Introduction

In conjunction with national efforts to increase the availability of addiction treatment outcomes, the Alcohol and Drug Abuse Division of the Minnesota Department of Human Services provides the following measures for the entire state of Minnesota and for individual treatment providers licensed under state Rule 31. This report will be updated annually.

The measures fall into four categories. (1) The **Patient Profile** presents background information about patients obtained at admission to treatment. (2) **Discharge Status** describes the situation in which the patient leaves treatment. (3) **National Outcomes Measures (NOMS)** are prescribed by the Substance Abuse and Mental Health Services Administration (SAMHSA) and provide information at admission and discharge on patients' status in six critical domains of living. SAMHSA initially considered family support as another indicator but decided not to include it. Because DHS continues to collect the data, the measure is included in this report. (4) **Dimensions of Addiction** are similar to measures developed by the American Society of Addiction Medicine and provide information at admission and discharge on six dimensions of addiction.

The **Patient Profile** presents the percentages of patients in categories of gender, race, age, primary substance, source of income, and sources of referral to treatment. These are obviously not measures of performance but rather provide a picture of the mix of patients seen statewide and by different providers. Since patients can have two sources of referral, the percentages for this measure do not sum to 100.

The next measure is **Discharge Status**. Considerable research demonstrates that completing treatment is associated with post-treatment abstinence.

The **NOMS** attempt to capture meaningful, real life outcomes for people who are striving to attain and sustain recovery and participate fully in their communities in the wake of receiving treatment for an active addiction to drugs or alcohol. They include: rates of homelessness, unemployment, arrest, alcohol and drug use, involvement in self-help groups, and family support for recovery. Since these measures are coded so that higher percentages indicate more people having trouble in that domain, declines in the percentages from admission to discharge indicate success.

Dimensions of Addiction show the percentages of patients with serious problems in six dimensions at admission and discharge. The severity levels within each dimension range from no problem (0) to extreme problem (4). The dimensions are:

1. Acute Intoxication/Withdrawal ranges from (0) patients who exhibit no intoxication or withdrawal symptoms to (4) those with symptoms so severe that the patient is a threat to self or others.
2. Biomedical Conditions and Complications range from (0) patients who are fully functional to (4) those with severe physical problems or conditions that require immediate medical intervention.
3. Emotional/Behavioral/Cognitive Problem ranges from (0) patients with good coping skills and impulse control to (4) those with such severe emotional or behavioral symptoms that they are unable to participate in treatment.
4. Resistance to Change ranges from (0) patients who admit problems and are committed to change to (4) those who are in denial and unwilling to change.

5. Relapse/Continued Use Potential ranges from (0) patients who recognize risk and are able to manage potential problems to (4) those who have no understanding of relapse issues and display high vulnerability for further substance use disorders.
6. Unsupportive Recovery Environment ranges from (0) environments that are supportive of recovery to (4) environments that are antagonistic to recovery.

The numbers shown in the tables are the percentages with (2) moderate, (3) severe or (4) extreme problems in a dimension. Declines in the percentages from admission to discharge indicate success.

For both NOMS and Dimensions of Addictions, the tables show percentages of patients at admission and discharge with problems. The last column shows the percentage improvement for each indicator. This is simply 100 times the difference between the percentage at admission and the percentage at discharge, divided by the percentage at admission. In other words, this column can be interpreted as the percentage of the problem that is reduced during treatment. Because negative values are set to 0, the measures range from 0 (no improvement) to 100 (all problems substantially improved). The last row under both NOMS and Dimensions of Addiction provides a summary measure of improvement. It results from dividing the sum of the percentage point improvements on each item by the sum of the percentages with a problem at admission on each item and multiplying this ratio by 100. In other words, the summary measure for NOMS assesses the percentage of the overall problem captured by NOMS that declines during treatment, and the summary measure for Dimensions of Addiction does the same for Dimensions of Addiction. Negative values indicate that the problem actually worsened, a value of 0 indicates that the problems remained about the same, and a value of 100 indicates that all problems showed substantial improvement.

All data are obtained from The Drug and Alcohol Abuse Normative Evaluation System (DAANES), which is administered by the Performance Measurement and Quality Improvement Division of the Department of Human Services in order to monitor treatment services for substance abuse in Minnesota. DAANES data are collected by providers as clients enter and leave episodes of treatment. All of these measures are based on episodes of treatment that began in 2010 and are accompanied by discharge data submitted by November 21, 2011. For all tables, data are presented only when there are at least 10 observations for the measure.
