Andrew, here is the adjusted cost estimate only including MN for RA-North. Hope your Friday is going great!

Engineering Cost Estimate	
North Route (23 miles)	
Work Item	Cost
Planning / Permitting*	\$ 4,075,000
ROW Acquisition*	\$ 13,750,000
Engineering*	\$ 625,000
Procurement	\$ 2,100,000
Construction	\$ 16,000,000
Closure	\$ 1,250,000
Total	\$ 40,000,000
Estimate Accuracy: +/- 15%	
* The estimate includes realized costs to date, plus the estimated cost to complete work items for the 23 miles of alternative route proposed in MN.

Subject: Action Required: Costs
Importance: High

Hi Scott.

I need a cost estimate for RA-North WITHOUT the ND portion. I need this as soon as possible, preferably before noon today.

Please let me know you've received this email.

Thank you.

—Andrew

Energy Environmental Review and Analysis

Date: February 15, 2024

Project: Otter Tail to Wilkin CO₂ Pipeline Project
IP 7093/PPL-22-422

Respond: March 8, 2024

Please respond to the following questions or provide the requested data or information. Staff will use the information provided to develop the environmental document for the project, which is a public document. Your response, in its entirety, will be included in the environmental document as an appendix; therefore, **responses will be publicly available** unless otherwise designated by the respondent as “nonpublic information” pursuant to Minnesota Statute § 13.02, subdivision 12.

Directions: Responses to questions should be contained within this form to the greatest extent possible (**11-point Calibri, plain text font, RGB 192, 0, 0**). Attach supporting documentation, as necessary. While data and information requests, for example, shapefiles or draft plans, will not be contained within this form, document their submittal using this form as follows: *“Requested information sent to whom by what means on date.”*

Do not eFile your response. Return the completed form, as a PDF, along with necessary supporting documentation, and/or requested data or information to andrew.levi@state.mn.us. Contact me at (651) 539-1840 with questions.

1. Please respond to mitigation proposed or discussed in the draft EIS or proposed during the public comment period—safety related or otherwise. List those mitigations the company would agree to undertake.

*Please see the file loaded to the Otter Tail to Wilkin ShareFile site titled “**SII 11_1_SCS_ Otter Tail to Wilkin Response to DEIS Recommendations**”.*

2. The final EIS may include a recommendation to use a combination of check valves and pressure control valves where possible instead of only SCADA-controlled block valves for pipeline isolation. Please provide comment on this potential recommendation.

Since the block valves proposed for this project can take up to 10 minutes to isolate the pipeline (that is, 10 minutes from rupture to valve closure), a combination of check valves and pressure-controlled valves (PCVs), also called “slam-shut” valves, could close instantaneously or nearly instantaneously in the event of rapid pipeline depressurization.

Summit does not agree with this potential recommendation. This recommendation appears to misunderstand the assumed valve closure time used in the dispersion analysis. Summit chose a 10-minute closure time in the dispersion model to produce conservative results. The mainline valves can cycle to closed in 17 seconds. Check valves in a mainline can cause complications while running smart tools,

potentially leading to failed smart tool runs due to damage from the internal components within the check valve.

3. The desktop studies Allied performed suggest different frost depths throughout the project area than those generated by the applicant's desktop studies. Both studies use available, generalized data which does not reliably indicate the actual frost depth or soil type at all points along the proposed pipeline centerline.

Therefore, the final EIS may suggest the applicant engage a qualified geotechnical firm to 1) create a soil-testing program to ensure the pipeline is installed beneath all potential frost heave areas or 2) conduct an engineering analysis using field-collected data that demonstrates why a burial depth is appropriate for each length of the proposed pipeline. This analysis would be based on engineering logic applicable to this pipeline, not on generalized data. If this second option is used, a qualified geotechnical firm should perform the soil testing on field-collected soil samples, which is necessary to understand if the local soil conditions pose a frost heave threat to the proposed pipeline.

Please provide comment on this potential recommendation.

Should the applicant have plans to test local soils along the right-of-way during construction activities, please describe that testing.

Summit does not agree with this potential recommendation and does not plan to conduct soil testing across the Project. For frost heave to be considered an issue for pipelines, there are three criteria to that need to be met: 1) the pipeline would need to be installed above the frost depth; 2) there must be presence of sufficient soil moisture/water; and 3) there must be the presence of susceptible soils, which are generally considered fine grained soils (> 10% of material smaller than 0.075 millimeters (mm), and >3% of material less than 0.02 mm).

As stated in the Scoping Environmental Assessment Worksheet (EAW), Section 6.b, "SCS's Contractor would install the pipeline to allow for a minimum of 54 inches depth of cover, measured from the top of the pipe to ground surface, in accordance with MDA agricultural area standards at Minnesota Statutes Section 216G.07 or landowner agreements. The minimum depth of cover would be increased to 60 inches at waterbody and drainage ditch crossings as well as private road crossings as measured at the bottom of the road ditch." Also, Section 11.b of the Scoping EAW notes: "The typical dimensions of the pipeline trench would be approximately 5.4 feet (65 inches) deep."

Notably, Summit's placement of the pipeline at a standard 54 inches of depth of cover is consistent with the Minnesota Department of Agriculture's recommendation for greater depth in agricultural lands. The U.S. Department of Transportation (USDOT) Pipeline and Hazardous Materials Safety Administration (PHMSA) establishes minimum depth of cover requirements in 49 CFR 195.248 which range from 30 inches to 48 inches. Summit's depth of cover commitment at 54 inches also exceeds PHMSA requirements. These depth of cover standards have been in place for decades, and Summit is unaware of any documented frost heave issues on pipelines installed across the state of Minnesota at these depths.

It should also be noted that the carbon dioxide (CO₂) entering the pipeline is estimated to be 80 degrees Fahrenheit during winter months. This warmer CO₂ stream will prevent soil in the immediate vicinity of the pipeline from freezing. In addition, if frost depths reach beyond 58 inches, the amount of movement at such a depth would be very small given the relation to the thickness of any underlying ice lenses. Today's

materials have evolved including the introduction of more ductile steels allowing greater allowable deformation due to external loads.

4. Provide a cover page for the Minnesota ECP indicating the different projects in Minnesota and the different pipeline diameters associated with each project.

Please see the file loaded to the Otter Tail to Wilkin ShareFile site titled "*SI 11_4_SCS_Otter Tail to Wilkin ECP Cover Page*" which can be used by EERA to help clarify pipeline diameters presented on the typical drawings within the Minnesota ECP.

5. Provide further information concerning how water will be used at the capture facility.

Water is necessary for capture facility operation to cool the CO₂, lubricating oil, and glycol moving through and being used by the capture facility. Cooling water circulates through the capture facility's heat exchangers to cool off CO₂ as it is compressed, to cool off lubricating oil from the compressors, and to cool off glycol from the dehydration unit regeneration system. The cooling water, which is cooler than the warmer CO₂, lubricating oil, and glycol used during the CO₂ capture process, pulls heat from the CO₂, lubricating oil, and glycol as the water passes through heat exchangers. No water comes into direct contact with the CO₂, lubricating oil, or glycol in any part of the process.

The water, which is now warm, then flows to the capture facility cooling tower. The purpose of the cooling tower is to bring air in contact with the warm water, which cools the water. During this process, a small volume of water is evaporated/vaporized. Some vaporized water will also leave the system through windage, or drift, from the cooling tower. This vaporized and/or drifted amount of water must then be made up by more fresh water to maintain a consistent volume of water within the system. Some water is also discharged from the cooling tower to manage mineral content in the water circulating within the bulk water system. The discharged amount of water must then also be made up by fresh water to maintain a consistent volume of water within the system.

The underlined sections in the description above are the only consumptive uses of water from the capture facility. The quantity of water used by the capture facility is equal to the amount of water vaporized in the cooling tower, plus any windage or drift from the cooling tower (negligible), plus water discharged from the cooling tower. There are no additional consumptive uses.

6. Please verify CO₂ capture rates at the facility.

The capture facility will capture approximately 100% of the CO₂ emissions from the Green Plains Ethanol Plant's scrubber stack during normal operations. CO₂ can only be captured if the Green Plains Ethanol Plant is operational, and the operational rates will vary over time. The capture facility may also not be operational during periods of maintenance. Summit has based its initial CO₂ capture rate estimates using best available assumptions on these variables.

Captured CO₂ will be metered as it is injected into the pipeline. The CO₂ emitted by the capture facility will be determined based on mass balance. The capture facility will report annual air emissions, including CO₂, to the Minnesota Pollution Control Agency as required by the capture facility's air permit. The actual CO₂ capture rates may be determined by comparing the amount of captured CO₂ to the potential CO₂ produced by the Green Plains Ethanol Plant.

Recommendation	Reference	Response
Surveys		
[EERA] Potential impacts to ground-nesting birds during construction would be lessened or avoided by conducting surveys for these species and their nests, per USFWS standards, at appropriate timing ahead of construction.	5-114	Summit intends to follow USFWS guidance regarding compliance with the Migratory Bird Treaty Act (MBTA) and will continue to consult with the USFWS regarding MBTA. Additionally, a MBTA plan is under development for company use with the contractors during construction and during operations. Summit will also work with MDNR to determine if additional surveys are necessary prior to construction. To avoid duplicative, and potentially conflicting requirements, Summit recommends any special condition related to this issue reference adherence to USFWS and MDNR's Natural Heritage Review recommendations rather than including the specific language suggested on DEIS page 5-114.
[EERA] Prior to construction, field surveys should be conducted for state-listed species. Surveys for state-listed plants should follow the MnDNR protocol described in the April 2022 "Guidance for Documenting and Collecting Rare Plants."	5-115	Summit is coordinating with MDNR on required surveys and protocols. To date, surveys have not identified concerns for impacts to state-listed species. Pages 75-76 of the Scoping EAW contain additional discussion of this issue.
[EERA] Appropriate surveys for archaeological resources should occur regardless of which route alternative is selected. If archaeological resources are found, treatment plans should be prepared in consultation with Tribes and SHPO as appropriate.	5-80; 11-13	Summit will complete archeological surveys regardless of the route selected and is committed to avoiding impacts to any identified eligible cultural resources and Tribal areas of interest through route modifications or construction methodology. If identified resources cannot be avoided, then treatment plans would be developed with Tribes and SHPO, as appropriate. To date, Summit has surveyed 99.8% of RA-South, and the construction of the Project will not impact any cultural resources eligible

Recommendation	Reference	Response
		for listing under the National Historic Preservation Act or Tribal areas of interest.
Restoration		
[CURE] Proper restoration of native vegetation communities would benefit rare and unique species. The proposed performance standard of 70 percent vegetation density relative to background native vegetation cover is too low and should be higher. In addition, revegetation goals should be met throughout the life of the project.	5-115	<p>There is no regulatory requirement that mandates a performance standard greater than 70 percent; and therefore, Summit does not agree with this recommendation. The proposed 70 percent revegetation standard is in accordance with the revegetation standards contained within Condition 13.2 of the Minnesota Pollution Control Agency's (MPCA) Construction Stormwater General Permit. The condition is as follows:</p> <p><i>Permittees must complete all construction activity and must install permanent cover over all areas prior to submitting the NOT. Vegetative cover must consist of a uniform perennial vegetation with a density of 70 percent of its expected final growth. Vegetation is not required where the function of a specific area dictates no vegetation, such as impervious surfaces or the base of a sand filter. [Minn. R. 7090].</i></p>
[EERA] A Vegetation Management Plan (VMP) should be prepared in consultation with the Vegetation Management Plan Working Group (VMPWG), a multi-agency group led by EERA staff in conjunction with several other state agencies, to address potential impacts related to pipeline construction, operation, and maintenance. The VMP should discuss existing vegetation, reestablishment and restoration, seed mixes, noxious weeds and invasive species, herbicide use, sensitive plant communities, and other topics identified during coordination with the VMPWG. Preparation and Implementation of such a plan would improve recovery efforts for state-listed plants and their habitats potentially affected by the project.	5-115	Summit will prepare a Vegetation Management Plan in consultation with the Vegetation Management Working Group prior to the start of construction of the Project.

Recommendation	Reference	Response
[MPCA] Details be provided in the ECP for preventing excessive crowning or subsidence above the restored centerline, and for addressing excessive crowning or subsidence if it is discovered during post-construction monitoring.	5-145	Summit will include details in the ECP for preventing excessive crowning or subsidence above the restored centerline. Summit will restore the construction workspace to as close to the original pre-construction contours as practicable. If uneven settling occurs or surface drainage problems develop as a result of pipeline construction, Summit will provide additional land leveling services after receiving a landowner's written notice, weather and soil conditions permitting. Alternatively, Summit will negotiate with the landowner for reasonable compensation in lieu of restoration.
Environmental Impact Mitigation		
If the selected route alignment is near the Foxhome Prairie High Biodiversity MBS site, the alignment should follow the south side of the road in the area and avoid crossing the MBS site.	5-115	The Applicant's Preferred Route (RA-South) does not cross this MBS site, so there would be no impacts to the site. If the RA-North route were to be selected, Summit would evaluate resources along the route and coordinate with MDNR to avoid impacts to the Foxhome Prairie High Biodiversity MBS site.
[DNR] One additional mitigation for nesting birds in areas of grass/shrub vegetation to be cleared for construction would be to mow/cut these areas during non-nesting season prior to actual construction so suitable nesting habitat is not present prior to final clearing and construction	5-115 and 5-151	Summit intends to follow USFWS guidance regarding compliance with MBTA and will continue to consult with the USFWS regarding MBTA. Additionally, a MBTA plan is under development for company use with the contractors during construction and during operations. Summit recommends the Commission not establish separate conditions on this issue but rather defer to USFWS and the MDNR's Natural Heritage Review for appropriate measures to minimize potential impacts to nesting birds.

Summit Carbon Solutions
Otter Tail to Wilkin Project
SII 11_1_Summit_ Otter Tail to Wilkin Response to DEIS Recommendations

Recommendation	Reference	Response
<p>[EERA] The applicant should use only “bio-netting” or “natural netting” types and mulch products without synthetic (plastic) fiber additives.</p> <p>[MNDOT] And to reduce potential construction impacts on state-listed species, MnDOT recommended the use of erosion control techniques that avoid entrapping or entangling small wildlife.</p>	5-116 and 5-151; 5-115	Summit has already agreed to use wildlife-friendly erosion and sediment control BMPs that contain biodegradable netting (Category 3N or 4N natural fibers) and to avoid the use of plastic mesh. Both BMPs help to minimize wildlife mortality resulting from the use of erosion and sediment control materials. See DEIS Appendix D (Minnesota Environmental Construction Plan).
[MNDOT] Follow MnDOT’s 2020 Standard Specifications for Construction for rolled erosion control materials that specify only natural fibers with no plastic mesh be used	5-151	During construction, Summit will follow MnDOT’s 2020 Standard Specifications for Construction for rolled erosion control materials that specify only natural fibers with no plastic mesh be used.
[EERA] No temporary workspace areas shall be placed within or adjacent to wetlands or water resources, as practicable.	5-138	This is not practicable, as the crossing of wetlands will require some temporary workspace. Summit is reducing the width of temporary workspace required for the crossing of wetlands from 50 feet to 25 feet to minimize the temporary impacts to the wetland. Additionally, additional temporary workspace (ATWS) will be sited outside of wetlands to the extent practicable (See DEIS Appendix D (Minnesota Environmental Construction Plan).
[EERA] “Soil excavated from the wetlands and riparian areas shall be contained and not placed back into the wetland or riparian area.” and “Water resource areas disturbed by construction activities shall be restored to pre-construction conditions in accordance with the requirements of applicable state and federal permits or laws and landowner agreements. All requirements of the U.S. Army Corps of Engineers (USACE), Minnesota Department of Natural Resources (DNR), and local units of government shall be met.”	5-138	This requirement would be in conflict of Condition 14 of the USACE’s Utility Regional General Permit. The condition is as follows [bolded for emphasis]: Restoration of Temporary Impacts: All temporary impacts in waters of the US, including discharges resulting from side casting material excavated from trenching, that occur as a result of the regulated activity must be fully contained with appropriate erosion control or containment methods, be restored to pre-construction contours and elevations, and, as appropriate, revegetated with native, non-invasive

Recommendation	Reference	Response
		vegetation, unless otherwise conditioned in a Corps RGP verification. All temporary access roads constructed in waters of the US must be properly bridged or culverted to maintain surface flows. In temporarily excavated wetlands, the top 6 to 12 inches of the excavation should normally be backfilled with topsoil originating from the wetland. No temporary excavation area, including, but not limited to trenches, may be constructed, or backfilled in such a manner as to drain waters of the United States (e.g., backfilling with extensive gravel layers, creating a French drain effect).
[EERA] The applicant provide documentation of coordination with the Fergus Falls Fish & Game Club.	5-56; 11-13	Summit agrees with this recommendation. As discussed in the Application, Summit is coordinating closely with the Fergus Falls Fish & Game Club to minimize impacts to its land and associated recreational economies during construction and operation of the Project. Application at 40-41. Summit will continue to coordinate with the club and, if RA-South is approved, will provide documentation of such coordination prior to construction.
Sheet Piling/Crossing Methods/Construction Specifications		
[DNR] Exploratory borings should be conducted to characterize the shallow subsurface anywhere sheet piling would be used and submitted to DNR groundwater staff for evaluation. Exploratory borings should be conducted to at least the maximum depth of any construction impacts.	5-139	Summit agrees with this recommendation and will conduct exploratory borings anywhere sheet piling would be used.
[DNR] At a minimum, Pennsylvania standards for trench breaker placement should be used, and knowledge gained from additional subsurface site characterization may provide further guidance on where to place trench breakers most effectively. Trench breakers should be	5-139	Permanent trench breaker placement is discussed in Section 2.9.1 of the Minnesota ECP. As committed to the MDNR in Enclosure 2 of its September 1, 2022 Project introduction letter (see Route Permit Application, Appendix 8), Summit is presently

Recommendation	Reference	Response
<p>used at the entrance and exit of every waterbody regardless of slope (except for HDD crossings).</p>		<p>proposing to install trench breakers at the entry and exit from every public water crossing, except for at HDD crossings. In addition, as outlined Section 5.5 of the Minnesota ECP, trench breakers will be installed at wetland boundaries where the pipeline trench may cause a wetland to drain, or the trench bottom will be sealed to maintain wetland hydrology. Summit plans to select the location of trench breakers across the Project based on field conditions at the time of construction and will consider the degree and length of slope, presence of down-slope sensitive resource areas such as wetlands and waterbodies, and proximity to other features such as roads and/or railroads. Generally, slopes are higher in the eastern portion of the Project, while the majority of the Project, and particularly the western portion of the Project, is located in areas where slope is not a concern (0.001-6.71 degree slope; see Figure 11-3 of the Scoping EAW).</p> <p>Summit plans account for the substantial body of knowledge that it has and will gain regarding the placement of trench breakers. In Summit's view, those plans are consistent with the intent of the Pennsylvania standards, while also accounting for local, site-specific knowledge to use trench breakers most effectively. Use of this field condition review will ensure that Summit will not install trench breakers where they would not provide the intended benefit (i.e., on steep slopes where trench line erosion has the risk of occurring and at slopes adjacent to wetlands and waterbodies). In other</p>

Summit Carbon Solutions
Otter Tail to Wilkin Project
SII 11_1_Summit_ Otter Tail to Wilkin Response to DEIS Recommendations

Recommendation	Reference	Response
		words, while Summit does not intend to specifically implement the Pennsylvania Standards, Summit's plans will achieve the same or greater levels of protection, which is consistent with the Pennsylvania Standards regarding the use of alternate BMPs.
[DNR] The pipeline should be installed deep enough to prevent pipe exposure over time. The DNR's Area Hydrologists may have specific data on depth of cover for river and stream crossings and should be consulted.	5-139	Summit agrees with this recommendation and will consult with the MDNR when crossing designs are prepared for construction at Public Waters.
[DNR] Unintentional release evaluations should be conducted for water crossings proposed to be installed via HDD to ensure the soils are amenable to HDD. (As indicated in Section 5.7.3.3, the applicant has completed geotechnical evaluations for two of the three HDD crossings at waterbodies and plans to conduct an investigation at the third once access is obtained. An assessment of the potential for an inadvertent release of drilling mud is part of the feasibility analysis and design for HDDs.)	5-139 and 5-115	Unintentional release evaluations will be conducted to ensure soils are amenable for HDD crossing method. Summit's contractor will develop an HDD contingency plan to address unintended return or release of drilling fluid within wetlands, waterbodies, and areas immediately adjacent to wetlands and waterbodies, such as stream banks or steep slopes, where drilling fluid releases can quickly reach surface waters. Containment, response, and clean-up equipment would be available at both sides of an HDD crossing location and one side of a bore prior to commencement to assure a timely response in the event of an inadvertent release of drilling fluid.
[DNR] The applicant should continue to consult with DNR on groundwater investigations for the potential routes and on construction methods in relation to groundwater.	5-139	Summit currently has an ongoing groundwater investigation underway and will continue to consult with the MDNR.
[EERA] Geotechnical investigations prior to construction in beach ridge areas would identify areas where sheet pile use should be avoided	5-137	Summit has committed to not using sheet piling in the beach ridge areas.
[EERA] The applicant should provide to the Commission results of geotechnical evaluations of groundwater conditions for any beach ridge areas in which sheet piling would be used for pipeline construction. The evaluations should be provided 30 days prior to the Plan and Profile submittal, and the applicant should document coordination with DNR	5-139 and 11-13	Summit has committed to not using sheet piling in the beach ridge areas, so the recommendations are not applicable.

Recommendation	Reference	Response
staff. The submittal could include DNR staff concurrence regarding use of sheet piling."		
[EERA/MDH] The applicant should provide documentation of coordination with residents located within 1,320 feet of HDD entries. The submittal should document locations of sound dampening barrier walls and include a plan for monitoring noise levels at these locations during HDD operations. The information should be provided 30 days prior to submittal of the Plan and Profile. In its review of a preliminary version of the draft EIS, the Minnesota Department of Health concurred with this mitigation measure.	5-37; 11-12	The equipment needed to construct the HDD would have a temporary and short-term impact on noise levels in the vicinity of the Project, which would decrease from the levels presented in the response to SII 4 Question 8 based on distance, topography, and weather conditions. Summit will coordinate with nearby landowners along the Project prior to execution of HDDs. Summit's Contractor will determine the need for noise mitigation and noise monitoring based on feedback received from landowners during construction.
[EERA] Isolated dry trench crossing methods should be used on all stream crossings instead of the proposed open trench method. This method reduces silt and sediment suspension and transport to downstream waterbodies. This would reduce potential impacts from local and downstream transport of disturbed sediments on state-listed mussel species.	5-115	Summit will implement the isolated dry trench crossing method on streams with perceivable water flow during construction. If a stream is dry and has no perceivable water flow, then Summit intends to use the proposed open trench method.
[DNR] Selecting a crossing technique that is most appropriate for each waterbody, after consultation with DNR.	5-150	Summit will consult with the MDNR when designing and selecting Public Water waterbody crossing methods.
[EERA] A special permit condition requiring the applicant to identify locations of fracture arrestors and any locations of thicker-walled pipe on the Plan and Profile filed with the Commission is reasonable.	8-26 and 11-13	Yes. Summit can provide this information. The Project will be constructed of 4-inch nominal diameter pipeline. The 4-inch pipe is all 0.189 inches thick and is self-arresting.
Emergency Response		
[EERA] Applicant-provided indoor CO2 detectors for residences within 1,000 feet of the project is a reasonable mitigation measure. This distance was chosen based on the most impactful scenario as described in Appendix G.	8-26 and 11-13	While Summit agrees with Dr. Micheal Lumpkin's testimony, Summit is willing to supply CO ₂ detectors to residents within 1,000 feet of the Project centerline, if required by the Commission.

Recommendation	Reference	Response
[EERA] A special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission is reasonable.	8-26 and 11-13	As discussed in the Application, Summit has prepared a draft Emergency Response Plan (provided as Application Appendix 6) and will develop a final Emergency Response Plan in accordance with PHMSA requirements which will be provided to PHMSA. Summit has no objection to inclusion of a special permit condition requiring Summit to file with the Commission its final Emergency Response Plan that is provided to PHMSA.
[EERA] A special permit condition requiring the applicant to provide an accidental release plan, developed in coordination with local emergency responders, for Commission review 30 days prior to submittal of the Plan and Profile is reasonable.	8-26 and 11-13	As noted above, the Emergency Response Plan will include the information required by PHMSA, and any additional/other information required by the Commission would be addressed in a separate document.
[EERA – row above continued] The accidental release plan could include the specific equipment, training, and reimbursement that could be provided to emergency managers.		Summit will file a compliance filing describing its coordination with county emergency managers, including information about equipment, training, and reimbursement provided to emergency managers.
[EERA – row above continued] The plan could also list the names of the emergency responders and a provision to update contact information as needed.		Summit’s Emergency Response Plan will include contact information for Summit’s qualified and trained response personnel as well as contact information of the county emergency managers.
[EERA – row above continued] The plan could discuss the feasibility of a “reverse 911” notice that goes out to landowners’ telephones in the event of an emergency shutdown or rupture.		In accordance with PHMSA regulations, in the event of an emergency condition on the pipeline, Summit’s control center will immediately notify the public safety answering point (PSAP) for each county. Depending on the incident type and severity, additional regulatory notifications, including notifying the public will occur. Summit plans to utilize

Summit Carbon Solutions
Otter Tail to Wilkin Project
SII 11_1_Summit_ Otter Tail to Wilkin Response to DEIS Recommendations

Recommendation	Reference	Response
		an electronic notification system, such as Send Word Now, to notify the PSAP in each county.
[EERA – row above continued] The release plan could identify how the applicant would pay for costs of any repair to public infrastructure or private property (including crops and livestock) that might occur during an accidental release.		Summit does not object to filing a compliance filing identifying how the applicant would pay for costs of any repair to public infrastructure or private property (including crops and livestock) that might occur during an accidental release.
[EERA] A special permit condition requiring the applicant to provide its public education plan for Commission review 30 days prior to submittal of the Plan and Profile is reasonable. The public education plan could include specific safety information for neighboring landowners, including what to do in case of a rupture.	8-26 and 11-13	Summit agrees with a special permit condition requiring it to provide its public education plan for Commission review 30 days prior to submittal of the Plan and Profile. As discussed in the Application, Summit will implement comprehensive public awareness and education outreach programs, including damage prevention programs, that meet or exceed industry standards and regulatory requirements concerning public awareness of pipelines and pipeline operations. Application at 26. The public awareness programs are intended to inform members of the public in the vicinity of the pipeline and facilities to protect the public from injury, prevent or mitigate effects on the environment, protect the pipeline and facility assets from damage by the public, and provide ongoing public awareness.
[MCEA] Public concerns about the Project have largely centered around the possibility of a pipeline leak or rupture. The DEIS acknowledges receiving comments about the possibility of adding an odorant to the CO ₂ to help mitigate this concern. However, the DEIS did not adequately address whether this is a feasible or effective mitigation measure. The FEIS must address the concerns of the public, in part, by exploring the efficacy in mitigating the effects of a rupture by adding an odorant.	8-25	Summit does not plan to add an odorant to the pipeline. 49 CFR Part 195 does not identify a requirement for the use of odorant in hazardous liquid or carbon dioxide pipelines. Odorant requirements typically apply to low pressure natural gas distribution pipelines and are primarily intended to alert occupants of a gas leak occurring inside of a residence

Recommendation	Reference	Response
		<p>or structure. If federal regulations are amended in the future to require the use of an odorant in CO₂ pipelines, Summit believes that mandate will be preceded by research establishing whether the combination of CO₂ and commercially available odorants will compromise the integrity of pipeline systems and sequestration facility components.</p> <p>Presently, the primary component in many odorants is concentrated Methyl Mercaptan. This material is considered hazardous by the OSHA Hazard Communication Standard (29 CFR 1910.1200). Odorizing a pipeline system would require multiple injection facilities and would introduce additional logistic and design changes needed for the safe storage and overland transport of concentrated Methyl Mercaptan.</p>

Environmental Construction Plan

This Minnesota Environmental Construction Plan (ECP) would be applicable to any Midwest Carbon Express pipeline that is constructed by Summit Carbon Solutions in the state of Minnesota. The ECP contains typical drawings which are applicable to a variety of pipeline diameters.

As of March 2024, Summit Carbon Solutions has one project before the Minnesota Public Utilities Commission, the Otter Tail to Wilkin Project in Otter Tail and Wilkin Counties. This pipeline has a 4 inch diameter.

Other potential pipeline infrastructure in Minnesota, by county, includes:

- Kandiyohi, Chippewa – 8 inch diameter
- Renville – 6 and 8 inch diameter
- Yellow Medicine – 8 inch diameter
- Redwood – 8 and 10 inch diameter
- Cottonwood, Jackson – 10 inch diameter
- Martin – 6 and 8 inch diameter

Respond: ASAP

Please respond to the following questions or provide the requested data or information. Staff will use the information provided to develop the environmental document for the project, which is a public document. Your response, in its entirety, will be included in the environmental document as an appendix; therefore, **responses will be publicly available** unless otherwise designated by the respondent as “nonpublic information” pursuant to Minnesota Statute § 13.02, subdivision 12.

Directions: Responses to questions should be contained within this form to the greatest extent possible (**11-point Calibri, plain text font, RGB 192, 0, 0**). Attach supporting documentation as necessary. While data and information requests, for example, shapefiles or draft plans, will not be contained within this form, document their submittal using this form as follows: *“Requested information sent to whom by what means on date.”*

Do not eFile your response. Return the completed form, as a PDF, along with necessary supporting documentation, and/or requested data or information to andrew.levi@state.mn.us. Contact me at (651) 539-1840 with questions.

1. The final EIS may include a recommendation that any land application of drill cuttings and drilling mud within the construction workspace must be done prior to replacing topsoil. Please provide comment on this potential recommendation.

Summit assumes that in asking this question, EERA is envisioning that drill cuttings and drilling mud be placed within excavated trenches or HDD pits, and then topsoil be placed over the materials. Summit does not agree with this recommendation as it has the potential to result in logistical challenges related to construction timing and additional environmental impacts.

Execution of HDDs is conducted by a specialized construction crew which is not responsible for mainline pipeline installation. The installation of the mainline pipe on either side of the HDD might be completed before and/or after the HDD. If the mainline pipeline near the HDD had already been installed, but the HDD had not yet occurred or would not yet occur for some time, this would lead to extended, and potentially lengthy, periods of time where the trench must stay open, and topsoil must remain piled on the right-of-way while awaiting drilling materials. As stated in the Environmental Construction Plan (ECP), Summit intends to minimize the length of time any open excavation is left open to the extent practicable. Section 3.2 of the Minnesota ECP states that, “Except at boreholes and tie-ins, the Contractor will limit the amount of excavated open trench in uplands to a maximum of 15 days of anticipated welding production per spread, or 15 miles per spread. For locations along the Project where the USACE Section 404 Utility RGP applies (i.e., waters of the U.S.), this will be limited to 5,280 linear feet of open trench.”

Leaving the trench or any other excavation open to await placement of drilling materials is inconsistent with this goal and would add to the concern raised in Question 4, below, regarding entrapment of wildlife in open excavations.

If the mainline pipeline near the HDD had not yet been installed, the topsoil may have not yet been removed and there would therefore be no place to apply drilling materials. Drill materials may then need to be stored nearby while awaiting an open trench, or transported to another location on the right-of-way, for disposal. It is highly likely that either scenario would occur at each HDD because it is rare that the construction ROW is returned to its pre-construction state at the same time as adjacent drilling activities.

Furthermore, drill cuttings and drilling mud are traditionally land-applied by mixing with topsoil. As previously stated in response to SII #5, Question 14, the Minnesota Pollution Control Agency (MPCA) does not require a permit or approval to land apply drilling mud with additives that are approved by Minnesota Department of Health (MDH) or additives that meet ANSI/NSF Standard 60 (drinking water well material standards). Drilling mud mixed with additives that are not on the MDH approved additive list and/or do not meet ANSI/NSF Standard 60 must be disposed of as a solid waste at an approved facility or Summit must obtain a land application permit from MPCA.

It is not a common practice within the pipeline industry to bury drilling mud. Burying a mass of clay material between the subsoil and topsoil could lead to localized differences in permeability related to the surrounding soils. Burying mud would also displace either topsoil or subsoil from the trench and require that topsoil or subsoil be disposed of elsewhere. Furthermore, drilling mud properly mixed in to topsoil can prove to be a beneficial amendment to improve water retention in loamy sand soils.

Sections 4.5.6 and 10.4 of the Minnesota ECP state that the contractor will dispose of HDD drill cuttings and drilling mud at a SCS-approved location with landowner approval. This process allows for the appropriate flexibility and permissions for managing these materials. Please also see response to SII #5, Question 15, for additional information on how Summit plans to manage drill cuttings and drilling mud.

2. Summit has stated that water for operation of the Project (approximately 13 million gallons per year) would be from onsite wells at the ethanol plant. Clarify how many wells would be used and what aquifers they are completed in. Does Summit propose to obtain the water by amending an existing DNR Water Appropriation Permit, or would a new permit be needed? Has Summit determined the source(s) of water to be used during construction of the pipeline and the source and volume of water for construction of the capture facility?

Regarding water needed for operation of the capture facility, the Green Plains Ethanol Plant currently has two groundwater wells. The Minnesota Well Index (MWI) ID for the first well is 795966; it was completed to a depth of 211 feet in a quaternary buried artesian aquifer.¹ This is a commercial well. The MWI ID for the second well is 846639; it was completed to a depth of 199 feet in an undocumented aquifer.² This is a domestic well. Should the capture facility utilize water from the Green Plains Ethanol Plant wells, it would likely utilize the commercial well (MWI ID 795966). However, Summit has not yet finalized these plans with the Green Plains Ethanol Plant and Summit has not yet held conversations with the MDNR regarding the need to amend an existing MDNR Water Appropriation Permit, or the need to obtain a new permit, for the capture facility's operational water needs.

¹ <https://mnwellindex.web.health.state.mn.us/mwi/index.xhtml?wellId=0000795966>

² <https://mnwellindex.web.health.state.mn.us/mwi/index.xhtml?wellId=0000846639>

As stated in the Direct Testimony of Jason Zoller filed on February 13, 2024, “Summit is currently exploring options for appropriation of water, including duration of use, volume, and appropriation location(s). These could be private, municipal, or surface water sources. Once proposed/preferred and contingency sources and volumes are finalized, these details would be reviewed by the MDNR.” Summit has not yet determined the source(s) of water to be used during construction of the pipeline. Summit has also not yet determined the source and/or volume of water needed for construction of the capture facility.

3. Discuss the potential risk of some soil types to cause corrosion of the underground pipeline and whether any of those soils are present along the route alternatives. If applicable, describe Summit’s plans to mitigate or minimize potential for degradation of infrastructure from these soils, aside from the standard measures of epoxy coating and installation of a cathodic protection system.

All soil types will cause corrosion on an unprotected pipeline through the process of galvanic corrosion. The pipe protections applied to counter this will be the same for all soil types, including coating and cathodic protection (CP) as required by 49 CFR Subpart H – Corrosion Control (Section 195.563 and Sections 195.567 through 195.577). Summit will complete site specific soil resistivity testing along the permitted route to finalize CP design. If soil resistivity conditions are found that warrant additional protection, additional current sources may be applied, or voltage potentials may be adjusted to ensure proper protection against galvanic corrosion. The CP system will be in operation under the timeline defined by 49 CFR Subpart H – Section 195.563(a) and will be continuously monitored once commissioned.

4. State whether Summit would adhere to DNR’s recommendations that a) any open trenches incorporate escape routes so that any animals that enter the trench can escape, such as by including moderate grade ramps; and b) trenches would be inspected immediately prior to backfilling, and that any trapped animals present would be removed.

As stated in the Minnesota ECP, Section 3.2, “Plugs of subsoil in the ditch will be left or bridges may also be constructed to allow the passage of wildlife and livestock.” Summit believes this is sufficient. In addition, because the pipeline is only 4 inches in diameter, the trench will be excavated with a single backhoe bucket. This will result in a trench width that is approximately 10.5 inches at the bottom and 30 inches at the top, with a trench depth of approximately 59 inches. These dimensions will not allow for installation of “moderate grade ramps” within the trench. Summit’s Route Permit Application, page 58, also states: “Trenches may also be sloped where they start and end to allow ramps for livestock or other wildlife to escape.” Summit will commit to adding this sentence in Section 3.2 of the ECP.

Wildlife entrapment is typically more of an issue on pipeline projects with a large pipe diameter, deeper trench, wider excavation, and location within wildlife habitat. As the Project is occurring in agricultural areas, where native wildlife habitat is scarce, Summit anticipates that this will be a relatively small issue. However, Summit will commit to adding this sentence in Section 3.3 of the ECP: “The Contractor will inspect the trench prior to backfilling to determine if there are any trapped animals, and if there are, the animals will be removed.”

5. Does the pipeline construction design consider the prevention of French drain effects via the pipeline trench across the entire project, and especially in the beach ridge area? At a minimum, address the following statement: “Pennsylvania standards for trench breaker placement should be used and additional knowledge gained from more expansive subsurface site characterization may provide further guidance on where to place trench breakers most effectively.”

Portions of this response are repeated from Summit's response to SII #5, Question 20. Permanent trench breaker placement is discussed in Section 2.9.1 of the Minnesota ECP. As committed to the MDNR in Enclosure 2 of its September 1, 2022 Project introduction letter (see Route Permit Application, Appendix 8), Summit is presently proposing to install trench breakers at the entry and exit from every public water crossing, except for at HDD crossings. In addition, as outlined Section 5.5 of the Minnesota ECP, trench breakers will be installed at wetland boundaries where the pipeline trench may cause a wetland to drain, or the trench bottom will be sealed to maintain wetland hydrology.

Summit plans to select the location of trench breakers across the Project based on field conditions at the time of construction and will consider the degree and length of slope, presence of down-slope sensitive resource areas such as wetlands and waterbodies, and proximity to other features such as roads and/or railroads. Generally, slopes are higher in the eastern portion of the Project, while the majority of the Project, and particularly the western portion of the Project, is located in areas where slope is not a concern (0.001-6.71 degree slope; see Figure 11-3 of the Scoping EAW).

Use of this field condition review will ensure that Summit will not install trench breakers where they would not provide the intended benefit (i.e., on steep slopes where trench line erosion has the risk of occurring and at slopes adjacent to wetlands and waterbodies). When trench breakers are installed in areas where they do not provide any benefit, they have the potential to further disturb existing drainage patterns. This is especially important to prevent in agricultural fields where landowners have installed tile systems to effectively manage water on their property.

The "Pennsylvania standards" for trench breaker (plug) placement can be found in the Pennsylvania Department of Environmental Protection (DEP)'s "Erosion and Sediment Pollution Control Program Manual" (DEP Manual)¹ in Standard Construction Detail #13-4, and as shown below in Table 13.1 of the Manual.

PA DEP

TABLE 13.1
Maximum Spacing and Materials for Trench Plugs

Trench Slope (%)	Spacing L (FT)	Plug Material
< 5	1,000	* Clay, Bentonite, or Concrete Filled Sacks
5 - 15	500	* Clay, Bentonite, or Concrete Filled Sacks
15 - 25	300	* Clay, Bentonite, or Concrete Filled Sacks
25 - 35	200	* Clay, Bentonite, or Concrete Filled Sacks
35 - 100	100	* Clay, Bentonite, or Concrete Filled Sacks
> 100	50	Cement Filled Bags (Wetted) or Mortared Stone

***TOPSOIL MAY NOT BE USED TO FILL SACKS.**

Impervious trench plugs are required for all stream, river, wetland, or other water body crossings.

The DEP Manual describes the materials within as BMPs and design standards to minimize accelerated erosion and sediment pollution associated with construction activities in Pennsylvania, and to ensure compliance with Pennsylvania regulations found at 25 Pa. Code Chapter 102 (DEP Manual, p. i and ii). The policies and procedures in the DEP Manual are "not an adjudication or a regulation. There is no intent by DEP to give the rules in these policies that weight or deference" (DEP Manual, p. i). The DEP Manual offers

Pennsylvania users the options to utilize alternate BMPs that are not listed in this manual but that provide the same (or greater) level of protection (DEP Manual, p. i).

When describing the occurrence of the “French Drain” effect, DEP noted that the backfill considered was “usually permeable aggregate” (DEP Manual, p. 286). The Project will not backfill the trench with permeable aggregate but with native material, which on the Project will be subsoil and topsoil soil free from rocks or other materials that would damage the pipeline. There are no locations in which the Project would use permeable aggregate to backfill the Project, although this practice is used in other parts of the United States where rocky, stony, or bedrock trenches are excavated and filled with coarse material that would be more likely to cause the “French Drain” effect.

It is not practical, nor would it provide any additional protection, to install trench breakers at “all stream, river, wetland, or other waterbody crossings” as suggested in the DEP Manual. For example, trench breakers do not need to be installed at waterbodies crossed by the HDD method. The HDD method is a trenchless method that involves no direct excavation of the features crossed. Furthermore, at the point that the HDD crosses the waterbody feature, it is generally located between 30 to 40 feet below the stream bed. Here, installation of a trench breaker is not necessary and would be impractical.

Summit’s commitment to installation of trench breakers in specific locations as outlined in the Minnesota ECP, and additional site review considering slope and other conditions, will adequately prevent “French Drain” effects via the pipeline trench while working to ensure that landowner’s existing drainage patterns are maintained to the extent practicable and are not unnecessarily modified. Prior to construction, Summit will identify the general location of trench breakers on construction alignment sheets with a note to “Field Verify” the precise location through coordination between Summit’s EIs and the Contractor. It is possible that Summit’s work with the MDNR in the beach ridge area may offer insight into where trench breakers may be desirable, and if such areas are identified during this process, Summit will consider these locations in its pre-construction planning. During construction, trench breakers may be moved short distances in either direction from the location identified on the construction alignment sheets to more stable soils, or to accommodate other site-specific conditions. Additional trench breakers may also be added depending on site-specific conditions. Summit will require the Contractor to have additional materials on hand to install additional trench breakers as needed.

6. Provide a response to DNR’s recommended changes to Summit’s Environmental Construction Plan in its comment filed February 23, 2024.

The MDNR’s February 23, 2024 comments on the ECP are repeated below, with Summit’s response following. Note that the MDNR did not preface all of these comments on the ECP as “recommended changes;” therefore, where Summit will reflect a change in a revised ECP in response to MDNR comment, those changes are noted in bold.

Page 5. The DNR recommends that erosion control mesh be limited to materials that specify only natural fibers, with no plastic.

