of the Final EIS introduces all of the proposed BLRT Extension project corridor parks, and Chapter 8 presents the Amended Draft Section 4(f) Evaluation of the proposed BLRT Extension project impacts to park properties.
117N	Thorsen	Madge	None provided	117	Email	6 – Noise and Vibration Effects	The DEIS does not appear to report any baseline measurements of noise within the parks; the closest approximation that a lay reader can	Please see response to Comment 5B.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
							discern is from two homes that were monitored, Receptors L-10 and L-11, Noise and Vibration Technical Report at p.14. Their noise levels in 24 hours of monitoring ranged from 45 to 51 decibels, or "rural ambient noise" levels. Within the parks it is likely even quieter. Although common sense seems conclusive that converting rural ambient noise levels into 82 decibels of linear LRT noise every 7-10 minutes is a "severe impact" if there is any doubt, at a minimum, base noise levels must be measured within the parks and impacts specifically assessed (including in winter months when any dampening effects of foliage would be gone).	
117O	Thorsen	Madge	None provided	117	Email	5 – Environmental Effects	The DEIS did not explore noise criteria and does not report on specific community attitudinal factors related to these parks and to their conversion to predominate transitway use.	Please see responses to Comments 5B and117C.
117P	Thorsen	Madge	None provided	117	Email	6 – Noise and Vibration Effects	The DEIS does not carefully address or analyze vibration within the parks. Trails are within and closer than 50 feet from the proposed tracks in many locations and common sense says they would be negatively impacted by vibration.	Vibration impacts are an indoor phenomenon and are not assessed for outdoor land uses. Vibration is discussed in Chapter 5 (Section 5.7) of the Final EIS. There are no vibration impacts within the parks anticipated from the proposed BLRT Extension project.
117Q	Thorsen	Madge	None provided	117	Email	5 – Environmental Effects	The DEIS concludes, without supplying adequate facts or reasoning, that visual impacts within the Parks are "moderate." Photos of Sochacki reflect an effort to create an "industrial feel" by including shots of the current power lines in every photo.	Please see response to Comment 91B.
117R	Thorsen	Madge	None provided	117	Email	5 – Environmental Effects	No specific description of the trees to be removed, or their number, or vegetation to be stripped is given, nor is any assessment of whether replacements or replanting would even be possible. Mature trees cannot be replaced; defoliation cannot always be overcome.	The Council has analyzed the extent of plant communities that would be impacted by the proposed BLRT Extension project, including forested areas. Several areas have been identified where tree re-planting would occur. These analyses are described in the Final EIS (Section 5.8). It is true that mature trees cannot be planted and that some mortality of re-planted trees is likely to occur.
117S	Thorsen	Madge	None provided	117	Email	5 – Environmental Effects	No description or sketch or analysis is given of the planned appearance of anything within the parks including the dramatic change based on planned raised berms, tracks, roads and catenaries as well as artificial retaining walls, all of which would traverse Grimes Pond and the wetlands. This visual impact (and wetland destruction) does not appear to have any realistic mitigation possibilities.	The Final EIS (Section 4.5 and Appendix F) includes several visualizations depicting what the proposed BLRT Extension project would look like form several points of view. Some methods may be feasible to lessen potential visual impacts, such as with strategic plantings. The Council will continue to coordinate with cities and other stakeholders as design advances, including landscaping in areas that are disturbed by the project.
117T	Thorsen	Madge	None provided	117	Email	5 – Environmental Effects	The DEIS does not specifically address the impact of one track being replaced by three new tracks plus a service road; that the current power lines and towers are well-screened but will be moved for the LRT and presumably become unscreened; that additional support poles, catenaries, TPSS buildings, and the trains themselves create a permanent visual intrusion in the narrow confines of Sochacki and Mary Hills. Instead, the Report concludes blandly and without factual support that impacts on the perceived natural characters of the parks would only be moderate. The conclusion is unsubstantiated.	Please see response to Comment 91B.
117U	Thorsen	Madge	None provided	117	Email	5 – Environmental Effects	The DEIS does not answer the question: How can replacing bucolic views with a constant vision of passing trains day and night and secondary utilitarian structures be anything other than a "high" visual impact?	Please see response to Comment 91B.
117V	Thorsen	Madge	None provided	117	Email	6 – Noise and Vibration Effects	Although the DEIS mentions "mitigation" over and over again, no explanation is given as to how light rail noise could be mitigated within the parks.	Table 5.6-7 in the Final EIS details the proposed noise mitigation for the proposed BLRT Extension project. Specifically, noise mitigation would include the construction of a noise barriers on the east side of the proposed BLRT Extension project corridor generally between Golden Valley Road and 36th Avenue.
117W	Thorsen	Madge	None provided	117	Email	5 – Environmental	Although the DEIS mentions "mitigation" over and over again, no explanation is given as to how visual impact could be mitigated within	Please see response to Comment 91B.

						Effects	the parks.	