- As stated in Jason Zoller’s Direct Testimony filed on February 13, 2024, “Summit will follow MnDOT’s 2020 Standard Specifications for Construction for rolled erosion control materials that specify only natural fibers with no plastic mesh be used.” This was a recommendation of the MDNR that EERA included in the DEIS. Therefore, Summit will revise the statement on page 5 of the ECP as follows: “The Contractor will ~~select wildlife-friendly erosion control fabric that~~

~~contains biodegradable netting (Category 3N or 4N natural fibers) and will avoid the use of plastic mesh follow MnDOT's 2020 Standard Specifications for Construction (or more recent edition) for rolled erosion control materials that specify only natural fibers with no plastic mesh be used."~~

Page 7, trench breakers. The DNR previously provided recommendations to follow Pennsylvania standards for trench breaker placement. The draft EIS includes these recommendations in sections 4.6 and 5.7.83, which discuss mitigation measures offered during scoping. The DNR continues to recommend that Pennsylvania standards for trench breakers be utilized, and recommends that the ECP be updated.

- See response to Question 5, above. Summit is not proposing ECP revisions in response to this comment.

The ECP should clarify if travel lanes will be used on HDD river crossings. If a travel lane is used across waterbodies, significantly more vegetation removal and disturbance will occur, including bridge construction. The DNR recommends that no travel lanes be utilized across waters that use HDD.

- For this Project, Summit will not use travel lanes or bridges across any HDD crossings. As stated in Section 2.4.2 of the DEIS, "No ground disturbance would occur between the entry and exit of HDDs."

The Minnesota ECP is a general construction document that would apply to any Midwest Carbon Express infrastructure constructed in Minnesota and does not contain information on specific crossing methods or bridge use. Therefore, this revision would not be appropriate, and Summit is not proposing ECP revisions in response to this comment. Summit needs to retain the ability to consider using bridges at future HDD crossings because there may not be adequate road infrastructure in the area surrounding future HDDs to support a work-around.

Where trench crossings are used for streams, we recommend segregating the streambed surface material for restoring streambed surface material that is usually courser than underlying material (similar to how topsoil is segregated in uplands).

- Summit will add the following statement to Section 4.8 of the Minnesota ECP. "Where trenched crossings were used, the Contractor will restore the stream by first replacing underlying streambed materials in the trench before replacing streambed surface/substrate materials to support the consistency of the disturbed stream bottom relative to undisturbed areas."

The DNR recommends not using flowing open cut method for any stream crossing.

- While the flowing open cut method is presented as a general construction method in Section 4.5.2 of the ECP, Summit is not proposing to use this method at any waterbodies that are crossed by the Project. The ECP does not contain information on specific crossing methods.

As Jason Zoller describes in Direct Testimony filed on February 13, 2024, "Summit will implement the isolated dry trench crossing method on delineated waterbodies with perceivable water flow during construction. If a delineated waterbody is dry and has no perceivable water flow, then Summit intends to use the proposed open trench method." Jason Zoller's Rebuttal Testimony filed on March 14, 2024 states, "If a delineated waterbody is dry and has no perceivable water

flow, then Summit intends to use open cut methods...Open cut methods are employed in areas where no perceivable water flow is present or anticipated to be present from initial disturbance and final stabilization as an industry standard method for installation of pipe across dry waterbodies, and this method will comply with applicable permit regulations and conditions.” Therefore, Summit will keep the flowing open cut method description in the ECP as a general construction method, but it is not proposed for use on the Project. Summit is not proposing ECP revisions in response to this comment.

The ECP should address trench crowning/subsidence. The ECP should address post construction monitoring for topography and crowning/subsidence, vegetation restoration, erosion, and monitoring groundwater expressions along the project route.

- As stated in Scott O’Konek’s Direct Testimony filed on February 13, 2024, “Summit will include details in the [ECP] for preventing excessive crowning or subsidence above the restored centerline. Summit will restore the construction workspace to as close to the original pre-construction contours as practicable. If uneven settling occurs or surface drainage problems develop as a result of pipeline construction, Summit will provide additional land leveling services after receiving a landowner's written notice, weather and soil conditions permitting.” **Summit will revise the ECP to address trench crowning/subsidence.**

Section 8.2 of the ECP states, “SCS will monitor areas where stabilization and restoration methods are implemented in accordance with requirements in state permits and landowner agreements. Monitoring will identify areas where remedial measures are required to establish a stable surface for reclamation to be successful. This may include re-grading, re-seeding, re-mulching, and additional monitoring.” Summit suggests that further details on post-construction monitoring and restoration is best addressed in a post-construction monitoring plan with the appropriate regulatory agencies.

Page 14. The ECP states that HDD drilling fluids and additives will be nontoxic to the aquatic environment and humans. Toxicity is primarily related to magnitude of release, as larger amounts of even “nontoxic” drilling fluids could be harmful to aquatic life. The contingency plan to address inadvertent release response should include equipment such as a functioning vac-truck on site and other equipment/materials. This contingency plan should be in coordination with the DNR utility license application.

- As stated in Section 4.5 of the ECP, “The Contractor will develop a contingency plan to address an inadvertent return during a directional drill. The contingency plan will include instructions for monitoring during the directional drill and mitigation in the event that there is a release of drilling fluids. Containment, response, and clean-up equipment will be available at both sides of an HDD crossing location and one side of a guided or road bore prior to commencement to assure a timely response in the event of an inadvertent release of drilling fluid.” Summit’s Contractor will prepare these plans closer to the time of construction and will provide them to the MDNR as part of the public water licensing effort. Summit is not proposing ECP revisions in response to this comment.

7. Respond to numerous comments that questioned the ability of the project to capture 100% of the CO₂ emissions from the ethanol plant.

This response is repeated from Summit's response to SII #11, Question 6. The capture facility will capture approximately 100% of the CO₂ emissions from the Green Plains Ethanol Plant's scrubber stack during normal operations. CO₂ can only be captured if the Green Plains Ethanol Plant is operational, and the operational rates will vary over time. The capture facility may also not be operational during periods of maintenance. Summit has based its initial CO₂ capture rate estimates using best available assumptions on these variables.

8. Will water recycling ponds be used at the capture facility during operation?

No.

9. Provide more details on drilling mud additives that would be used. Include a description of any additives that are not on the MDH-approved additive list and the potential environmental impacts of these additives in the event of an inadvertent return.

Summit will seek to utilize MDH-approved additives before considering other options; The drilling mud additives will be determined closer to construction by Summit's HDD contractor. Because Summit is not aware of any non-MDH-approved additives under consideration, it is not possible to describe the environmental impacts of such additives in the event of an inadvertent return.

10. Describe any measures Summit proposes to follow the PHMSA advisory bulletin issued in May 2022. Include measures that plan for and mitigate risks related to shrink-well soils and frost-heave.

Summit has addressed both shrink-swell soils and frost heave in other data requests. Summit consults with geotechnical engineers across its footprint and will develop a Phase I Geohazard Assessment for the Project. The Phase I Geohazard Assessment is designed to comply with the recommendations within Advisory Bulletin (ABD-2022-01). The Phase I Assessment is a desktop assessment intended to identify and assess potential geohazards (i.e., naturally occurring or human-triggered geologic conditions, ongoing geologic processes, or potential natural events that could adversely affect construction and/or operation of a pipeline) along the Project route. The information collected during the Phase I Assessment can be used to understand where potentially hazardous geologic, hydrologic, or atmospheric features and conditions may be present along the proposed pipelines and may ultimately be used to guide best management practices during pipeline construction and operation to avoid, mitigate, and/or monitor possible geohazards. Based on the perceived threat potential, select hazards identified during a Phase I Assessment may be further assessed through more detailed assessment(s), such as Phase II Assessment (e.g., field reconnaissance), and possibly Phase III Assessment (site-specific investigations), where necessary, to improve understanding and characterization of the selected hazard(s). Additional phase assessments will be at the recommendation of a geohazard consultant. In addition, Summit will run an inertial measurement unit (IMU) smart tool as part of the baseline assessment after construction. During operations, Summit will have the ability to run additional IMU smart tools to track movement, strain, and stress within the pipeline.

Respond: As soon as possible

Please respond to the following questions or provide the requested data or information. Staff will use the information provided to develop the environmental document for the project, which is a public document. Your response, in its entirety, will be included in the environmental document as an appendix; therefore, **responses will be publicly available** unless otherwise designated by the respondent as “nonpublic information” pursuant to Minnesota Statute § 13.02, subdivision 12.

Directions: Responses to questions should be contained within this form to the greatest extent possible (**11-point Calibri, plain text font, RGB 192, 0, 0**). Attach supporting documentation as necessary. While data and information requests, for example, shapefiles or draft plans, will not be contained within this form, document their submittal using this form as follows: “*Requested information sent to whom by what means on date.*”

Do not eFile your response. Return the completed form, as a PDF, along with necessary supporting documentation, and/or requested data or information to andrew.levi@state.mn.us. Contact me at (651) 539-1840 with questions.

1. Summit has indicated that it would be solely responsible for costs associated with an accidental release of CO₂. However, commenters asked who would have financial responsibility for clean-up and damages in the case of a release of CO₂. Representative comment includes: “Who will be liable if there’s an accident with the pipeline or construction causes damage to the natural environment, farmland, or built structures?” Please respond to this comment and confirm Scott O’Konek’s response to a question asked at the Breckenridge public meeting on February 6, 2024, that Summit would be responsible for 100 percent of costs in case of an accident.

Confirmed as to Mr. O’Konek’s prior statement.

2. Respond to concerns about ability of landowners to obtain insurance and increased costs of insurance. Representative comments include:
 - a. “Also, we’ve recently been notified from our insurance company that there are ‘a lot of red flags that could lead to a gap in coverage as it relates to liability for damages and/or bodily injury related to this pipeline.’ I think we also need solid clarification on who is responsible for all the scenarios surrounding a rupture/accident that happens on privately held land.”
 - b. “The EIS is inadequate because it does not address the increased cost of insurance for those households, farms, and businesses living with in the 1,600 ROI.”

The Interstate Natural Gas Association of America (INGAA) Foundation published a report dated February 2016 titled “Pipeline Impact to Property Value and Property Insurability” (the INGAA Report). The INGAA Report provides an evaluation of valuations and insurability of lands along interstate natural gas pipeline easements located in Ohio, Virginia, New Jersey, Pennsylvania, and Mississippi. While the INGAA Report is not focused on Minnesota farmlands or CO₂ pipelines specifically, the results provide useful insight regarding potential impacts to insurability along interstate pipelines. Some of the major conclusions from the INGAA report are as follows: (1) insurance companies and agents have said that there is no indication that the presence of a natural gas pipeline would hinder a buyer’s ability to acquire property insurance; and (2) insurance companies and agents have said that there is no indication that premiums paid for insurance policies would increase because of the proximity to a natural gas pipeline.

Regarding potential gaps in insurance coverage, Summit has taken steps to ensure that landowners do not incur uninsurable risk because of the pipeline. Specifically, Summit has agreed to indemnify landowners for loss resulting from Summit’s use of the easements, which would include loss resulting from the pipeline. Summit includes the following language in its template easement agreements with landowners: “Company shall pay commercially reasonable costs and indemnify and hold Landowner harmless for any loss, damage, claim, or action resulting from Company’s use of the Easements, except to the extent such loss, damage, claim or action arises out of, relates to, and/or results from the gross negligence or willful misconduct of Landowner, its tenants, guests, invitees, agents, and the like, and/or those acting by or through them or subject to their control.” Notably, Summit is obtaining its agreements on a voluntary basis and landowners have had the opportunity to further address liability issues to their satisfaction before granting Summit the easements. Further, based on Summit’s review in Minnesota and elsewhere, there is not a plausible scenario in which owners of land adjoined to the pipeline would be held liable, or carry insurance for, an accidental release from the pipeline. Likewise, Summit has no indication that insurance coverages would be required of landowners, either on the pipeline route or otherwise, related to the pipeline.

3. Provide an updated construction schedule for the pipeline and the capture facility. Is winter construction planned?

Summit has prepared the following revised construction schedule. These dates do not include a winter construction season, and, at this time, Summit does not plan to construct the Project during the winter.

- Pipeline Construction August 2025 – October 2025
- Capture Facility Construction August 2025 – March 2026

4. Respond to the following comment on the Draft EIS: “In Appendix E,6.3 it states that in frozen conditions a ripper can be used to scarify the topsoil to aid in removal. How would the operator in this case be able to determine topsoil depth? If he goes too deep, mixing top and subsoil will occur and cause even more permanent damage to the land.”

As stated in the Draft EIS, Appendix E, Section 2 (Summit’s Agricultural Protection Plan), “[Summit] will employ Agricultural Inspectors whose role is to verify compliance with the requirements of the [Agricultural Protection Plan] during construction of the pipeline.” Listed duties in this section include, but are not limited to, “provide construction personnel with field training on specific topics, such as protocols for topsoil stripping” and “observe construction activities on agricultural land on a continual basis” and

“be responsible for verifying [Summit’s] compliance with provisions of the [Agricultural Protection Plan] during construction.” Further, the Agricultural Inspector has the authority to stop construction activities that are determined to be out of compliance with the provisions of the Agricultural Protection Plan.

5. Respond to the following comment on the Draft EIS: “Appendix F 2.8.2 states that in frost conditions that Summit has the right to modify the plans. What does this mean?”

Appendix F 2.8.2 (Summit’s Winter Construction Plan) states that, “Trench topsoil will be segregated as practicable but modified dependent on depth of frost, thickness of topsoil, and the trenching method used.” Prior to this statement, the Winter Construction Plan states that “Where frozen blocks have been cut, excavation equipment (e.g., a backhoe or excavator) will be used to remove the large frozen blocks and to place them adjacent to the trench.” The sentence in question indicates that depending on conditions, the ability to segregate topsoil will require flexibility in methodology. Segregation of topsoil in winter with a shallow frost depth will occur differently than with a deep freeze in more saturated soil conditions where soil may need to be cut in blocks. Soils with little to no frost layer may still be able to be segregated in separate piles by topsoil and subsoil, but segregation may not occur in the same manner when soil must be stored in blocks. See response to Supplemental Information Request Number 4 regarding the oversight responsibilities of the Agricultural Monitor.

6. Respond to the following comment from the Minnesota DNR on the Draft EIS: “In addition to the stated potential risk of sheet pile causing a breach in a confining layer, the proposed depth of excavation for the pipeline may also be deep enough to compromise shallow confining layers, if present. This may be of heightened concern through the beach ridge system or near wetlands and surface water features. The EIS should discuss these potential impacts, as well as proposed mitigation.”

Following coordination with the MDNR, Summit has agreed to use ground penetrating radar to study the depth of the confining layer through the entire beach ridge area crossed by the pipeline to further define existing conditions and advise on construction methodology. Summit has also committed to not using sheet piling in the beach ridge area.

7. In applicant surrebuttal testimony on March 28, 2024, Scott O’Konek responded to a question regarding pipeline construction in beach ridge areas with the following: “If the horizontal direction drill (HDD) method is used *outside* [emphasis added] the beach ridge area, pipe will be installed to a depth of six to ten feet. A shallow bore installed to a depth of six to ten feet will minimize the likelihood of intersecting groundwater.” Table 2-2 of the DEIS indicates, based on information provided by the applicant, that the minimum cover at the lowest point for the five HDDs proposed for the project (none of which would be within the beach ridge area crossed between MPs 4 and 9) would range from 20 to 25 feet. Section 2.4.8 of the DEIS also states: “The actual depths of the HDDs could be greater. For example, the geotechnical investigation report for the Otter Tail River crossing indicates an estimated HDD depth of 46 feet below the bottom of the river channel.” Explain this apparent discrepancy in how deep the pipeline sections constructed via HDD would be installed and clarify what the actual HDD depths would be, if available.

This statement in Mr. O’Konek’s testimony should have stated, “If the horizontal direction drill (HDD) method is used *inside*....” Summit will make this correction to the testimony prior to the hearing. The shallower depth inside of the beach ridge area is intended to provide mitigation for potential shallow

groundwater in areas where Summit does not have additional construction workspace. Referenced text in Table 2-2 and Section 2.4.8 is correct.

8. Respond to the following comment from the Minnesota DNR on the ECP: “Where trench crossings are used for streams, we recommend segregating the streambed surface material for restoring streambed surface material that is usually coarser than underlaying material (similar to how topsoil is segregated in uplands).” Please respond to this comment.

See response to Supplemental Information Inquiry Number 12, Question 6 (page 6 of 8).

9. Provide additional details on the effectiveness/efficiency of the sequestration site in North Dakota, such as a range of permanent sequestration rates, and citations to applicable studies. Discuss potential for leaks during and after the sequestration process. How much CO₂ could potentially be lost to leaks? Describe proposed monitoring and maintenance at the sequestration site.

Below are links to detailed information on the size of the storage reservoir, injection rates, design elements to ensure safe and permanent storage of the CO₂ in the formation. They also contain the monitoring plan for during injection and post injection.

- <https://www.dmr.nd.gov/dmr/sites/www/files/documents/Oil%20and%20Gas/Class%20VI/Summit/SCS%20%233/C30877.pdf>

10. Please provide clarification on applicant testimony from Alex Lange on February 13, 2024, that stated: “When emergency conditions indicate a small leak, in addition to closing valves and isolating the pipe segment, Summit’s operations team would also open vents and complete a controlled blowdown at the MLV site to safely evacuate the pipeline segment of product such that the duration of the leak would be much shorter **longer** than described in the DEIS.” The DEIS describes a guillotine rupture, which has the shortest leak duration possible. Is the correction in red (replacement of the word “shorter” with “longer”) what was meant? If not, please explain what was meant. As written, it sounds like a controlled blowdown would provide a leak duration shorter than what is described in the DEIS, that is, a guillotine rupture.

Mr. Lange’s quoted statement describes conditions related to a small leak, and the statement is accurate as written.

11. Please provide the letter from PHMSA to the applicant that is mentioned by commenters. Representative comments include: “PHMSA has expressly said in public letters to CO₂ pipeline companies like Summit that state and local authorities can exercise their powers to regulate land use—including setback distances—and that “nothing in the federal pipeline safety law impinges on these traditional prerogatives of local—or state—government.”

Please see Attachment 13-11, *PHMSA Letter to Summit Clarifying Federal, State, and Local Government Pipeline Authorities*.

12. Please update the tables of noise sensitive receptors provided for each route alternative (Table 5-6, Table 5-7, and Table 5-8 in Section 5.4.5 of the Draft EIS) to expand the definition of a noise sensitive receptor from residences and businesses to the longer list of receivers within areas grouped according to land activities by the noise area classification system established in Minnesota Rule 7030.0050, Subp. 2, using Noise Area Classification 1. Provide revised shapefiles with newly identified noise receptors. The revised tables should identify any of the following within 1,600 feet of the route width of RA-North, RA-Hybrid, and RA-South:

- Household Units (includes farmhouses)
- Hotels, motels, or other overnight lodging
- Mobile home parks or courts
- Other residential units
- Motion picture production
- Medical and other health services
- Correctional institutions
- Educational services
- Religious activities
- Cultural activities and nature exhibitions
- Entertainment assembly
- Camping and picnicking areas (designated)
- Resorts and group camps
- Other cultural, entertainment, and recreational activities

Summit has prepared updated tables of noise sensitive receptors (NSRs) with 1,600 feet of Alternative Route 1 (previously referred to as CURE alternative route 2); Alternative Route 2 (previously CURE alternative route 3); and Alternative Route 3 (Summit's proposed route) using the requested terms (see Attachment 13-12). Note:

- Summit has changed the previously reported "residences" to "household units."
- Summit previously reported each "Garage/Barn." This is a category which is not represented in the above list, so these features were not relabeled.
- Summit previously reported each "Industrial" and "Business." If the type of "Industrial" or "Business" feature was not represented on the list, it was not relabeled.

For all receptors within the 1,600-foot route buffers, Summit did not locate any NSRs beyond those of Household Unit, Garage/Barn, Business, or Industrial.

A zip file with the following shapefiles has also been provided on the Summit ShareFile site:

Contents	Preview	Description

Receptor_Alternative_Route_3_1600ft.shp		

13. In applicant testimony on February 13, 2024, Jason Zoller listed additional studies that have been performed for the project. Provide these studies.

A copy of the following reports has been provided with this response (see Attachment 13-13 folder):

- Wetland and Waterbody Delineation Report – Minnesota [dated October 3, 2022]
- Wetland and Waterbody Delineation Supplemental Report for MNL-305 and 20 MNL-321 (2022) – Minnesota [dated March 31, 2023]
- Results of 2022 Field Surveys for Listed Butterfly and Plant Species in Minnesota [dated February 28, 2023] - **Marked as NONPUBLIC**
- Results of 2022-2023 Field Surveys for Listed Butterfly and Plant Species in Minnesota [dated January 18, 2024] – **Marked as NONPUBLIC**

The following report is not provided with this response as Summit is currently addressing comments received from the SHPO regarding the content of the report. Once, the report is revised and resubmitted to the SHPO, Summit will provide a copy of the report.

- Draft Minnesota Conventional Archaeological Resources Survey (Phase 1) 12 Volume 4: Fieldwork Report Addendum (MNL-305 and MNL-321) For Work Completed Between July 2, 2022, and November 14, 2022 on MNL-321 in Otter Tail County and MNL-305 in Martin County, and Since December 3, 2021, for the Eliminated Segment of MNL-305 in Faribault County [dated March 31, 2023]

14. Sherri Webb filed a comment dated February 23, 2024, that is included in eDockets Document ID 20243-204403-01. Please describe the 13 permit applications that are noted in her comment on page 340 of 461 of the PDF.

Summit has not applied for 13 water well permits. Summit has applied for one permit in Lawler, Iowa.

15. Please confirm that the entire pipeline project would be designed and built in a manner that would arrest crack propagation and that, therefore, fracture arrestors are not needed.

Confirmed.

16. Does Summit know of any precedent for adding an odorant to CO₂ pipelines? If so, please provide the name of the project, pipeline, and details of use of odorant in other CO₂ pipelines.

No.

17. Please clarify the updated calculations in this portion of Benjamin Nelson's March 14, 2024, applicant rebuttal testimony to Dr. Grubert's earlier testimony: "this results in emission sources of 26,349 MT CO₂e, or 14% of the 0.19 metric tons per annum. As such, an expected 14% reduction would result in a reduction of 5.0 gCO₂e/MJ from the base impact of 36.3 gCO₂e/MJ mentioned above." Provide sources for updated assumptions in this calculation.

Mr. Nelson's full response on this point is as follows, with the portion quoted in question 17 in bold:

"The carbon capture and storage process is designed for 100% electrical use. Summit agrees that these sources of emissions should be incorporated into the impact of the CI score. The system is designed to utilize 38.5 million kWh. Utilizing the GREET emission factor for MROW of 684 g CO₂e/kWh (as done by DEIS), **this results in emission sources of 26,349 MT CO₂e, or 14% of the 0.19 mmtpa. As such, an expected 14% reduction would result in a reduction of 5.0 g CO₂e/MJ from the base impact of 36.3 g CO₂e/MJ mentioned above.**"

Sources and Calculations:

CO₂e emissions:

38.5 million kWh. The DEIS report stated 39.3 million kWh (Table 5-39, footnote e). The 38.5 million kWh assumption is updated to reflect Summit's response to Question 6 in Summit's Response to Supplemental Information Inquiry 5.

GREET emission factor for MROW of 684 g CO₂e/kWh.

Source: <https://www.energy.gov/eere/greet>.

Note that this is the same assumption the DEIS uses in Table 5-39, footnote e.

Calculation of CO₂ sources:

$38.5 \text{ million kWh} * 684 \text{ g CO}_2\text{e/kWh} / 1,000,000 \text{ g/MT} = 26,349 \text{ MT CO}_2\text{e}$

CI impact of CO₂ emissions:

0.19 million MT captured.

This assumption is the same as used in the DEIS report. For example, Table 5-39 lists it as 185,454 (without rounding).

Calculation of emissions sources to captured CO₂:

$26,349 / 185,454 = 14\%$

Calculation of impact to CI:

$$36.3 \text{ g CO}_2\text{e/MJ} * 14\% = 5 \text{ g CO}_2\text{e/MJ}$$

18. Please explain in relative detail how the project would provide tax revenue to the local economy. For example, how is the project taxed? How is the money distributed?

In Minnesota, a CO₂ pipeline should be subject to property tax and centrally assessed by the Commissioner of Revenue at its market value as of January 2 each year. The January 2 assessment date forms the basis for the tax due and payable in the following year (e.g., the January 2, 2024, assessed value forms the basis for the taxes payable in 2025). The market value of a centrally assessed property is set forth in Administrative Rule 8100, and generally requires the operating property of the entire pipeline to be valued as a unit using a combination of the income and cost approaches. The unit value is then allocated back to Minnesota and to each county and local taxing district in which the CO₂ pipeline is located. The tax is then administered by the treasurer's office for each county, who will issue property tax statements and distribute the tax collected in the same manner as all other property taxes.

19. Public commenters ask about electricity use at the capture facility. Representative comments include: "EERA should revisit the potential for impacts to the electrical system and other Lake Region Coop customers and member-owners. It is important to know both the total expected energy use as well as the variable demand that is anticipated by the project's additional electric usage. Will the project's use spike at the same time as the existing plant's demand? Will Lake Region Coop have to implement peak-shaving policies and technologies elsewhere to manage this new intense use? Even if no immediate upgrades are required to deliver energy to the plant, will this increase member-owners' exposure to power outages or brown-outs in times of peak demand?" Also, "who is paying for that electricity? Summit or the ethanol facility? And if the latter, will those cost increases be passed on to producers or other member-owners?"

When operating, the CO₂ capture facility is expected to draw 3,678 kW of electrical load from the grid. Summit plans to install variable frequency drives on all medium-voltage electrical loads to limit the impact on the electrical grid as loads come online. To serve our load, Lake Region Electric Coop (LREC) plans to upgrade a feeder in the existing substation. They have indicated to Summit that their system has ample capacity to manage the incremental load without issue. Summit is responsible for all costs associated with the upgrade and operation of the capture facility, including the cost of the utility power. LREC has not indicated to Summit that the additional load would cause the utility to implement peak-shaving policies or technologies anywhere in their system. LREC has not indicated that, nor does Summit anticipate an increase in other member-owners exposure to power outages or brown-outs.

U.S. Department
of Transportation
**Pipeline and Hazardous
Materials Safety
Administration**

1200 New Jersey Avenue, SE
Washington, DC 20590

9/15/2023

Mr. Lee Blank
CEO
Summit Carbon Solutions
2321 N Loop Dr. Suite 221
Ames, Iowa 50010

Dear Mr. Blank:

The Pipeline and Hazardous Materials Safety Administration (PHMSA) has received several inquiries regarding the ability of federal, state, and local governments to affect the siting, design, construction, operation, and maintenance of carbon dioxide pipelines. The widespread interest in understanding PHMSA's authorities underscores a need to reiterate the message we shared in 2014 with a company proposing a high-visibility interstate pipeline, a message directly related to current pipeline projects proposed by your companies.

As was the case in 2014, PHMSA continues to support and encourage all three levels of government—federal, state, and local—working collaboratively to ensure the nation's pipeline systems are constructed and operated in a manner that protects public safety and the environment.

Congress has vested PHMSA with authority to regulate the design, construction, operation, and maintenance of pipeline systems, including carbon dioxide pipelines, and to protect life, property, and the environment from hazards associated with pipeline operations. While the Federal Energy Regulatory Commission has exclusive authority to regulate the siting of interstate gas transmission pipelines, there is no equivalent federal agency that determines siting of all other pipelines, such as carbon dioxide pipelines. Therefore, the responsibility for siting new carbon dioxide pipelines rests largely with the individual states and counties through which the pipelines will operate and is governed by state and local law.

The Role of PHMSA

Under the federal pipeline safety laws (49 U.S.C. § 60101 *et seq.*), PHMSA is charged with carrying out a nationwide program for regulating the country's pipelines that transport gas, hazardous liquids, and carbon dioxide. With passage of the federal pipeline safety laws, Congress determined pipeline safety is best promoted through PHMSA's development of nationwide safety standards.

PHMSA takes this responsibility seriously and has promulgated comprehensive safety regulations at 49 C.F.R. Parts 190-199. Dozens of current federal requirements regulate the safety of carbon dioxide pipelines' design,¹ construction,² testing,³ operation and maintenance,⁴ operator qualification,⁵ corrosion control,⁶ and emergency response planning.⁷ PHMSA inspects compliance with these requirements and enforces these standards through administrative and judicial enforcement processes.

Recently, PHMSA promulgated new, more stringent standards for automatic and remote shut off valves that affect carbon dioxide pipelines (Additional information: "New rule will help improve public safety and reduce greenhouse gas emissions following pipeline failures").⁸ PHMSA also announced a number of additional actions to strengthen current pipeline safety requirements for carbon dioxide pipelines (Additional information: "PHMSA announces new safety measures to protect Americans from carbon dioxide pipeline failures"),⁹ including a new rulemaking which is currently under way.

While rulemakings like this involve meticulous crafting of highly technical updates, PHMSA also retains broad authority to address imminent risks to the public posed by a pipeline—even if not specifically delineated in a rule or standard. To this extent, PHMSA will engage with all carbon dioxide pipeline project developers to ensure any unique and imminent risks from such projects are adequately mitigated pursuant to PHMSA's statutory safety authority.

The Role of State Pipeline Regulators

Federal safety standards apply to both interstate and intrastate pipeline facilities. Only PHMSA can regulate the safety of interstate pipelines, and federal pipeline safety laws expressly prohibit states from enacting or enforcing pipeline safety standards with respect to interstate pipelines (except one-call notification program regulations). However, through an agreement with PHMSA, a state authority may be authorized to inspect interstate pipelines as an agent of PHMSA, and to refer violations to PHMSA for enforcement. Thus, PHMSA's state partners play an important role in assisting to oversee the safety of the nation's interstate pipelines.

PHMSA's state partners also play a critical role in regulating the safety of intrastate pipelines. A state authority that submits a certification to PHMSA may assume exclusive regulatory authority for the safety of its intrastate pipelines. The certification must document, among other things,

¹ 49 CFR part 195, subpart C (<https://www.ecfr.gov/current/title-49/subtitle-B/chapter-I/subchapter-D/part-195/subpart-C>).

² Subpart D (<https://www.ecfr.gov/current/title-49/subtitle-B/chapter-I/subchapter-D/part-195/subpart-D>).

³ Subpart E (<https://www.ecfr.gov/current/title-49/subtitle-B/chapter-I/subchapter-D/part-195/subpart-E>).

⁴ Subpart F (<https://www.ecfr.gov/current/title-49/subtitle-B/chapter-I/subchapter-D/part-195/subpart-F>).

⁵ Subpart G (<https://www.ecfr.gov/current/title-49/subtitle-B/chapter-I/subchapter-D/part-195/subpart-G>).

⁶ Subpart H (<https://www.ecfr.gov/current/title-49/subtitle-B/chapter-I/subchapter-D/part-195/subpart-H>).

⁷ E.g., Subpart F, §§ 195.402, 195.403, 195.408.

⁸ <https://www.phmsa.dot.gov/news/phmsa-announces-requirements-pipeline-shut-valves-strengthen-safety-improve-response-efforts>

⁹ <https://www.phmsa.dot.gov/news/phmsa-announces-new-safety-measures-protect-americans-carbon-dioxide-pipeline-failures>

that the state has appropriate jurisdiction under state law; has adopted the federal safety standards to which the certification applies; inspects operators for compliance with those standards; and enforces the standards to address noncompliance.

PHMSA's national regulatory program relies heavily on the efforts of these state partners, who employ roughly 70 percent of all pipeline inspectors and whose jurisdiction covers more than 80 percent of regulated pipelines. As noted above, federal law requires certified state authorities to adopt safety standards at least as stringent as, and compatible with, the federal standards. The state authorities will also inspect, regulate, and take enforcement action against operators of intrastate pipelines within their borders.

The Role of Local Governments

Federal preemption of pipeline safety means that states do not have independent authority to regulate pipeline safety but derive that authority from federal law through a certification to PHMSA.

In the case of local governments that are not subject to federal certification of pipeline safety authority, they may still exercise other powers granted to them under state law but none that adopt or enforce pipeline safety standards or contradict federal law.

However, PHMSA cannot prescribe the location or routing of a pipeline and cannot prohibit the construction of non-pipeline buildings in proximity to a pipeline. Local governments have traditionally exercised broad powers to regulate land use, including setback distances and property development that includes development in the vicinity of pipelines. Nothing in the federal pipeline safety law impinges on these traditional prerogatives of local—or state—government, so long as officials do not attempt to regulate the field of pipeline safety preempted by federal law.

PHMSA recognizes local governments have implemented authorities under state law that contribute in many ways to the safety of their citizens. We have seen localities consider measures, such as:

1. Controlling dangerous excavation activity near pipelines.
2. Limiting certain land use activities along pipeline rights-of-way.
3. Restricting land use and development along pipeline rights-of-way through zoning, setbacks, and similar measures.
4. Requiring the consideration of pipeline facilities in proposed local development plans.
5. Designing local emergency response plans and training with regulators and operators.
6. Requiring specific building code design or construction standards near pipelines.
7. Improving emergency response and evacuation plans in the event of a pipeline release.
8. Participating in federal environmental studies conducted under the National Environmental Policy Act (NEPA) and similar state laws for new pipeline construction projects.

Each state treats these issues differently, so pipeline operators should be prepared to deal directly with each locality and state body interested in the siting and construction process.

Collaboration Among Stakeholders

PHMSA believes pipeline safety is the shared responsibility of federal and state regulators as well as all other stakeholders, including pipeline operators, excavators, property owners, and local governments. In 2010, PHMSA launched the Pipelines and Informed Planning Alliance (PIPA)—available at <https://primis.phmsa.dot.gov/comm/pipa/LandUsePlanning.html>—to help pipeline safety stakeholders define their respective roles related to land use practices near pipelines and to develop best practices.

The PIPA documents are 13 years old, but they remain of value today. PHMSA looks forward to you, along with other private and public stakeholders, engaging with PHMSA in updating these documents to focus on the unique circumstances of new pipeline construction. I encourage all pipeline operators to carefully consider and adopt, as appropriate, these best practices to protect their existing and proposed rights-of-way, and to engage all stakeholders in promoting the safety of interstate pipelines.

Each community affected by an existing or proposed pipeline faces unique risks. The effective control and mitigation of such risks involves a combination of measures employed by facility operators, regulatory bodies, community groups, and individual members of the community. As a pipeline release can impact individuals, businesses, property owners, and the environment, it is important that all stakeholders carefully consider land use and development plans to make risk-informed choices that protect the best interests of the public and the individual parties involved. Sharing appropriate information with state or local governments and emergency planners, which may include dispersion models or emergency response plans, may help stakeholders make risk-informed decisions.

Bringing a pipeline into a community is often a complicated endeavor that requires tremendous coordination and open communication among stakeholders to be successful. We greatly value the efforts of pipeline operators who spend the time and energy to make sure the process goes smoothly and are responsive to all parties involved. Thank you for your cooperation in this effort.

Sincerely,

Alan K. Mayberry
Associate Administrator for Pipeline Safety

NOTICE:

In accordance with Minnesota Rules, part 7829.0500 and Minnesota Statutes Chapter 13, Summit Carbon has designated portions of the report titled "Results of 2022-2023 Field Surveys for Listed Butterfly and Plant Species in Minnesota" as NONPUBLIC DATA – NOT FOR PUBLIC DISCLOSURE because it contains natural heritage information. Natural heritage information is nonpublic under Minn. Stat. § 84.0872. The Minnesota Department of Natural Resources also restricts its dissemination by license agreement. Given the need to include nonpublic information, Summit Carbon will prepare both Nonpublic and Public versions of "Results of 2022-2023 Field Surveys for Listed Butterfly and Plant Species in Minnesota."

1 Introduction

Summit Carbon Solutions, LLC (SCS) is proposing to develop the Midwest Carbon Express Project (the Project), a carbon capture, transportation, and sequestration project that will capture and transport carbon dioxide (CO₂) emissions from industrial facilities in Iowa, Minnesota, Nebraska, North Dakota, and South Dakota to a sequestration site in North Dakota, where the CO₂ will be safely and permanently stored. Construction of the Project will involve approximately 2,000 miles of 4-inch to 24-inch pipelines.

SCS is preparing for Project permitting and construction with support from Merjent, Inc. (Merjent) for the Project's environmental review efforts in Minnesota. SCS and Merjent have been coordinating with the Minnesota Department of Natural Resources (MDNR) regarding potential occurrences of sensitive species,¹ including field surveys for certain species in 2022 and 2023. On February 28, 2023, Merjent submitted a report entitled *Results of 2022 Field Surveys for Listed Butterfly and Plant Species in Minnesota*. Merjent then completed additional field surveys in 2023. This current report combines the previously reported results of the 2022 field surveys² with the new results of the 2023 field surveys. The surveys have been conducted along the Project's Minnesota pipeline segments (shown on the map in Figure 1 and listed in Table 1 with their associated counties and year(s) of survey). The 2023 field work was limited to the MNL-304A and MNL-304B laterals.

Table 1: Pipeline Segments in Minnesota and Associated Counties

Pipeline Segment ID	Counties	Year(s) When Survey Locations Were Identified
MNL-321 ^a	Otter Tail, Wilkin	2022
MNL-337	Chippewa, Kandiyohi, Renville	N/A (no survey locations identified)
MNL-303	Chippewa, Redwood, Renville, Yellow Medicine	2022
MNL-304A ^b	Jackson	2022, 2023
MNL-304B	Cottonwood	2022, 2023
MNL-305 ^c	Martin	2022
^a Prior communication with MDNR has referred to this as the "Otter Tail to Wilkin Project."		
^b Prior communication with MDNR has referred to this as the "Jackson County Project."		
^c Prior communication with MDNR has referred to this as the "Martin County Project."		

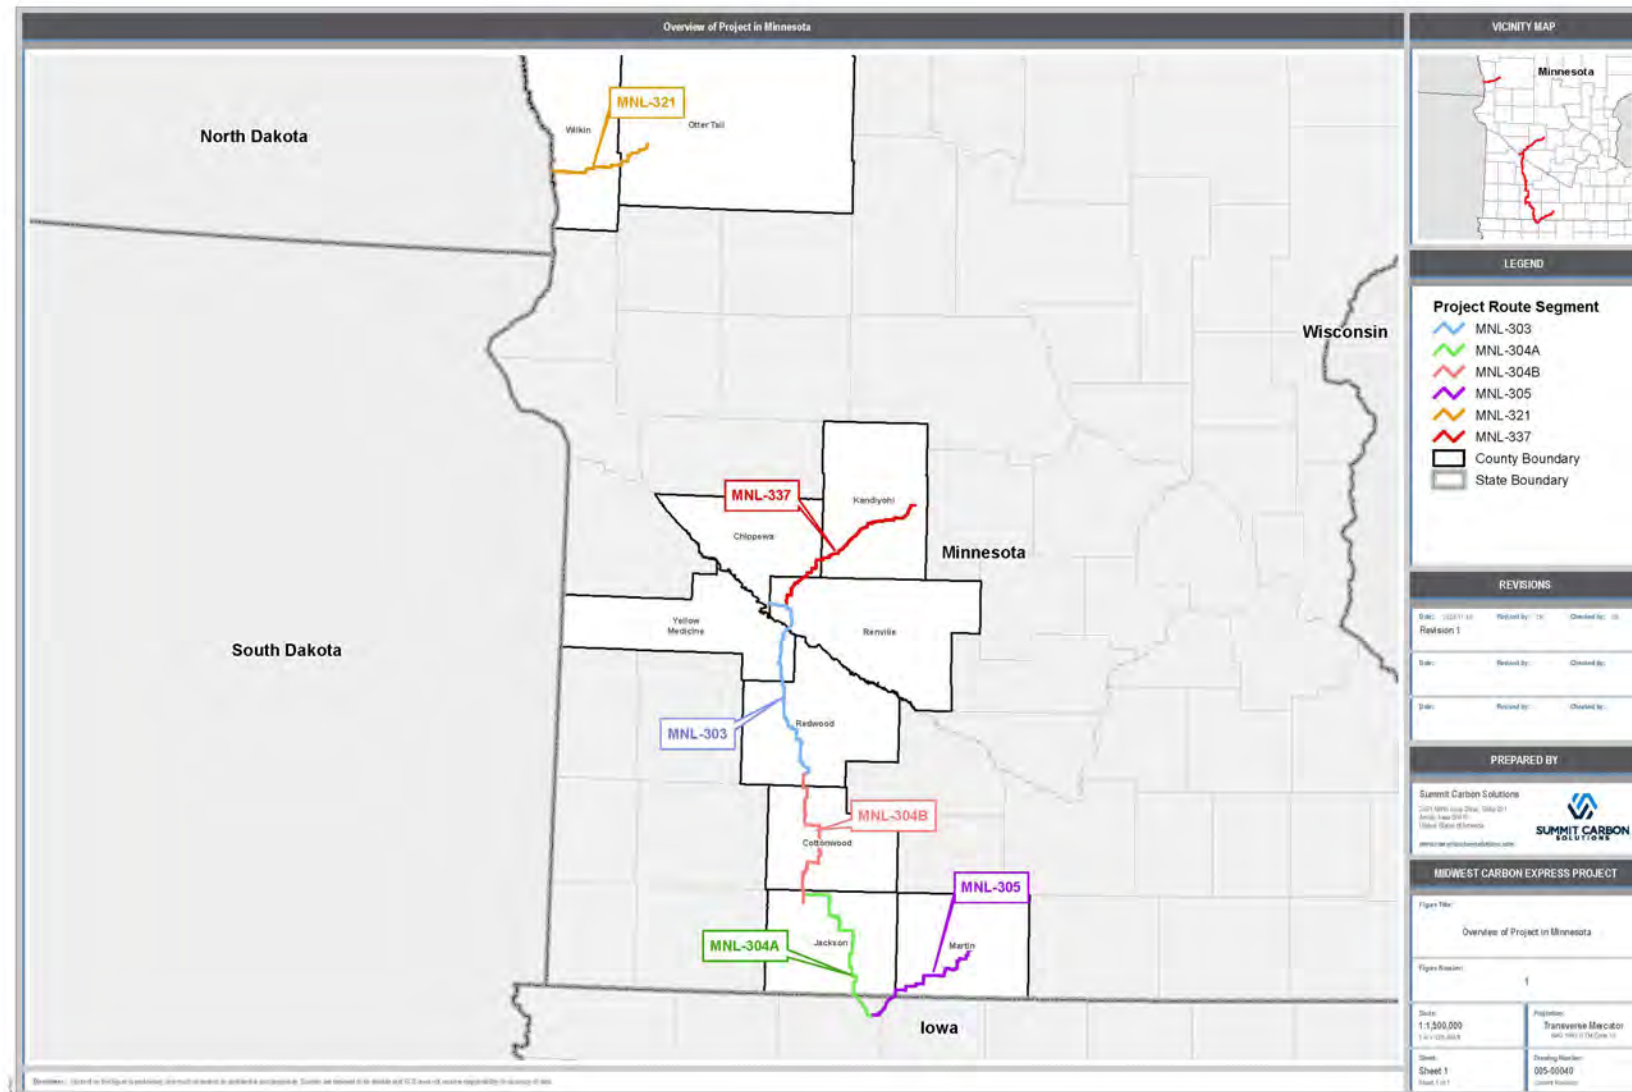

In both 2022 and 2023, plant surveys targeted species that are state-listed in Minnesota as special concern, threatened, or endangered and for which suitable habitat may occur in or near the environmental survey area. Plant species on the MDNR watch list according to MNTaxa³ were also to be documented if observed.

¹ SCS submitted a letter to MDNR on April 5, 2022, requesting consultation regarding sensitive species in Minnesota's Natural Heritage Information System database and providing its proposed survey protocol for sensitive plant species in the vicinity of the Project. MDNR responded on May 13, 2022, with approval of SCS's protocol, which was followed to obtain the results reported here. SCS submitted a protocol again on May 17, 2023, with the same content as in 2022 except for revised locations of the sites to be surveyed. The plant survey methodology was the same in both years.

² Sites that were surveyed in 2022 and included in the 2022 report but are no longer within the Project's environmental survey area are not included here except as footnotes in Attachments A-D.

³ MDNR watch-list status was obtained from http://www.dnr.state.mn.us/eco/mcbs/plant_lists.html.

Figure 1: Overview of Project in Minnesota

Additionally, through a parallel coordination process with the U.S. Fish and Wildlife Service (USFWS), four federally listed species were determined to warrant field habitat assessments (Table 2).⁴

Table 2: Federally Listed Species Targeted for Survey in Minnesota

Species	Federal Status	Minnesota Status	Survey Year(s)
Dakota Skipper (<i>Hesperia dacotae</i>)	Threatened	Endangered	2022
Poweshiek Skipperling (<i>Oarisma poweshiek</i>)	Endangered	Endangered	2022
Prairie Bush Clover (<i>Lespedeza leptostachya</i>)	Threatened	Threatened	2022, 2023
Western Prairie Fringed Orchid (<i>Platanthera praeclara</i>)	Threatened	Endangered	2022, 2023

All four species in Table 2 are also state-listed in Minnesota. Although the butterfly species were not targeted as part of SCS's 2022 correspondence with MDNR regarding survey protocols, results of 2022 butterfly habitat assessments are reported here due to the species' state status. In 2023, surveys for three additional state-listed butterfly species at one site were added to the scope of field work: Ottoe Skipper (*Hesperia ottoe*), state-listed endangered; Iowa skipper (*Atrytone arogos iowa*), state-listed special concern; and regal fritillary (*Argynnis idalia*), state-listed special concern. These three species are not federally listed.

2 Butterfly Survey Methods

Merjent worked with qualified biologists at Midwest Natural Resources, Inc. (MNR) to identify and assess habitat within the Project's environmental survey area in Minnesota for the Dakota skipper and Poweshiek skipperling (in 2022) and for the Ottoe skipper, Iowa skipper, and regal fritillary (in 2023). All of the Lepidoptera species targeted for field survey are inhabitants of native prairie remnants.

In 2022, MNR conducted a desktop assessment to identify areas of potentially suitable habitat for the Dakota skipper and Poweshiek skipperling within the Project footprint and then completed on-the-ground surveys to evaluate those areas further. Where suitable habitat was present as determined by the field surveys, MNR conducted occupancy surveys during the appropriate flight period. Methods for the desktop assessment and field surveys are described further below. MNR's biologists conducting the surveys, Otto Gockman and Jake Walden, are both MDNR-approved Prairie Skipper Surveyors and hold a Federal Recovery Permit for the Dakota skipper.

MNR did not conduct an additional desktop assessment in 2023, but Merjent identified relevant occurrences of the Ottoe skipper, Iowa skipper, and regal fritillary (one occurrence per species) in MDNR's Natural Heritage Information System (NHIS) dataset in a single location. The polygons representing the occurrences crossed or were near a portion of the Project footprint that was new to 2023. Given the overlap of the three NHIS occurrences in one area, Merjent determined that the area warranted a field survey to assess the potential for suitable habitat for the three species. Jake Walden of MNR conducted the field surveys.

⁴ USFWS did not specifically request field surveys for the Dakota skipper, but SCS included this species in the desktop and field effort because of its status as endangered in Minnesota and the similarity of its habitat requirements to the Poweshiek skipperling.

2.1 Desktop Assessment

For the 2022 surveys, MNR evaluated areas of potentially uncultivated grassland within the Project footprint in Minnesota by using the following publicly available data.

- Recent and historic aerial imagery from the National Agricultural Imagery Program and Google Earth
- National Land Cover Dataset (NLCD)
- Lidar elevation
- Natural Resources Conservation Service Soil Survey Geographic Database
- MDNR Native Plant Communities (NPCs), typically located within Minnesota Biological Survey (MBS) Sites of Biodiversity Significance
- Minnesota Railroad Right-of-way Prairies (ROW Prairies)

For 2023, Merjent determined that no further desktop assessment using the 2022 approach was needed.

2.2 Field Surveys

Between May 31 and June 15, 2022, MNR conducted field surveys for suitable habitat at the areas identified in the desktop assessment. The pedestrian surveys involved evaluating the quality of each habitat polygon based on the presence of larval-host species as well as nectar plants. Habitat documentation included: estimating cover of native graminoids, native forbs, non-native species (both graminoids and forbs), and trees and shrubs; documenting presence/absence of requisite prairie species and cover, where applicable; and taking representative photographs at each location.

MNR conducted occupancy surveys for the Dakota skipper and Poweshiek skipperling, where indicated by the June field habitat assessments, on July 3, 6, and 9, 2022. Occupancy survey methods were based on the Dakota Skipper North Dakota Survey Protocol, prepared by the USFWS Mountain-Prairie Region in 2018 and used at the request of USFWS. MNR's methodology followed the specifications in that document for survey frequency and duration, timing and environmental conditions, phenological indicators, and other aspects. MNR consulted with MDNR and USFWS about the appropriate window for the species' flight periods, based on 2022 phenology in the relevant portion of the state (late June through mid-July, accordingly).

Using the same field methods as in 2022, MNR conducted an initial field habitat assessment for the Ottoe skipper, Iowa skipper, and regal fritillary on June 2, 2023, where the Project footprint intersected NHIS occurrence data. MNR then conducted occupancy surveys at suitable habitat identified within the Project footprint on July 15, 17, and 20, 2023.

3 Plant Survey Methods

Similar to the approach taken for butterflies, in 2022 and 2023 Merjent conducted a desktop assessment to identify areas of potentially suitable habitat for state-listed plants within the Project footprint. The assessment considered all state-listed plant species, including the two federally listed species in Table 2. Merjent's Andy Kranz, a MDNR-approved botanist, then carried out field surveys. Methods for the desktop assessment and field surveys are described further below.

3.1 Desktop Assessment

In 2022 and 2023, Merjent identified the areas to be surveyed in the field by reviewing NHIS data and public data sources. Where features from the sources listed below overlapped the Project environmental survey area (or were within 1 mile, for NHIS occurrences), Merjent considered the location to have potentially suitable habitat for the two federally listed plant species and/or for other state-listed species that may occur in the Project vicinity.

- NHIS Element Occurrences of rare plants within a 1-mile radius, where potentially suitable habitats were visible within the environmental survey area on aerial imagery⁵
- Other potentially suitable habitats visible on aerial imagery, such as potential fens, sites with aquatic features, or other aerial signatures that were unique relative to the surrounding area
- MBS sites (with a biodiversity significance ranking of moderate, high, or outstanding)⁶
- NPCs⁷
- ROW Prairies⁸

Western prairie fringed orchids and prairie bush clovers both inhabit native prairie remnants, with the orchid preferring wet-mesic prairie types and the clover preferring dry-mesic prairie types. Sites with the potential for any native prairie types were flagged for field survey. Wooded NPCs were mostly absent in the Project environmental survey area.

3.2 Field Surveys

The field surveys had three objectives: (1) to determine whether any state-listed plants were present within the Project environmental survey area; (2) to assess, regardless of survey timing, the habitat suitability for the western prairie fringed orchid and/or prairie bush clover at each site; and (3) if possible, depending on survey timing, to document whether any western prairie fringed orchid and/or prairie bush clover individuals were present. According to MDNR, the optimal identification window for the western prairie fringed orchid is between late June and late July (when they are flowering), and the optimal window for the prairie bush clover is mid-August through September (when they are producing fruit).

Surveys in 2022 were conducted on June 6, 7, and 8; on July 9; and on September 1, 2, 22, 23, and 24. Surveys in 2023 were conducted on June 12, June 13, and August 7.

Where western prairie fringed orchid habitat was present, it was rated according to the following criteria. The criteria were developed in coordination with USFWS and used in field habitat assessments for the same species in the Nebraska, North Dakota, and South Dakota portions of the Project footprint.⁹

- Western prairie fringed orchid habitat criteria:
 - Excellent (A) - completely native tall-grass/lowland/mesic prairie, appears to be mowed or lightly grazed every year or two. Suitable hydrology present.
 - Good (B) - primarily native tall-grass/lowland/mesic prairie and non-native vegetation, appears to be hayed or lightly grazed every year or two. Suitable hydrology present.
 - Fair (C) - mix of native tall-grass/lowland/mesic prairie and non-native vegetation, appears to be hayed or lightly grazed approximately every year or two. Suitable hydrology present.
 - Poor (D) - primarily non-native vegetation with a minor native tall-grass/lowland/mesic prairie component, appears to be hayed or lightly grazed every year or two, or is a mix of native and non-native plant species but heavily grazed and/or sprayed to reduce broadleaf species. Suitable hydrology present.

⁵ Merjent used NHIS data dated 2/15/2022 through MDNR license agreement 1066.

⁶ Merjent used MBS data (obtained from MN Geospatial Commons) with a content date of 2/16/2023.

⁷ Merjent used NPC data (obtained from MN Geospatial Commons) with a content date of 2/10/2023.

⁸ Merjent used ROW Prairie data (obtained from MN Geospatial Commons) with a content date of 7/27/2017.

⁹ The field habitat assessments outside of Minnesota are not reported here. A USFWS-approved set of western prairie fringed orchid habitat criteria is described in the 2022 Western Prairie Fringed Orchid Study Plan, prepared by WESTECH Environmental Services, Inc., on March 4, 2022, for Perennial Environmental Services, which is providing support to SCS for the Project's environmental review in Nebraska, North Dakota, and South Dakota.

4 Results

The field results are provided in Attachments A, B, C, and D, with each attachment containing: (a) a table that summarizes the presence or absence of findings for surveyed areas along each pipeline segment; (b) an overview map that shows the survey sites for that pipeline segment; and (c) site-specific maps where habitats and/or individuals were documented (all as outlined below). There were no locations along the MNL-337 segment that warranted survey.

- MNL-321 (Attachment A): Table A, Figures A-1 (overview map) and A-2 (site-specific map)
- MNL-303 (Attachment B): Table B, Figure B-1 (overview map)
- MNL-304 (Attachment C):
 - MNL-304A: Table C1, Figures C-1 (overview map) and C-2 through C-5 (site-specific maps)
 - MNL-304B: Table C2, Figure C-6 (overview map)
- MNL-305 (Attachment D): Table D, Figures D-1 (overview map) and D-2 (site-specific map)

The following abbreviations are used in the attachments.

- Dakota skipper (DASK)
- Poweshiek skipperling (POSK)
- Prairie bush clover (PBCL)
- Western prairie fringed orchid (WPFO)

5 Reporting

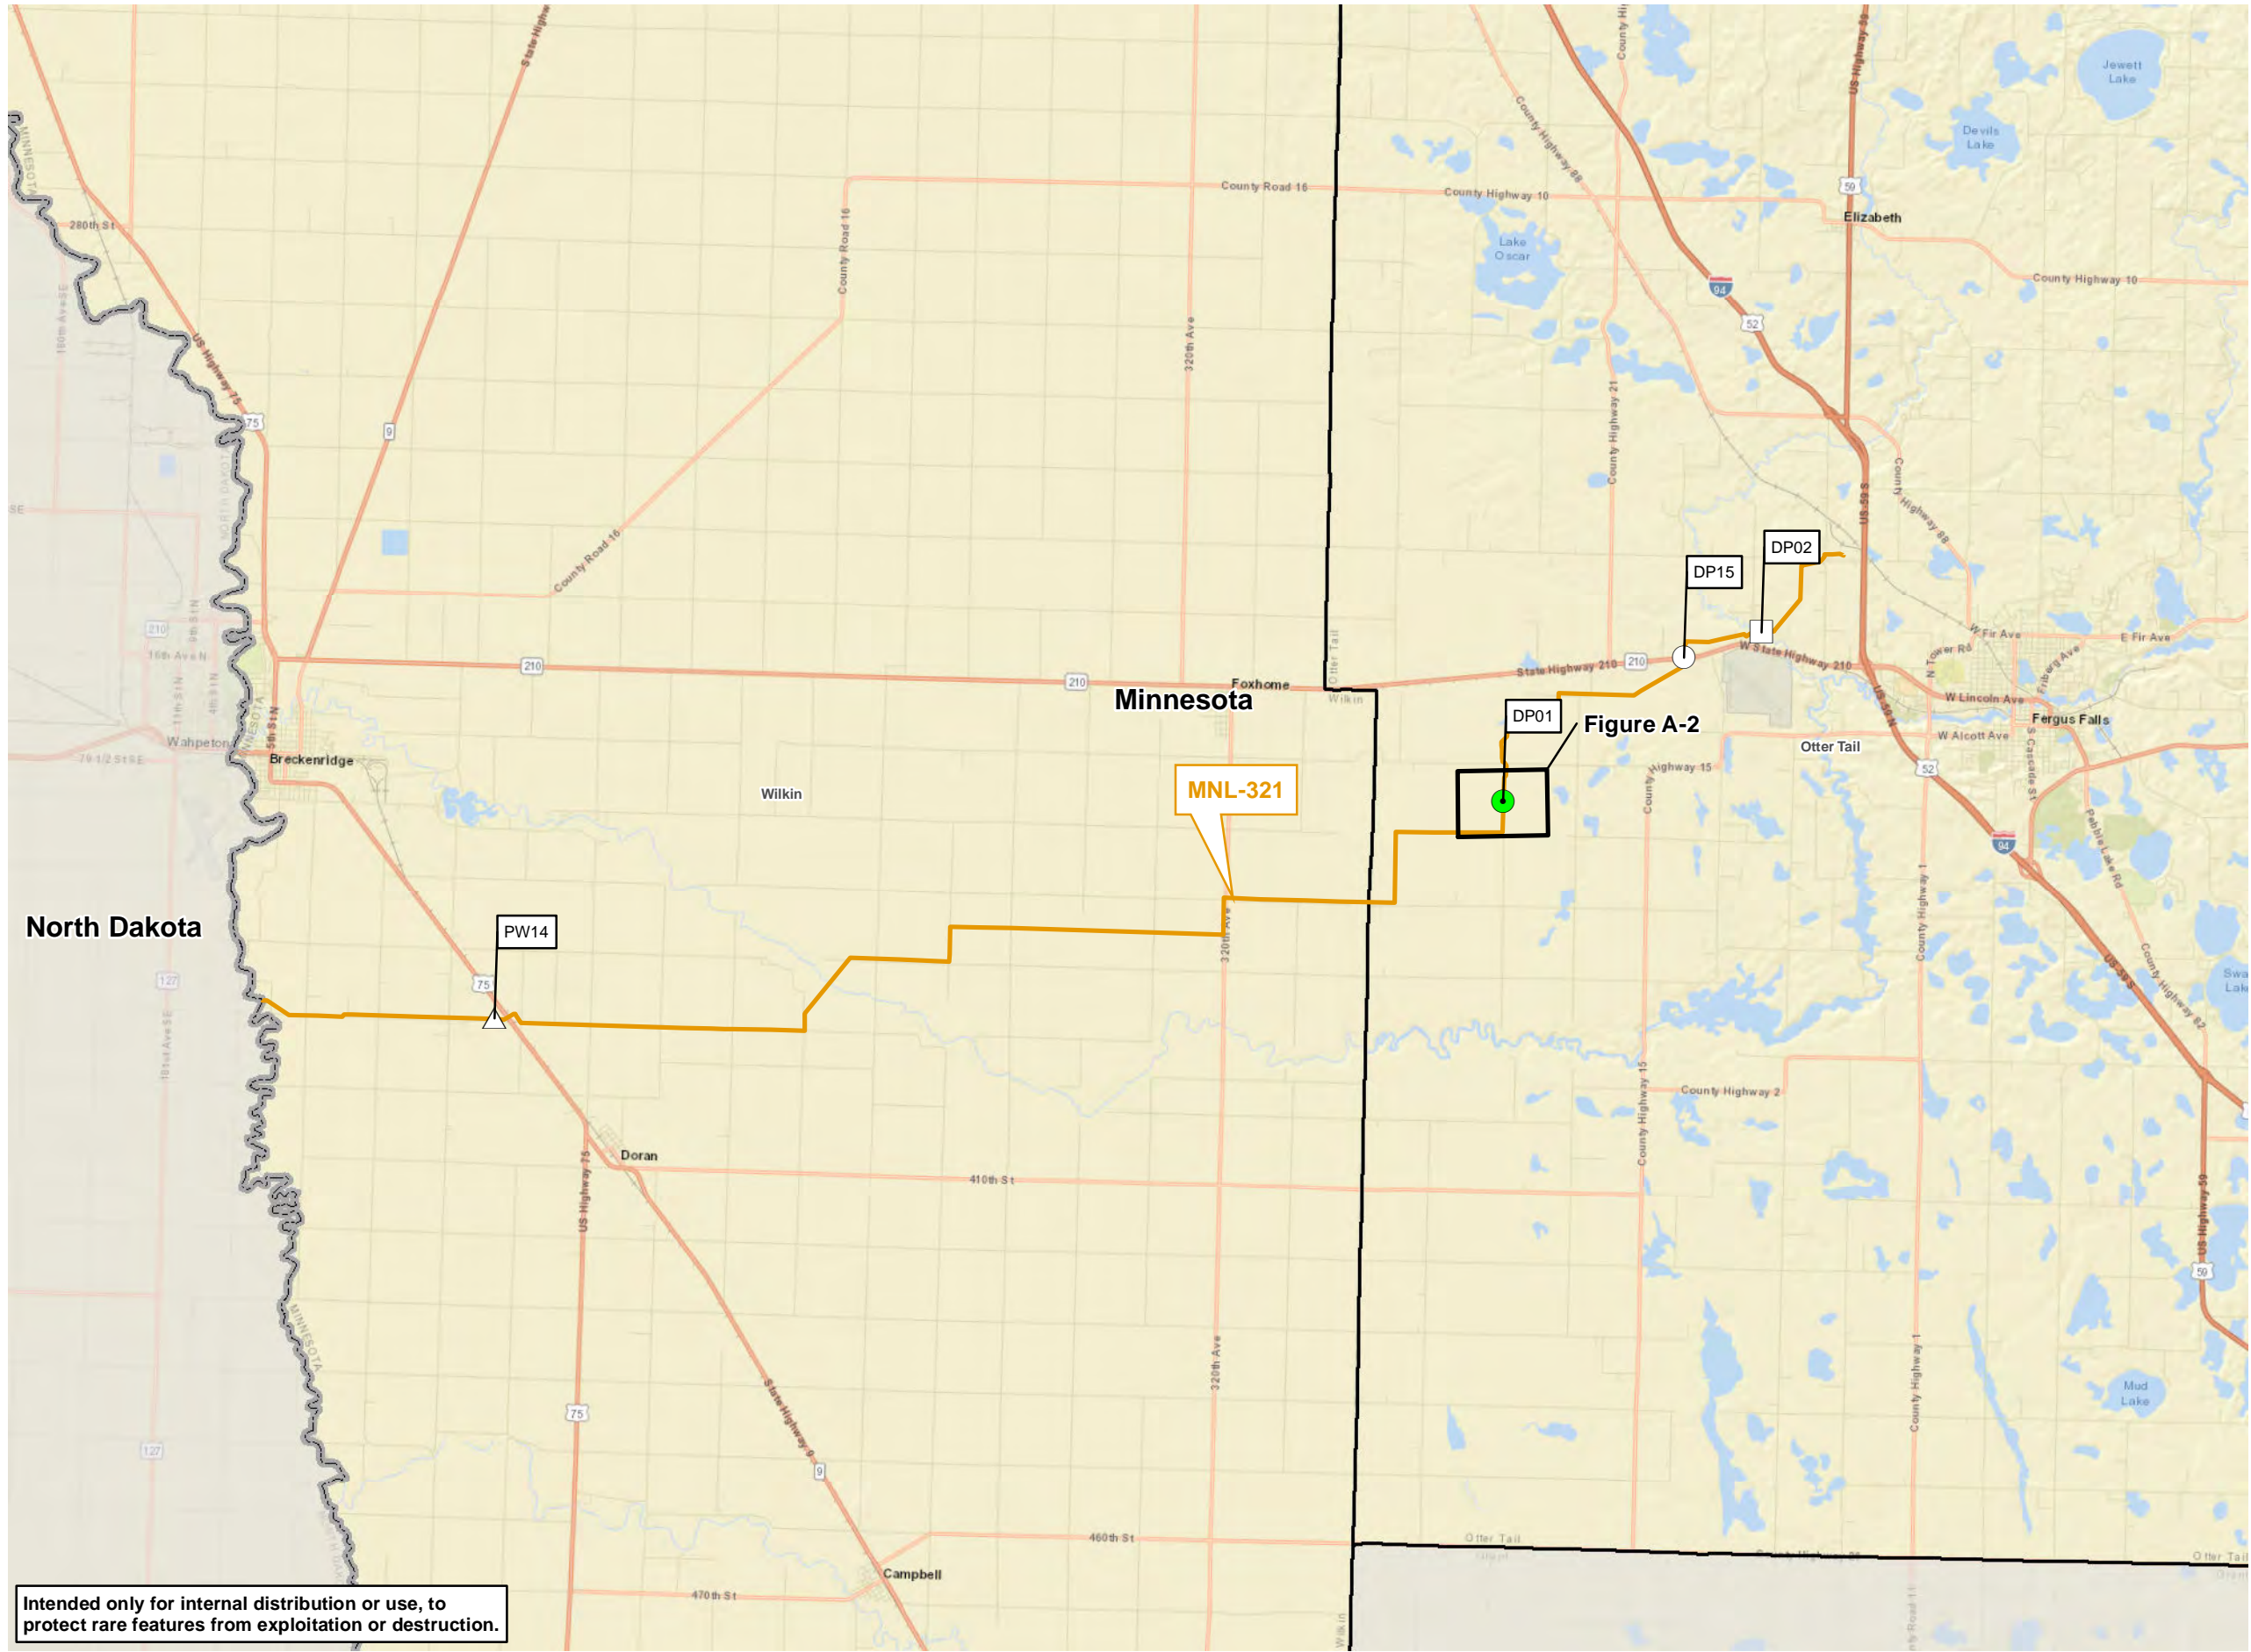

Per MDNR's Rare Species Survey Reports Memo (2012) (Attachment E), Merjent's botanist completed an electronic submission of the 2022 survey findings that must be reported for NHIS purposes (i.e., documented occurrences of state-listed species) on February 22, 2023. Welby Smith at MDNR confirmed the identification of the state-listed species reported in 2022. Despite additional survey locations being identified in 2023, there were no findings of state-listed species to report in 2023. The NHIS documentation and the species identification confirmation from 2022 are in Attachment F. The plant survey methods used to obtain the results reported here are consistent with MDNR's Guidance on Documenting and Collecting Rare Plants (2018) (Attachment G).

Attachment A – MNL-321 Survey Sites and Results

Table A: Survey Sites and Outcomes for MNL-321, Listed East to West (Figure A-1)

Site ID	Targeted for Listed Butterfly Surveys? (Year)	Butterfly Survey Outcome	Targeted for Listed Plant Surveys? (Year)	Plant Survey Outcome	Site-specific Map
DP02	Yes (2022)	No habitat/no individuals.	No	N/A (surveyed only for DASK/POSK)	N/A
DP15	Yes (2022)	No habitat/no individuals.	Yes (2022)	No habitat/no individuals.	N/A
DP01 ^a	Yes (2022)	Suitable DASK/POSK habitat was present. No DASK or POSK individuals were observed during occupancy surveys.	Yes (2022)	Suitable WPFO habitat was present (rank C/D). Small white lady's-slipper (<i>Cypripedium candidum</i> ; state-listed special concern) was present. Merjent's botanist documented 17 individuals within the environmental survey area.	Figure A-2
PW14	No	N/A (surveyed only for plants)	Yes (2022)	No habitat/no individuals.	N/A

^a DP01 did not warrant survey again in 2023 but is within the May 2023 ESA as shown on Figure A-2.

Intended only for internal distribution or use, to protect rare features from exploitation or destruction.

DP08	Yes (2022)	No habitat/no individuals.	No	N/A (surveyed only for DASK/POSK)	N/A

¹⁰ The following ten sites were included in the 2022 report but are not listed in the table here, because they are no longer within the Project environmental survey area: DP04, DP05, DP06, PW13, DP19, PW18, DP07, PW17, DP18, and DP10. All sites with a DP prefix were surveyed for DASK/POSK habitat, with none found. All sites with a PW prefix, plus DP19, DP07, and DP18, were surveyed for PBCL/WPFO habitat and state-listed plants. The finding at PW13, DP19, PW18, PW17, and DP18 was no habitat/no individuals. At DP07, suitable PBCL and WPFO habitat was present (rank D for WPFO), but Merjent's botanist did not find individuals of PBCL, WPFO, or any other state-listed plants within the environmental survey area. Four sites (PW19, PW20, PW21, and DP08) were newly identified in 2023 but could not be accessed for survey.

Intended only for internal distribution or use, to protect rare features from exploitation or destruction.

Attachment E – MDNR's Rare Species Survey Reports Memo (2012)

Division of Ecological and Water Resources

TO: Endangered and Threatened Species Surveyors

FROM: Lisa Joyal, Endangered Species Review Coordinator

Phone: (651) 259-5109

e-mail: lisa.joyal@state.mn.us

RE: Rare Species Survey Reports

The Minnesota Department of Natural Resources' Division of Ecological and Water Resources (DNR) relies upon the results of endangered and threatened species surveys to conserve these species through its conservation, management, environmental review, and permitting responsibilities. When surveys for rare species are requested as part of the environmental review process, the DNR makes every effort to coordinate closely with surveyors to ensure that survey results are reliable. High quality survey data enables the DNR's to uphold Minnesota's endangered species law (*Minnesota Statutes*, section 84.0895) and associated rules (*Minnesota Rules*, part 6212.1800 to 6212.2300 and 6134).

As such, for projects associated with environmental review, we request that survey proposals be submitted to the DNR before any survey work is initiated. This process is an attempt to avoid any potential delays or other problems due to incomplete list of target species or inappropriate survey protocol. Surveys should primarily target the species mentioned in the Natural Heritage letter, but should also target any other state-listed species that are likely to be found in the habitat in question. Please refer to the DNR Rare Species Guide (<http://www.dnr.state.mn.us/rsg/index.html>) for further information on the rare species that can be found in a particular habitat, and for the habitat and phenology of each targeted species. The DNR Rare Species Guide is the state's authoritative reference for Minnesota's endangered, threatened, and special concern species. It is a dynamic, interactive source that can be queried by county, ECS subsection, watershed, or habitat. Final survey results should also be submitted to the DNR.

Please include the following information in the Rare Species Survey Proposals and Survey Results:

- Purpose of the survey
- List of the targeted species
- Qualifications of the surveyor(s) and his or her experience working with the targeted species
- If applicable, a copy of the collection permit issued by the DNR.
- Survey date(s) and methodology
- Map (and GIS shapefile if large project area) of areas (to be) surveyed or assessed for habitat suitability
- Locations and number of individuals for any state-listed species
- State type of documentation for each listed species (e.g., photograph or collected specimen)
- A completed Rare Feature Reporting Form for each state-listed or tracked species, or a statement that the data has been submitted electronically
- Any associated specimens and electronic data should be submitted with the Survey Results

Survey Proposals and Survey Results may be sent electronically to the email address listed above or mailed to the following address:

Lisa Joyal
DNR Division of Ecological and Water Resources
500 Lafayette Road, Box 25
St. Paul, MN 55155

Thank you for your interest in conducting rare species surveys in Minnesota.

I am submitting data for observations of three rare plant populations in Minnesota documented during field surveys in 2022. The surveys were conducted to assess habitat for federally threatened plants. The surveys also documented plants that are state-listed in Minnesota as special concern, threatened, or endangered.

I observed one population each of *Arnoglossum plantagineum*, on June 6, 2022, and *Asclepias sullivantii*, on July 9, 2022, in the City of Fairmont, Martin County, Minnesota. These populations were observed during surveys as part of the Summit Carbon Solutions, LLC Martin County Project. The populations were located within the same parcel, owned by Fairmont Economic Development Authority.

I also observed one population of *Cypripedium candidum* on June 8, 2022, in Orwell Township, Otter Tail County. This population was observed during surveys as part of the Summit Carbon Solutions, LLC Otter Tail to Wilkin Project and is located on the property of Ethel Maack.

Please see the attached rare plant observation data spreadsheet and shapefiles for details.

Specimens of *A. plantagineum* and *A. sullivantii* were collected under DNR Special Permit #23226. This permit is assigned to Otto Gockman who was also conducting field work on the project. Correct identification was confirmed by Welby Smith and the specimens will be submitted to the University of Minnesota Herbarium.

Please contact me with any questions or concerns.

Respectfully submitted,

Andy Kranz

Hi Welby,

I have two specimens to submit, *Arnoglossum plantagineum* and *Asclepias sullivantii*, from the same railroad ROW in Martin County. These were collected in the course of 2022 Merjent work. I made collections at Otto's suggestion, under his permit number (he was working on the same project). Can

I bring these to you to verify ID?

I've attached some photos as well as herbarium labels and the NHIS data sheet.

Attachment G – MDNR’s Guidance on Documenting and Collecting Rare Plants (2018)

Guidance on Documenting and Collecting Rare Plants

DNR Division of Ecological and Water Resources

February 2018

Please refer to the following guidance if you will be submitting records for entry into the DNR's Natural Heritage Information System (NHIS). All botanical surveys conducted for environmental review or permitting purposes should follow this guidance.

Before Going in the Field

- Review the [current list of state-listed species](#) so you will know which species are rare.
- Check the Rare Features Database (see [How to Obtain Natural Heritage Data](#)) and, if applicable, the records of other public land managers to see if there are known occurrences of rare plants within your work or study area.
- Familiarize yourself with critical identifying features of species likely to be collected. This might include a visit to a herbarium to review previous collections of a plant species.
- Obtain the plant spreadsheet template for data entry purposes. Review this spreadsheet to familiarize yourself with the type of information that should be collected. The Rare Plant Observations spreadsheet template is available under "Submitting Data" on the [NHIS Website](#).
- Obtain a permit if you plan to collect specimen vouchers of state-listed endangered or threatened species. Minnesota's endangered species law (*Minnesota Statutes*, section 84.0895) and associated rules (*Minnesota Rules*, part 6212.1800 to 6212.2300 and 6134) prohibit the taking of threatened or endangered species without a permit. Please contact Richard Baker, Endangered Species Coordinator, at Richard.Baker@state.mn.us to request a permit.
- When required, obtain permits for collecting on public lands such as Scientific and Natural Areas, State Parks, and National Forests.
- Respect property owners' rights. Obtain permission from the private landowner or public land manager to 1) go on the land and 2) to collect plants.
- **Any surveys required through the DNR environmental review process must follow the standards contained in this Guidance.** Before initiating any such survey, the surveyor must receive approval of a project-specific survey plan from Lisa Joyal, Endangered Species Review Coordinator. Any proposed departure from the standards in the *Guidance* must be identified in the project-specific plan.

Specimen Collection

Most rare plant records in the DNR's Rare Features Database are documented with collected specimens deposited in credible herbaria. Records documented by standard herbarium collections in museums are strongly preferred over all other forms of documentation. A specimen of a rare plant often is sufficient if it includes a portion of the plant that allows positive identification of the species.

Under what circumstances should I collect a herbarium specimen?

- Collect state-listed endangered or threatened plants only if you have a permit. If you have unintentionally collected an endangered or threatened plant without a permit, the specimen should be submitted to the DNR as soon as is practical following the procedures described below, with a brief note attached that explains the circumstances.
- For new locations of a species, collect a specimen; in general, make no more than one collection of a particular species per 40 acres of habitat.
- For previously known populations of an endangered or threatened plant, consider collecting a new voucher if the DNR's Rare Features Database indicates that it has been more than thirty years since the last voucher was collected from the population.
- For any given species, collect only when distinguishing characters are present (usually flowers and/or fruits are necessary); if key characters are not present, mark the location and return at the appropriate time for collecting a specimen with distinguishing characteristics.
- For endangered or threatened vascular plants, collect a complete specimen (which includes roots) only when the population has more than 100 individuals.

- For populations of endangered or threatened vascular plants with fewer than 100 individuals, collect only the distinguishing portion of the plant (e.g., a portion of the inflorescence that has one or more flowers or a portion of the stem that has one or more leaves). A partial specimen might be inadequate to confirm the identification. In this case, supplement the partial collection with a close-up photograph that clearly shows the diagnostic features. Please note that in many cases photographs are not sufficient to confirm identification.
- For aquatic plants, collect a portion of the stem with leaves and fruits or flowers. Do not collect the roots. If you are unsure whether you have found a rare species, collect several specimens. Please note that in most cases photographs are not sufficient to confirm the identification of aquatic species. If your target search area is aquatic, please contact Welby Smith, DNR Botanist, at Welby.Smith@state.mn.us for additional guidance.
- For *Botrychium* spp., always collect a specimen of the above-ground portion of the plant, regardless of the apparent population size or the state status of the species.
- For mosses, liverworts, fungi and lichens, collect such that the viability of the population is maintained.

How do I make a proper collection? See General Guidelines for Collecting Vascular Plant Specimens on page 3.

Specimen Submission

- For quality control purposes, the identification of the specimen must be confirmed by a qualified second party before a record can be entered into the Rare Features Database.
- Send specimen(s) of state-listed species or suspected state-listed species directly to Welby Smith, DNR Botanist, for verification. Each specimen must have a label that meets the Bell Museum standards (see page 3). Do not submit unknown specimens unless you suspect that it is a state-listed species. If you are unsure of the species' identification, you can leave the space for the scientific name blank. Send specimens to:
 Welby Smith
 Minnesota Department of Natural Resources
 Division of Ecological Resources
 500 Lafayette Road, Box 25
 St. Paul, MN 55155
- DNR staff will complete verification or submit the specimen to an outside expert for annotation. Following verification, the DNR will donate specimens to the University of Minnesota Herbarium, a division of the [Bell Museum of Natural History](#). Save response from the DNR and submit with data.

Data Submission

- Follow the directions and templates under "Submitting Data" on the [NHIS Website](#).
- Document *all* state-listed endangered, threatened, or special concern species encountered. Include type of documentation for each record (e.g., photograph or specimen).
- Submit data electronically as a spreadsheet with an accompanying shapefile. Use the Rare Plant Observations spreadsheet template available under "Submitting Data" at [NHIS Website](#).
- **Important!** *Ensure that the unique identifier for each record is the same in the shapefile, the spreadsheet, the report's tables and figures, and the information submitted with the specimens.*
- Submit cover sheet, survey report, GIS shapefile, spreadsheet, and email verifying specimen identification to Reports.NHIS@state.mn.us.

How will my records be used to protect rare plants?

- Conservation planning at local, state and regional levels.
- Environmental review of development projects.
- Research about life history.
- Revisions to the state list of endangered, threatened and special concern species.
- Legal challenges related to protected species locations are possible. Properly vouchered specimens are often critical in the protection of rare plant populations in these cases.

Questions?

- **Regarding permits:** Contact Rich Baker at Richard.Baker@state.mn.us or 651-259-5073.
- **Regarding specimens:** Contact Welby Smith at Welby.Smith@state.mn.us or 651-259-5142.
 or Hannah Texler at Hannah.Texler@state.mn.us or 651-259-5048.
- **Regarding data submittal:** Contact Karen Cieminski at Karen.Cieminski@state.mn.us or 651-259-5081.
- **Regarding environmental review process:** Contact Lisa Joyal at Lisa.Joyal@state.mn.us or 651-259-5109.

General Guidelines for Collecting Vascular Plant Specimens*

*For mosses, liverworts, algae, fungi and lichens, please contact the [University of Minnesota Herbarium](#) for collection guidelines.

1. **Equipment:** Plant press, straps (2), felt blotters, ventilators (corrugated boards), and newspaper. Also, a knife or other tool for cutting and digging and a notebook of standardized form for recording field data. The press can be made from $\frac{3}{4}$ " plywood cut 12" x 18" (2 pieces); the ventilators can be cut from discarded "cardboard" boxes, also 12" x 18" (the corrugations should run the short direction). The blotters can be obtained from a stationery store.
2. **Preparation:** Once the specimen is found, it is necessary to determine what portion of the plant will be collected. A complete collection includes the entire plant with roots, but for purposes of conservation, the roots of rare species should not be collected if the population consists of fewer than 100 individuals. For most species, such as orchids, a single flower is enough for purposes of identification. Other species, e.g., sedges, usually require the complete aboveground stem with mature fruit. Specimens of trees and shrubs should include a twig with mature leaves and flowers and/or fruit. Specimens that do not show diagnostic features cannot be identified and are worthless. If only a portion of the plant is collected, it is important to record a description of the entire plant.

Before collecting plants, it is a good idea to check with the curator of the herbarium where the specimen will be deposited. Some herbaria may not accept a partial specimen unless it has special significance (e.g., a new location for an endangered species).

3. **Pressing and processing specimens:** The freshly collected specimen is placed within the sheet of folded newspaper with the leaves, flowers, etc. in a natural position, but clearly showing the diagnostic features. The paper is placed between two sheets of felt blotters, which are themselves placed between two corrugated ventilators. It is then put within the press, which is tightened with the straps (or ropes). Several specimens can be put in a single press by layering the blotters and ventilators. Commercial plant presses are slightly larger than herbarium paper so the specimens should not fill the plant press side to side. Also, be sure to leave room for a label in the lower right portion. The press must then be put in a warm dry place until the plants are dry. A simple plant drier that uses heat rising from a light bulb works well, but is not essential. The blotters should be changed every day until the specimen is dry. If a specimen does not dry within 4-5 days, it will likely begin to decompose. When the specimen is dry, it should be taken from the press, but kept within the folded newspaper for protection.

A label (see example below) must be prepared before the specimen can be sent to a herbarium. The label should be on acid-free, archival quality paper. We suggest that you use labels that are 2 $\frac{3}{4}$ x 4 $\frac{1}{4}$ inches in size, but other labels not to exceed 3 x 5 inches will be acceptable. At a bare minimum, the label must contain the name of the species, location of collection, description of habitat, name of collector, and date of collection. The label should also include latitude and longitude coordinates and/or UTM coordinates, and, if a permit was required, the permit number. Providing a label is the responsibility of the collector, not the herbarium or the DNR. A specimen without a label will not be accepted by a herbarium.

After the label is prepared, it should be put with the specimen inside the folded newspaper, which may be held between two corrugated ventilators for rigidity. The herbarium will mount the specimen and label on a stiff sheet of paper and accession it into their collection.

The University of Minnesota Herbarium, a division of the Bell Museum of Natural History, houses the largest collection documenting Minnesota's plant diversity and is the primary repository for the DNR's Minnesota Biological Survey. Additional [guidance on collecting rare plants for museum specimens](#) can be found on the University of Minnesota Herbarium website.

Plants of Scott County, Minnesota, USA

Silphium integrifolium Michx. var. *integrifolium*

3 miles west of Jordan in north half of quarter-quarter section.

Approximately 100 plants in wet to wet-mesic prairie on terrace within the Minnesota River Valley. In heavily grazed pasture dominated mostly by *Spartina pectinata* and *Agrostis stolonifera*. Soils range from black muck with marl concretions to silt loam. Site has been compacted by grazing. Glacial erratics common. Associated with *Carex stricta*, *Pycnanthemum virginianum*, *Lobelia siphilitica*, *Lysimachia quadriflora*, *Aster puniceus*.

MINNESOTA BIOLOGICAL SURVEY
MINNESOTA DEPARTMENT OF NATURAL RESOURCES

NOTICE:

In accordance with Minnesota Rules, part 7829.0500 and Minnesota Statutes Chapter 13, Summit Carbon has designated portions of the report titled "Results of 2022 Field Surveys for Listed Butterfly and Plant Species in Minnesota" as NONPUBLIC DATA – NOT FOR PUBLIC DISCLOSURE because it contains natural heritage information. Natural heritage information is nonpublic under Minn. Stat. § 84.0872. The Minnesota Department of Natural Resources also restricts its dissemination by license agreement. Given the need to include nonpublic information, Summit Carbon will prepare both Nonpublic and Public versions of "Results of 2022 Field Surveys for Listed Butterfly and Plant Species in Minnesota."

Results of 2022 Field Surveys for Listed Butterfly and Plant Species in Minnesota

WPFO	western prairie fringed orchid

1 Introduction

Summit Carbon Solutions, LLC (SCS) is proposing to develop the Midwest Carbon Express Project (the Project), a carbon capture, transportation, and sequestration project that will capture and transport carbon dioxide (CO₂) emissions from industrial facilities in Iowa, Minnesota, Nebraska, North Dakota, and South Dakota to a sequestration site in North Dakota, where the CO₂ will be safely and permanently stored. Construction of the Project will involve approximately 2,000 miles of 4-inch to 24-inch pipelines.

SCS is preparing for Project permitting and construction with support from Merjent, Inc. (Merjent) for the Project's environmental review efforts in Minnesota. SCS and Merjent have been coordinating with the Minnesota Department of Natural Resources (MDNR) regarding potential occurrences of sensitive species.¹ This report describes field surveys conducted in 2022 along the Project's five Minnesota pipeline segments (shown on the map in Figure 1 and listed in Table 1 with their associated counties).