117X	Thorsen	Madge	None provided	117	Email	5 – Environmental Effects	Although the DEIS mentions “mitigation” over and over again, no explanation is given as to how destruction of wetlands could be mitigated within the parks.	Mitigation within public parks is subject to Section 4(f) and 6(f) review (see Chapter 8 of the Final EIS). Proposed mitigation within public parks would have to be compatible with the intended use of those portions of the public parks. The Council analyzed areas that may be compatible with wetland mitigation in public parks. The Council realizes that in constrained urbanized areas, every opportunity for wetland mitigation must be examined as to whether it would be feasible. (Also see Section 5.3 of the Final EIS.) Also please see response to Comment 26B and MASTER RESPONSE #16.
117Y	Thorsen	Madge	None provided	117	Email	6 – Noise and Vibration Effects	Sound walls are proposed on the east side of the parks near heavily impacted homes and would sacrifice views on both sides of the parks and do nothing for park users on the trails and meandering paths right next to noisy unscreened trains. Nothing is proposed that could feasibly or physically enclose the tracks from 36th Avenue to Golden Valley Road and beyond into Wirth Park in order to mitigate visual impact and sound.	Please see MASTER RESPONSE #17.
117Z	Thorsen	Madge	None provided	117	Email	7 – Alternatives, Engineering and Design	It seems the only realistic option is to reject D-1 and place trains in an urban environment instead or put them underground. Where is the analysis of the alternative of tunnels, in D-1 or D-2? (common sense suggests they wouldn’t work in a wetland park but a subway in North Minneapolis might well be a terrific resource that would lessen undesirable impacts of the LRT and enhance density and development).	Please see MASTER RESPONSE #20.
118A	Lindeman	LeAnn	None provided	118	US Mail	4 – Social and Economic Effects	When I bought my future retirement home in Maplebrook Estates – over 20 years ago – it never occurred to me that my home would be condemned. Broadway was well developed and has continued to fill in the few empty spots – example churches, a business complex, many houses, a large townhouse complex, the college, a car dealership, a park, a ball diamond, 4 shopping areas. Why must the light rail destroy the neighborhood? This area is too developed for light rail. It should be placed in a route which does not destroy established neighborhoods. Broadway is not a proper place.	Hennepin County is developing the West Broadway Avenue Reconstruction project. An Environmental Assessment Worksheet for the roadway project was completed and a Negative Declaration finding issued. The Final EIS discloses this information in Chapter 2 – Alternatives and in Chapter 6 – Indirect Impacts and Cumulative Effects. No residential property displacements would occur as a result of the proposed BLRT Extension project. Chapter 4 (Section 4.2) of the Final EIS discusses community facilities/community character and cohesion. Impacts associated with the proposed BLRT Extension project were not severe enough to affect overall community character and cohesion, or the accessibility to and use of community facilities.
118B	Lindeman	LeAnn	None provided	118	US Mail	6 – Noise and Vibration Effects	What about the 20 hour per day noise of the Light rail?	Please see MASTER RESPONSE #17. No moderate or severe noise impacts are anticipated along West Broadway Avenue as a result of the proposed BLRT Extension project after Quiet Zones are implemented.
118C	Lindeman	LeAnn	None provided	118	US Mail	6 – Noise and Vibration Effects	What about the vibration from the light rail?	Vibration impacts have been assessed at sensitive locations throughout the proposed BLRT Extension project corridor consistent with FTA methodology and impact criteria. Where impacts have been identified, mitigation measures have been recommended. Vibration is discussed in Chapter 5 (Section 5.7) of the Final EIS. No vibration impacts are anticipated along West Broadway Avenue as a result of the proposed BLRT Extension project. Please see also MASTER RESPONSE #18.
118D	Lindeman	LeAnn	None provided	118	US Mail	7 – Alternatives, Engineering and Design	This LR should be placed elsewhere where there is room so homes, etc. do not have to be destroyed or impacted. I am not against Broadway becoming 4 lanes. But Broadway is no place for light rail or medians with trees, grass. Too much damage is being done to our community.	Please see MASTER RESPONSE #1.
122A	Moren	Mae	None provided	122	US Mail	7 – Alternatives, Engineering and Design	Having lived on Theodore Wirth Parkway most of my life, I’m opposed to the LRT here because of problems with the bus system. When I was a teenager, it was no problem taking a bus downtown for a dance or to meet friends at night. While working downtown, I’d take the bus and there were few problems. But now if you don’t go at rush hour it becomes a very different experience not at all pleasant.	Please see MASTER RESPONSE #8.

Comment ID	Last Name	First Name	Organization	Communication Number	Comment Type	Theme	Comment	Official Response
122B	Moren	Mae	None provided	122	US Mail	4 – Social and Economic Effects	If there isn't safety measures for buses why add more problems? Address the problems that are here. A new shiny LRT is not going to make going to places safe.	Please see MASTER RESPONSE #8.
123A	Rocheford	Mike	None provided	123	US Mail	5 – Environmental Effects	What is the impact on water tables – level and flow of water in Sochacki and Mary Hills. Where will the water go? We have many issues with flooding. What is the impact of the new LRT going to have on this? I see nothing addressing this.	Please see response to Comment 26A.