Table 1: Pipeline Segments in Minnesota and Associated Counties

Pipeline Segment ID	Counties
MNL-321	Otter Tail, Wilkin
MNL-337	Chippewa, Kandiyohi, Renville
MNL-303	Chippewa, Redwood, Renville, Yellow Medicine
MNL-304	Cottonwood, Jackson, Redwood
MNL-305	Martin

The surveys targeted plants that are state-listed in Minnesota as special concern, threatened, or endangered and for which suitable habitat may occur in or near the environmental survey area. Species on the MDNR watch list according to MNTAXA² were also documented when observed. Additionally, through a parallel coordination process with the U.S. Fish and Wildlife Service (USFWS), four federally listed species were determined to warrant field surveys (Table 2).³ All four species, two butterflies and two plants, are also state-listed in Minnesota. Although the butterfly species were not targeted as part of SCS's correspondence with the MDNR regarding survey protocols, results of butterfly habitat assessments are reported here due to the species' state status.

Table 2: Federally Listed Species Targeted for Survey

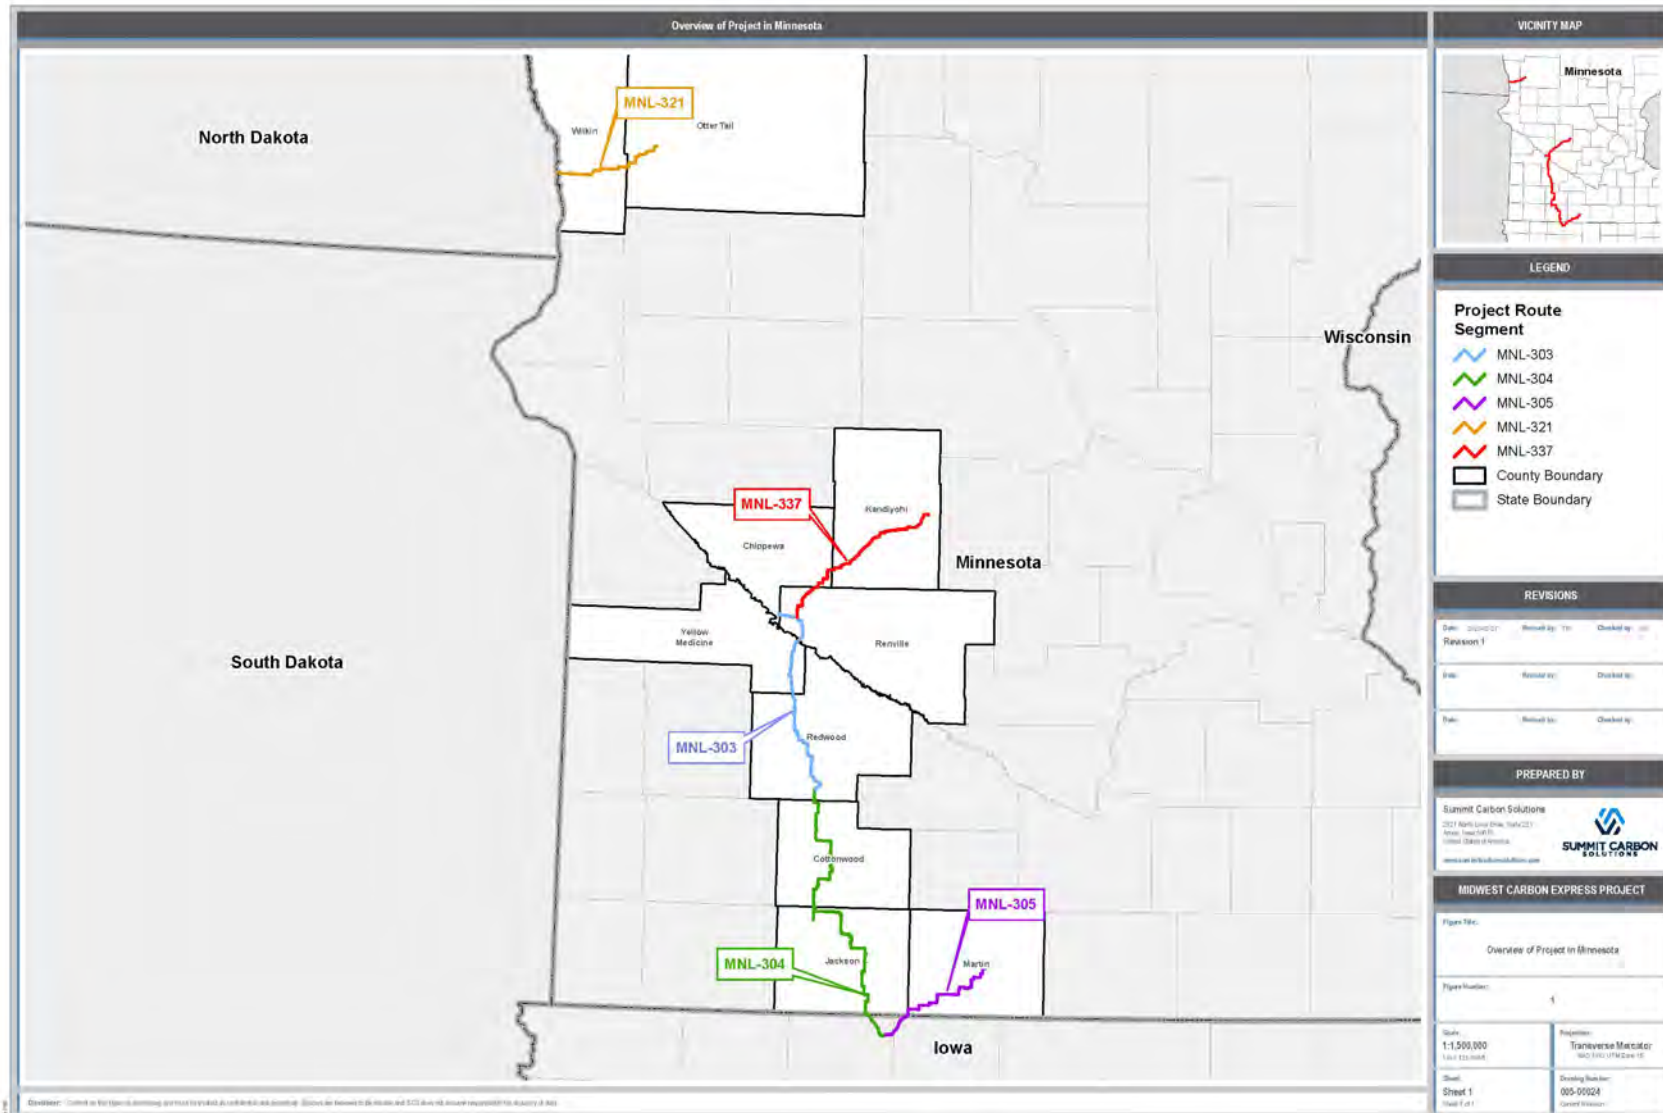

Species	Federal Status	Minnesota Status
Dakota Skipper (<i>Hesperia dacotae</i>)	Threatened	Endangered
Poweshiek Skipperling (<i>Oarisma poweshiek</i>)	Endangered	Endangered
Prairie Bush Clover (<i>Lespedeza leptostachya</i>)	Threatened	Threatened
Western Prairie Fringed Orchid (<i>Platanthera praeclara</i>)	Threatened	Endangered

¹ SCS submitted a letter to MDNR on April 5, 2022, requesting consultation regarding sensitive species in Minnesota's Natural Heritage Information System database and providing its proposed survey protocol for sensitive flora species in the vicinity of the Project. MDNR responded on May 13, 2022, with approval of SCS's protocol, which was followed to obtain the results reported here.

² MDNR watch-list status was obtained from http://www.dnr.state.mn.us/eco/mcbs/plant_lists.html.

³ USFWS did not specifically request field surveys for the Dakota skipper, but SCS included this species in the desktop and field effort because of its status as endangered in Minnesota and the similarity of its habitat requirements to the Poweshiek skipperling.

Figure 1: Overview of Project in Minnesota

2 Butterfly Survey Methods

Merjent worked with qualified biologists at Midwest Natural Resources, Inc. (MNR) to identify and assess habitat for the Dakota skipper and Poweshiek skipperling within the Project's environmental survey area in Minnesota. Both Lepidoptera species inhabit native prairie remnants. MNR conducted a desktop assessment to identify areas of potentially suitable habitat within the Project footprint and then completed on-the-ground surveys to evaluate those areas further. Where suitable habitat was present as determined by the field surveys, MNR conducted occupancy surveys during the 2022 flight period. Methods for the desktop assessment and field surveys are described further below. MNR's biologists conducting the surveys, Otto Gockman and Jake Walden, are both MDNR-approved Prairie Skipper Surveyors and hold a Federal Recovery Permit for the Dakota skipper.

2.1 Desktop Assessment

MNR evaluated areas of potentially uncultivated grassland within the Project footprint in Minnesota by using the following publicly available data.

- Recent and historic aerial imagery from the National Agricultural Imagery Program and Google Earth
- National Land Cover Dataset (NLCD)
- Lidar elevation
- Natural Resources Conservation Service Soil Survey Geographic Database
- MDNR Native Plant Communities (NPCs), typically located within Sites of Biodiversity Significance (SOBS)
- Minnesota Railroad Right-of-way Prairies (ROW Prairies)

2.2 Field Surveys

Between May 31 and June 15, 2022, MNR conducted field surveys for the areas identified in the desktop assessment. The pedestrian surveys involved evaluating the quality of each habitat polygon based on the presence of larval-host species as well as nectar plants. Habitat documentation included: estimating cover of native graminoids, native forbs, non-native species (both graminoids and forbs), and trees and shrubs; documenting presence/absence of requisite prairie species and cover, where applicable; and taking representative photographs at each location.

MNR then conducted occupancy surveys, where indicated by the June field habitat assessments, on July 3, 6, and 9, 2022. Occupancy survey methods were based on the Dakota Skipper North Dakota Survey Protocol, prepared by the USFWS Mountain-Prairie Region in 2018 and used at the request of USFWS. MNR's methodology followed the specifications in this document for survey frequency and duration, timing and environmental conditions, phenological indicators, and other aspects. MNR consulted with MDNR and USFWS about the appropriate window to target for the species' flight periods in Otter Tail County, based on this year's phenology (late June through mid-July, accordingly).

3 Plant Survey Methods

Similar to the approach taken for butterflies, Merjent conducted a desktop assessment to identify areas of potentially suitable habitat for state-listed plants within the Project footprint. The assessment considered all state-listed species, including the two that are also federally listed (see Table 2). Merjent's Andy Kranz, a MDNR-approved botanist, then carried out field surveys. Methods for the desktop assessment and field surveys are described further below.

3.1 Desktop Assessment

Merjent identified the areas to be surveyed in the field by reviewing MDNR's Natural Heritage Information System (NHIS) and public data sources. Where resources from the sources listed below overlapped the Project

environmental survey area (or based on the criteria given below for certain data sources), Merjent considered the location to have potentially suitable habitat for the two federally listed plant species and/or for other state-listed species that may occur in the Project vicinity.

- NHIS⁴ Element Occurrences of state-listed plants within a 1-mile radius, where potentially suitable habitats are visible within the environmental survey area on aerial imagery
- Other potentially suitable habitats visible on aerial imagery, such as potential fens, sites with aquatic features, or other aerial signatures that are unique relative to the surrounding area
- SOBS (with a biodiversity significance ranking of moderate, high, or outstanding)⁵
- NPCs⁶
- ROW Prairies⁷

Western prairie fringed orchids and prairie bush clovers both inhabit native prairie remnants, with the orchid preferring wet-mesic prairie types and the clover preferring dry-mesic prairie types. Sites with the potential for any native prairie types were flagged for field survey. Wooded NPCs were mostly absent in the Project environmental survey area.

3.2 Field Surveys

The field surveys had three objectives: (1) to determine whether any state-listed plants were present within the Project environmental survey area; (2) to assess, regardless of survey timing, the habitat suitability for the western prairie fringed orchid and/or prairie bush clover at each site; and (3) if possible, depending on survey timing, to document whether any western prairie fringed orchid and/or prairie bush clover individuals were present. According to MDNR, the optimal identification window for the western prairie fringed orchid is between late June and late July (when they are flowering), and the optimal window for the prairie bush clover is mid-August through September (when they are producing fruit).

Surveys in 2022 were conducted between June 6 and June 8, on July 9, and during the time frame of September 1-2 and September 22-24.

Where western prairie fringed orchid habitat was present, it was rated according to the following criteria. The criteria were developed in coordination with USFWS and used in field habitat assessments for the same species in the Nebraska, North Dakota, and South Dakota portions of the Project footprint.⁸

- Western prairie fringed orchid habitat criteria:
 - Excellent (A) - completely native tall-grass/lowland/mesic prairie, appears to be mowed or lightly grazed every year or two. Suitable hydrology present.
 - Good (B) - primarily native tall-grass/lowland/mesic prairie and non-native vegetation, appears to be hayed or lightly grazed every year or two. Suitable hydrology present.
 - Fair (C) - mix of native tall-grass/lowland/mesic prairie and non-native vegetation, appears to be hayed or lightly grazed approximately every year or two. Suitable hydrology present.

⁴ Merjent used data dated 2/15/2022 through MDNR license agreement 1066.

⁵ Merjent used SOBS data (obtained from MN Geospatial Commons) with a content date of 2/24/2022.

⁶ Merjent used NPC data (obtained from MN Geospatial Commons) with a content date of 3/2/2022.

⁷ Merjent used ROW Prairie data (obtained from MN Geospatial Commons) with a content date of 7/27/2017.

⁸ The field habitat assessments outside of Minnesota are not reported here. A USFWS-approved set of western prairie fringed orchid habitat criteria is described in the 2022 Western Prairie Fringed Orchid Study Plan, prepared by WESTECH Environmental Services, Inc., on March 4, 2022, for Perennial Environmental Services, which is providing support to SCS for the Project's environmental review in Nebraska, North Dakota, and South Dakota.

- Poor (D) - primarily non-native vegetation with a minor native tall-grass/lowland/mesic prairie component, appears to be hayed or lightly grazed every year or two, or is a mix of native and non-native plant species but heavily grazed and/or sprayed to reduce broadleaf species. Suitable hydrology present.

4 Results

Through the desktop assessments, sites with potentially suitable habitat for Dakota skippers, Poweshiek skipperlings, western prairie fringed orchids, prairie bush clovers, and/or other state-listed plant species were identified along four of the five Project segments in Minnesota. All sites were at least partially accessible in the field. The field results are provided in Attachments A, B, C, and D, with each attachment containing a table that summarizes the findings for each line segment, an overview map that shows the survey sites for that segment, and site-specific maps where habitats and/or individuals were documented (all as outlined below). There were no targeted survey locations along the MNL-337 segment.

- MNL-321 (Attachment A): Table A, Figures A-1 (overview map) and A-2 (site-specific map)
- MNL-303 (Attachment B): Table B, Figures B-1 (overview map) and B-2 (site-specific map)
- MNL-304 (Attachment C): Table C, Figures C-1 (overview map) and C-2 through C-5 (site-specific maps)
- MNL-305 (Attachment D): Table D, Figures D-1 (overview map) and D-2 (site-specific map)

The following abbreviations are used in the attachments.

- Dakota skipper (DASK)
- Poweshiek skipperling (POSK)
- Prairie bush clover (PBCL)
- Western prairie fringed orchid (WPFO)

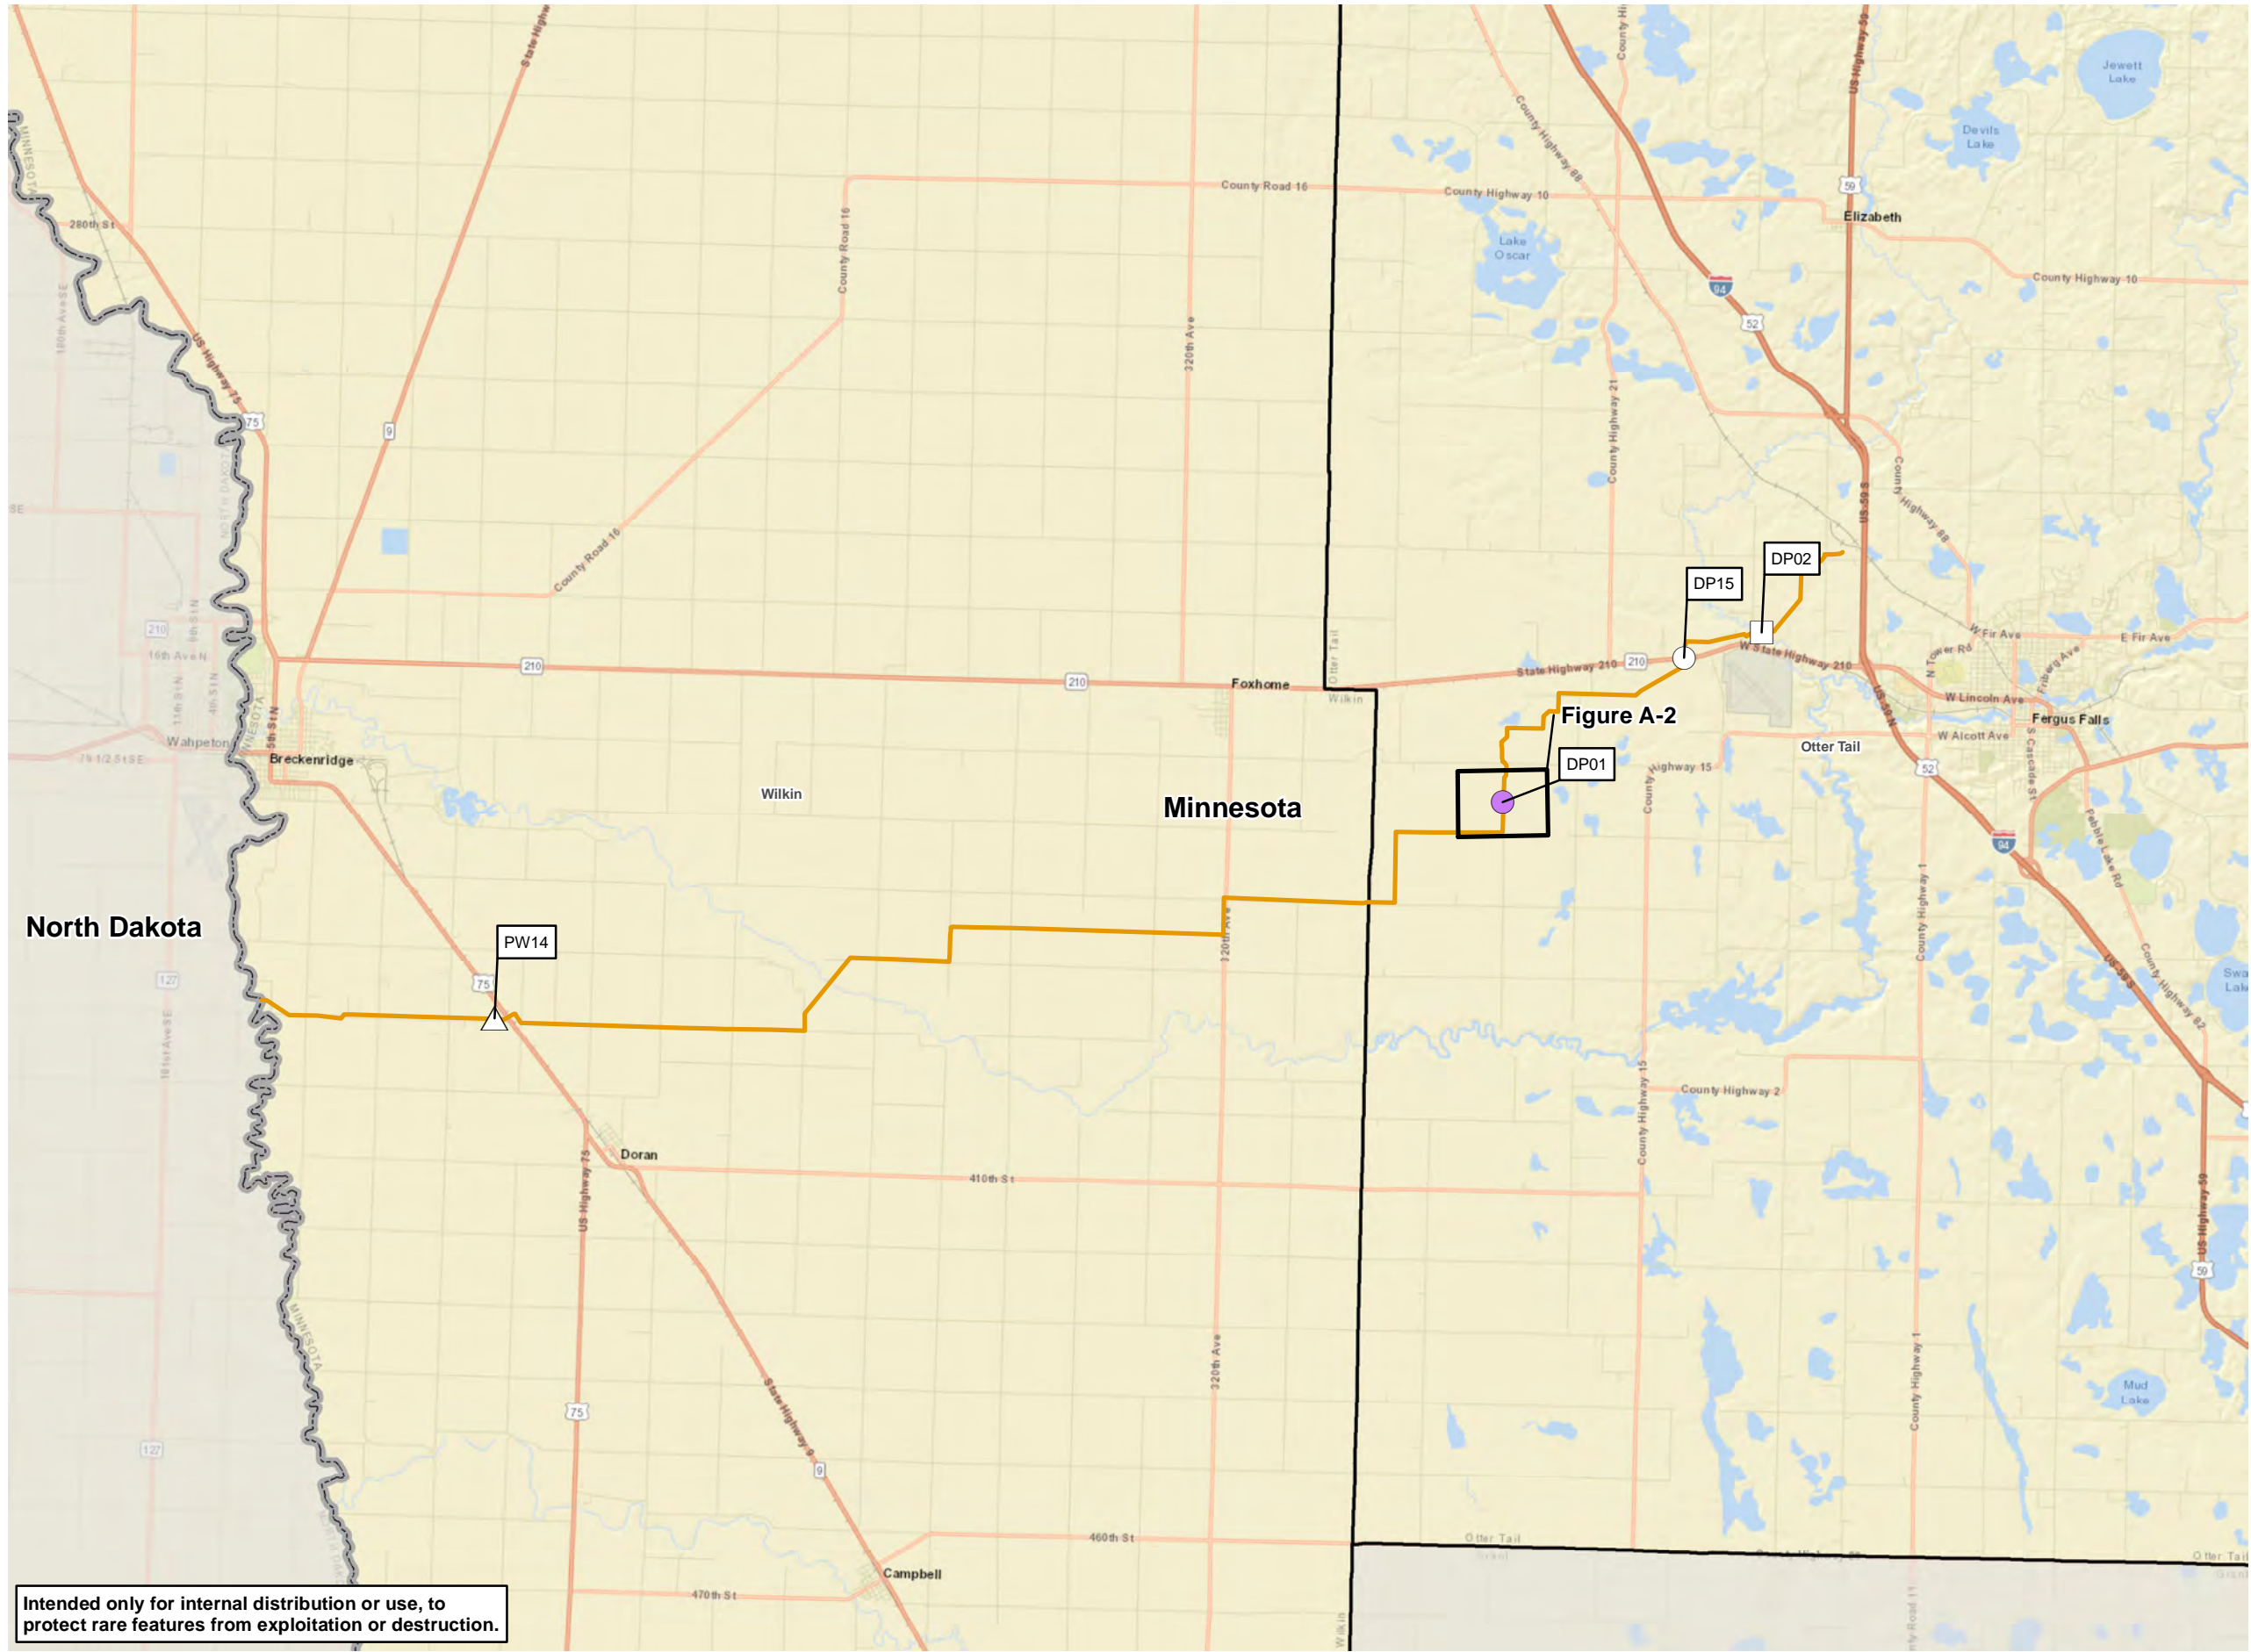

5 Reporting

Per MDNR's Rare Species Survey Reports Memo (2012) (Attachment E), Merjent's botanist submitted the required NHIS documentation electronically on February 22, 2023. Welby Smith at MDNR confirmed the identification of the two state-threatened species that were documented. The NHIS documentation and the species identification confirmation are in Attachment F. The plant survey methods used to obtain the results reported here are consistent with MDNR's Guidance on Documenting and Collecting Rare Plants (2018) (Attachment G).

Attachment E – MDNR's Rare Species Survey Reports Memo (2012)

Division of Ecological and Water Resources

TO: Endangered and Threatened Species Surveyors

FROM: Lisa Joyal, Endangered Species Review Coordinator

Phone: (651) 259-5109

e-mail: lisa.joyal@state.mn.us

RE: Rare Species Survey Reports

The Minnesota Department of Natural Resources' Division of Ecological and Water Resources (DNR) relies upon the results of endangered and threatened species surveys to conserve these species through its conservation, management, environmental review, and permitting responsibilities. When surveys for rare species are requested as part of the environmental review process, the DNR makes every effort to coordinate closely with surveyors to ensure that survey results are reliable. High quality survey data enables the DNR's to uphold Minnesota's endangered species law (*Minnesota Statutes*, section 84.0895) and associated rules (*Minnesota Rules*, part 6212.1800 to 6212.2300 and 6134).

As such, for projects associated with environmental review, we request that survey proposals be submitted to the DNR before any survey work is initiated. This process is an attempt to avoid any potential delays or other problems due to incomplete list of target species or inappropriate survey protocol. Surveys should primarily target the species mentioned in the Natural Heritage letter, but should also target any other state-listed species that are likely to be found in the habitat in question. Please refer to the DNR Rare Species Guide (<http://www.dnr.state.mn.us/rsg/index.html>) for further information on the rare species that can be found in a particular habitat, and for the habitat and phenology of each targeted species. The DNR Rare Species Guide is the state's authoritative reference for Minnesota's endangered, threatened, and special concern species. It is a dynamic, interactive source that can be queried by county, ECS subsection, watershed, or habitat. Final survey results should also be submitted to the DNR.

Please include the following information in the Rare Species Survey Proposals and Survey Results:

- Purpose of the survey
- List of the targeted species
- Qualifications of the surveyor(s) and his or her experience working with the targeted species
- If applicable, a copy of the collection permit issued by the DNR.
- Survey date(s) and methodology
- Map (and GIS shapefile if large project area) of areas (to be) surveyed or assessed for habitat suitability
- Locations and number of individuals for any state-listed species
- State type of documentation for each listed species (e.g., photograph or collected specimen)
- A completed Rare Feature Reporting Form for each state-listed or tracked species, or a statement that the data has been submitted electronically
- Any associated specimens and electronic data should be submitted with the Survey Results

Survey Proposals and Survey Results may be sent electronically to the email address listed above or mailed to the following address:

Lisa Joyal
DNR Division of Ecological and Water Resources
500 Lafayette Road, Box 25
St. Paul, MN 55155

Thank you for your interest in conducting rare species surveys in Minnesota.

I am submitting data for observations of three rare plant populations in Minnesota documented during field surveys in 2022. The surveys were conducted to assess habitat for federally threatened plants. The surveys also documented plants that are state-listed in Minnesota as special concern, threatened, or endangered.

I observed one population each of *Arnoglossum plantagineum*, on June 6, 2022, and *Asclepias sullivantii*, on July 9, 2022, in the City of Fairmont, Martin County, Minnesota. These populations were observed during surveys as part of the Summit Carbon Solutions, LLC Martin County Project. The populations were located within the same parcel, owned by Fairmont Economic Development Authority.

I also observed one population of *Cypripedium candidum* on June 8, 2022, in Orwell Township, Otter Tail County. This population was observed during surveys as part of the Summit Carbon Solutions, LLC Otter Tail to Wilkin Project and is located on the property of Ethel Maack.

Please see the attached rare plant observation data spreadsheet and shapefiles for details.

Specimens of *A. plantagineum* and *A. sullivantii* were collected under DNR Special Permit #23226. This permit is assigned to Otto Gockman who was also conducting field work on the project. Correct identification was confirmed by Welby Smith and the specimens will be submitted to the University of Minnesota Herbarium.

Please contact me with any questions or concerns.

Respectfully submitted,

Andy Kranz

Hi Welby,

I have two specimens to submit, *Arnoglossum plantagineum* and *Asclepias sullivantii*, from the same railroad ROW in Martin County. These were collected in the course of 2022 Merjent work. I made collections at Otto's suggestion, under his permit number (he was working on the same project). Can

I bring these to you to verify ID?

I've attached some photos as well as herbarium labels and the NHIS data sheet.

Attachment G – MDNR’s Guidance on Documenting and Collecting Rare Plants (2018)

Guidance on Documenting and Collecting Rare Plants

DNR Division of Ecological and Water Resources

February 2018

Please refer to the following guidance if you will be submitting records for entry into the DNR's Natural Heritage Information System (NHIS). All botanical surveys conducted for environmental review or permitting purposes should follow this guidance.

Before Going in the Field

- Review the [current list of state-listed species](#) so you will know which species are rare.
- Check the Rare Features Database (see [How to Obtain Natural Heritage Data](#)) and, if applicable, the records of other public land managers to see if there are known occurrences of rare plants within your work or study area.
- Familiarize yourself with critical identifying features of species likely to be collected. This might include a visit to a herbarium to review previous collections of a plant species.
- Obtain the plant spreadsheet template for data entry purposes. Review this spreadsheet to familiarize yourself with the type of information that should be collected. The Rare Plant Observations spreadsheet template is available under "Submitting Data" on the [NHIS Website](#).
- Obtain a permit if you plan to collect specimen vouchers of state-listed endangered or threatened species. Minnesota's endangered species law (*Minnesota Statutes*, section 84.0895) and associated rules (*Minnesota Rules*, part 6212.1800 to 6212.2300 and 6134) prohibit the taking of threatened or endangered species without a permit. Please contact Richard Baker, Endangered Species Coordinator, at Richard.Baker@state.mn.us to request a permit.
- When required, obtain permits for collecting on public lands such as Scientific and Natural Areas, State Parks, and National Forests.
- Respect property owners' rights. Obtain permission from the private landowner or public land manager to 1) go on the land and 2) to collect plants.
- **Any surveys required through the DNR environmental review process must follow the standards contained in this Guidance.** Before initiating any such survey, the surveyor must receive approval of a project-specific survey plan from Lisa Joyal, Endangered Species Review Coordinator. Any proposed departure from the standards in the *Guidance* must be identified in the project-specific plan.

Specimen Collection

Most rare plant records in the DNR's Rare Features Database are documented with collected specimens deposited in credible herbaria. Records documented by standard herbarium collections in museums are strongly preferred over all other forms of documentation. A specimen of a rare plant often is sufficient if it includes a portion of the plant that allows positive identification of the species.

Under what circumstances should I collect a herbarium specimen?

- Collect state-listed endangered or threatened plants only if you have a permit. If you have unintentionally collected an endangered or threatened plant without a permit, the specimen should be submitted to the DNR as soon as is practical following the procedures described below, with a brief note attached that explains the circumstances.
- For new locations of a species, collect a specimen; in general, make no more than one collection of a particular species per 40 acres of habitat.
- For previously known populations of an endangered or threatened plant, consider collecting a new voucher if the DNR's Rare Features Database indicates that it has been more than thirty years since the last voucher was collected from the population.
- For any given species, collect only when distinguishing characters are present (usually flowers and/or fruits are necessary); if key characters are not present, mark the location and return at the appropriate time for collecting a specimen with distinguishing characteristics.
- For endangered or threatened vascular plants, collect a complete specimen (which includes roots) only when the population has more than 100 individuals.

- For populations of endangered or threatened vascular plants with fewer than 100 individuals, collect only the distinguishing portion of the plant (e.g., a portion of the inflorescence that has one or more flowers or a portion of the stem that has one or more leaves). A partial specimen might be inadequate to confirm the identification. In this case, supplement the partial collection with a close-up photograph that clearly shows the diagnostic features. Please note that in many cases photographs are not sufficient to confirm identification.
- For aquatic plants, collect a portion of the stem with leaves and fruits or flowers. Do not collect the roots. If you are unsure whether you have found a rare species, collect several specimens. Please note that in most cases photographs are not sufficient to confirm the identification of aquatic species. If your target search area is aquatic, please contact Welby Smith, DNR Botanist, at Welby.Smith@state.mn.us for additional guidance.
- For *Botrychium* spp., always collect a specimen of the above-ground portion of the plant, regardless of the apparent population size or the state status of the species.
- For mosses, liverworts, fungi and lichens, collect such that the viability of the population is maintained.

How do I make a proper collection? See General Guidelines for Collecting Vascular Plant Specimens on page 3.

Specimen Submission

- For quality control purposes, the identification of the specimen must be confirmed by a qualified second party before a record can be entered into the Rare Features Database.
- Send specimen(s) of state-listed species or suspected state-listed species directly to Welby Smith, DNR Botanist, for verification. Each specimen must have a label that meets the Bell Museum standards (see page 3). Do not submit unknown specimens unless you suspect that it is a state-listed species. If you are unsure of the species' identification, you can leave the space for the scientific name blank. Send specimens to:
 Welby Smith
 Minnesota Department of Natural Resources
 Division of Ecological Resources
 500 Lafayette Road, Box 25
 St. Paul, MN 55155
- DNR staff will complete verification or submit the specimen to an outside expert for annotation. Following verification, the DNR will donate specimens to the University of Minnesota Herbarium, a division of the [Bell Museum of Natural History](#). Save response from the DNR and submit with data.

Data Submission

- Follow the directions and templates under "Submitting Data" on the [NHIS Website](#).
- Document *all* state-listed endangered, threatened, or special concern species encountered. Include type of documentation for each record (e.g., photograph or specimen).
- Submit data electronically as a spreadsheet with an accompanying shapefile. Use the Rare Plant Observations spreadsheet template available under "Submitting Data" at [NHIS Website](#).
- **Important!** *Ensure that the unique identifier for each record is the same in the shapefile, the spreadsheet, the report's tables and figures, and the information submitted with the specimens.*
- Submit cover sheet, survey report, GIS shapefile, spreadsheet, and email verifying specimen identification to Reports.NHIS@state.mn.us.

How will my records be used to protect rare plants?

- Conservation planning at local, state and regional levels.
- Environmental review of development projects.
- Research about life history.
- Revisions to the state list of endangered, threatened and special concern species.
- Legal challenges related to protected species locations are possible. Properly vouchered specimens are often critical in the protection of rare plant populations in these cases.

Questions?

- **Regarding permits:** Contact Rich Baker at Richard.Baker@state.mn.us or 651-259-5073.
- **Regarding specimens:** Contact Welby Smith at Welby.Smith@state.mn.us or 651-259-5142.
or Hannah Texler at Hannah.Texler@state.mn.us or 651-259-5048.
- **Regarding data submittal:** Contact Karen Cieminski at Karen.Cieminski@state.mn.us or 651-259-5081.
- **Regarding environmental review process:** Contact Lisa Joyal at Lisa.Joyal@state.mn.us or 651-259-5109.

General Guidelines for Collecting Vascular Plant Specimens*

*For mosses, liverworts, algae, fungi and lichens, please contact the [University of Minnesota Herbarium](#) for collection guidelines.

1. **Equipment:** Plant press, straps (2), felt blotters, ventilators (corrugated boards), and newspaper. Also, a knife or other tool for cutting and digging and a notebook of standardized form for recording field data. The press can be made from $\frac{3}{4}$ " plywood cut 12" x 18" (2 pieces); the ventilators can be cut from discarded "cardboard" boxes, also 12" x 18" (the corrugations should run the short direction). The blotters can be obtained from a stationery store.
2. **Preparation:** Once the specimen is found, it is necessary to determine what portion of the plant will be collected. A complete collection includes the entire plant with roots, but for purposes of conservation, the roots of rare species should not be collected if the population consists of fewer than 100 individuals. For most species, such as orchids, a single flower is enough for purposes of identification. Other species, e.g., sedges, usually require the complete aboveground stem with mature fruit. Specimens of trees and shrubs should include a twig with mature leaves and flowers and/or fruit. Specimens that do not show diagnostic features cannot be identified and are worthless. If only a portion of the plant is collected, it is important to record a description of the entire plant.

Before collecting plants, it is a good idea to check with the curator of the herbarium where the specimen will be deposited. Some herbaria may not accept a partial specimen unless it has special significance (e.g., a new location for an endangered species).

3. **Pressing and processing specimens:** The freshly collected specimen is placed within the sheet of folded newspaper with the leaves, flowers, etc. in a natural position, but clearly showing the diagnostic features. The paper is placed between two sheets of felt blotters, which are themselves placed between two corrugated ventilators. It is then put within the press, which is tightened with the straps (or ropes). Several specimens can be put in a single press by layering the blotters and ventilators. Commercial plant presses are slightly larger than herbarium paper so the specimens should not fill the plant press side to side. Also, be sure to leave room for a label in the lower right portion. The press must then be put in a warm dry place until the plants are dry. A simple plant drier that uses heat rising from a light bulb works well, but is not essential. The blotters should be changed every day until the specimen is dry. If a specimen does not dry within 4-5 days, it will likely begin to decompose. When the specimen is dry, it should be taken from the press, but kept within the folded newspaper for protection.

A label (see example below) must be prepared before the specimen can be sent to a herbarium. The label should be on acid-free, archival quality paper. We suggest that you use labels that are 2 $\frac{3}{4}$ x 4 $\frac{1}{4}$ inches in size, but other labels not to exceed 3 x 5 inches will be acceptable. At a bare minimum, the label must contain the name of the species, location of collection, description of habitat, name of collector, and date of collection. The label should also include latitude and longitude coordinates and/or UTM coordinates, and, if a permit was required, the permit number. Providing a label is the responsibility of the collector, not the herbarium or the DNR. A specimen without a label will not be accepted by a herbarium.

After the label is prepared, it should be put with the specimen inside the folded newspaper, which may be held between two corrugated ventilators for rigidity. The herbarium will mount the specimen and label on a stiff sheet of paper and accession it into their collection.

The University of Minnesota Herbarium, a division of the Bell Museum of Natural History, houses the largest collection documenting Minnesota's plant diversity and is the primary repository for the DNR's Minnesota Biological Survey. Additional [guidance on collecting rare plants for museum specimens](#) can be found on the University of Minnesota Herbarium website.

Plants of Scott County, Minnesota, USA

Silphium integrifolium Michx. var. *integrifolium*

3 miles west of Jordan in north half of quarter-quarter section.
Approximately 100 plants in wet to wet-mesic prairie on terrace within the Minnesota River Valley. In heavily grazed pasture dominated mostly by *Spartina pectinata* and *Agrostis stolonifera*. Soils range from black muck with marl concretions to silt loam. Site has been compacted by grazing. Glacial erratics common. Associated with *Carex stricta*, *Pycnanthemum virginianum*, *Lobelia siphilitica*, *Lysimachia quadriflora*, *Aster puniceus*.

1 Introduction

Summit Carbon Solutions, LLC (SCS) retained Merjent, Inc. (Merjent) to conduct wetland and waterbody surveys for the Midwest Carbon Express Project (Project) in the State of Minnesota. The Project will capture carbon dioxide (CO₂) from industrial facilities across five states (i.e., Iowa, Minnesota, Nebraska, South Dakota, and North Dakota) and transport the captured CO₂ via pipeline to North Dakota to be permanently sequestered within deep underground geologic formations. The Project aims to reduce the carbon intensity of biofuels produced from ethanol facilities and work towards achieving climate goals while creating jobs and other economic benefits across the Project footprint. The planned pipeline is approximately 2,000 miles, with diameters ranging from 4 to 24 inches.

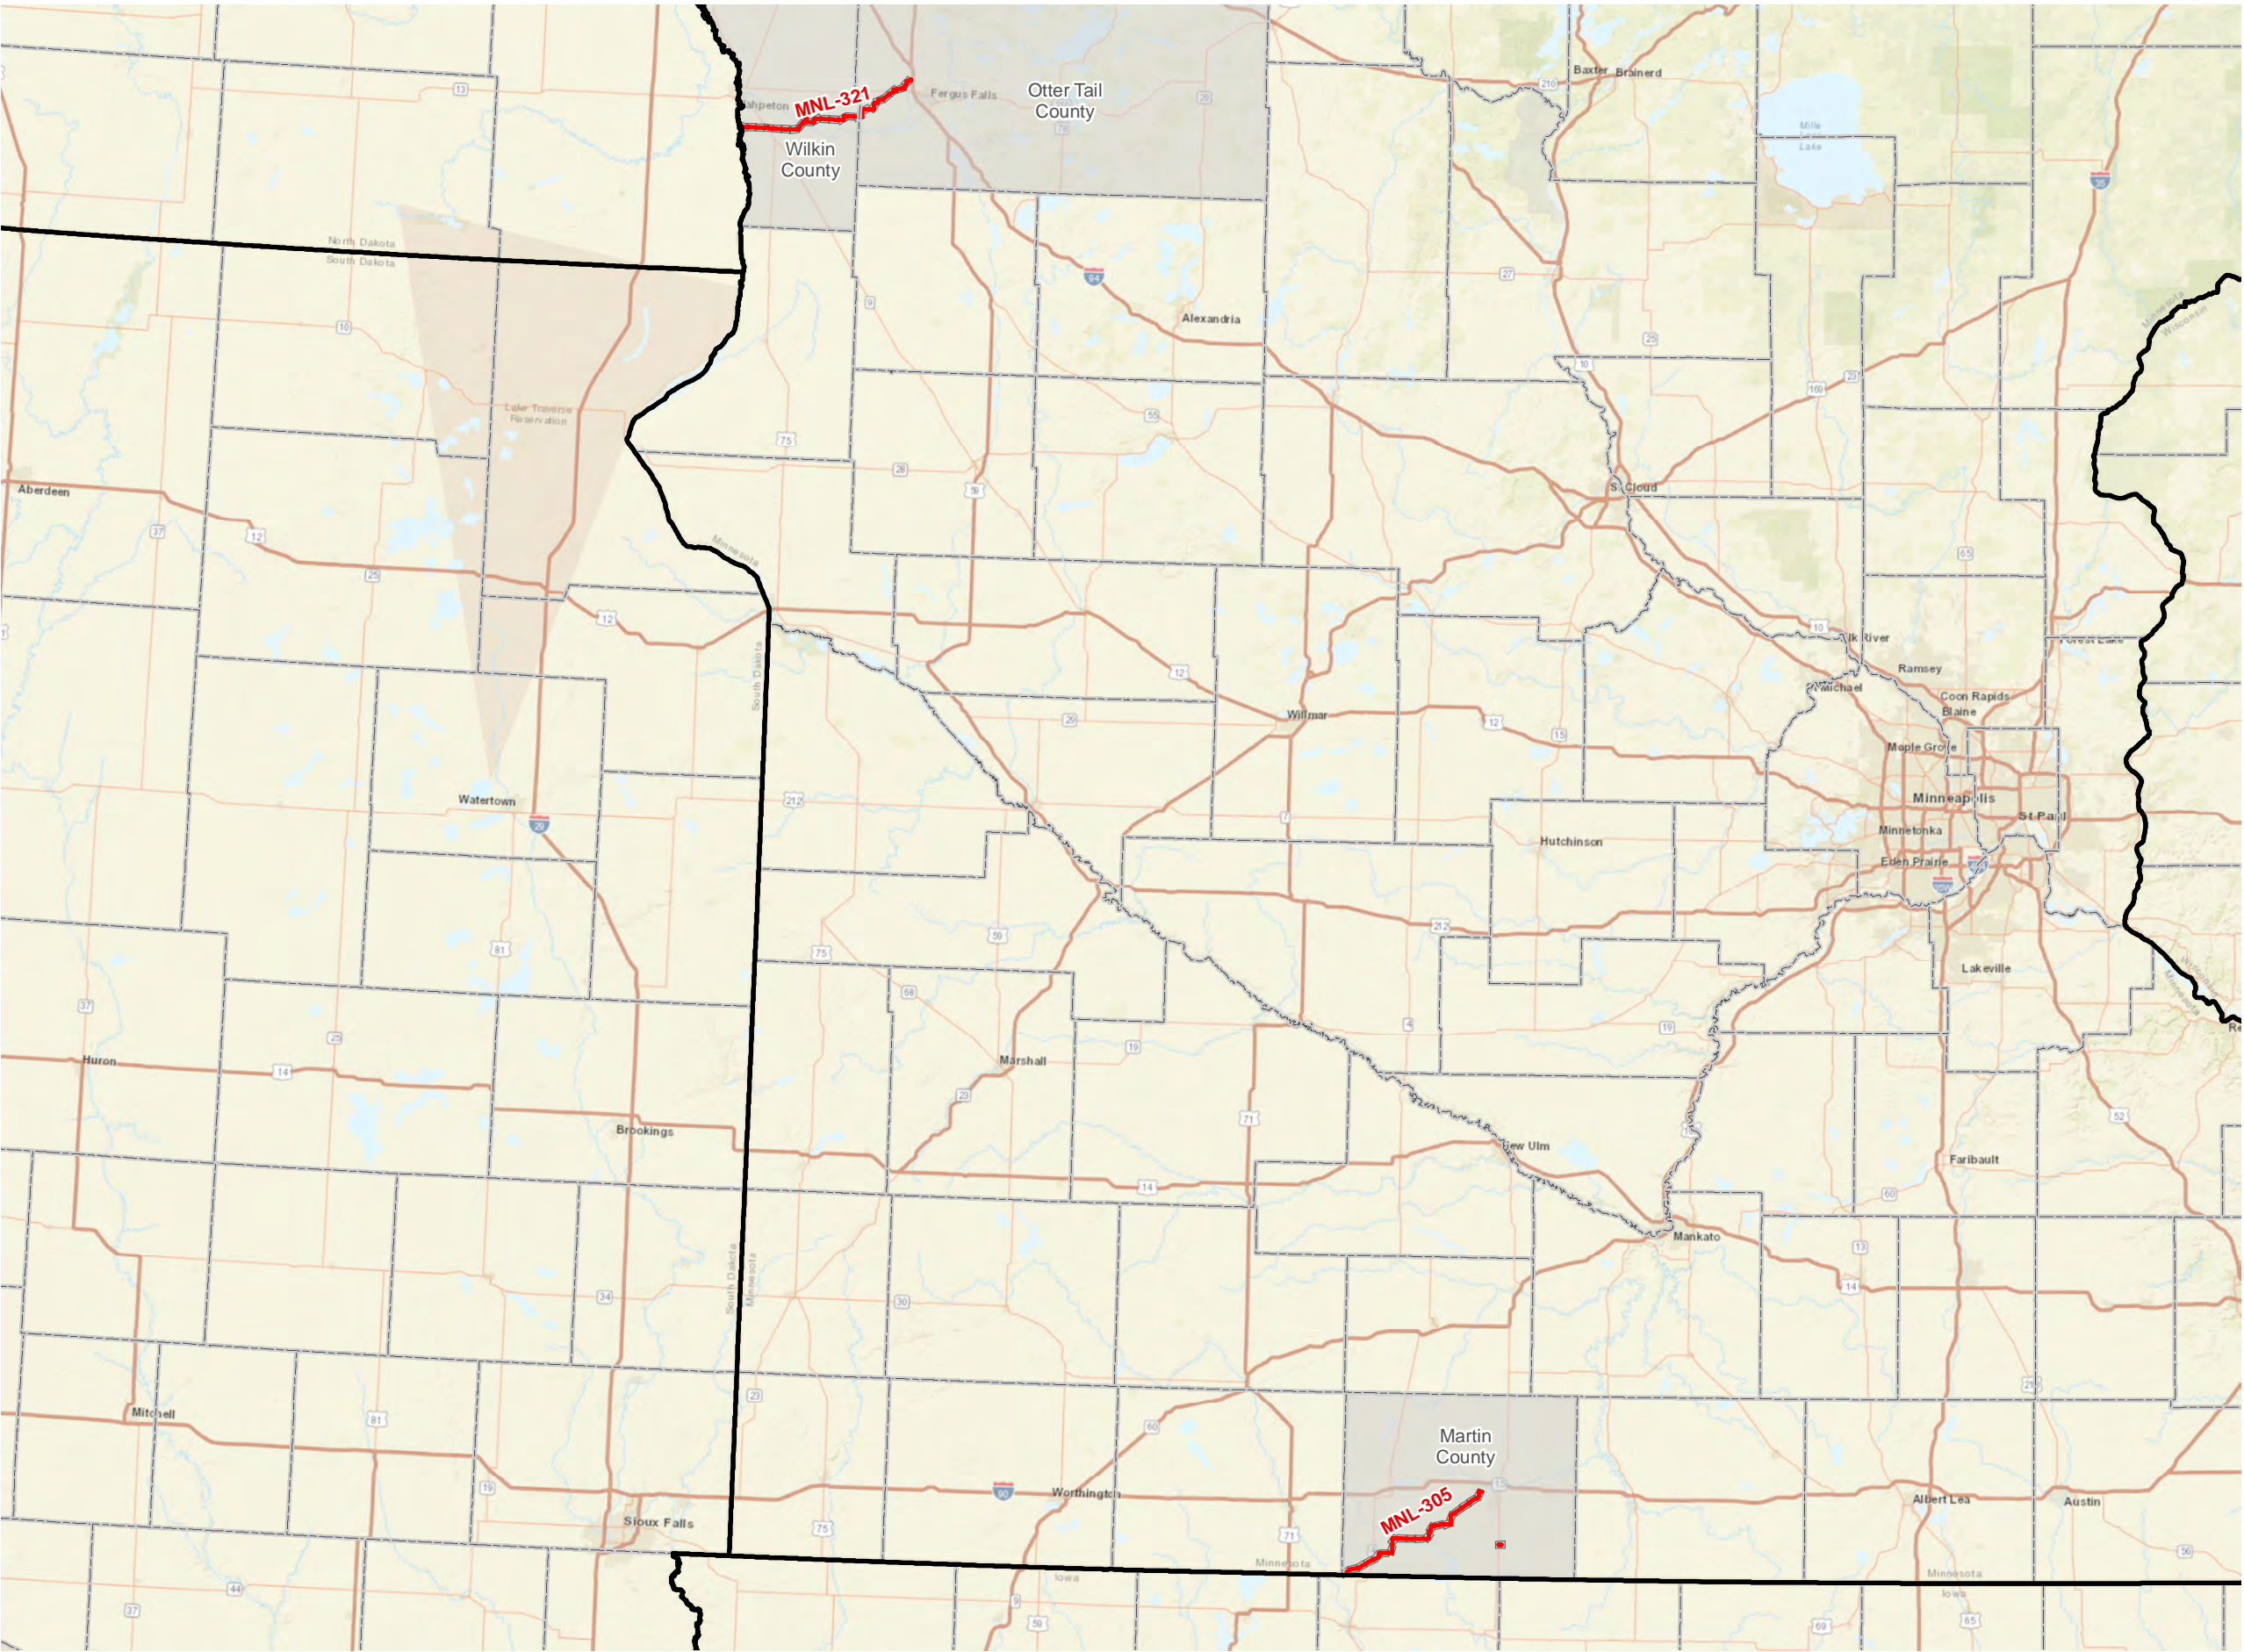

Field crews conducted surveys in accordance with technical guidance from the U.S. Army Corps of Engineers (USACE) and Minnesota Department of Natural Resources (MDNR). The purpose of the wetland and waterbody field surveys was to identify aquatic resources within the environmental survey corridor for use in workspace planning and evaluation, impact analyses, and water resources permitting.

Specific objectives of the surveys were to:

- 1) delineate wetland boundaries;
- 2) categorize wetland community types; and
- 3) locate and characterize waterbodies.

Wetland and waterbody surveys were conducted on two-line segments in three counties in Minnesota (refer to Table 1 and Figure 1).

The wetland delineation performed by Merjent included the identification and recording of physical features that may be considered Waters of the United States (WOTUS) as defined by the USACE. WOTUS include most wetlands, rivers, creeks, streams, lakes, tributaries, etc. This report summarizes the results of the wetland delineation within the Project survey area and will be utilized to determine impacts to potentially jurisdictional WOTUS.

2 Methodology

2.1 Identification of Potential Waters of the United States

Merjent completed a resource review of background site information to prepare for the survey effort. Data compiled as part of the resource review included:

- U.S. Geological Survey (USGS) topographic maps;
- U.S. Department of Agriculture, Natural Resource Conservation Service (NRCS) soil survey data;
- U.S. Fish and Wildlife Service (USFWS) National Wetlands Inventory (NWI) data;
- MDNR NWI Data; and
- recent aerial imagery.

Appendix 1 includes the map index of the environmental survey corridor, and Appendix 2 includes the environmental features exhibit used to conduct the field survey and desktop review.

In addition to the Biological Survey Methodology and Protocols for Minnesota ("Biological Survey Protocols;" refer to Appendix 3) a unique naming scheme was used to identify wetlands and waterbody features. This consisted of feature type abbreviation (W for wetland, U for uplands, and S for waterbodies), company/team ID (1002, 1003, 1004, etc.), county code (OT for Otter Tail County), and feature ID number. For example, a wetland location would be labeled W1004OT001, an upland would be U10041OT001, and a waterbody would be S1004OT001. For multitype wetlands, a suffix with the cover type was added to the wetland name, such as Palustrine Forested (PFO), Palustrine Scrub-Shrub (PSS), or Palustrine Emergent (PEM) (e.g., W2001OT001_PEM).

A separate naming scheme was utilized for wetland and waterbody features that were identified via desktop analysis. Wetland features were labeled using a nomenclature that includes a feature type (W for wetlands and S for waterbodies), number code for company identification (1), county code (e.g., WI for Wilkin County), feature number/ID, and "DT" to denote that the feature was generated at a workstation and not surveyed in the field. For example, a desktop wetland location would be labeled W_1_WI_001_DT.

2.1.1 Wetlands

Field crews conducted wetland surveys in accordance with the criteria and methods outlined in:

- the USACE Wetlands Delineation Manual, Technical Report Y-87-1 (Environmental Laboratory, 1987; Manual);
- subsequent guidance documents (USACE, 1991a; 1991b; 1992); and
- applicable Regional Supplements to the 1987 Manual.

Merjent determined antecedent precipitation within each county crossed by the environmental survey corridor using the date when the field survey was conducted. Merjent evaluated antecedent precipitation with the Precipitation Worksheet using Gridded Database (Minnesota Climatology Working Group) for the 3 months prior to the date of field survey. The worksheet, which applies the methodology described in Engineering Field Handbook,

Part 650: Hydrology Tools for Wetland Determination (NRCS, 1997), calculates the multi-month score for the prior 3 months based on precipitation data. Merjent generated a precipitation worksheet for the approximate mid-point of the environmental survey corridor within each county and is summarized in Table 2-1 and Table 2-2 (refer to Appendix 4).

Field crews conducted on-site wetland delineations using the three criteria technical approach (i.e., vegetation, soil, and hydrology) as described in the Biological Survey Protocols and as defined in the Manual and applicable Regional Supplements. According to procedures described in the Manual and applicable Regional Supplements, field crews determined an area to be a wetland if under normal circumstances it reflects a predominance of:

- hydrophytic vegetation;
- hydric soils; and
- wetland hydrology (e.g., inundated or saturated soils).

Field crews located and recorded wetland sample points and boundaries using global positioning system (GPS) technology with sub-meter accuracy. Each wetland feature was given a unique ID as defined in the Biological Survey Protocols. After collection, Merjent reviewed, geospatially corrected, and consolidated the collected data for use in workspace evaluation and impact analyses. Wetlands included PEM, PSS, and PFO vegetative communities.

2.1.2 Waterbodies

Field crews identified, classified, and documented waterbodies according to the methodology outlined in the Biological Survey Protocols and the Classification of Wetlands and Deepwater Habitats (Cowardin, 1979). Field crews located and delineated waterbody boundaries with sub-meter GPS technology. Each waterbody feature was given a unique ID as defined by the Biological Survey Protocols. Field crews collected the following attributes in the field and used them to classify each waterbody:

- top of bank width and height;
- ordinary high-water mark (OHWM) width and height;
- substrate type;
- flow direction;
- estimated water velocity;
- water quality; and
- dominant riparian vegetation.

Field crews identified OHWMs, if present, per USACE Regulatory Guidance Letter 05-05 (USACE, 2005) and took photographs at each waterbody to record general conditions at the time of the field survey. Field crews identified Ephemeral, Intermittent, Perennial, and pond or other open water types of waterbodies.

2.2 Desktop Delineation Review

A desktop delineation review of wetlands and waterbodies was conducted for all Project areas that were not surveyed by field crews during the 2021 or 2022 surveys. Merjent gathered available data and imagery resources to complete a detailed assessment of potential wetland and waterbody locations within the Project environmental survey corridor. Resources utilized for the desktop delineation review included:

- USGS topographic maps;
- NRCS soil survey data;
- USFWS NWI data;
- MDNR NWI Data;

- Google Earth™ historic imagery (multiple years);
- National Agricultural Imagery Program (NAIP) Imagery (multiple years); and
- NAIP imagery color-infrared (multiple years).

Each potential wetland and waterbody feature identified was given a unique feature ID. Each potential wetland community was classified according to the Classification of Wetlands and Deepwater Habitats of the United States (Cowardin, 1979), Circular 39 System, and Wetland Plants and Plant Communities of Minnesota and Wisconsin (Eggers and Reed, Ver. 3.2, 2015). Each potential waterbody was classified by flow regime. Field surveys for these areas are anticipated to be completed in the summer and fall of 2022, access and weather permitting.

3 Results

3.1 Survey Completion

Field crews conducted wetland and waterbody surveys of approximately 43.7 miles (1,533.1 acres) of the 53.5-mile (2,061.9-acre) Project environmental survey corridor. A desktop delineation review was completed for the remaining 9.8 miles (528.8.5 acres).

3.2 Wetland & Waterbody Delineation Summary

Field crews identified 20 waterbodies and 60 wetlands containing 62 wetland communities. The desktop delineation review identified 9 waterbodies and 37 wetlands containing 37 wetland communities. Appendix 2 includes maps illustrating wetlands and waterbodies by Cowardin Class. Appendix 5 includes a tabular list of wetland and waterbody features and associated data collected: Table 3 summarizes wetland and waterbody features by Cowardin Class; Table 3-1 provides a summary of wetland features; and Table 3-2 provides a summary of waterbody features. Appendix 6 includes the USACE Wetland Determination Data Forms. Appendix 7 includes photographs of each sampled wetland and waterbody and representative photos of the environmental survey corridor.

1 Introduction

Summit Carbon Solutions, LLC (SCS) retained Merjent, Inc. (Merjent) to conduct wetland and waterbody surveys for the Midwest Carbon Express Project (Project) in the State of Minnesota. The Project will capture carbon dioxide (CO₂) from industrial facilities across five states (i.e., Iowa, Minnesota, Nebraska, South Dakota, and North Dakota) and transport the captured CO₂ via pipeline to a sequestration area in North Dakota, where the CO₂ will be safely and permanently stored deep underground utilizing separately permitted Class VI injection wells. Once operational, the Project will include approximately 2,000 miles of pipelines for transportation of CO₂ from industrial facilities.

Field crews conducted surveys in accordance with technical guidance from the U.S. Army Corps of Engineers (USACE) and Minnesota Department of Natural Resources (MDNR). The purpose of the wetland and waterbody field surveys was to identify aquatic resources within the environmental survey area for use in workspace planning and evaluation, impact analyses, and water resources permitting.

Specific objectives of the surveys were to:

- 1) delineate wetland boundaries;
- 2) categorize wetland community types; and
- 3) locate and characterize waterbodies.

On October 3, 2022, SCS submitted a preliminary report to the USACE that summarized the results of surveys conducted during 2021 and the first half of the 2022 field season through July 1 along the pipeline laterals listed in Table 1. This new report supersedes the October 2022 report by providing field survey results for the full 2021 and 2022 field seasons along the pipeline laterals listed in Table 1. On January 10, 2023, SCS submitted a report to the USACE that summarized the full 2021 and 2022 field survey results conducted along the MNL-303, MNL-304, and MNL-337 pipeline laterals.

Wetland and waterbody surveys were conducted on two pipeline laterals in three counties in Minnesota (refer to Table 1 and Figure 1).

Table 1: Pipeline Laterals

Pipeline Lateral	Counties	Total Mileage
MNL-305	Martin	29.4
MNL-321	Otter Tail, Wilkin	28.1
Total Mileage		57.5

The wetland delineation performed by Merjent included the identification and recording of physical features that may be considered Waters of the United States (WOTUS) as defined by the USACE. WOTUS include most wetlands, rivers, creeks, streams, lakes, tributaries, etc. This report summarizes the results of the wetland delineation within the Project environmental survey area and will be utilized to determine impacts to potential WOTUS.

2 Methodology

2.1 Identification of Potential Waters of the United States

Merjent completed a resource review of background site information to prepare for the survey effort. Data compiled as part of the resource review included:

- U.S. Geological Survey (USGS) topographic maps;
- U.S. Department of Agriculture, Natural Resource Conservation Service (NRCS) soil survey data;
- U.S. Fish and Wildlife Service (USFWS) National Wetlands Inventory (NWI) data; and
- recent aerial imagery.

Appendix 1 includes the map index of the environmental survey area, and Appendix 2 includes the environmental features exhibit used to conduct the field survey and desktop review.

In addition to the Biological Survey Methodology and Protocols for Minnesota (“Biological Survey Protocols;” refer to Appendix 3) a unique naming scheme was used to identify wetlands and waterbody features. This consisted of feature type abbreviation (W for wetland, U for uplands, and S for waterbodies), company/team ID (1002, 1003, 1004, etc.), county code (e.g., OT for Otter Tail County), and feature ID number. For example, a wetland location would be labeled W1004OT001, an upland would be U10041OT001, and a waterbody would be S1004OT001. For multitype wetlands, a suffix with the cover type was added to the wetland name, such as Palustrine Forested (PFO), Palustrine Scrub-Shrub (PSS), or Palustrine Emergent (PEM) (e.g., W1004JA001_PEM).

A separate naming scheme was utilized for wetland and waterbody features that were identified via desktop analysis. Wetland features were labeled using a nomenclature that includes a feature type (W for wetlands and S for waterbodies), number code for company identification (1), county code (e.g., OT for Otter Tail County), feature number/ID, and “DT” to denote that the feature was generated at a workstation and not surveyed in the field. For example, a desktop wetland location would be labeled W_1_OT_001_DT.

2.1.1 Wetlands

Field crews conducted wetland surveys in accordance with the criteria and methods outlined in:

- the USACE Wetlands Delineation Manual, Technical Report Y-87-1 (Environmental Laboratory, 1987; Manual);
- subsequent guidance documents (USACE, 1991a; 1991b; 1992); and
- applicable Regional Supplements to the 1987 Manual.

Merjent determined antecedent precipitation within each county crossed by the environmental survey area using the date when the field survey was conducted. Merjent evaluated antecedent precipitation with the Precipitation Worksheet using the Gridded Database (Minnesota Climatology Working Group) for the 3 months prior to the date of field survey. The worksheet, which applies the methodology described in Engineering Field Handbook, Part 650: Hydrology Tools for Wetland Determination (NRCS, 1997), calculates the multi-month score for the prior 3 months based on precipitation data. Merjent generated a precipitation worksheet for the approximate mid-point of the environmental survey area within each county and is summarized in Table 2-1 and Table 2-2 (refer to Appendix 4).

Field crews conducted on-site wetland delineations using the three criteria technical approach (i.e., vegetation, soil, and hydrology) as described in the Biological Survey Protocols and as defined in the Manual and applicable Regional Supplements. According to procedures described in the Manual and applicable Regional Supplements, field crews determined an area to be a wetland if under normal circumstances it reflects a predominance of:

- hydrophytic vegetation;
- hydric soils; and

- wetland hydrology (e.g., inundated or saturated soils).

Field crews located and recorded wetland sample points and boundaries using global positioning system (GPS) technology with sub-meter accuracy. Each wetland feature was given a unique ID as defined in the Biological Survey Protocols. After collection, Merjent reviewed, geospatially corrected, and consolidated the collected data for use in workspace evaluation and impact analyses. Wetlands included PEM, PSS, and PFO vegetative communities.

2.1.2 Waterbodies

Field crews identified, classified, and documented waterbodies according to the methodology outlined in the Biological Survey Protocols and the Classification of Wetlands and Deepwater Habitats (Cowardin, 1979). Field crews located and delineated waterbody boundaries with sub-meter GPS technology. Each waterbody feature was given a unique ID as defined by the Biological Survey Protocols. Field crews collected the following attributes in the field and used them to classify each waterbody:

- top of bank width and height;
- ordinary high-water mark (OHWM) width and height;
- substrate type;
- flow direction;
- estimated water velocity;
- water quality; and
- dominant riparian vegetation.

Field crews identified OHWMs, if present, per USACE Regulatory Guidance Letter 05-05 (USACE, 2005) and took photographs of each waterbody to record general conditions at the time of the field survey. Field crews identified Ephemeral, Intermittent, Perennial, and pond or other open water types of waterbodies. When field crews encountered a mapped National Hydrography Dataset (NHD) waterbody that did not exhibit the characteristics to be classified as a waterbody, photographs were taken to document the presence of upland conditions. Photographs of these areas are available in Appendix 7 and Table 8-1 in Appendix 8 lists NHDs crossed by the Project environmental survey area that did not exhibit characteristics to be classified as a waterbody.

2.2 Desktop Delineation Review

A desktop delineation review of wetlands and waterbodies was conducted for all Project areas that were not surveyed by field crews during the 2021 or 2022 surveys. Merjent gathered available data and imagery resources to complete a detailed assessment of potential wetland and waterbody locations within the Project environmental survey area. Resources utilized for the desktop delineation review included:

- USGS topographic maps;
- NRCS soil survey data;
- USFWS NWI data;
- Google Earth™ historic imagery (multiple years);
- National Agricultural Imagery Program (NAIP) Imagery (multiple years); and
- NAIP imagery color-infrared (multiple years).

Each potential wetland and waterbody feature identified was given a unique feature ID. Each potential wetland community was classified according to the Classification of Wetlands and Deepwater Habitats of the United States (Cowardin, 1979), Circular 39 System, and Wetland Plants and Plant Communities of Minnesota and Wisconsin (Eggers and Reed, Ver. 3.2, 2015). Each potential waterbody was classified by flow regime. Field surveys for these areas are anticipated to be completed in the spring and summer of 2023, access and weather permitting.

3 Results

3.1 Survey Completion

Field crews conducted wetland and waterbody surveys of approximately 45.7 miles (1,600.0 acres) of the 57.5-mile (2,220.0-acre) Project environmental survey area in Minnesota. A desktop delineation review was completed for the remaining 11.8 miles (620.0 acres) in Minnesota.

3.2 Wetland & Waterbody Delineation Summary

Field crews identified 20 waterbodies and 65 wetlands containing 70 wetland communities. The desktop delineation review identified 11 waterbodies and 45 wetlands containing 46 wetland communities. Appendix 2 includes maps illustrating wetlands and waterbodies by Cowardin Class. Appendix 5 includes tables of wetland and waterbody features and associated data collected: Table 3 summarizes wetland and waterbody features by Cowardin Class; Table 3-1 provides a summary of wetland features; and Table 3-2 provides a summary of waterbody features. Appendix 6 includes the USACE Wetland Determination Data Forms. Appendix 7 includes a photograph location map set, photographs of each sampled wetland and waterbody, and representative photos of the environmental survey area.

1 Scope

The objective of the Biological Survey Methodology and Protocols for Minnesota is to ensure that Merjent, Inc. (Merjent) and its subconsultants implement consistent field data collection procedures for wetland and waterbody surveys for Summit Carbon Solution's (SCS) Midwest Carbon Express (MCE) project. The Biological Survey Methodology and Protocols incorporates all applicable agency and client requirements to facilitate timely and complete permitting applications.

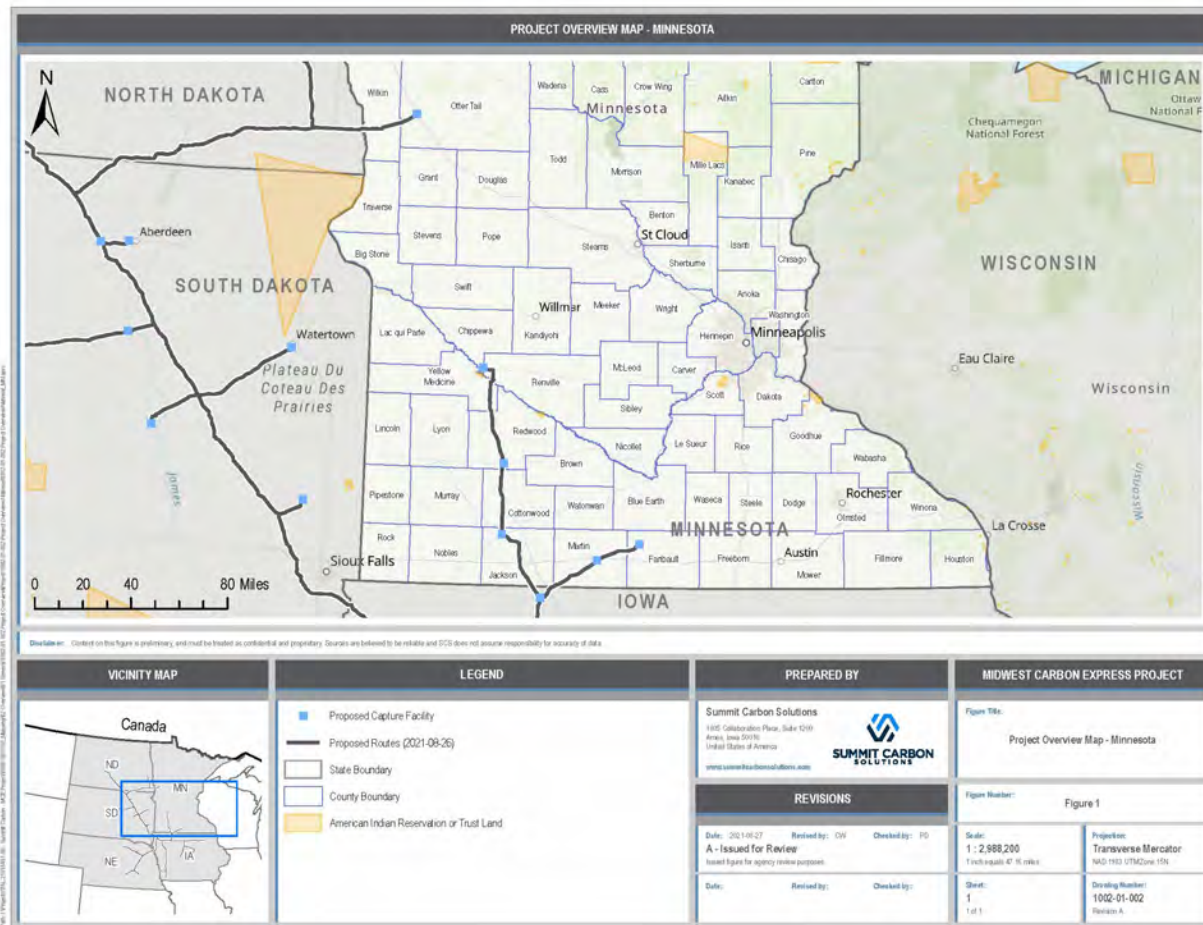

Figure 1 Project Overview in Minnesota

2 Preliminary Survey Protocols

2.1 Desktop Review

It is assumed prior to survey, the field staff will review all relevant and available spatial information related to each survey type including, but not limited National Wetland Inventory (NWI), National Hydrography Database (NHD), Natural Resource Conservation Service data for hydric soils, aerial imagery, etc.

2.2 Safety

Safety is a priority for SCS and Merjent. Compliance with all safety requirements is mandated by SCS and Merjent. For specific information on safety requirements, please refer to the Project Specific Health and Safety Plan (HASP). A daily tailgate form will be required to document potential site-specific issues and controls to address them.

For the MCE project, permission to conduct biological resource surveys within the environmental survey corridor will be secured through right-of-way (ROW) agents in coordination with Merjent's Field Logistics Coordinator prior to Merjent's biological crews entering the survey corridor. However, if a crew is ever asked by a landowner to vacate their property, the survey crew will cease work immediately, leave the property without question, and notify the appropriate ROW contact as well as the appropriate Merjent Field Logistics Coordinator.

3 Survey Protocols

3.1 Wetland and waterbody delineations

Crews will delineate and collect data for all wetland and waterbody features encountered in the environmental survey corridor as follows:

- Wetland delineation methods will follow the standardized protocol as described in the U.S. Army Corps of Engineers (USACE) Wetland Delineation Manual (1987) and associated Regional Supplements (Midwest Region (Version 2.0, 2010) and Great Plains Region (Version 2.0, 2010))
 - Surveys will require the collection of wetland boundaries, sample points, and completion of the appropriate USACE Regional Supplement sample point forms. The boundaries of each regional supplement are defined by the U.S. Department of Agriculture Land Resource Regions boundaries.
- Surveys will require the delineation of wetland communities according to the Classification of Wetlands and Deepwater Habitats of the United States (Cowardin, 1979), Circular 39 System and Eggers and Reed.
- All waterbody features encountered in the environmental survey corridor will be delineated and have characteristics documented regardless of the potential jurisdictional status.

4 Typical Sampling Protocol

4.1 Wetland Sampling Protocol

The entire environmental survey corridor will be walked, not just the exterior boundary of a located wetland (as far as safe conditions allow). This will minimize the chance of missing upland inclusions, potential Rare, Threatened and Endangered (RTE) species habitat or wetland communities that may affect permitting, construction, or mitigation.

All wetlands will be delineated regardless of potential jurisdictional status. Examples of potential scenarios and sampling can be found in Appendix A.

4.1.1 Vegetation

Vegetation sampling and documentation will follow procedures as described in the appropriate Regional Supplement.

4.1.2 Hydrology

Hydrology sampling and documentation will follow procedures as described in the appropriate Regional Supplement.

4.1.3 Soils

Soil sampling and documentation will follow procedures as described in the appropriate Regional Supplement. This requirement includes one soil sample collected at each data point. Due to safety concerns, one exception is:

- 1) No soil sampling will occur near roadsides. In cases of roadside wetlands, crews will be restricted from sampling the soils and assume soils are hydric. Crews are to indicate such on their data forms (i.e., in soil notes write: “roadside wetland – soils assumed hydric).

4.1.4 Upland Inclusions within Wetland Complexes

Upland inclusions within a wetland may be observed. Upland inclusions greater than 2,500 square feet will be delineated. In these cases:

- Collect an USACE data form to represent the upland inclusion.

4.1.5 Photo Documentation

Photos of all surveyed wetlands will be captured. The purpose of photos is to characterize the surveyed wetland. A representative photograph should be taken of each wetland. If multiple plant communities are present in each wetland, a representative photograph of each plant community should be taken. Photos of upland areas are not necessary. Photos should:

- Be taken in the landscape (horizontal) orientation;
- Be representative of the wetland plant community. It is not necessary to be standing within the wetland, and it may be preferable to stand back from the wetland plant community while taking the photo;
- Not be taken looking into the sun as this will obscure the photo. When possible, the sun should be at the back of the photographer;
- Be level with the horizon such that the top quarter of the photo captures the sky (assuming flat topography and open conditions); and
- Be taken of NWI wetlands that are entirely upland (see below).

4.1.6 National Wetland Inventory – Upland Verification

An area may be identified as a NWI wetland, but field indicators may conclude that the area is entirely upland. In these situations, field crews will:

- 1) Collect a USACE wetland determination data point location within the area indicated by NWI to be wetland.
- 2) Complete a USACE wetland determination data form (including soils) to document why the NWI-indicated area is entirely upland.
- 3) Take a photograph of the NWI-indicated area to further characterize its upland nature.

In other instances, crews may locate a NWI that overlaps the observed wetland or is “skewed” from the observed wetland. In those cases, no additional documentation is needed for the upland fragment of the NWI area.

4.1.7 Lakes & Ponds

Lakes, ponds, and areas of small open water will be delineated as wetland features and classified according to the Cowardin Classification System (i.e., either Lacustrine or Palustrine).

A USACE wetland determination data point per feature may not be necessary where a lake or pond feature either lacks a vegetative fringe or has a narrow fringe comprised of annual or perennial vegetation.

Crews are to collect a USACE wetland determination point in the vegetative fringe if one is present. In that situation, crews should note in the data form that the emergent component is associated with an open water feature and crews should identify the Cowardin class for the open water component within the remarks section of the wetland data form (e.g., PUB, L1UB).

4.1.8 PUB Wetland vs Deepwater Aquatic Habitat (Lake or Pond)

In determining whether an area meets the definition of a palustrine unconsolidated bottom (PUB) wetland or a waterbody (lake or pond) the below criteria shall be used.

- Lakes or ponds are areas that are permanently inundated at mean annual water depths >6.6 feet or permanently inundated areas ≤6.6 feet in depth that do not support rooted-emergent or woody plant species.

4.1.9 Roadside Ditches

According to Merjent safety standard practices, no digging may occur in roadside ditches because of the increased likelihood that buried utilities will be present. Roadside ditches may fall into one of the three following categories:

The crews will delineate roadside ditches as wetlands when:

- They are entirely vegetated and dominated by hydrophytic vegetation; and
- A bed and bank are not present (i.e., no ordinary high-water mark (OHWM))

“Roadside ditch wetlands” will use the Wetland ID nomenclature outlined in this document, and only the vegetation and hydrology section of the USACE wetland determination data form will be filled out. Indicate in the soil comments, “Soils not sampled due to safety requirements – soils assumed hydric”.

The crews will delineate roadside ditches as waterbodies when:

- A bed and bank are present (i.e., OHWM present).

“Roadside ditch waterbodies” will use the Waterbody ID nomenclature outlined below in this protocol.

4.1.10 Special Resources

Special resources are features of unique agency designation or meet the criteria of unique agency designations. In general, all special resources wetlands will be delineated following standard delineation methods as described above. In addition, special resource wetlands will likely be evaluated by the team’s botanical staff separate from the delineation process.

4.1.11 Existing (Known) Special Resources

Known special resources such as areas identified as High and Outstanding Sites of Biological Significance by the Minnesota Biological Survey (formerly Minnesota County Biological Survey) will automatically be surveyed by the team’s botanical staff. The areas will be identified during the desktop review and targeted for rare plant surveys. The results of the botanical surveys will be addressed in a separate report.

4.1.12 Unknown Special Resources

There may be situations where field crews identify a previously undocumented special resource, such as calcareous fens. In these situations, field crews will report their findings to the biological lead, who will immediately alert the team. The team will formulate an adaptive field survey strategy to address these types of occurrences.

4.2 Waterbody Sampling Protocol

Crews will delineate and collect data for all waterbody features encountered in the environmental survey corridor as follows:

- Waterbodies <10 feet between OHWM will be delineated by capturing the centerline of the waterbody bed.
- Waterbodies >10 feet will be delineated by capturing the OHWM along each bank. The OHWM will be identified according to USACE Regulatory Guidance Letter (No. 05-05, December 7, 2005) *Subject: Ordinary High Water Mark Identification*.

- Each delineated waterbody will require the collection of a waterbody point and photos.

4.2.1 Flow Regime Classifications

Flow regime will be defined as ephemeral, intermittent, or perennial.

- 1) Ephemeral waterbodies – Inundated following spring thaw and after periods of rainfall. These features otherwise lack hydrology.
- 2) Intermittent waterbodies – Likely have water present within the feature throughout the growing season. These features will additionally show evidence of sorting or stratification of materials (cobble, sand, organic matter). During other seasons, these features generally lack hydrology.
- 3) Perennial waterbodies – Possess surface water hydrology consistently throughout the year, regardless of season.

4.2.2 Water Quality

The water quality of each individual water body will be classified as high, medium or low based on the below characteristics:

- 1) High - Waterbody consisting of either an Intermittent or Perennial flow regime which has aquatic fauna present. Riffles and pools are most likely present. Adjacent wetlands may be present and 30-60% native woody community species are present. No maintenance and/or grazing is apparent within the buffer. Additionally, channelization is absent, and no dams, dikes, levees, culverts, riprap, bulkheads, armor, or hoof tread found along the feature.
- 2) Medium - Waterbody consisting of either an Ephemeral, Intermittent or Perennial flow regime with a high degree of sedimentation or turbidity and few pools and riffles. Aquatic fauna may not be present. Area may be surrounded by woody vegetation with less than or equal to 30-60% aerial coverage with little to no maintenance or grazing visible. Less than 100 feet or the minority of the feature within the survey corridor is adversely impacted by channelization, dams, dikes, levees, culverts, riprap, bulkheads, armor, or hoof tread found along the feature.
- 3) Low - Waterbody consisting of either an Ephemeral or Intermittent flow regime, with a high degree of sedimentation or turbidity and no pools and riffles. Aquatic fauna most likely not present. Trash may or may not be present. Areas such as these may have a poor surrounding riparian buffer such as cropland, grazed pasture, maintained ROW or similar condition. More than 100 feet of the feature or the majority of the feature within the survey corridor is adversely impacted by channelization, dams, dikes, levees, culverts, riprap, bulkheads, armor, or hoof tread found along the feature.

4.2.3 Waterbodies within Wetland Complexes

There may be situations where a waterbody feature is surrounded by a poorly developed floating organic mat, leading to safety concerns for field crews. Under these circumstances, the waterbody feature will be digitized based on high resolution aerial photography. However, all pertinent data for the waterbody data form would be collected to the extent possible given the conditions.

4.2.4 Bank Heights

Crews will provide bank height data when delineating a waterbody. A view looking upstream will be used to differentiate the left bank from the right bank of a waterbody.

4.2.5 NHD Verification

An area may be identified as a NHD waterbody, but field indicators may conclude the area is not a waterbody or wetland resource and is entirely upland. In these situations, field crews will take a photopoint with at least two photos documenting the area as upland.

4.3 Habitat Assessment and Rare, Threatened, and Endangered Species

Merjent Technical Leads will review the available Natural Heritage Information System (NHIS) data. This review will also inform planning for Minnesota special-status species surveys that could need to occur to support routing/permitting of the Project. Merjent will submit an NHIS Review request to the Minnesota Department of Natural Resources to initiate consultation. The results of this review will provide information on specific species occurrences in or near the Project area and help define whether species-specific surveys may be needed.

4.3.1 Habitat Assessments

All field leads will determine the potential for suitable RTE species habitats within the environmental survey corridor. Crews will identify, collect data, and photograph areas within the survey corridor that have the potential to support the presence of RTE species. See Appendix B for a list of potential species within the project survey area.

4.4 Land Use

Land use descriptions will be collected along the environmental survey corridor for the project to classify current conditions observed on the ground. Examples of land use values include:

- Open Land
- Forested
- Agricultural field (active)
- Agricultural field (fallow)
- Residential
- Industrial
- Transportation
- Tallgrass Prairie
- Shortgrass Prairie
- Mixed Grass Prairie
- Sand Hills
- Hayfield
- Tamed Grassland

5 Field Data Collection

Data collection is limited to the bounds of the environmental survey corridor. Data will be collected electronically using a Global Positioning System (GPS) datalogger and a mobile tablet computer (tablet) on the ArcGIS Online (AGO) Field Maps Application. Survey teams will consist of two people. Recommended division of responsibility is as follows:

- Crew Member A will operate a sub-meter GPS datalogger (Trimble R1 GPS unit that pairs with a tablet via a Bluetooth connection) to geolocate the wetland boundary and USACE sample point locations.
- Crew Member B will operate a tablet to collect wetland parameter data, which includes:
 - USACE Wetland Determination Data Form information;
 - Wetland community observation point information; and
 - Photo, caption, and location.

5.1 Data Processing

5.1.1 Field Data QA/QC

The daily uploaded data (geographic information system (GIS), mobile device data and photos) shall be considered “raw” data that has not undergone post-processing, QA/QC, or editing. Merjent shall review all raw data to confirm completeness.

Crew members must QA/QC attribute data collected on their mobile device before the daily data upload. Post processing of the data will include edits to wetland lines and community polygons within a given wetland complex. Data sheets also require review following collection in the field and before uploading at the end of the day. Community polygons will be created during post-process within each wetland feature to match collected community observation points

5.1.2 Daily Data Upload

All data collected with the GPS datalogger will be converted to a GIS shapefile format and uploaded nightly to Merjent’s SharePoint site. Merjent shall review this data to confirm daily progress in the field

All data collected via tablet, or otherwise, will be uploaded to Merjent’s SharePoint site on a daily basis.

5.1.3 Daily Progress Tracking

5.1.3.1 Survey Start and Stop Points

Crews will log a “start” point and a “stop” point at the beginning and end of each day for the areas worked. If crews are moving around due to lack of survey access, the start and stop points will be used for each individual parcel or area surveyed.

5.1.3.2 Survey Status

At the end of the day, on the tablet in the collector application, crews will update the status of the individual parcels surveyed with the fields below:

- Complete – Biological surveys complete for the entirety of the environmental survey area in that parcel.
- In Progress – A portion of the environmental survey area has been completed in that parcel.
- Not Started (default) – Biological surveys have not been started in that parcel.

5.1.4 Post-Processed Data and QA/QC

Spatial data collected in the field will be post-processed by Merjent. Line data of wetlands and waterbodies will be processed into appropriate polygons and lines. Merjent will QA/QC attribute data collected on the tablets. GIS data will also include point data representing data collection points. The Feature ID of wetland polygons and waterbody lines must match that of the point data.

Post processing of the data will include edits to wetland lines and community polygons within a given wetland complex. Data sheets may also require editing following collection in the field. Community polygons will be created during post-process within each wetland feature to match collected community observation points. A unique numerical ID will be assigned for each community within a wetland.

An updated, contractor QA/QC Geodatabase of all GIS data, and updated data sheets are due Wednesday at 9:00 a.m. CDT. This data shall include all data collected for the prior week of fieldwork (i.e., the September 29 data submittal shall include all data collected for the period of September 20 through September 25). Merjent will conduct an additional QA/QC review of all data submitted.

5.1.5 Coordinate System

The WGS 84 UTM coordinate system will be used for all field-collected data.

5.1.6 Electronic Devices

5.1.6.1 Trimble GPS

Sub-meter Trimble R1 GPS Units paired with a tablet will be used to locate wetland boundaries and USACE sample point locations within the environmental survey corridor.

5.1.6.2 Mobile Tablet Computer

USACE data form information, wetland community observation point data, and photos will be collected using a tablet.

5.2 Field Data ID Nomenclature

5.2.1 Community Type Classification

The wetland community type will be categorized based on the Cowardin Classification System, Eggers & Reed Classification System, and Circular 39.

For wetlands with multiple Cowardin classes, each discrete community will be identified when it comprises 10 percent or more of the wetland complex. Each discrete community within a wetland complex will require a “wetland community observation point” form and photo. Each unique community will also require a representative USACE Wetland Determination Form.

Each wetland will be labeled in the following manner:

- “W”; Team ID; County Code, Chronological Feature Number
 - “W” – Each Wetland ID begins with a static “W”
 - Team ID – Unique four digit team ID (Merjent team numbers can start with 1 (1001, 1002, 1003, etc.)
 - County Code – Two letter county abbreviation
 - Numerical designation in consecutive order within the County Code and Team

Example 1: W1003OT001 is the first wetland delineated within Otter Tail County (OT abbreviation) by Team 1003.

Each waterbody will be labelled in the above manner with the exception of an “S” in place of an “W” at the beginning of the ID.

Each potential habitat will be labelled in the above manner with the exception of an “H” in place of an “W” at the beginning of the ID.

Each land use point will be labelled in the above manner with the exception of an “LU” in place of an “W” at the beginning of the ID.

5.2.1.1 USACE Wetland Determination Data Sheets & Points (Wetland & Upland)

Each USACE wetland determination data point will be labeled in the following manner.

- Wetland (“W”) or Upland (“U”); Team ID; County Code; Wetland Number; Point Number.
 - As with the “W1003OT001” example above, all data points for this wetland will contain 1003OT001, which identifies these data points as part of the first wetland delineated within in Otter Tail County by Team 1003.

- Wetland data sheets will begin with “W” and end with a Point Number that increases with each wetland data point collected (“W1003OT001_W1” “W1003OT001_W2” and so on).
- Upland data sheets will begin with “U” and end with a “U” and Point Number that increases with each upland data point collected (“W1003OT001_U1” “W1003OT001_U2” and so on).
- Transects of upland/wetland data points should have matching point numbers when possible (“W1003OT001_W2” paired with “W1003OT001_U2”).
- For multitype wetlands, a suffix with the cover type will be added to the wetland name, such as palustrine forested (PFO), palustrine scrub shrub (PSS) or palustrine emergent (PEM). An example wetland ID for a single type of wetland would be W1001OL001, while a PFO/PEM wetland complex would be labeled as W1001OL001_PFO and W1001OL001_PEM, respectively.

5.2.1.2 Photos

Photo IDs should match Wetland IDs. To take a photo of a wetland, or a specific plant community within a complex, it may be necessary to do so from outside the wetland or community. The name for the photo should match the wetland or community being photographed; not the location where it was taken. For example, a photo of a wetland taken from an upland should be labeled with a W, not a U or upland label.

5.2.2 Data Collection Fields

Wetland Line Data – Collected on AGO Field Maps

- 1) Feature ID – Unique Wetland Feature ID (see above for naming convention)
- 2) Feature Type – Select PEM, PFO, PSS, PUB
- 3) State and County – State and County the wetland line is in
- 4) Date – Date of survey
- 5) Remarks – Additional comments of importance

Wetland Community Observation Point - Collected on AGO Field Maps

- 1) Feature_ID – Unique Wetland Feature ID (see above for naming convention)
- 2) Sub Community ID – Starting with “01”, increase incrementally for each wetland community within a wetland complex
- 3) Date – Date of survey
- 4) Cowardin – Select PEM, PFO, PSS, PUB

USACE Data Form Point or Soil Station Point - Collected on AGO Field Maps

- 1) Feature Type – Select PEM, PFO, PSS, PUB, Upland
- 2) Feature ID – Unique Wetland Feature ID (see above for naming convention)
- 3) State and County – State and County the photo point is in
- 4) Date – Date of photograph
- 5) Remarks – Additional comments of importance

Wetland Community Observation Form – Collected on tablet

- 1) Feature ID – Unique Wetland Feature ID (see above for naming convention)
- 2) Sub Community ID – Starting with “01”, increase incrementally for each wetland community within a wetland complex
- 3) Date – Date of survey

- 4) Cowardin – Select PEM, PFO, PSS, PUB
- 5) Eggers & Reed – Identify the appropriate community type
 - a) Seasonally Flooded Basin
 - b) Shallow, Open Water Community
 - c) Fresh (Wet) Meadow
 - d) Wet to Wet-Mesic Prairie
 - e) Calcareous Fen
 - f) Deep Marsh
 - g) Shallow Marsh
 - h) Sedge Meadow
 - i) Open Bog
 - j) Shrub-Carr
 - k) Alder Thicket
 - l) Coniferous Swamp
 - m) Coniferous Bog
 - n) Hardwood Swamp
 - o) Floodplain Forest
- 6) Circular 39
 - a) Type 1 – Seasonally Flooded Basins or Floodplains
 - b) Type 2 – Wet Meadows
 - c) Type 3 – Shallow Marshes
 - d) Type 4 – Deep Marshes
 - e) Type 5 – Open Water Wetlands
 - f) Type 6 – Shrub Swamps
 - g) Type 7 – Wooded Swamps
 - h) Type 8 – Bogs
- 7) Dominant Plants – List the top three dominant plants
- 8) Notes – Relevant information observed by crews in the field
- 9) Data Sheet – Was a data sheet completed for the sample point (Y/N)
- 10) County – County the wetland is located in
- 11) State – State the wetland is located in

USACE Wetland Determination Forms (applicable regional supplement) – Collected on tablet

- 1) Standard USACE form information

Stream Data Plot - Collected on AGO Field Maps

- 1) Feature ID – Unique Stream Feature ID (see above for naming convention)
- 2) Flow Regime – Ephemeral, intermittent, or perennial
- 3) OHWM Width – Width of OHWM
- 4) OHWM Point – Left Bank (when facing upstream)
- 5) OHWM Point – Right Bank (when facing upstream)

- 6) Top of Bank (TOB) Width – Width of top of bank
- 7) TOB Point – Left Bank (when facing upstream)
- 8) TOB Point – Right Bank (when facing upstream)
- 9) Depth – Current water depth
- 10) Substrate – Channel substrate (e.g. sand, cobble/gravel, organic, silt/clay)
- 11) Flow Rate – Flow rate in feet per second
- 12) Riparian Species – List the three dominant riparian species (regardless if adjacent area is upland or wetland)
- 13) Water Quality – High, Medium, Low
- 14) Flow Direction – North, South, Northwest, etc.
- 15) Bank Heights – Height measurement for both the right and left bank

Photo Point – Collected on Tablet

- 1) Feature ID – See above for naming convention. Feature ID of photo point should match the wetland or stream photographed
- 2) Feature Description – Direction in which the photo was taken (East, West, Southeast etc.)
- 3) State and County – State and County the photo point is in
- 4) Date – Date of photograph
- 5) Remarks – Additional comments of importance

Start and Stop Survey Point - Collected on AGO Field Maps

- 1) Feature Type – Start or Stop point
- 2) Crew ID – Unique Crew ID
- 3) State and County – State and County the point is in
- 4) Date – Date of survey
- 5) Remarks – Additional comments of importance

RTE Habitat Point - Collected on AGO Field Maps

- 1) Feature Type – Choose species from dropdown
- 2) Feature ID – Unique habitat ID
- 3) Feature Description – General description of habitat
- 4) State and County – State and County the habitat point is in
- 5) Date – Date of survey
- 6) Remarks – Additional comments of importance

Land Use Point - Collected on AGO Field Maps

- 1) Feature Type – Choose type of land use from dropdown
- 2) Feature ID – Unique Land Use ID (see above for naming convention)
- 3) Feature Description – General description of land use (if applicable)

Appendix 1 – Illustrated Field Scenario Examples

ILLUSTRATED FIELD SCENARIOS

Example 1. Small Size (<750' linear boundary length) and One Vegetative Community

Collection should include:

- 1) **1 red point** to represent upland USACE wetland determination data form (on the tablet) and associated GPS location (on the Trimble);
- 2) **1 blue point** to represent wetland USACE wetland determination data form (tablet) and associated GPS location (Trimble);
- 3) **1 pink point** to represent wetland community observation point form with photo (tablet); and
- 4) **Blue lines** to represent GPS location of wetland boundary (Trimble).
 - a. Crews should collect enough vertices to capture the true shape of the wetland feature and avoid square or rectangular boundaries.
 - b. At a minimum, five points should be recorded per vertex.

Example 2. Large Size (>750' linear boundary length) and One Vegetative Community

Collection should include:

- 1) **2 red points** to represent upland USACE wetland determination data forms (on the tablet) and associated GPS location (on the Trimble);
- 2) **2 blue points** to represent wetland USACE wetland determination data forms (tablet) and associated GPS location (Trimble);
- 3) **1 pink point** to represent wetland community observation point form with photo (tablet); and
- 4) **Blue lines** to represent GPS location of wetland boundary (Trimble).
 - a. Crews should collect enough vertices to capture the true shape of the wetland feature and avoid square or rectangular boundaries.
 - b. At a minimum, five points should be recorded per vertex.

Example 3. Large Size (>750' linear boundary length), 3 Unique Vegetative Communities Comprised of 9 Discrete Areas, and One Wetland Boundary Adjacent to the Road

Collection should include:

- 5) **1 red point** to represent upland USACE wetland determination data form (on the tablet) and associated GPS location (on the Trimble);
- 6) **3 blue points** to represent wetland USACE wetland determination data forms (tablet) and associated GPS location (Trimble);
- 7) **9 pink points** to represent wetland community observation point forms with photo (tablet); and
- 8) **Blue lines** to represent GPS location of wetland boundary (Trimble).
 - a. Crews should collect enough vertices to capture the true shape of the wetland feature and avoid square or rectangular boundaries.
 - b. At a minimum, five points should be recorded per vertex.

When multiple wetland community boundaries (pink points) are present, respective GIS staff will align them during the QA/QC process.

Example 4. Upland Inclusions (>2,500 ft²) and 2 Unique Vegetative Communities

Collection should include:

- 1) **3 red points** to represent upland USACE wetland determination data forms (on the tablet) and associated GPS location (on the Trimble);
- 2) **2 blue points** to represent wetland USACE wetland determination data forms (tablet) and associated GPS location (Trimble);
- 3) **2 pink points** to represent wetland community observation point forms with photo (tablet); and
- 4) **Blue lines** to represent GPS location of wetland boundary (Trimble).
 - a. Crews should collect enough vertices to capture the true shape of the wetland feature and avoid square or rectangular boundaries.
 - b. At a minimum, five points should be recorded per vertex.

When multiple wetland community boundaries are present, respective GIS staff will align them during the QA/QC process.

Example 5. Series of 2 Wetlands in Close Proximity to One Another

Collection should include:

- 1) **4 red points** to represent upland USACE wetland determination data forms (on the tablet) and associated GPS location (on the Trimble);
- 2) **3 blue points** to represent wetland USACE wetland determination data forms (tablet) and associated GPS location (Trimble);
- 3) **2 pink points** to represent community observation point forms with photo (tablet); and
- 4) **Blue lines** to represent GPS location of wetland boundary (Trimble).
 - a. Crews should collect enough vertices to capture the true shape of the wetland feature and avoid square or rectangular boundaries.
 - b. At a minimum, five points should be recorded per vertex.

When multiple wetland community boundaries (pink points) are present, respective GIS staff will align them during the QA/QC process.

Example 6. Lakes, Ponds and Open Water

Collection should include:

- 1) **1 red point** to represent upland USACE wetland determination data form (on the tablet) and associated GPS location (on the Trimble);
- 2) **1 blue point** to represent wetland USACE wetland determination data form (tablet) and associated GPS location (Trimble);
- 3) **1 pink point** to represent wetland community observation point form with photo (tablet); and
- 4) **Blue lines** to represent GPS location of wetland boundary (Trimble).
 - a. Crews should collect enough vertices to capture the true shape of the wetland feature and avoid square or rectangular boundaries.
 - b. At a minimum, five points should be recorded per vertex.

Appendix 2 – Potential Rare, Threatened, and Endangered Species

Merjent, Inc. (Merjent), reviewed the U.S. Fish and Wildlife Service’s Information for Planning and Consultation (IPaC) website¹ for a list of species and critical habitat that may be present along the proposed route in both Minnesota and Iowa. The table below provides the federal status and counties of occurrence where species and designated critical habitat may occur.

Scientific Name	Common Name	Federal Status	County	State	Line
<i>Myotis sodalis</i>	Indiana bat	Endangered	Boone, Story	IA	IAL-301 IAL-302
<i>Myotis septentrionalis</i>	Northern long-eared bat	Threatened	All	Both	All
<i>Charadrius melodus</i>	Piping plover	Endangered	Pottawatomie, Woodbury	IA	IAL-306 IAL-307 IAL-308
<i>Sistrurus catenatus</i>	Eastern massasauga	Threatened	Chickasaw	IA	IAM-101
<i>Notropis topeka</i>	Topeka shiner	Endangered	8	IA	IAL-301 IAL-302 IAT-202 IAM-102 SDM-104
<i>Scaphirhynchus albus</i>	Pallid sturgeon	Endangered	5	IA	IAL-318 IAT-205 IAL-306 IAL-307
<i>Bombus affinis</i>	Rusty patched bumble bee	Endangered	Boone/Story Jackson	IA MN	IAL-301 IAL-302 MNL-304
<i>Hesperia dacotae</i>	Dakota Skipper	Threatened	Chippewa	MN	MNL-303
<i>Oarisma poweshiek</i>	Poweshiek skipperling	Endangered	5 4	IA MN	IAM-101 IAM-102 IAT-201 IAT-202 IAT-203 MNL-304 MNL-303 MNL-305 ML-321
<i>Danaus plexippus</i>	Monarch butterfly	Candidate	All	Both	All
<i>Lespedeza leptostachya</i>	Prairie bush clover	Threatened	Most	Both	All
<i>Platanthera praeclara</i>	Western prairie fringed orchid	Threatened	All Iowa	IA	All Iowa lines
<i>Platanthera leucophaea</i>	Eastern prairie fringed orchid	Threatened	Hardin, Story	IA	IAL-301

Indiana bat

Indiana bats hibernate in caves or, occasionally, in abandoned mines. They require cool, humid caves with stable temperatures under 50°F but above freezing; very few caves within the range of the species have these conditions. Hibernation is an adaptation for survival during the cold winter months when prey species are not available. Bats must store energy in the form of fat before hibernating; during the 6 months of hibernation, this stored fat is the bat's only source of energy. If bats are disturbed during hibernation, they may deplete energy stores meant to sustain them until spring emergence. This depletion could lead to reduced fitness and death of individuals.

After hibernation, Indiana bats migrate to their summer habitat in wooded areas and small stream corridors with well-developed riparian woods where they usually roost under exfoliating tree bark on dead or dying trees. They can also be found foraging in upland areas in or along the edges of forest habitat. During summer, males roost alone or in small groups, while females roost in larger groups of up to 100 bats or more.

The range of the Indiana bat overlaps the proposed route in Boone and Story Counties, IA. Tree clearing within these two counties will need to be addressed for impacts on Indiana bats. Generally, tree clearing of trees greater than 5" diameter at breast height (dbh) may only occur between November 1 and March 31. Suitable hibernacula such as caves or mines do not appear to be present within the Project area and therefore impacts to winter habitat are not expected.

Indiana bat summary

- Only in Boone and Story Counties, Iowa
- Tree clearing generally prohibited April 1 to October 31 (potentially October 1)
- Winter habitat (i.e., caves/hibernacula) unlikely based on initial desktop review
- Habitat assessments can be done almost any time of year
- Presence/Absence (P/A) surveys (unlikely to be required, would not recommend) need to be done in summer

Northern long-eared bat

The range of the northern long-eared bat stretches across much of the Eastern and Midwestern U.S. During summer, northern long-eared bats roost singly or in colonies under bark, in cavities, or in crevices of both live and dead trees. Males and non-reproductive females may also roost in cooler places such as caves and mines. This species is thought to be opportunistic in selecting roosts, utilizing tree species based on the tree's ability to retain bark or provide cavities or crevices. It has also been found, rarely, roosting in structures such as barns and sheds. In winter, northern long-eared bats utilize caves and mines as hibernacula.

The northern long-eared bat was listed as a federally threatened species in May 2015, with an interim 4(d) rule; effective February 16, 2016, the U.S. Fish and Wildlife Service (USFWS) finalized the 4(d) rule. A 4(d) rule may only be applied to species listed as threatened, and is a tool periodically utilized by the USFWS to allow for flexibility in Endangered Species Act implementation. The rule allows the USFWS to tailor take restrictions to those that make the most sense for protecting and managing at-risk species and directs the USFWS to issue regulations considered "necessary and advisable to provide for the conservation of threatened species."

Merjent reviewed the USFWS Known Northern Long-eared Bat Hibernacula and Roost Trees in Iowa map² (dated May 3, 2016) to identify the presence of maternity roost trees or hibernacula in the vicinity of the Project. No known roost trees or hibernacula have been recorded in the counties and/or townships in which the Project occurs. Therefore, Incidental take of northern long-eared bats would not be prohibited under the 4(d) rule because project activities are not conducted within 0.25 mile of known hibernacula and do not remove known roost trees or trees within 150 feet of known roosts. Streamlined consultation can be used to satisfy Section 7 consultation for projects with a federal nexus.

Northern long-eared bat summary

- Present in all counties
- Tree clearing should be covered by 4(d)/Programmatic Biological Opinion (which will go away if/when listed as endangered)

Eastern massasauga

The eastern massasauga rattlesnake is a short, heavy-bodied snake found wet prairies, marshes, and low-lying areas along lakes and rivers. Massasaugas are very rare in Iowa and prefer emergent wetlands, shrub wetlands, and lowland hardwood habitats, and avoid upland hardwood and disturbed habitats. The massasauga is primarily a diurnal ambush predator, feeding mainly on small mammals. They generally occupy wetland habitats in the spring, fall, and winter, and overwintering habitat varies depending on geographic location. The species is often reported to overwinter in crayfish burrows, but may also use small mammal burrows, old stumps, rotten logs and moist poorly drained habitats. Known sites appear to be characterized by the presence of the water table near the surface for hibernation, and hibernation sites are located below the frost line; the presence of water that does not freeze is critical to hibernaculum suitability. Individuals emerge from winter dormancy as spring floods begin in March and April and are active until late October.

The range of the eastern massasauga overlaps the proposed route in Chickasaw County, IA. Suitable wetland habitat for the species is isolated and fragmented in the vicinity of the proposed route. Eastern massasaugas are sensitive to vibration. Impacts are possible where the proposed route crosses wetlands, bottomland forest, and adjacent uplands. Areas such as agricultural fields, and open landscape not adjacent to wetlands are unsuitable habitat.

Eastern massasauga rattlesnake summary:

- Only in Chickasaw County, IA
- Impacts should be considered in areas of large, contiguous tracts of wetland habitat
- Due to isolated and heavily fragmented landscape, impacts are unlikely

Topeka shiner

The Topeka shiner, an endangered species, is a small minnow that lives in small to mid-size prairie streams in the central U.S. where it is usually found in pool and run areas. Suitable streams tend to have good water quality and cool to moderate temperatures. In Iowa, Minnesota, and portions of South Dakota, Topeka shiners also occur in oxbows and off-channel pools.

² Known Northern Long-eared Bat Hibernacula and Roost Trees in Iowa. Available at <https://www.fws.gov/midwest/endangered/mammals/nleb/pdf/IowaNLEBHibernaculaAndRoostsByTWP03May16.pdf>. Accessed August 2019.

Suitable habitat may present along the proposed route at stream crossings in eight Iowa counties. USFWS designated critical habitat (DCH) is present in several counties, but specifically in close proximity to the route in Greene County, IA.

Topeka shiner summary:

- Listed in 8 counties in Iowa
- DCH occurs in 18 project counties in IA and MN
- Primary concern is stream crossings

Pallid sturgeon

Pallid sturgeon are bottom dwelling, slow growing fish that feed primarily on small fish and immature aquatic insects. Suitable habitat is present in the Missouri River on the border between Iowa and Nebraska and Big Sioux River between Iowa and South Dakota. Impacts need to only be considered for impacts to the Missouri River and immediate tributaries.

Pallid sturgeon summary:

- Iowa border counties with Missouri River
- Only habitat is Missouri River and Big Sioux River and immediate tributaries

Rusty patched bumble bee

The rusty patched bumble bee is a medium-sized bumble bee; workers and males are characterized by a rusty-colored patch located centrally on the second abdominal segment. Queens lack the species' eponymous rusty patch and can be further distinguished from workers and males by their large size.

Suitable habitat for the rusty patched bumble bee can be found in grasslands, prairies, marshes, agricultural areas, woodlands, and residential parks and gardens. The species is a generalist forager and utilizes both pollen and nectar from a wide variety of plants. It is thought that like other bumble bee species, rusty patched bumble bees typically forage within 0.6 mile from the nest site. Nests are commonly established underground in abandoned rodent burrows or other cavities, typically 1 to 4 feet beneath the surface; however, the species may also utilize clumps of grass aboveground. Suitable habitat must also provide overwintering sites for hibernating queens. While little is known regarding the overwintering habits of rusty patched queens, it is thought they may behave similarly to other *Bombus* species, that is, queens hibernate in a chamber created in uncompacted soils. Rusty patched bumble bees may choose sites in sandy, moss-covered soils on northwest slopes, and may be found in interior forest areas; areas with these characteristics near forested edges and open fields may be especially important. They may also use other areas, such as compost piles or mole hills.

The USFWS has identified "high potential zones (HPZ)" around current records (i.e., 2007-present); these areas indicate a high probability of rusty patched bumble bee presence. Within these zones, both suitable and unsuitable habitat may be present. The proposed Project route (8/2/6/2021 route) does not intersect a high potential zone as defined in the March 17, 2021 USFWS dataset, but does occur within a low potential zone in Jackson County, MN and Story County, IA. Low potential zones are the most likely areas to convert to HPZ during USFWS dataset updates. If the

Project occurs in HPZ, to fully determine impacts, field surveys assessing suitable foraging and overwinter habitat may need to be conducted. In general, cropland and roadside shoulders that exhibit high compaction do not provide suitable habitat; however, any pockets of floral blooms would provide suitable habitat. Forest edge habitat provides suitable overwinter habitat and would need to be avoided

during the hibernation period of October 15 to March 14. Inversely, habitat that provides only suitable active season foraging resources should be avoided from March 15 to October 14.

Rusty patched bumble bee summary:

- Boone and Story County, IA and Jackson County, MN
- Jackson County HPZ is in close proximity to route
- Impacts can be avoided by conducting work in summer habitat between October 15 and March 14
- Impacts to overwintering habitat can be avoided by conducting work March 15 to October 14

Dakota skipper

The Dakota skipper is a small butterfly that lives in high-quality mixed and tallgrass prairie. It has been extirpated from Illinois and Iowa and now occurs in remnants of native mixed and tallgrass prairie in Minnesota, the Dakotas and southern Canada. Impacts to Dakota skipper should be considered where the proposed route crosses native prairie. It does not appear the route crosses native prairie in the lone county in which Dakota skipper is listed along the proposed route (Chippewa County, MN).

Dakota skipper summary:

- Only in Chippewa County, MN
- Not within USWFS DCH
- Suitable habitat not identified on desktop review
- If route crosses prairie, research and surveys to identify native vs restored prairie will be prudent

Poweshiek skipperling

Poweshiek skipperlings are small butterflies most often found in remnants of native prairie in Iowa, Minnesota, North Dakota, South Dakota, and Wisconsin and in fens in Michigan. However, this skipperling may have been extirpated from the Dakotas, Minnesota and Iowa within the last 10 years – an area that, until recently, contained the vast majority of the surviving populations.

Poweshiek skipperling summary:

- Multiple counties in IA and MN.
- Not within USFWS DCH
- If route crosses prairie, research and surveys to identify native vs restored prairie will be prudent

Monarch butterfly

In general, butterfly habitat requirements include host plants for larvae, adult nectar sources, and sites for roosting, thermoregulation, mating, hibernation, and predator escape. In addition to these, the monarch butterfly requires conditions and resources for initiating and completing migration both to and from winter roosting areas, making them vulnerable to habitat degradation across wide areas. Because monarchs are host-plant specific, they are entirely dependent on the abundance of milkweeds, and threats to milkweed thus threaten their survival, as do threats to the specific forested areas that provide the microclimatic conditions they need to survive the winter.

This species is currently listed as a candidate species and therefore is not granted the full legal protections of a threatened or endangered species. Impacts to suitable habitat would occur where floral resources are present, especially milkweed.

Monarch butterfly summary:

- Candidate species
- Suitable habitat likely present throughout proposed route
- Species may be listed before Project goes to construction
- Candidate Conservation Agreement with Assurances (CCAA) an option

Prairie bush clover

Prairie bush clover is found only in the tallgrass prairie region of four Midwestern states. It is a member of the bean family and a midwestern "endemic" – known only from the tallgrass prairie region of the upper Mississippi River Valley.

Impacts can be avoided by avoiding work in any native prairies along the proposed route.

Prairie bush clover summary:

- Listed in most counties
- Habitat is limited to native tallgrass prairie
- Survey period: July to August (source: WI DNR; verify with botanist on staff for IA regional differences). MN DNR: August-September optimal; ID possible anytime after early June

Western prairie fringed orchid

The western prairie fringed orchid occurs most often in mesic to wet unplowed tallgrass prairies and meadows (native prairie areas and prairie remnants). Impacts can be avoided by avoiding work in any native prairies along the proposed route.

Western prairie fringed orchid summary:

- Western Iowa counties
- Habitat limited to mesic and wet native prairie
- Survey: July (source: MN DNR)

Eastern prairie fringed orchid

The eastern prairie fringed orchid occurs in a wide variety of habitats, from mesic prairie to wetlands such as sedge meadows, marsh edges, even bogs. It requires full sun for optimum growth and flowering and a grassy habitat with little or no woody encroachment. A symbiotic relationship between the seed and soil fungi, called mycorrhizae, is necessary for seedlings to become established. This fungi helps the seeds assimilate nutrients in the soil.

Suitable habitat may be present in Hardin and Story Counties, Iowa where the proposed route crosses wetland or prairie habitat.

Eastern prairie fringed orchid summary:

- Hardin and Story Counties, IA only
- Habitat more general than western prairie fringed orchid

- Survey period: July (source: WI DNR; verify with botanist on staff for IA regional differences).
USFWS: June 28 to July 11

Subject: RE: MN EIS - Questions & Letter of Support

CAUTION: This email originated from a sender outside of LREC. Please use caution when opening links and attachments.

Good afternoon, Tim. Below is a question (text in black) we received pertaining to our MN EIS and our response (text in red). Could you review the response and see if you agree with my answer from the LREC perspective?

19. Public commenters ask about electricity use at the capture facility. Representative comments include: "EERA should revisit the potential for impacts to the electrical system and other Lake Region Coop customers and member-owners. It is important to know both the total expected energy use as well as the variable demand that is anticipated by the project's additional electric usage. Will the project's use spike at the same time as the existing plant's demand? Will Lake Region Coop have to implement peak-shaving policies and technologies elsewhere to manage this new intense use? Even if no immediate upgrades are required to deliver energy to the plant, will this increase member-owners' exposure to power outages or brown-outs in times of peak demand?" Also, "who is paying for that electricity? Summit or the ethanol facility? And if the latter, will those cost increases be passed on to producers or other member-owners?"

When operating, the CO₂ capture facility is expected to draw 3,678 kW of electrical load from the grid. Summit plans to install variable frequency drives on all medium-voltage electrical loads to limit the impact on the electrical grid as loads come online. To serve our load, Lake Region Electric Coop (LREC) plans to upgrade a feeder in the existing substation. They have indicated to Summit that their system has ample capacity to manage the incremental load without issue. Summit is responsible for all costs associated with the upgrade and operation of the capture facility, including the cost of the utility power. LREC has not indicated to Summit that the additional load would cause the utility to implement peak-shaving policies or technologies anywhere in their system. LREC has not indicated that, nor does Summit anticipate an increase in other member-owners exposure to power outages or brown-outs.

Thanks,
DANIEL WOOD | O: 515-531-2611 | M: 307-331-9491 | DWOOD@SUMMITCARBON.COM

Tribal Government and State Agency Correspondence

Summary of EERA Outreach

Department of Commerce Energy Environmental Review and Analysis (EERA) staff provided a summary of the scoping process to the Minnesota Public Utilities Commission (Commission) and recommended a final scope for the environmental impact statement (EIS) for the Otter Tail to Wilkin Carbon Dioxide (CO₂) Pipeline Project (project). The Commission concurred with EERA staff recommendations. On September 26, 2023, the Commission issued an *Order Approving Scope of Environmental Review and Denying Stay* (Order) approving the scope of the EIS. In the Order, the Commission requested that EERA staff coordinate with the Minnesota Office of Pipeline Safety (MNOPS), Tribal governments, and state agencies to ensure that their expertise is reflected in the EIS and that the environmental review process benefits from their expertise.

EERA staff compiled a list of Tribal government and state agency contacts. The following summarizes correspondence between EERA staff and those Tribal government and state agency contacts. The Tribal governments and state agencies contacted are listed in **Table 1** below.

EERA Emails to Contacts

On October 20, 2023, EERA staff emailed the Tribal government contacts a letter to provide an update on the project and request their participation in the preparation of the draft EIS. The letter also provided an estimated timeline, anticipated opportunities for contacts to formally comment on the project, a preliminary EIS table of contents, and a project factsheet.

On October 27, 2023, EERA staff emailed state agency contacts a letter similar to the letter emailed to Tribal governments.

A representative sample of these emails and letters is included in **Attachment A**.

On November 17, 2023, EERA staff sent a follow-up email to the contacts (**Table 1**). EERA staff notified the contacts that preliminary draft EIS chapters would be sent to them in approximately 2 to 3 weeks. This email also asked that the contacts provide EERA staff with their comments within 2 weeks of receiving the preliminary draft EIS chapters. A representative sample of this email is included in **Attachment A**.

EERA Preliminary Draft Submission

On December 8, 2023, EERA staff emailed the contacts a preliminary draft of the EIS. This included Chapters 1 through 5, Chapters 7 through 9, a detailed mapset, and a comment table. EERA staff requested that responses be provided in the comment table by December 22, 2023. Representative samples of these emails are included in **Attachment A**.

Responses

On October 25, 2023, EERA staff received an email from the Shakopee Mdewakanton Community stating that they would defer their comments to the White Earth Nation (**Attachment B**).

On December 13, 2023, Mille Lacs Band of Ojibwe, Air Quality Specialist Charles J. Lippert, responded to the email with a few follow-up questions. EERA staff contacted Mr. Lippert to discuss his questions. On December 21, 2023, Mr. Lippert emailed the Mille Lacs Band of Ojibwe’s responses and comments to EERA staff.

On December 15, 2023, EERA staff received an email from the White Earth Nation. Renee Keezer, the Pesticide Coordinator for White Earth Nation, had a few questions about the preliminary draft EIS Chapters 6 and 9.

On December 21, 2023, Paul Hartzheim with the Department of Transportation (MnDOT) emailed comments to EERA staff in the comment table (**Attachment B**). MnDOT had staff from the Office of Environmental Stewardship–Environmental Assessment Unit, Cultural Resources Unit, Scenic Byways, and District 4 provide comments and review of the preliminary draft chapters and detailed mapset.

On December 22, 2023, EERA staff received an email response from MNOPS. Jon Wolfgram, Deputy Director of MNOPS, provided responses in the comment table and included a letter with “comments regarding the MNOPS oversight of intrastate pipelines and the interstate agent agreement with [the Pipeline and Hazardous Materials Safety Administration] PHMSA” (**Attachment B**).

On December 22, 2023, EERA staff received an email response from the Department of Health (MDH). David Bell, a research scientist at MDH, emailed EERA staff a completed comment table that provided EERA staff with feedback on the draft of Chapter 5 of the EIS (**Attachment B**). Comments from MDH focused on environmental justice, noise, public health, air quality, geology, and water.

On December 27, 2023, EERA staff received an email response from the Department of Natural Resources (DNR). Cynthia Warzecha, an Energy Projects Planner, sent DNR’s comment table as an email attachment (**Attachment B**). DNR’s comments focused on natural resources and mitigation recommendations.

Tribal Government and State Agency Contacts

Table 1 lists the Tribal government and state agency contacts included in the initial correspondence on October 20, 2023, and their email addresses. The same state contacts were used for the November 17, 2023, and December 8, 2023, follow-up emails from EERA staff.

Some Tribal government contacts were updated after the October and November 2023 emails due to changes in staff and contact information. For the December 8, 2023, EERA staff email to contacts, the EERA comment form was not sent to Alissa Jacobson and Jordan Holcomb at the Prairie Island Indian Community (see * in **Table 1**), Steve Shier of 1854 Treaty Authority was removed (see ** in **Table 1**), and Tyler Kaspar of 1854 Authority was added (see *** in **Table 1**) based on follow-up responses with contacts.

Re: **Otter Tail to Wilkin Carbon Dioxide Pipeline Project**

Draft Environmental Impact Statement Preparation

Greetings:

The purpose of this letter is to provide an update on the Otter Tail to Wilkin Carbon Dioxide Pipeline Project (project) and request your participation in the preparation of the draft environmental impact statement (EIS) for the project.

On August 31, 2023, the Minnesota Public Utilities Commission (Commission) determined the scope of the EIS. Staff within the Department of Commerce, Energy Environmental Review and Analysis (EERA) unit are responsible for preparing the EIS. On September 26, 2023, EERA issued a *Notice of Environmental Impact Statement Preparation*. The Commission has 280 days from the notice date to determine the adequacy of the EIS. To meet the 280-day deadline, EERA staff must issue the draft EIS in January 2024.

The Commission requested EERA coordinate with Tribal governments and other state agencies to ensure their expertise is reflected in the EIS. To ensure Tribal government expertise is included, we plan to send you select draft sections of the EIS. It is difficult to say exactly when this will occur, but we anticipate this to be in December 2023. We will provide you additional notice about two weeks before we send the draft sections. We plan to send the following sections, but can send others as requested:

- Archaeological and Historic Resources
- Cultural Resources
- Environmental Justice
- Public Health and Safety
- Tribal Treaty Rights

We ask that you provide comments within two weeks of receipt of the draft sections so that we can incorporate your comments into the draft EIS. Your comments in their entirety will be included as an appendix to the draft EIS along with comments from other Tribal governments and state agencies.

In addition to our request in this letter, there will be multiple opportunities to formally comment on the project. These include:

- Draft EIS comment period (opens with issuance of draft EIS)
- Draft EIS public meetings (February 2024)
- Comment on adequacy of the EIS (May 2024)
- Public Hearings (May 2024)

Should you have any comments at this time, please provide those to me now at the email below. Also, please let me know if you would like to review any draft sections beyond those listed here.

Thank you for your assistance in preparing the draft EIS. If you have any questions or concerns, please don't hesitate to contact me at 651-539-1840 or andrew.levi@state.mn.us.

Sincerely,

A handwritten signature in blue ink, appearing to read "A. Levi", is positioned above the typed name.

Draft Environmental Impact Statement Preparation

Greetings:

The purpose of this letter is to provide an update on the Otter Tail to Wilkin Carbon Dioxide Pipeline Project (project) and request your participation in the preparation of the draft environmental impact statement (EIS) for the project.

On August 31, 2023, the Minnesota Public Utilities Commission (Commission) determined the scope of the EIS. Staff within the Department of Commerce, Energy Environmental Review and Analysis (EERA) unit are responsible for preparing the EIS. On September 26, 2023, EERA issued a *Notice of Environmental Impact Statement Preparation*. The Commission has 280 days from the notice date to determine the adequacy of the EIS. To meet the 280-day deadline, EERA staff must issue the draft EIS in January 2024.

The Commission requested EERA coordinate with Tribal governments and other state agencies to ensure their expertise is reflected in the EIS. To ensure your expertise is included, ***we plan to send you draft section(s) of the EIS that you request*** (see attached Preliminary EIS Table of Contents). It is difficult to say exactly when this will occur, but we anticipate this to be in December 2023. We will provide you additional notice about two weeks before we send the draft section(s).

We ask that you provide comments within two weeks of receipt of the draft section(s) so that we can incorporate your comments into the draft EIS. Your comments in their entirety will be included as an appendix to the draft EIS along with comments from Tribal governments and other state agencies.

In addition to our request in this letter, there will be multiple opportunities to formally comment on the project. These include:

- Draft EIS comment period (opens with issuance of draft EIS)
- Draft EIS public meetings (February 2024)
- Comment on adequacy of the EIS (May 2024)
- Public Hearings (May 2024)

Should you have any comments at this time, please provide those to me now at the email below. As indicated above, please let me know which sections of the draft EIS you would like to review.

Thank you for your assistance in preparing the draft EIS. If you have any questions or concerns, please don't hesitate to contact me at 651-539-1840 or andrew.levi@state.mn.us.

Sincerely,

A handwritten signature in blue ink, appearing to read 'A. Levi'.

Greetings:

As follow up to our October 2023 email, we are providing notice that preliminary draft sections of the draft environmental impact statement (EIS) being prepared for the Otter Tail to Wilkin Carbon Dioxide Pipeline Project will be sent to you in two to three weeks.

We ask that you provide comments within two weeks of receipt of the draft sections so that we have time to incorporate your comments into the draft EIS. We understand this is a short turnaround, but to meet deadlines outlined in rule the draft EIS must be published in January 2024.

To speed our review of the comments we receive, we will also provide a table for your comments. More explanation will be given at that time.

Thank you in advance for your assistance in preparing the draft EIS. If you have any questions or concerns, please don't hesitate to contact me at 651-539-1840 or by email.

Enjoy the weekend!

Thank you.

—Andrew

Subject: Otter Tail to Wilkin EIS -- Draft Chapters

Good afternoon,

As indicated in my emails sent to you in October and November, I am now sending you preliminary sections of the draft Environmental Impact Statement (EIS) being prepared for the Otter Tail to Wilkin CO2 Pipeline Project for your review and comment. There are three items for your attention: 1) pdfs of EIS chapters, 2) a comment table for your use, and 3) a link to a SharePoint site where you can view detailed maps showing the three route alternatives analyzed in the draft EIS.

1) Attached are separate pdf files of: Chapters 1 to 5 and Chapters 7 and 8, a drawing of the proposed CO2 capture facility, and the EIScreen report for the census tracts that would be crossed by the route alternatives. Each chapter includes a brief table of contents on the first page to help guide your review.

2) Also attached is a comment table (an Excel file) that we request be used to provide consolidated comments. Please save the file with the name of your Tribe or agency. Instructions are on the form. The comments you provide in the attached comment table will be included in an appendix to the draft EIS.

3) A SharePoint site has been established: [Detailed Mapset - Otter Tail to Wilkin CO2 Pipeline](#) . Here you will find detailed maps showing the three route alternatives analyzed. (You will be receiving an invitation from Eric Benton with HDR concerning SharePoint indicating your access is open. Please disregard. It is autogenerated and we can't shut it off. Use the link in this email.)

We are working as quickly as we can to prepare the document; however, it is still a work in progress. The attached draft EIS chapters are the current working versions; they are works in progress, lack some information and details, and are subject to change. Where portions are not ready, we note this with placeholders. Some chapters, along with the pipeline rupture study, are not ready. Also, these documents have not had a final technical edit and formatting review.

some information and details, and are subject to change. Where portions are not ready, we note this

Please focus your time on providing substantive comments using the attached Excel comment table. While pointing out something to fix or change is useful, providing a suggested fix is most helpful. We appreciate your attention to this matter and your time to provide your review and expertise to help inform the draft EIS. Don't hesitate to contact me with any questions. Note: I work a four 10-hour day schedule Tuesday through Friday.

We need your comments back no later than **Friday, December 22**, so that we can address and incorporate as many of your comments as possible into the Draft EIS that will be published January 23, 2024.

Thank you.

—Andrew

Attachment B

COMMENT SUMMARY TABLE

Available Sections of Draft Environmental Impact Statement (dated Dec. 8, 2023)

Otter Tail to Wilkin Carbon Dioxide Pipeline Project -- MPUC Docket No.: IP7093/PPL-22-422

Commenting Tribe or Agency: Mille Lacs Band of Ojibwe

Fill out the table and provide the page number and paragraph of the text on which you are commenting, along with your specific comment, recommendation, or any mitigation measures or other strategies that could address potential impacts of the proposed project. The first row of the comment table is filled out as an example.

Note to Reviewers: Please focus your comments on substantive content. It is most helpful to us if you include a suggested resolution and/or information that you would like added, including potential mitigation measures.

Chapter and Section	Page No.	Paragraph No. (from top of page)	Comment
Example: Section 5.4.3 Environmental Justice	Example: 5-37	Example: 2	Example: Text reads "Using these criteria, census tract 9609 in Otter Tail County was identified as an MPCA EJ area of concern within the ROI because 43 percent of the population has a reported income which is less than 100 percent of the federal poverty level." MPCA areas of concern are based on 200 percent of the federal poverty level. Correction: The sentence should read, "Using these criteria, census tract 9609 in Otter Tail County was identified as an MPCA EJ area of concern within the ROI because 43 percent of the population has a reported income which is less than 200 percent of the federal poverty level."
1.2 What is the project's purpose	1-2	1	Change "... permitted Class VI injection wells." to "... permitted federal Class VI injection wells issued by North Dakota." for clarity. This class of wells are done with a Federal permit, issued by North Dakota, as they have taken primacy for this permit type.
2.7 Decommissioning	2-14	8	Either remove draft document reviewer comment "[Comment from Andrew:....]" or highlight for draft document so that it wouldn't get lost in the final edits.
3.2.3 Public Meetings and Hearings	3-03	4	Appreciate the uncertain draft text areas being highlighted in this chapter, but wasn't sure if the "(note the Second Prehearing Order...)" was a comment for the draft document or if it was supposed to be part of the EIS text.
3.7 Are other permits or approvals required?	3-10	2 Right	In addition to federal agency providing the permit or approval constult with the SHPO, there may also be a consultation with Tribes or Tribal Historic Preservation Office (THPO), facilitated by the SHPO.
4 Alternatives			In other chapters, notes are marked in Arabic Numerals but in this chapter they are in Roman Numerals. Change to Arabic Numerals for consistency.
5.02.02 Minnesota River Prairie Subsection	5-04	2	When naming plants, also use botanical taxonomical names for clarity. Example: silver maple (Acer saccharinum).
5.02.03 Red River Prairie Subsection	5-04	3	When naming plants, also use botanical taxonomical names for clarity. Example: bluestems (Andropogon gerardii, Schizachyrium scoparium, etc.).
5.04.01.01 Existing Conditions	5-06	5	There are no montions of the historical trails to Abercrombie or historical trails to Brekenridge. RA-North crosses such trails at MP 2.6 and 14.7. RA-South crosses them at MP 2.8, 10.4, 15.6, and 15.9. RA-Hybrid crosses them at MP 2.6, 10.8, 16.4, and 16.7.
5.04.02.01 Existing Conditions	5-10	2	First bullet point "According to the U.S. Department of Housing and Urban Development..." shouldn't be a bullet point, as it introduces the list of tribes following it.
5.04.02.01 Existing Conditions	5-10	1	Change sentence to "During the period of European contact (1650-1837 AD) into the Post-Contact Period (1837 AD to Present), the Dakota people (historically known by Euro-American settlers as the Sioux) and the Ojibwe (historically known by the Euro-American settlers as the Chippewa) occupied the land within the local vicinity of the project area. In the 1825 Treaty of Prairie du Chien (7 Stat 272), the Ojibwe relinquished their claims to the area."
5.04.02.01 Existing Conditions			Ojibwe toponymy can describe the area a little more. For example: Otter Tail River is known in Ojibwe as Nigigwaanowe-ziibi (Otter Tail River) due to the long sandbar at the river's outlet into Otter Tail Lake which results in Fergus Falls being called Nigigwaanowe gakaabikaans (Little falls of the Otter Tail), Bois de Sioux as Gaa-edawayi'ii-maamiwang-ziibi (River from which it [Lake Traverse] flows out from both ends) due to the lake's location within Glacial Lake Agassiz and now is a basin divide, and Pelican River as Zhede-zaaga'iganiwi-ziibi (River that of Pelican Lake) due to Lakes Lizzie and Lida, known as Zhede-zaaga'igan aazhawaakwa (Pelican lake beyond the woods) and Zhede-zaaga'igan (Pelican lake) respectively, being a habitat for American white pelican (Pelecanus erythrorhynchos).

5.04.03.01 Existing Conditions	5-13	6	There is a discussion here on EPA tool EJScreen, but absent from the discussion is CEQ's Climate and Economic Justice Screening Tool (CEJST). See: https://screeningtool.geoplatform.gov/en/#9.9/46.2844/-96.3457 . It also identifies Census Tract 9609 as a disadvantaged community due to Legacy pollution by being in the proximity to Risk Management Plan facilities located within 5 kilometers (3 miles).
5.04.09.01 Existing Conditions	5-53	2	Mention that there are 115 kV and 345 kV Electric Transmission Lines nearby, but the project does not cross them.
5.04.10.01 Existing Conditions	5-63	Figure 5-11	Missing from the map are Wildlife Management Areas and Walk-in Access Areas, as these are also Recreational facilities in the project vicinity.
5.04.10.01 Existing Conditions	5-63	Figure 5-11	Change title "vacinity" to "vicinity".
5.04.10.01 Existing Conditions	5-63	Figure 5-11	Otter Tail River State Water Trail is shown in the map but isn't labeled. Please label this feature.
5.04.12.01 Existing Conditions	5-67	9	Change subsection title to "Treaty with the Sioux-Sisseton and Wahpeton Bands (10 Stat. 949)" for clarity.
5.04.12.01 Existing Conditions	5-67	9	Discuss in this section that Dakota (Sioux) and Ojibwe (Chippewa) occupied the project area, and the Ojibwe relinquished their claims to the area in 1825. Then speak about the lands in the local vicinity of the project were ceded to the United States government in two 1851 treaties. The area that was ceded in 1851 should be referenced as Royce Area 289.
5.04.12.01 Existing Conditions	5-68	3	Change subsection title to "Treaty With the Sioux-Mdewakanton and Wahpakoota Bands (10 Stat. 954)" for clarity.
5.04.12.01 Existing Conditions			Since the project ends at the Bois de Sioux River and the river serves as the boundary for Royce Area 538, there should be a very brief discussion about the September 20, 1872, Agreement with the Sisseton and Wahpeton Sioux (Rev. Stat. 1050), which the Royce Area 289 abuts.
5.04.12.01 Existing Conditions			There should be a very brief acknowledgement that the project is greater than 30-miles upstream from Royce Area 357 for the February 22, 1855, Treaty with the Chippewa-Mississippi and Pillager Bands (10 Stat. 1165) and Royce Area 445 for the 1863 Treaty with the Chippewa-Red Lake and Pembina Bands (13 Stat. 667).
5.05.05.01 Existing Conditions	5-78	4	Add "Next closest aggregate source is within ¾ mile of the RA-North route width (ID: 56139). Satellite imagery from August 2022 shows no evidence of mining operations at this location."
5.07.01.02 Existing Conditions	5-93	5	Add additional information regarding the next closest air monitoring station to the project area is in Fargo, North Dakota. Also mention that as of the time of this EIS, there were air sensor units located in Fargo, Cotton Lake, and Alexandria.
7 No Action Alternative	7-1	2	If the project is not constructed, will this result in Green Plains Ethanol Plant emitting CO2 into the environment? This is not captured in this paragraph.
9 Cumulative Potential Effects			Cumulative Potential Effects should also take into consideration any projects, discharges, and emissions in neighboring state (North Dakota) that are within 50-miles of Minnesota borders that can have impacts in Minnesota, and more specifically to the project, though cannot be regulated by Minnesota, but have the potential to limit Minnesota's ability to permit its own sources.

COMMENT SUMMARY TABLE

Available Sections of Draft Environmental Impact Statement (dated Dec. 8, 2023)

Otter Tail to Wilkin Carbon Dioxide Pipeline Project -- MPUC Docket No.: IP7093/PPL-22-422

Commenting Tribe or Agency: MnDOT

Fill out the table and provide the page number and paragraph of the text on which you are commenting, along with your specific comment, recommendation, or any mitigation measures or other strategies that could address potential impacts of the proposed project. The first row of the comment table is filled out as an example.

Note to Reviewers: Please focus your comments on substantive content. It is most helpful to us if you include a suggested resolution and/or information that you would like added, including potential mitigation measures.

Chapter and Section	Page No.	Paragraph No. (from top of page)	Comment
Example: Section 5.4.3 Environmental Justice	Example: 5-37	Example: 2	Example: Text reads "Using these criteria, census tract 9609 in Otter Tail County was identified as an MPCA EJ area of concern within the ROI because 43 percent of the population has a reported income which is less than 100 percent of the federal poverty level." MPCA areas of concern are based on 200 percent of the federal poverty level. Correction: The sentence should read, "Using these criteria, census tract 9609 in Otter Tail County was identified as an MPCA EJ area of concern within the ROI because 43 percent of the population has a reported income which is less than 200 percent of the federal poverty level."
All Maps			Add symbology in legend to denote, county, state, and US highways.
Route Overview, RA-South, and RA-Hybrid Overview maps			Move label for city of Fergus Falls to the east. The majority of the city (including downtown) is located east of I-94. The label on the figure appears to be on/near the airport (which I am sure is within city limits, but not in the center of the city). The label on the RA-North map looks good.
Route Overview Map			Add "MINNESOTA" on east side of Bois de Sioux River ("NORTH DAKOTA" is identified on the west side)
Detailed Mapsets	All		The detailed maps all display "undelineated NWI wetlands." Is there a reason why delineated wetlands within the study area are not displayed?
Chapter 1.2	1-1	6	The pipeline does not technically interconnect to the broader MCE project at the MN/ND border. Based on mapping of the overall MCE project on the applicant's website, the line continues for several miles in ND before combining with another lateral from an ethanol plant located in ND.
Chapter 2.1	2-2	Fig 2-1	Can you include a higher resolution figure? Some of the text is not clear (particularly in the legend), even when zooming in.
Chapter 2.2	2-3		Clarify typical TWS and ATWS dimensions (XX' x XX') at road crossings (MnDOT and County/Township).
Chapter 2.8	2-15	2	This is the first mention of "North" and "Hybrid" route alternatives, and neither are mentioned in Chapter 1 either. Need to define and describe these routes (and include figures) before introducing here out of the blue without context.
Chapter 3.2	3-2	Fig 3-1	Suggest adding rough timelines for each EIS step to the figure.
Chapter 3.2.3	3-3	4 and 5	Include locations/times of Feb 7 and 8 public meetings and May hearings, if/when known. Clarify if in-person only, or if a hybrid option will be available.
Chapter 3.7	3-6	4	RE: the sentence: Tables 3-1 and 3-2 lists permits and approvals that <i>might</i> be required for the project pipeline and capture facilities, and a description of applicable agency role(s) associated with the permits/approvals. Is it possible in the tables to denote which permits that applicant <i>must/will</i> acquire, versus those that <i>might/may</i> be required (pending final project design)?
Chapter 3.7	3-10		Rename MnDOT "Road Crossing Permits" to "Utility Accommodation on Trunk Highway Right of Way" and "Miscellaneous Work on Trunk Highway Right of Way" permits
Chapter 4.3	4-2	1	Suggest adding a few sentences to describe how/why the alternatives were derived.
Chapter 4.3.1-3	4-2 and 4-3		To me, it makes sense to describe RA-North and RA-South before introducing the RA-Hybrid option, since the hybrid option is a combination of the two. Suggest swapping current Section 4.3.2 and 4.3.3, or move the South (preferred option) to 4.3.1, then North as 4.3.2, and Hybrid as 4.3.3.
Chapter 5.4.1.1 and 5.4.1.3 (Applicant Proposed Mitigation)	5-9	3	There should be a statement if any trees and/or shrubby vegetation will need to be removed within the 1,600 foot ROI of the Scenic Byway crossings. There does not appear to be any trees/shrubby veg at the crossing locations themselves, but unclear if clearing may be needed within the ROI that may impact users of Scenic Byway.

Chapter 5.4.3.1	5-16	Fig 5-4	This figure shows <i>all</i> EJ Census tracts, EJ tracts should be called out and added to the legend. Also, the figure gives percentages for minority populations but no info on percent of low-income households
Chapter 5.4.3.2	5-17	5	Re: air emissions, the paragraph mentions a 100,000 tpy limit for CO2. What other air quality parameters (e.g., NOx, SO4, etc.) are in this permit? Suggest listing out as these are likely to have a more localized impact compared to CO2 emissions.
Chapter 5.4.4.1	5-18	2	A bit nitpicky, but the sentence " <i>the project is located entirely on privately owned land</i> " is a bit misleading. Suggest something like "With the exception or road, railroad, and public water crossings, the project is located entirely on privately owned land." There is also mention of crossing of USFWS WPAs later in the document. Clarify if these are publicly owned (or privately owned but managed by USFWS).
Chapter 5.4.9.1	5-54 - 5-56	Table 5-17	Sort road crossings for each alternative in a logical order (suggest from east to west, MP 0.0 - MP 24.5), also call out US 75 as King of Trails Scenic Byway.
Chapter 5.4.9.2 (Roadways)	5-57 and 5-8		Suggest moving last paragraph in section to the front to address impacts on the roadways crossed first, and then go on to describe general traffic/roadway impacts in the region.
Chapter 5.4.10.2	5-63	2	The paragraph states "Both RA-Hybrid and RA-South would also cross the King of Trails State Scenic Byway (U.S. Highway 75)". In fact, all three RAs (including North) cross the SB. The north route crosses in a different location; RA-Hybrid and South cross at the same location. Also, confirm if any trees/shrubs need to be removed within 1600 feet of SB crossing (see earlier comment)
Chapter 5.5.6	5-78		General Comment - The role of the King of Trail Scenic Byway as it relates to local tourism should be addressed/mentioned in this section.
Chapter 5.6 (Archaeological and Historic Resources)	General comments from OES-CRU: not sure if changes to DEIS are warranted or if these should be incorporated into permit conditions		There are no known or suspected archaeological sites, burials, or historic properties are within or immediately adjacent to MnDOT ROW where crossings are proposed. <u>General comments/expectations are below:</u> The Applicant should provide a summary of cultural field surveys and coordination with SHPO to date. If surveys have not been completed, provide an anticipated schedule for completion. If the Applicant is aware of or becomes aware of significant cultural resources findings in or adjacent to MnDOT ROW, please contact our office at CulturalResources.dot@state.mn.us. In addition, the Applicant shall prepare a Post Review Discovery Plan (PRDP - <i>previously referred to as an Unanticipated Discoveries Plan</i>) and submit to MnDOT for review and contact information for MnDOT's Cultural Resource Unit (CRU) staff must be included in the PRDP. This plan should outline the steps to be followed in the event of an unanticipated discovery of archaeological materials, human remains, or burials, and include language specific to the coordination with MnDOT when a discovery is on MnDOT ROW. MnDOT CRU staff should be notified (CulturalResources.dot@state.mn.us) within 24 hours/days in the event of an unanticipated find on or adjacent to MnDOT property during construction. Additional archaeological investigations (e.g., literature reviews, reconnaissance surveys [if warranted]) may be required where co-location is proposed or where temporary easement may be located within MnDOT ROW. Investigations should include in-field inspections to document areas of soil disturbance and to identify potentially unknown archaeological sites within areas of moderate to high archaeological potential. A PRDP should be developed for the project in advance of construction and provided to MnDOT CRU.
Chapter 5.7.5			The DEIS discusses potential for take of eggs or young of state-listed birds. Will a state DNR takings permit be sought? Most birds are also protected by federal law, will a federal permit be sought? Will tree clearing be done during the non-nesting season? If not, that's also a risk for incidental take of birds under the Migratory Bird Treaty Act (federal).
Chapter 5.7.5			Soil stockpiles, trenches, and other exposed soils typically attract birds that nest if vertical faces. The DEIS/EIS should address how this will be avoided or minimized (e.g., soil stock piles covered or graded to avoid creating vertical faces).
Chapter 5.7.5.2			The USFWS listing work plan has several potential listing decisions expected in the coming 6-12 months. Project proponent is encouraged to monitor these development and update consultations / analyses as required. https://www.fws.gov/project/national-listing-workplan
Chapter 5.7.5.3	5-118		Effective date for northern long-eared bat was delayed to March 31, 2023. Update text to reflect the delay.
Chapter 5.7.5.3	5-118		Note removal of non-roost trees during bird nesting season is expected to result in incidental take of protected birds.
Chapter 5.7.5.3	5-118		Impacts to monarch butterfly may be negligible, but 'take' as defined in regulation may still occur. Explicitly acknowledge this.
Chapter 5.7.5.3	5-118		States that take of state-listed birds "would not occur as part of project operation." Mowing and herbicide applications on utility and other rights-of-way may result in direct and indirect effects, including take of ground-nesting species. The effects of project operation should be reassessed and verified.
Chapter 5.7.5.4	5-119		Riprap and other erosion control practices (i.e., use of plastic erosion blanket) may entrap or entangle small wildlife, including protected wild animals. The DEIS/EIS should state whether it will use erosion techniques that avoid these impacts. If not, these impacts should be assessed as part of the proposed action.
Chapter 5.7.10.2	5-158		The DEIS states, "... the impacts to the viability of any given reptile or amphibian species would be short-term and negligible to minimal." What is the basis of the statement? Provide data, references, citations. Many studies exist, especially for turtles (a reptile), that even small increases in human-caused mortality is significant and unsustainable for population viability.
Chapter 9.1	Table 9-1		Several of the projects in the table have construction dates in the past. Try to get updates on status of these projects.
Chapter 9.1			Potential future MnDOT projects in the area should be considered in Cumulative Impacts. These can be accessed by MnDOT's State Transportation Improvement Program (STIP, https://www.dot.state.mn.us/planning/program/stip.html) and Capital Highway Investment Program (CHIP, https://www.dot.state.mn.us/planning/10yearplan/district-chip.html).

COMMENT SUMMARY TABLE
Available Sections of Draft Environmental Impact Statement (dated Dec. 8, 2023)
Otter Tail to Wilkin Carbon Dioxide Pipeline Project -- MPUC Docket No.: IP7093/PPL-22-422

Commenting Tribe or Agency: MNOPS

Fill out the table and provide the page number and paragraph of the text on which you are commenting, along with your specific comment, recommendation, or any mitigation measures or other strategies that could address potential impacts of the proposed project. The first row of the comment table is filled out as an example.

Note to Reviewers: Please focus your comments on substantive content. It is most helpful to us if you include a suggested resolution and/or information that you would like added, including potential mitigation measures.

Chapter and Section	Page No.	Paragraph No. (from top of page)	Comment
Example: Section 5.4.3 Environmental Justice	Example: 5-37	Example: 2	Example: Text reads "Using these criteria, census tract 9609 in Otter Tail County was identified as an MPCA EJ area of concern within the ROI because 43 percent of the population has a reported income which is less than 100 percent of the federal poverty level." MPCA areas of concern are based on 200 percent of the federal poverty level. Correction: The sentence should read, "Using these criteria, census tract 9609 in Otter Tail County was identified as an MPCA EJ area of concern within the ROI because 43 percent of the population has a reported income which is less than 200 percent of the federal poverty level."
Chapter 3 - Section 3.7	3-8	Table 3-1	The chart lists "Potential Permits and Approvals Required – Pipeline Facilities." DPS / MNOPS does not issue any permits associated with the project. Tex reads "The Minnesota Office of Pipeline Safety (MNOPS) acts as a regulatory agency ensuring Minnesota’s pipeline infrastructure is in compliance with applicable pipeline safety standards." Text should be amended to:The Minnesota Office of Pipeline Safety (MNOPS) acts as a regulatory agency ensuring Minnesota’s intrastate pipeline infrastructure is in compliance with applicable pipeline safety standards. <u>MNOPS maintains an agreement with PHMSA annually to conduct inspections of interstate pipelines as requested.</u>

COMMENT SUMMARY TABLE

Available Sections of Draft Environmental Impact Statement (dated Dec. 8, 2023)

Otter Tail to Wilkin Carbon Dioxide Pipeline Project -- MPUC Docket No.: IP7093/PPL-22-422

Commenting Tribe or Agency: Minnesota Department of Health

Fill out the table and provide the page number and paragraph of the text on which you are commenting, along with your specific comment, recommendation, or any mitigation measures or other strategies that could address potential impacts of the proposed project. The first row of the comment table is filled out as an example.

Note to Reviewers: Please focus your comments on substantive content. It is most helpful to us if you include a suggested resolution and/or information that you would like added, including potential mitigation measures.

Chapter and Section	Page No.	Paragraph No. (from top of page)	Comment
Section 5.4.3.1 Environmental Justice	5-14	2 & 3	First two paragraphs under heading "Pollution Control Agency Areas of Concern" are very similar and repeat each other often. Correction: remove or edit one of the paragraphs
Section 5.4.3.2 Environmental Justice	5-16	general comment	While the document identifies census tract 9609 as an environmental justice (EJ) area of concern and states that, "This census tract is given additional consideration in evaluating potential disproportionate impacts from construction and operation of the project", no mention is made as to whether additional consideration or effort was, or is, planned to ensure meaningful community engagement within this EJ area of concern. A key tenant of effective EJ work is ensuring that communities have the opportunity to meaningfully participate in decisions that may affect their community and health. Document should clarify if specific effort has been made or when it plans to do so.
Section 5.4.5.2 Noise	5-32	1	Text reads "If noise mitigation is required, temporary sound dampening barrier walls would be placed around the equipment. The applicant has stated that it would coordinate with nearby landowners prior to starting HDDs, and its contractor would determine the need for noise mitigation and noise monitoring based on feedback received from landowners during construction." Comment: While open conversation with NSR landowners is a good step, the above sentence could be interpreted to mean that noise mitigation and noise monitoring at these HDD NSR locations will only be used if landowner feedback requests it. The onus for determining safe/acceptable sound levels should not be placed on the landowner. Further, since document states that "Because some NSRs would be less than 1,320 feet from the drilling equipment, the noise standards listed in Table 5-5 could be exceeded at these locations," these HDD NSR locations should be set up for noise monitoring and then appropriate mitigations should be employed as needed. Text should be updated to clarify these points
Section 5.4.5.3 Noise	5-33	6	MDH agrees with Mitigation recommended by EERA staff stating "EERA staff recommends as a special permit condition that the applicant provide, for Commission review and approval, a plan for coordinating with residents located within 1,320 feet of HDD entries, and as needed, monitoring noise levels at these locations during HDD operations to ensure noise standards are met. The plan should be provided 30 days prior to submittal of the plan and profile."
Section 5.4.8.2 Public Health and Safety	5-43	2	Section heading, "Operations Health and Safety". Comment: This section did not include a discussion on potential distances that CO2 plumes could reach in the event of pipeline rupture. Presumably this information would be available in "Appendix G Pipeline Rupture Analysis Study" though MDH has not yet had the opportunity to review this study/appendix. Accurate modeling of these potential distances for multiple scenarios but especially during worst case scenarios, is vitally important to protecting the health and safety of first responders and of the residents and communities located along the proposed routes so that proper route planning and preparedness training can be in place.
Section 5.4.8.2 Public Health and Safety	5-44	5	Text reads "The minimum depth of the pipeline as built by the applicant would be below the maximum depth where soil freezes in this region, except under potentially extreme conditions." Comment: Specific depths should be listed here as well as a definition given for what constitutes "potentially extreme conditions".
Section 5.4.8.3 Public Health and Safety	5-45	4	MDH emphasizes and supports the statement that reads "If PHMSA identifies any updated mitigation strategies or safety guidelines during this environmental review, the Commission has stated that it would be prudent for EERA staff and the applicant to take that information into account even if the updates have not been finalized as amended federal rules by the time the EIS is completed."
Section 5.4.8.3 Public Health and Safety	5-47	2	Text reads "...the applicant has developed a draft Emergency Response Plan, provided as Appendix 6 to its Route Permit Application,..." Comment: It is unclear if the draft Emergency Response Plan will also be provided as an appendix to this EIS. Due to the importance of this plan to protecting health and safety of the communities this proposed project will pass through and due to the fact that the PHMSA is reviewing and potentially updating its pipeline safety rules specifically for CO2 pipelines, any and all plans relating to emergency response and safety measures/procedures should be made readily available. Correction: Ensure draft Emergency Response Plan is included in this EIS

Section 5.4.8.3 Public Health and Safety	5-49	2	Text reads "This mitigaion would not be consistent with PHMSA regulations, which set out standards for the design and safety of liquid and gas pipelines, but do not specify any setback or minimum distance between the pipeline and a residence." Comment: While this statement is true of current PHMSA regulations, as noted elsewhere in this document, PHMSA have initiated rulemaking specially to look at whether design and safety standards for CO2 pipelines need updating. Text here should again aknowledge the upcoming PHMSA rulemaking process. It is possible that setbacks become incorporated as part of that rulemaking process. Again, while residential setbacks are not required at this time, MDH would encourage design and placement of CO2 pipelines that ensure to the best degree possible the safety of the communities and individual residences with which the pipeline crosses.
Section 5.7.1.1 Air Quality and Greenhouse Gas Emissions	5-90	5	Heading: Regulatory Framework. Comment: MDH has developed health-based air guidance values which may be used by the public, industry, state and local risk managers, and other stakeholders to assist in evaluating potential health risks to people from exposures to a chemical in air. MDH has air guidance values for NO2 and H2S and encourages the project to consider whether these values may be useful when evaulating the health, safety, and emergency preparedness of this project.
Section 5.7.3 Geology and Topography	5-109	5.7.3.1	A review of well records in the County Well Index shows land surface artesian conditions - static water levels above the land surface at the time of construction as opposed to static water levels above the top of the buried aquifer, within 1 mile of RA-South, RA-North and RA-hybrid for both shallow (less than 100 feet) and deeper confined aquifers. Recommend this section include brief discussion of artesian aquifers.
Section 5.7.8.1 Water Resources	5-135	6	Text reads "Placeholder for summary" Recommend potential artesian conditions in buried aquifers added to summary.
Section 5.7.8.1 Water Resources	5-136	1	Text states that the project does not cross state special designated waters. RA-North, RA-Hybrid, and RA-South make multiple crossing over surface waterways that have been delineated as portions of the Spill Management Area (SMA) of the city of Moorhead's Drinking Water Supply Management Area - Surface Water as delineated by the Minnesota Department of Health (MDH). Document should be updated with this information.
Section 5.7.8.1 Water Resources	5-138	2	Text acknowledges the Otter Tail River as a drinking water protected surface water in the RA-Hybrid area. Consideration should be given to project impacts to the Fergus Falls Source Water Assessment Area. The project area is downstream of the city's surface water intake and impacts are unlikely.
Section 5.7.8.1 Water Resources	5-140	2	Text acknowledges the Otter Tail River as a drinking water protected surface water in the RA-South area. Consideration should be given to project impacts to the Fergus Falls Source Water Assessment Area. The project area is downstream of the city's surface water intake and impacts are unlikely.
Section 5.7.8.1 Water Resources	5-143	3	"Based on the Minnesota Department of Health's (MDH's) County Well Index (CWI) database: <ul style="list-style-type: none"> • 56 wells are located within one mile of RA-North • 42 wells are located within one mile of RA-Hybrid • 73 wells are located within one mile of RA-South" CWI does not include all existing wells in Minnesota. In order to provide a more complete inventory of all wells located within one mile of each proposed pipeline route, and more importantly wells located within the construction workspaces, a field inspection of each route would need to be completed. Document should be updated with whether this step has been taken or should aknowledge that field inspections may discover more wells and what the plans would be for those potentially discovered wells.
Section 5.7.8.1 Water Resources	5-143	4	Text reads "The tables below summarize wells located within the respective construction workspace for each alternative." Well setback distances should be noted as well as noting the proper procedure should any wells require sealing. Minnesota Rules, part 4725.2150 provides minimum required separation distances between a well and a pipe with flammable or volitle gas, a pipeline. The requirements of this part are minimum standards and do not exempt persons from more restrictive requirements of the Occupational Safety and Health Administration. Any well that is identified to be located less than the minimum required distance from the pipeline provided in Minnesota Rules, part 4725.2150, must be sealed by a Minnesota licensed well contractor. The licensed well contractor is required to provide a report of any well sealed to MDH. Any well discovered during excavation and construction work for the pipeline should be reported to MDH, protected from damage, and protected from becoming lost, so an evaluation for sealing by a licensed well contractor can be completed. Any well that is uncovered, where the wellhead had been buried, cannot be reburied unless sealed by a licensed well contractor.
Section 5.7.8 Water Resources	5-143	5	Text acknowledges four wells within the RA-North construction workspace. Text should also acknowledge that this route crosses the city of Breckenridge Drinking Water Supply Management Area.
Section 5.7.8.2 Water Resources	5-144	2	Impacts to surface water during construction activity is addressed. The temporary risk to Moorhead's Spill Management Areas should be added as a potential impact due to the expected land use change and temporary modification to the natural environment which can be expected to increase the rate of contaminant conveyance and reduce the ability for the utility and area emergency response entities to take action within the previously calculated response time period.
Section 5.7.8.2 Water Resources	5-145	4	Dewatering of the trench locations may impact aquifer recharge rates. The impact can't be assumed as temporary and short-term as stated. More detailed discussion/analysis should be added.
Section 5.7.8.2 Water Resources	5-145	5, 6, 7, 8	Text reads "Ground disturbance associated with construction would be primarily limited to the upper 5-6 feet of soil, which above the water table of most regional aquifers" Here and in subsequent paragraphs, recommend placeholders for additional text include potential aquifer impacts due to excavation in areas with land surface or near-land surface artesian conditions in buried aquifers.

Commenting Tribe or Agency: **MN DNR**

Fill out the table and provide the page number and paragraph of the text on which you are commenting, along with your specific comment, recommendation, or any mitigation measures or other strategies that could address potential impacts of the proposed project. The first row of the comment table is filled out as an example.

Note to Reviewers: Please focus your comments on substantive content. It is most helpful to us if you include a suggested resolution and/or information that you would like added, including potential mitigation measures.

Chapter and Section	Page No.	Paragraph No. (from top of page)	Comment
Example: Section 5.4.3 Environmental Justice	Example: 5-37	Example: 2	Example: Text reads "Using these criteria, census tract 9609 in Otter Tail County was identified as an MPCA EJ area of concern within the ROI because 43 percent of the population has a reported income which is less than 100 percent of the federal poverty level." MPCA areas of concern are based on 200 percent of the federal poverty level. Correction: The sentence should read, "Using these criteria, census tract 9609 in Otter Tail County was identified as an MPCA EJ area of concern within the ROI because 43 percent of the population has a reported income which is less than 200 percent of the federal poverty level."
5.7.5.2	5-115	RA South	Starting here and in following sections there appears to be some inaccuracies/inconsistencies in names of state and federal wildlife lands along the routes. WPAs are Waterfowl Production Areas managed by the US Fish & Wildlife Service. WMAs are Wildlife Management Areas administered by the MN DNR. Also note the Walk-in-Area public hunting area (Otter Tail #921 https://www.dnr.state.mn.us/walkin/index.html , private land open to public hunting) south of Hw 210 along RA S & Hybrid most applicable to 5.4.10 Recreation and 5.7.4 Public and Designated Lands.
5.7.5.4	5-119		RA North - Recommended mitigation at Foxhome Prairie High Biodiversity MBS site is to align pipe on the south side of the road in this area and not cross the MBS site.
5.7.5	5-113		Please review August 23, 2023 Natural Heritage Review letter (MCE 2023-00306) for further rare natural feature information from MN DNR for the applicants preferred route (RA South). Recommend the RA-North and Hybrid routes be reviewed by MN DNR by submitting review request through Minnesota Conservation Explorer https://mce.dnr.state.mn.us/natural-heritage-review [attach file]
5.7.5.3	5-118		" <i>There would be no removal of western prairie fringed orchid...</i> " How do we know this? Have all RAs been surveyed over several years to confirm no western prairie fringed orchid occurrence? Recommend plant surveys on all RAs. Plant surveys have been conducted on RA South and found Small White Lady's Slipper in the Orwell 9 MBS site and potential habitat for western prairie fringed orchid.
5.7.5.4	5-123		" <i>Direct impacts to state-listed nesting birds would be minimized by conducting nesting surveys...</i> " Surveys alone would not mitigate for impacts to listed-birds (or any other migratory birds), only document what is there, without an avoidance plan. One additional mitigation for nesting birds in areas of grass/shrub vegetation to be cleared for construction would be to mow/cut these areas during non-nesting season prior to actual construction so suitable nesting habitat is not present prior to final clearing and construction.
5.7.6.2	5-126		" <i>Soil temperature may vary from heat convection and conduction of the operating pipeline. As described in Section 2.6.1, the CO2 would enter the pipeline at a temperature between 90 °F and 115 °F and would then cool down to the ambient ground temperature.</i> " EIS should consider effects of the elevated pipe temperature on surrounding soils, wetlands, and waterbodies. The high temperature of the pipeline may alter decomposition rate in soils/wetlands, change soil frost formation, alter shallow groundwater flow, and have other effects.
5.7.5.4	5-122		In addition to HDD inadvertent release evaluations, robust plans for inadvertent release response should be developed (probably in the ECP).
5.7.7.3	5-133		" <i>prepare a VMP VMPWG.</i> " should probably be reworded to: prepare a VMP <i>in consultation with the</i> VMPWG.

5.7.8.2	5-145		Groundwater. This section should be expanded. Initial groundwater investigations by the applicant did find artesian groundwater conditions are present along proposed route RA-South in the beach ridge system. The other RAs have not had groundwater investigations conducted. The section of overlap between RA-North and Hybrid is the area of greatest groundwater concern for those routes. The applicant is conducting groundwater investigations on route RA-South in the beach ridge area on the eastern side of the project in consultation with MN DNR. Applicant should continue to consult with MN DNR on groundwater investigations for the potential routes and on construction methods in relation to groundwater. Project construction has the potential to intersect shallow confined groundwater potentially causing a breach in a confined aquifer. Shallow geology and groundwater can be highly variable and complex in the beach ridge areas.
5.7.8.2	5-145		The potential maximum depth of project disturbance should be considered in relation to groundwater resources. For example if sheetpile is used to stabilize the trench, the depth of the sheetpile will extend beyond the trench excavation depth. Breaching shallow confined aquifers could have significant long-term impacts to groundwater resources.
5.7.10.1	5-156		Some wildlife species in the project area are listed, but no specific fish species are given, EIS could include at least representative fish found in the major rivers in the project area - Pelican and Otter Tail rivers.
5.7.10.3	5-160		"(Category 3N or 4N natural fibers)" MN DOT 2020 Standard Specifications for Construction for rolled erosion control materials now only use only natural fibers with no plastic mesh and these specifications could be used for this project.

Andrew-

I confirmed yesterday with our Business Council that we will not be participating in the EIS and will defer to the White Earth Nation on this.

Thanks,

Steve

Good morning,

Thank you for your reply. If you do choose to decline, please let me know. If I have a record of that I won't need to continue to fill up your inboxes.

Have a good week!

Thank you.

—Andrew

Subject: State of MN - Otter Tail to Wilkin EIS

This message came from **outside the organization**. Do Not click on links, open attachments or respond unless you know the content is safe.

Greetings:

Attached is a letter from the Department of Commerce inviting you to help prepare the draft environmental impact statement for the Otter Tail to Wilkin Carbon Dioxide Pipeline Project.

Please don't hesitate to contact me with any questions.

Thank you.

—Andrew

Appendix K

Environmental Justice Screen Report

Appendix K EJScreen REPORT

The following excerpt is from *How to Interpret a Standard Report in EJSCREEN* prepared by the U.S. Environmental Protection Agency and retrieved from <https://www.epa.gov/ejscreen/how-interpretstandard-report-ejscreen>.

Percentiles are a way to see how local residents compare to everyone else in the United States. Instead of just showing numbers out of context, EJSCREEN lets you compare a community to the rest of the state, EPA region and nation, by using percentiles. The national percentile tells you what percent of the US population has an equal or lower value, meaning less potential for exposure/risk/proximity to certain facilities, or a lower percent minority.

The U.S. percentile uses the U.S. population as the basis of comparison. The state percentile is calculated based on the population in a given state (or District of Columbia or Puerto Rico).

The state and U.S. percentiles will be similar if the state and U.S. average indicator values are similar. However, if the state average is lower than the U.S. average, the state percentile shown will be higher than U.S. percentile shown. Alternatively, if the state average is higher than the U.S. average, the state percentile shown will be lower than U.S. percentile shown. The state percentile being lower than the U.S. percentile does not mean the indicator value is lower in the given place, it just means the state average is higher than the U.S. average.

Percentages or Percentiles?

A percentage is an absolute term. If you received 80% on a test of one hundred questions you had 80 correct answers.

A percentile is a relative term, and tells you how you have done on the test in comparison to the others who took the test. A percentile of 80 means that you scored equal to or better than 80% of people who took the test.

In EJSCREEN, if your results indicate that an area is 48% minority and is at the 69th national percentile, this means that 48% of the area's population is minority, and that is an equal or higher % minority than where 69% of the US population lives.

EJScreen Community Report

This report provides environmental and socioeconomic information for user-defined areas, and combines that data into environmental justice and supplemental indexes.

Otter Tail County, MN

Tract: 27111960800,27111961700,27167950100,27111960900
Population: 15,193
Area in square miles: 1184.71

Dynamic map initially showing the user-selected area

COMMUNITY INFORMATION

LANGUAGES SPOKEN AT HOME

LANGUAGE	PERCENT
English	97%
Spanish	1%
Other and Unspecified	1%
Total Non-English	3%

BREAKDOWN BY RACE

BREAKDOWN BY AGE

LIMITED ENGLISH SPEAKING BREAKDOWN

Notes: Numbers may not sum to totals due to rounding. Hispanic population can be of any race. Source: U.S. Census Bureau, American Community Survey (ACS) 2017-2021. Life expectancy data comes from the Centers for Disease Control.

Environmental Justice & Supplemental Indexes

The environmental justice and supplemental indexes are a combination of environmental and socioeconomic information. There are thirteen EJ indexes and supplemental indexes in EJScreen reflecting the 13 environmental indicators. The indexes for a selected area are compared to those for all other locations in the state or nation. For more information and calculation details on the EJ and supplemental indexes, please visit the [EJScreen website](#).

EJ INDEXES

The EJ indexes help users screen for potential EJ concerns. To do this, the EJ index combines data on low income and people of color populations with a single environmental indicator.

EJ INDEXES FOR THE SELECTED LOCATION

SUPPLEMENTAL INDEXES

The supplemental indexes offer a different perspective on community-level vulnerability. They combine data on percent low-income, percent linguistically isolated, percent less than high school education, percent unemployed, and low life expectancy with a single environmental indicator.

SUPPLEMENTAL INDEXES FOR THE SELECTED LOCATION

These percentiles provide perspective on how the selected block group or buffer area compares to the entire state or nation.

*Diesel particulate matter, air toxics cancer risk, and air toxics respiratory hazard index are from the EPA's Air Toxics Data Update, which is the Agency's ongoing, comprehensive evaluation of air toxics in the United States. This effort aims to prioritize air toxics, emission sources, and locations of interest for further study. It is important to remember that the air toxics data presented here provide broad estimates of health risks over geographic areas of the country, not definitive risks to specific individuals or locations. Cancer risks and hazard indices from the Air Toxics Data Update are reported to one significant figure and any additional significant figures here are due to rounding. More information on the Air Toxics Data Update can be found at: <https://www.epa.gov/haps/air-toxics-data-update>.

DRAFT

1 Introduction

Summit Carbon Solutions (SCS) intends to execute a project to capture and transport carbon dioxide (CO₂) in Minnesota (the Project), including six capture facilities, one pump station, and approximately 200 miles of CO₂ pipeline laterals that will cross portions of Chippewa, Cottonwood, Jackson, Kandiyohi, Martin, Otter Tail, Redwood, Renville, Wilkin, and Yellow Medicine Counties. The Project is part of a larger system identified as the Midwest Carbon Express (MCE) also located in North Dakota, South Dakota, Nebraska, and Iowa. MCE scope includes construction of capture facilities, approximately 2,000 miles of new CO₂ pipeline, pipeline facilities (pump stations, metering stations, etc.), and permanently storage in Class VI sequestration injection facilities.

SCS has committed to conducting historic and cultural surveys on 100% of disturbed areas across MCE, including the Project. If previously unidentified historic properties are discovered by monitors, construction personnel, or unanticipated adverse effects on previously identified historic properties occur as Project construction activities are carried out, the construction contractor will immediately halt all construction activity in the vicinity and implement measures to protect the discovery from further impacts, looting, or vandalism.

This document describes the procedures for dealing with unanticipated discoveries during the course of Project construction in the State of Minnesota. The plan will be implemented across all lands regardless of ownership. It is intended to:

- Maintain compliance with applicable Federal and State laws and regulations during construction of the Project.
- Describe the procedure the Project or its representative will follow to prepare for and deal with unanticipated discoveries.
- Provide directions and guidance to Project personnel as to the proper procedure to be followed should an unanticipated discovery occur.

Ahead of Project construction, Environmental Inspection (EI) staff and construction personnel across the Project will complete a comprehensive training program, including how to identify and protect possible cultural resources or human remains. EIs and construction personnel will have a responsibility to communicate possible discoveries to qualified staff retained by SCS, such as a professional archaeologist or physical anthropologist. A qualified archaeologist is an archaeologist who meets the Secretary of the Interior's Qualifications and Standards, as outlined in Title 36 of the Code of Federal Regulations (CFR) Part 61 and can be permitted by the Minnesota Office of the State Archaeologist (Minnesota Office of the State Archaeologist [MN OSA]).

2 Protection and Discovery of Cultural Resources

The EI staff will be responsible for erecting exclusionary fencing prior to construction in select locations where significant cultural resource sites are mapped directly adjacent to the Project workspace area. The EI staff may also install exclusionary signage that indicates a sensitive resource is present, and no trespassing may occur beyond the boundary fencing. EI staff will also be responsible for monitoring and spot-checking exclusion zones throughout all stages of construction to ensure the sites are entirely avoided by construction staff, equipment, or activity. If an exclusion zone is breached, or a cultural resources discovery is encountered outside of an exclusion zone, the procedures outlined below will be implemented. Cultural resources may include:

- Accumulation of shells, burned rocks, or other subsistence related materials;
- Area of charcoal or very dark soil with artifacts;
- Stone tools, projectile points, or dense concentrations of stone artifacts;
- Cluster of bones in association with shell, charcoal, burned rocks, or stone artifacts; and
- Historic structure or assemblage of historic materials older than 50 years.

2.1 Discovery Procedures

- 1) When a finding is made, the EI staff or construction personnel that identified the finding will notify their supervisor, the EI, and other personnel in the vicinity, and all ground disturbing work within a 100-foot radius will cease.
- 2) The EI will:
 - Immediately notify SCS or its representative;
 - Flag a 100-foot buffer zone around the find spot;
 - Ensure adequate security is in place to keep workers, press, and curiosity seekers away from the find spot;
 - Cover the find spot with a tarp; and
 - Have an individual stay at the location to prevent further disturbance until the qualified archaeologist has reviewed the find spot. The qualified archaeologist's review can be accomplished in-person or remotely with information provided by individuals at the find spot. This information would include photographs of suspected artifacts and/or cultural features as well as the setting of the find spot.
- 3) The EI will investigate the find spot in consultation with a qualified archaeologist. If it is determined that the find spot is not a cultural resource discovery, the EI will remove construction restrictions at the location. If the archaeologist evaluates the find spot as a cultural resources discovery, the EI will continue to protect the discovery location as noted above. The EI will include the event (regardless of how it is evaluated) in the applicable Project documentation.
- 4) If, upon field review by a qualified archaeologist, the finding is determined to be a cultural resources discovery, the qualified archaeologist will evaluate the resource in accordance with applicable regulations. The qualified archaeologist will make an initial recommendation of eligibility for inclusion on the National Register of Historic Places (NRHP). If the site is not likely to be NRHP-eligible, the qualified archaeologist will conclude the evaluation by preparing a site form that essentially exhausts the research potential of the site and, subsequently, the EI will remove construction restrictions at the location. If the discovery is determined to have the potential to be NRHP-eligible, the archaeologist and SCS or its representative will also consult with the Minnesota State Historic Preservation Office (SHPO) and/or MN OSA on how best to avoid, minimize, or otherwise mitigate further impacts.
- 5) If the discovery is within an area of federal or state jurisdiction, the appropriate federal/state agency will be immediately notified and consulted accordingly. Treatment measures may include mapping, photography, sample collection, or excavation. Note that SCS or its representative may choose to notify and coordinate with Native American Tribes or a Tribal organization such as the Minnesota Indian Affairs Council (MIAC). Notified federal or state agencies may also consult with these entities for compliance with applicable statutes or guidelines.

- 6) The archaeologist will implement the appropriate treatment measure(s) and provide a report on its methods and results as required. The investigation and technical report will be performed in compliance with the Secretary of Interior's Standards and Guidelines for Archaeological Documentation (48 CFR 44734—44737f); the Advisory County on Historic Preservation (ACHP) publication "Treatment of Archaeological Properties" (ACHP 1980); and follow the guidelines set forth by the SHPO and/or MN OSA. SCS or its representative will also consult with the applicable federal, tribal, and state entities on how best to avoid, minimize, or otherwise mitigate further impacts.

3 Procedures for the Discovery of Human Remains

In the event suspected human remains or funerary objects are discovered during construction activities, the following steps will be taken pursuant to Minnesota's Private Cemetery Act (Minn. Stat. §307.08):

- 1) All ground disturbing work within a 100-foot radius will cease. An EI will be notified, assuming one is not already on-site.
- 2) The EI will investigate the finding in consultation with a qualified archaeologist (virtually or in-person). If it is determined that the finding is not human remains, funerary objects, or archaeological, the EI will remove construction restrictions at the location. If it is determined that the finding may include human remains or funerary objects, the finding will be considered a discovery and the EI will take appropriate steps to protect the discovery location, including the following:
 - Immediately notify SCS or its representative;
 - Flag a buffer zone around the find spot;
 - Ensure adequate security is in place to keep workers, press, and curiosity seekers away from the find spot;
 - Cover the find spot with a tarp; and
 - Have an individual stay at the location to prevent further disturbance until law enforcement arrives.
- 3) If the discovery occurs on federal lands, SCS or its representative shall notify the federal law enforcement to initiate that agency's specific protocols.
- 4) If the discovery occurs on non-federal lands (both non-federal public and private), SCS or its representative shall notify the county sheriff. As required by Minn. Stat. §307.08, SCS will also notify the MN OSA of the discovery if it occurs on non-federal lands.
- 5) Should the human remains be determined not to be associated with a crime scene, federal law enforcement or the MN OSA (depending on jurisdiction) will determine if the discovery is Native American. If the discovery is determined to be Native American, federal law enforcement (on federal lands) will engage Native American Tribes to resolve next steps for handling the discovery under the Native American Graves Protection and Repatriation Act. If the MN OSA has jurisdiction (on non-federal public and private lands) the MN OSA will coordinate with the MIAC to resolve next steps for handling the discovery under the Private Cemeteries Act (Minn. Stat. Ch. 307).
- 6) After permission to resume construction has been issued by federal law enforcement, county sheriff, or State Archaeologist, SCS or its representative shall notify the on-site construction manager to restart ground-disturbing activities.

Conventional Plot

Model Input Field	Assumption	Content/Notes	Reference(s)
Historic Management (Pre-2000)			
Type (Upland or lowland):	upland	Upland is considered >660 ft above sea level. Wilkin County avg elevation above sea level is 1,050 ft Otter Tail County avg elevation above sea level is 1,355 ft	https://en.wikipedia.org/wiki/Upland_and_lowland Wilkin County topographic map, elevation, terrain (topographic-map.com) Otter Tail County topographic map, elevation, terrain (topographic-map.com)
Tillage:	Horse & Mule/Tractor plowing: Intensive Tilling	Historical research shows evidence of intensive tillage/plowing. Pre 1980 using disk chisel plow and after 1980 employing strip-till for corn and some no-till for soybeans. We will assume intensive tillage for pre 2000 by plow and disk chisel which is considered deep tillage (deeper than 10 inches) and soil inversion with less than 15% of soil surface protected from crop residue	https://extension.umn.edu/soil-management-and-health/tillage-implements-purpose-and-ideal-use#history-1202760
Irrigation:	none	approximately 1.5% cropland irrigated in 1997 approximately 1.4% cropland irrigated in 1992, 0.06% cropland irrigated in 1964	https://agcensus.library.cornell.edu/wp-content/uploads/1997-Minnesota- https://agcensus.library.cornell.edu/wp-content/uploads/1992-Minnesota-CHAPTER_1_State_Data-1569-Table-01.pdf

Conventional Plot

Model Input Field	Assumption	Content/Notes	Reference(s)
Baseline Management (2000-2022)			
Crop and Planting Date:	April 30th planting and October 30th harvest; 1	corn crop and planting data consistent each year and cannot overlap with seeding of cover crop	https://extension.umn.edu/corn-planting/planting-date-considerations-corn
Yield (bu/ac):	150	Based on average annual bushels per acre across Otter Tail and Wilkin counties for data spanning 2000-2022	see Baseline Corn Yield tab for calculations and data references
Residue Removal:	50%	Some researchers have previously recommended harvesting only about 30% under conventional tillage, while values up to 50% could be sustainably collected in no-till systems while others have estimated that up to 60% of corn stover could be sustainably removed	https://www.pubs.ext.vt.edu/content/dam/pubs_ext_vt_edu/CSES/CSES-180/CSES-180-PDF_rev2.pdf#:~:text=Some%20researchers%20have%20previously%20recommended%20harvesting%20only%20about,60%25%20of%20corn%20stover%20could%20be%20sustainably%20removed.
Irrigation:	None	Irrigation variable removed for simplification - assume well-watered. Data supports small number of corn farmers in Otter Tail and Wilkin County irrigate the farm (~9%)	see Farming Practice Estimation tab for calculations and data references

Conventional Plot

Model Input Field	Assumption	Content/Notes	Reference(s)
Manure/compost application:	Farmyard Manure, solid: 1 ton/acre resulting in 24 lbs N/acre in fall	Broadcasting manure onto the surface of a field is the oldest method of spreading. It is easy, cheap, and can be done during almost any season - using default 1 ton/acre application with C/N ratio 11.7 - high organic matter input user guide recommendations	https://extension.umn.edu/manure-management/manure-application-methods-and-nitrogen-losses
Fertilizer Application:	Nitrogen is added to fields	Nitrogen was applied to 99 percent of the total 1997 corn acreage in the ten States surveyed. South Dakota with 96 percent of the corn acreage treated was the lowest. The next lowest was Minnesota, where growers treated 97 percent of the planted corn acreage.	https://comet-farm.com/data/Cropland/FertilizerHelp.pdf https://www.nass.usda.gov/Statistics_by_State/Minnesota/Publications/Other_Press_Releases/2022/MN-Ag-Chem-Corn-2022.pdf
Element-N:	Element-N (N): 146 lbsN/acre Farmyard Manure, Solid: 24 lbsN/acre Total N: 170 lbsN/acre	Nitrogen was applied in spring. Combined Sources of Nitrogen inputs of Ammonia, Urea, Ammonium Nitrate, Ammonium Sulfate, Urea-ammonium nitrate solution. The same GREET derived default values are used in FD-CIC model as input parameters. Of the three primary macronutrients,	https://www.nass.usda.gov/Statistics_by_State/Minnesota/Publications/Other_Press_Releases/2022/MN-Ag-Chem-Corn-2022.pdf

**Agricultural Practices
Supplemental Information:
COMET Farm Guide**

January 8, 2024

HDR prepared this Step-By-Step Guide for the use of USDA's COMET-Farm process-based greenhouse gas (GHG) accounting system for the Otter Tail to Wilkin CO₂ Pipeline Project.

<https://comet-farm.com/>

COMET-Farm GHG accounting system works with user inputs and default values. Depending on available data, either custom inputs are provided, or default values can be chosen.

There are 3 steps in the COMET-Farm Tool:

Step 1 ACTIVITIES

Step 2 FIELD MANAGEMENT

Step 3 REPORT

This document describes how the COMET-Farm tool was used to determine an estimated change in greenhouse gas emissions associated with test case scenarios of corn feedstock producers implementing alternative agricultural practices within 40 miles of Fergus Falls, MN.

This document is a step-by-step guide detailing the process and assumed inputs into the COMET-Farm to best represent the test cases described in Chapter 6 Table 6-3. Each test case is shown with images to guide the user to recreate the same project description and results.

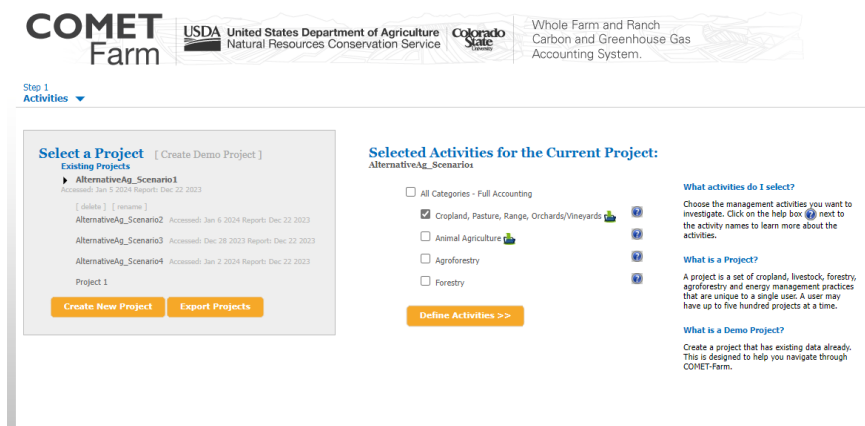

Test Case Inputs

AlternativeAg_Scenario 1

*1,000 acre parcel where there are no future changes in farming practices - a.k.a. business as usual (BAU) of conventional management

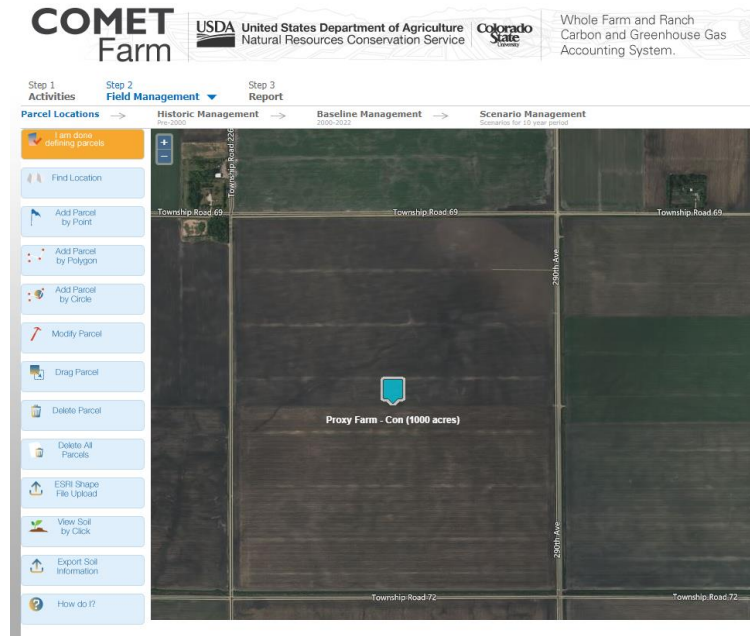

Step 1: ACTIVITIES

- Select the project file and select activities
 - choose Cropland

Step 2: FIELD MANAGEMENT

- Choose parcel location by point, polygon (if actual acreage is known), or circle
 - Choose a location by **Add Parcel by Point**

Parcel Location Attributes

Name: Conventional

Area(acres): 1000

Cancel Save Location

Soils data can be shown by choosing the soils option

When selected choose **I am done defining parcels**

- Define Historic Management (Pre-2000)
 - Choose
 - Pre-1980 Management: upland non-irrigated
 - CRP enrollment: no
 - 1980-2000 Management: Non-irrigated – Annual Crops in Rotation

Step 1 Activities | Step 2 **Field Management** | Step 3 Report

Parcel Locations → **Historic Management** → Baseline Management → Scenario Management

Pre-2000 | 2000-2022 | Scenarios for 10 year period

Select a parcel: Proxy Farm - Con

Proxy Farm - Con (1000 acres)

For parcel Proxy Farm - Con (selected at left) what was its historic management?

Pre-1980 Management: Upland Non-Irrigated (Pre 1980s)

Was this parcel enrolled in Conservation Reserve Program(CRP) at anytime before 2000? ☒ No ☐ Yes

1980-2000 Management: Non-Irrigated: Annual Crops in Rotation

1980-2000 Tillage: Intensive Tillage

Add Additional Crop for same year?: No

Add Additional Crop?

Would you like to add an additional crop for the same year?

If you have a second crop that spans between calendar years (i.e. **winter wheat**), add it as an additional crop this year and set its harvest date to be in the following year.

Yes, add additional crop for the same year.

AlternativeAg_Scenario 2

*250 acres where a suite of alternative agricultural practices are implemented in the next 10 years and 750 acres where there are no future changes in farming practices a.k.a. business as usual (BAU) of conventional management

Step 1: ACTIVITIES

- Select the project file and select activities
 - choose Cropland

The screenshot shows the COMET Farm web application interface. At the top, there are logos for COMET Farm, USDA, United States Department of Agriculture, Natural Resources Conservation Service, Colorado State, and Whole Farm and Ranch Carbon and Greenhouse Gas Accounting System. Below the logos, there is a navigation bar with "Step 1 Activities" and a dropdown arrow. The main content area is divided into two panels. The left panel, titled "Select a Project", shows a list of existing projects: "AlternativeAg_Scenario1", "AlternativeAg_Scenario2" (selected), "AlternativeAg_Scenario3", and "AlternativeAg_Scenario4". Below the list are buttons for "Create New Project" and "Export Projects". The right panel, titled "Selected Activities for the Current Project: AlternativeAg_Scenario2", shows a list of activities with checkboxes: "All Categories - Full Accounting", "Cropland, Pasture, Range, Orchards/Vineyards" (checked), "Animal Agriculture", "Agroforestry", and "Forestry". Below the list is a button for "Define Activities >>". To the right of the activity list, there are three informational sections: "What activities do I select?", "What is a Project?", and "What is a Demo Project?".

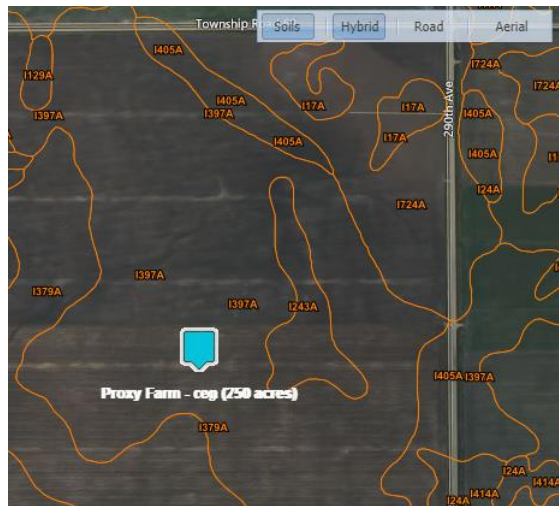

Define Activities

Step 2: FIELD MANAGEMENT

- Choose parcel location by point, polygon (if actual acreage is known), or circle
 - Choose point location and indicate total acres
 - Create two parcels at the same location to represent two different management choices; conventional and alternative/regenerative.

The screenshot shows the COMET Farm web application interface for Step 2: Field Management. The top navigation bar includes "Step 1 Activities", "Step 2 Field Management" (selected), and "Step 3 Report". Below the navigation bar, there are four tabs: "Parcel Locations", "Historic Management", "Baseline Management", and "Scenario Management". The "Parcel Locations" tab is active, showing a map of a field with various parcels outlined in orange. A blue square highlights a specific parcel labeled "Pruxy Farm - crop (250 acres)". On the left side of the map, there is a sidebar with a list of actions: "I got some existing parcels", "Find Location", "Add Parcel by Point", "Add Parcel by Polygon", "Add Parcel by Circle", "Modify Parcel", "Drag Parcel", "Delete Parcel", "Delete All Parcels", "ESRI Shape File Upload", "View Soil by Click", "Export Soil Information", and "How do I?".

- Ensure all test parcels are located at the same location and share the same soil data.

- When both parcels are created, select **I am done defining parcels**

- Select the parcel to define field management:
 - First, choose conventional parcel – this one will not change in the future. All inputs are the same as AlternativeAg_Scenario 1.
- Define Historic Management (Pre-2000)
 - Choose
 - Pre-1980 Management: upland non-irrigated
 - CRP enrollment: no
 - 1980-2000 Management: Non-irrigated – Annual Crops in Rotation

Step 1 Activities Step 2 **Field Management** Step 3 Report

NEW PROMPT

Add Additional Crop for same year?

No

Add Additional Crop?

Would you like to add an additional crop for the same year?

If you have a second crop that spans between calendar years (i.e. **winter wheat**), add it as an additional crop this year and set its harvest date to be in the following year.

Yes, add additional crop for the same year.

No Thanks, Continue >>

AlternativeAg_Scenario 3

*500 acres where a suite of alternative agricultural practices is implemented in the next 10 years and 500 acres where there are no future changes in farming practices a.k.a. business as usual (BAU) of conventional management

- Create two parcels at the same location to represent two different management choices; conventional and alternative/regenerative.

The screenshot shows the 'Parcel Location Attributes' dialog box in a software interface. The dialog has a 'Name' field with the text 'Proxy Farm - con', an 'Area(acres)' field with the value '500', and two buttons: 'Cancel' and 'Save Location'. The background of the interface shows a map with a yellow outline of a parcel labeled 'Proxy Farm - Reg (500 acres)'. The interface also has a sidebar with various options like 'Find Location', 'Add Parcel by Point', 'Add Parcel by Polygon', 'Add Parcel by Circle', 'Modify Parcel', and 'Drag Parcel'. At the top, there are tabs for 'Step 1 Activities', 'Step 2 Field Management', and 'Step 3 Report'.

*Follow the same steps for Historic, Baseline, and Scenario Management for AlternativeAg_Scenario 2. The only difference between inputs for test cases 2-4 is the acreage value for the parcel locations.

AlternativeAg_Scenario 4

*750 acres where a suite of alternative agricultural practices are implemented in the next 10 years and 250 acres where there are no future changes in farming practices a.k.a. business as usual (BAU) of conventional management

*Follow the same steps for Historic, Baseline, and Scenario Management for AlternativeAg_Scenario 2. The only difference between inputs for test cases 2-4 is the acreage value for the parcel locations.

1. Energy Reduction for electricity is based on achieving 62.5% reduction over the 25 year period. This results in a 2.5% reduction each year. 62.5% is the mid-point between the estimated reduction range of 50-75%.

2. Energy Reduction for natural gas is based on achieving 62.5% reduction over the 25 year period. This results in a 2.5% reduction each year. 62.5% is the mid-point between the estimated reduction range of 50-75%.

PVWatts
Energy Projections**

Caution: Photovoltaic system performance predictions calculated by PVWatts® include many inherent assumptions and uncertainties and do not reflect variations between PV technologies nor site-specific characteristics except as represented by PVWatts® inputs. For example, PV modules with better performance are not differentiated within PVWatts® from lesser performing modules. Both NREL and private companies provide more sophisticated PV modeling tools (such as the System Advisor Model at [/sam.nrel.gov](https://sam.nrel.gov)) that allow for more precise and complex modeling of PV systems.

The expected range is based on 30 years of actual weather data at the given location and is intended to provide an indication of the variation you might see. For more information, please refer to this NREL report: The Error Report.

Disclaimer: The PVWatts® Model ("Model") is provided by the National Renewable Energy Laboratory ("NREL"), which is operated by the Alliance for Sustainable Energy, LLC ("Alliance") for the U.S. Department of Energy ("DOE") and may be used for any purpose whatsoever.

The names DOE/NREL/ALLIANCE shall not be used in any representation, advertising, publicity or other manner whatsoever to endorse or promote any entity that adopts or uses the Model. DOE/NREL/ALLIANCE shall not provide any support, consulting, training or assistance of any kind with regard to the use of the Model or any updates, revisions or new versions of the Model.

YOU AGREE TO INDEMNIFY DOE/NREL/ALLIANCE, AND ITS AFFILIATES, OFFICERS, AGENTS, AND EMPLOYEES AGAINST ANY CLAIM OR DEMAND, INCLUDING REASONABLE ATTORNEYS' FEES, RELATED TO YOUR USE, RELIANCE, OR ADOPTION OF THE MODEL FOR ANY PURPOSE WHATSOEVER. THE MODEL IS PROVIDED BY DOE/NREL/ALLIANCE 'AS IS' AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE EXPRESSLY DISCLAIMED. IN NO EVENT SHALL DOE/NREL/ALLIANCE BE LIABLE FOR ANY SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES OR ANY DAMAGES WHATSOEVER, INCLUDING BUT NOT LIMITED TO CLAIMS ASSOCIATED WITH THE LOSS OF DATA OR PROFITS, WHICH MAY RESULT FROM ANY ACTION IN CONTRACT, NEGLIGENCE OR OTHER TORTIOUS CLAIM THAT ARISES OUT OF OR IN CONNECTION WITH THE USE OR PERFORMANCE OF THE MODEL.

The energy output range is based on analysis of 30 years of historical weather data, and is intended to provide an indication of the possible interannual variability in generation for a Fixed (open rack) PV system at this location.

PVWatts Calculator Inputs and Results

Glossary of Terms

Term	Description
Agency Personnel	Agency personnel refers to local, county, state, and/or federal employees, contractors, or businesses employed by governmental entities.
Blowdown	The act of releasing gas from the pipeline system so work can be done safely on the depressurized facilities.
Controlled Release	Often occurs due to safety reasons surrounding facility design, or intentional venting to perform maintenance or inspection of equipment.
Immediately Dangerous to Life and Health (IDLH)	The National Institute of Occupational Safety and Health defines an IDLH condition as a situation "that poses a threat of exposure to airborne contaminants when that exposure is likely to cause death or immediate or delayed permanent adverse health effects or prevent escape from such an environment". The IDLH limit represents the concentration of a chemical in the air to which healthy adult workers could be exposed (if their respirators fail) without suffering permanent or escape-impairing health effects.
Unintentional Release	A release caused by equipment leaks, defective seals, damaged pipeline, or other abnormal operating conditions.

DRAFT

1 Purpose

Summit Carbon Solutions, LLC (SCS) is proposing to construct and operate an approximately 28.1-mile carbon dioxide (CO₂) pipeline and associated facilities in portions of Wilkin and Otter Tail counties (the Otter Tail to Wilkin Project [Project]). The Project will capture and transport CO₂ from the Green Plains Otter Tail LLC Ethanol Plant (Green Plains Ethanol Plant) near Fergus Falls, Minnesota to the North Dakota and Minnesota border just south of the City of Breckenridge in Wilkin County. The CO₂ will ultimately be safely and permanently stored deep underground utilizing separately permitted Class VI injection wells in a sequestration site area in North Dakota.

This Emergency Response Plan (ERP or Plan) is for the Otter Tail to Wilkin Project pipeline system operated by SCS. The purpose of the ERP is to provide guidance for quick, safe, and effective response to an emergency to protect the public, all responders, SCS personnel, and the environment.

2 Scope of the Plan

This plan been developed to meet the requirements of Title 49 Code of Federal Regulations (CFR) 195.402(e) and is intended to cover incidents that could occur along the Otter Tail to Wilkin pipeline system.

This Plan is intended to provide the necessary information for pre-emergency planning as well as procedures for Company personnel to respond to and mitigate incidents during an emergency. A description of the pipeline system operations is included in Figure 1. Response procedures and guidelines are provided in Section 4 of this Plan.

Figure 1: General Pipeline System

General Pipeline System Information	
Pipeline Name:	Midwest Carbon Express – Otter Tail to Wilkin Project
Operator Name:	Summit Carbon Solutions, LLC
Operator Address:	2321 North Loop Drive Suite 221 Ames, IA 50010
Mainline Number	24-hour Emergency: [TBD before system startup] Corporate Headquarters: 515-531-2635
Qualified Individual(s):	Director, Regulatory Compliance (see Section 5 for contact information)
States Traversed:	Minnesota
Counties Traversed:	Otter Tail and Wilkin
Pipeline Description	
<p>The Summit Carbon Solutions Midwest Carbon Express – Otter Tail to Wilkin Project pipeline consists of approximately 28.1 miles of a high-strength carbon steel 4-inch diameter carbon dioxide (CO₂) pipeline. The line originates at the Green Plains Ethanol Plant near Fergus Falls, Otter Tail County, MN. The pipeline traverses generally south and west through Otter Tail and Wilkin Counties to the North Dakota and Minnesota border south of the City of Breckenridge in Wilkin County. The pipeline will be operated with a maximum operating pressure of 2,183 pounds per square inch and the CO₂ will be maintained in a dense phase or supercritical state during normal operations.</p> <p>See Section 9 for a map depicting the pipeline and facility locations and high populated and other populated areas.</p>	
Product Description	
<p>CO₂ is naturally occurring in the atmosphere, used in the food and beverage industry, and produced by the human body during ordinary respiration, so it is commonly perceived by the general public to be a relatively harmless gas. However, at concentrations of 4% by volume (40,000 parts per million [ppm]), CO₂ is Immediately Dangerous to Life or Health (IDLH), and at concentrations of 8% by volume (80,000 ppm) can cause dimmed sight, sweating, tremor, unconsciousness, and possible death by asphyxiation.¹ Because CO₂ is colorless, odorless, and heavier than air, a significant uncontrolled release may cause CO₂ to temporarily accumulate near the ground in low lying outdoor areas, and in confined spaces such as caverns, tunnels, and basements until it dissipates into the atmosphere. CO₂ is not flammable, combustible, or explosive.</p>

3 Response Teams

3.1 Introduction

This section describes organization features and duties of the Company's Qualified Individual (QI), Local Response Team (LRT), and Company Support Team (CST). The Company's initial response to an incident will be provided by the LRT, once activated by the QI. The Incident Commander (IC) will activate a CST if an incident exceeds the local capabilities. In some cases, the initial responders to an incident may include local law enforcement and/or local fire department(s). SCS will work with these agencies to manage a coordinated response effort.

The National Incident Management System Incident Command System (ICS) will be used to manage emergency response activities. Because ICS is a management tool that is readily adaptable to incidents of varying magnitude, it will be used for all emergency incidents. Staffing levels will be adjusted to meet specific response team needs based on incident size, severity, and type of emergency. Local agencies are also trained on using ICS and may fill roles during a coordinated response effort. ICS principles include:

- Common Terminology
- Manageable Span of Control
- Management by Objectives
- Incident Action Planning
- Comprehensive Resource Management
- Established Incident Facilities
- Integrated Communications

As a component of an ICS, the Unified Command (UC) is a structure that brings together the responsible party (i.e., SCS) and agencies at the command level. The UC links the organizations responding to the incident and provides a forum for the responsible party and responding agencies to make consensus decisions. Under the UC, the various responding agencies and company personnel may blend together throughout the organization to create an integrated response team. The ICS process requires the UC to set clear objectives to guide the on-scene response resources. The primary entities of a UC may be two or more of the following:

- Federal On-Scene Coordinator
- State On-Scene Coordinator
- Local On-Scene Coordinator
- Company IC (Responsible Party IC)

3.2 Qualified Individual

The QI is defined by the U.S. Department of Transportation, Pipeline and Hazardous Materials Administration (PHMSA) as a company employee that has been given authority to fund response efforts without consulting Company leadership for further authorization and knows how to commence the response procedures of this Plan. The QI is responsible for activating the ICS response organization, including the LRT and CST.

The QI will be an English-speaking SCS employee that is available on a 24-hour basis with the full authority to activate and deploy the necessary emergency response contractors. The QI or Alternate QI

will activate personnel and equipment, act as a liaison with the UC, and obligate any funds required to carry out all the required or direct emergency response activities.

3.3 Local Response Team

The first Company person on scene will function as the IC and person-in-charge until relieved by an authorized person who will then assume the position of IC. The number of positions/personnel required to staff the LRT will depend on the size and complexity of the incident. The duties of each position may be performed by the IC directly or delegated as the situation demands. The IC is always responsible for directing response activities and will assume the duties of all the primary positions until the duties can be delegated to other qualified personnel.

A typical ICS organization is shown in Figure 2. The LRT will fill the necessary positions and request additional support from the CST to fill/back up any additional positions necessitated by the incident. Detailed job descriptions of the response team positions are provided in this Section.

3.4 Company Support Team

For response operations outside of the capabilities of the LRT, the QI and IC will determine the need for mobilization of a CST. The members of the LRT will typically become members of the CST.

The CST, once fully staffed, is designed to cover all aspects of a comprehensive and prolonged incident response. The number of positions/personnel required to staff the CST will depend on the size and complexity of the incident. During a prolonged response, additional personnel may be cascaded in to fill additional ICS positions or relieve responding personnel.

The CST is staffed by trained personnel from various Company locations and by various contract resources as the situation requires.

Figure 2: Incident Command System Organization

Incident Command System Roles and Responsibilities

Incident Commander	
<p><i>The IC has responsibility for overall management of the incident. The IC has the authority to approve the use of a contractor even if no “open-end” contract exists, as well as the authority to commit monies to initiate response and clean-up activities. The first employee on-site will assume the responsibilities of IC until properly relieved. Generally, the most senior employee on-site will assume the IC position. The IC also has overall responsibility for the health and safety of responders.</i></p>	
<input type="radio"/>	Assess the situation and/or obtain a briefing from the prior IC.
<input type="radio"/>	Determine incident objectives and strategy.
<input type="radio"/>	Establish the immediate priorities.
<input type="radio"/>	Establish an Incident Command Post.
<input type="radio"/>	Brief Command Staff and Section Chiefs.
<input type="radio"/>	Establish an appropriate response organization commensurate with the severity of the incident and potential for impact to public health and/or the environment
<input type="radio"/>	Ensure planning meetings are scheduled as required.
<input type="radio"/>	Approve and authorize the implementation of an Incident Action Plan (IAP).
<input type="radio"/>	Ensure that adequate safety measures are in place.
<input type="radio"/>	Coordinate activity for all Command and General Staff.
<input type="radio"/>	Coordinate with key people and officials
<input type="radio"/>	Approve requests for additional resources or for the release of resources.
<input type="radio"/>	Keep appropriate agencies/organizations informed of incident status.
<input type="radio"/>	Approve the use of trainees, volunteers, and auxiliary personnel.
<input type="radio"/>	Authorize release of information to the news media
<input type="radio"/>	Ensure Incident Status Summary (ICS Form 209) is completed and forwarded to appropriate higher authority
<input type="radio"/>	Order the demobilization of the incident response when appropriate.

Safety Officer	
<p><i>The Safety Officer's (SOFR) function is to develop and recommend measures for assuring personnel safety, and to assess and/or anticipate hazardous and unsafe situations. Only one SOFR will be assigned for each incident; however, there may be assistants.</i></p>	
<input type="radio"/>	Participate in planning meetings.
<input type="radio"/>	Identify hazardous situations associated with the incident.
<input type="radio"/>	Review the IAP for safety implications.
<input type="radio"/>	Exercise emergency authority to stop and prevent unsafe acts.

Safety Officer	
<input type="checkbox"/>	Investigate accidents that have occurred within the incident area.
<input type="radio"/>	Review and approve the medical plan.
<input type="radio"/>	Develop the Site Safety Plan and publish Site Safety Plan summary (ICS Form 208) as required.

Public Information Officer	
<p><i>The Public Information Officer (PIO) is responsible for developing and releasing information about the incident to the news media, incident personnel, and other appropriate agencies and organizations.</i></p> <p><i>Only one PIO will be assigned for each incident. The PIO may have assistants as necessary. The assistants may represent assisting agencies, companies, or jurisdictions. The PIO and assistants will establish a Joint Information Center to assist with developing information releases.</i></p>	
<input type="radio"/>	Determine from the IC if there are any limits on information release.
<input type="radio"/>	Develop material for use in media briefings.
<input type="radio"/>	Obtain IC approval of media releases.
<input type="radio"/>	Inform media and conduct media briefings.
<input type="radio"/>	Arrange for tours and other interviews or briefings that may be required.
<input type="radio"/>	Obtain media information that may be useful to incident planning.
<input type="radio"/>	Maintain current information summaries and/or displays on the incident and provide information on the status of the incident to assigned personnel.

Liaison Officer	
<p><i>The Liaison Officer (LOFR) serves as a “go-between” linking the IC to various agencies. These are agencies that do not have a direct tactical assignment within the UC but have an interest in the response activities or wish to offer assistance.</i></p> <p><i>The LOFR intercepts, greets, and briefs agency representatives as they arrive on scene. It is the responsibility of the LOFR to notify the IC before escorting anyone to the Command Post. A separate Liaison Area may need to be established to accommodate agency representatives not directly involved in the UC.</i></p>	
<input type="radio"/>	Be a contact point for Agency Representatives.
<input type="radio"/>	Maintain a list of assisting and cooperating agencies and Agency Representatives. Monitor check-in sheets daily to ensure that all Agency Representatives are identified.
<input type="radio"/>	Assist in establishing and coordinating interagency contacts.
<input type="radio"/>	Keep federal, state, local agencies supporting the incident aware of incident status.
<input type="radio"/>	Monitor incident operations to identify current or potential inter-organizational problems.

Liaison Officer	
<input type="checkbox"/>	Participate in planning meetings, providing current resource status, including limitations and capability of assisting agency resources.
<input type="radio"/>	Coordinate response resource needs for incident investigation activities with the Operations Section Chief (OPS).
<input type="radio"/>	Ensure that all required agency forms, reports, and documents are completed prior to demobilization.
<input type="radio"/>	Coordinate activities of visiting agencies or government officials arriving to survey the response.

Operations Section Chief	
<p><i>The OPS is responsible for the management of all operations directly applicable to the primary mission (e.g., clean-up, recovery). The OPS activates and supervises tactical response elements in accordance with the IAP and directs its execution. The OPS also requests or releases resources; makes expedient changes to the IAP (as necessary); and reports these actions to the IC.</i></p>	
<input type="radio"/>	Develop operations portion of IAP.
<input type="radio"/>	Brief and assign Operations Section personnel in accordance with the IAP.
<input type="radio"/>	Supervise Operations Section.
<input type="radio"/>	Determine need and request additional resources.
<input type="radio"/>	Review suggested list of resources to be released and initiate recommendation for release of resources.
<input type="radio"/>	Assemble and disassemble Strike Teams assigned to the Operations Section.
<input type="radio"/>	Report information about special activities, events, and occurrences to the IC.

Planning Section Chief	
<p><i>The Planning Section Chief is responsible for the collection, evaluation, dissemination, and use of information; particularly with regard to the development of the incident and the status resources. This information is needed to: 1) understand the current situation, 2) predict the probable course of incident events; and 3) prepare alternative strategies for the incident.</i></p>	
<input type="radio"/>	Collect and process situation information about the incident.
<input type="radio"/>	Supervise preparation of the IAP.
<input type="radio"/>	Provide input to the IC and the OPS in preparing the IAP.
<input type="radio"/>	Chair planning meetings and participate in other meetings as required.
<input type="radio"/>	Assign available personnel already on-site to ICS organizational positions as appropriate.
<input type="radio"/>	Establish information requirements and reporting schedules for Planning Section Units (e.g., Resources, Situation Units).

Planning Section Chief	
<input type="checkbox"/>	Determine the need for any specialized resources in support of the incident.
<input type="radio"/>	If requested, assemble and disassemble Strike Teams and Task Forces not assigned to Operations.
<input type="radio"/>	Establish special information collection activities as necessary (e.g., weather, environmental, toxics).
<input type="radio"/>	Assemble information on alternative strategies to meet response objectives.
<input type="radio"/>	Provide periodic predictions on incident potential. The incident potential examines the current situation and the potential future situation based on the incident specifics (e.g., adverse weather, potential community impacts, duration of incident response operations, legal concerns)
<input type="radio"/>	Report any significant changes in incident status or any Critical Reporting Requirements to the IC (e.g., injury, public health impacts, special request from agencies).
<input type="radio"/>	Compile and display incident status information.
<input type="radio"/>	Oversee preparation and implementation of the Incident Demobilization Plan.
<input type="radio"/>	Based on incident severity and site-specific conditions, incorporate ICS forms and plans (e.g., Traffic, Medical ICS 206, Communications ICS 205, Site Safety ICS 208) into the IAP.

Logistics Section Chief	
<p><i>The Logistics Section Chief (LSC) is responsible for providing facilities, services, and material in support of the incident. The LSC participates in the development and implementation of the IAP.</i></p> <p><i>Resources are divided into Support and Services. Support resources are used in support of the IAP (e.g., boom, vacuum trucks, skimmers). Service resources include food/water, communication, and medical resources.</i></p>	
<input type="radio"/>	Plan the organization of the Logistics Section.
<input type="radio"/>	Assign work locations and preliminary work tasks to Section personnel.
<input type="radio"/>	Notify the Resources Unit of the Logistics Section units activated including names and locations of assigned personnel.
<input type="radio"/>	Assemble and brief Branch Directors and Unit Leaders.
<input type="radio"/>	Participate in preparation of the IAP.
<input type="radio"/>	Identify service and support requirements for planned and expected operations
<input type="radio"/>	Provide input to and review the Communications Plan, Medical Plan and Traffic Plan.
<input type="radio"/>	Coordinate and process requests for additional resources.
<input type="radio"/>	Review the IAP and estimate Section needs for the next operational period.
<input type="radio"/>	Advise on current service and support capabilities.

Logistics Section Chief	
<input type="radio"/>	Prepare service and support elements of the IAP.
<input type="radio"/>	Estimate future service and support requirements.
<input type="radio"/>	Recommend release of Unit resources in conformity with Incident Demobilization Plan.
<input type="radio"/>	Ensure the general welfare and safety of Logistics Section personnel.

Finance Section Chief	
<i>The Finance Section Chief (FSC) is responsible for all financial, administrative, and cost analysis aspects of the incident and for supervising members of the Finance Section. Depending on the incident, the FSC position may or may not be assigned. Agencies within the UC may require and staff the FSC position.</i>	
<input type="radio"/>	Attend planning meetings as required.
<input type="radio"/>	Manage all financial aspects of an incident.
<input type="radio"/>	Provide financial and cost analysis information as requested.
<input type="radio"/>	Gather pertinent information from briefings with responsible agencies.
<input type="radio"/>	Develop an operating plan for the Finance/Administration Section; fill supply and support needs.
<input type="radio"/>	Determine the need to set up and operate an incident commissary.
<input type="radio"/>	Meet with Assisting and Cooperating Agency Representatives, as needed.
<input type="radio"/>	Ensure that all personnel time records are accurately completed and transmitted, according to policy.
<input type="radio"/>	Provide financial input to demobilization planning.
<input type="radio"/>	Ensure that all obligation documents initiated at the incident are properly prepared and completed.
<input type="radio"/>	Brief administrative personnel on all incident-related financial issues needing attention or follow-up prior to leaving incident.

4 Procedure

4.1 Receiving, Identifying, and Classifying Incidents

Generally, an incident is a chain of events which has caused, or could have caused, injury, illness, and/or damage to the environment or the public. In this Plan, an incident refers to an event requiring some form of action on behalf of the Company. Notification of incidents may occur via phone from external sources (the public or emergency response agencies such as fire or police), phone from employees or contractors, or operational monitoring by the Pipeline Control Center. Regardless of the source, each incident's relative risk will be continually evaluated and characterized until it has been controlled and resolved. The initial IC role will be filled by the first Company employee to arrive at the incident scene.

An emergency is defined as an urgent, sudden, and serious event that requires immediate action that may result in harm to employees or the public, environmental degradation, and/or property damage. If

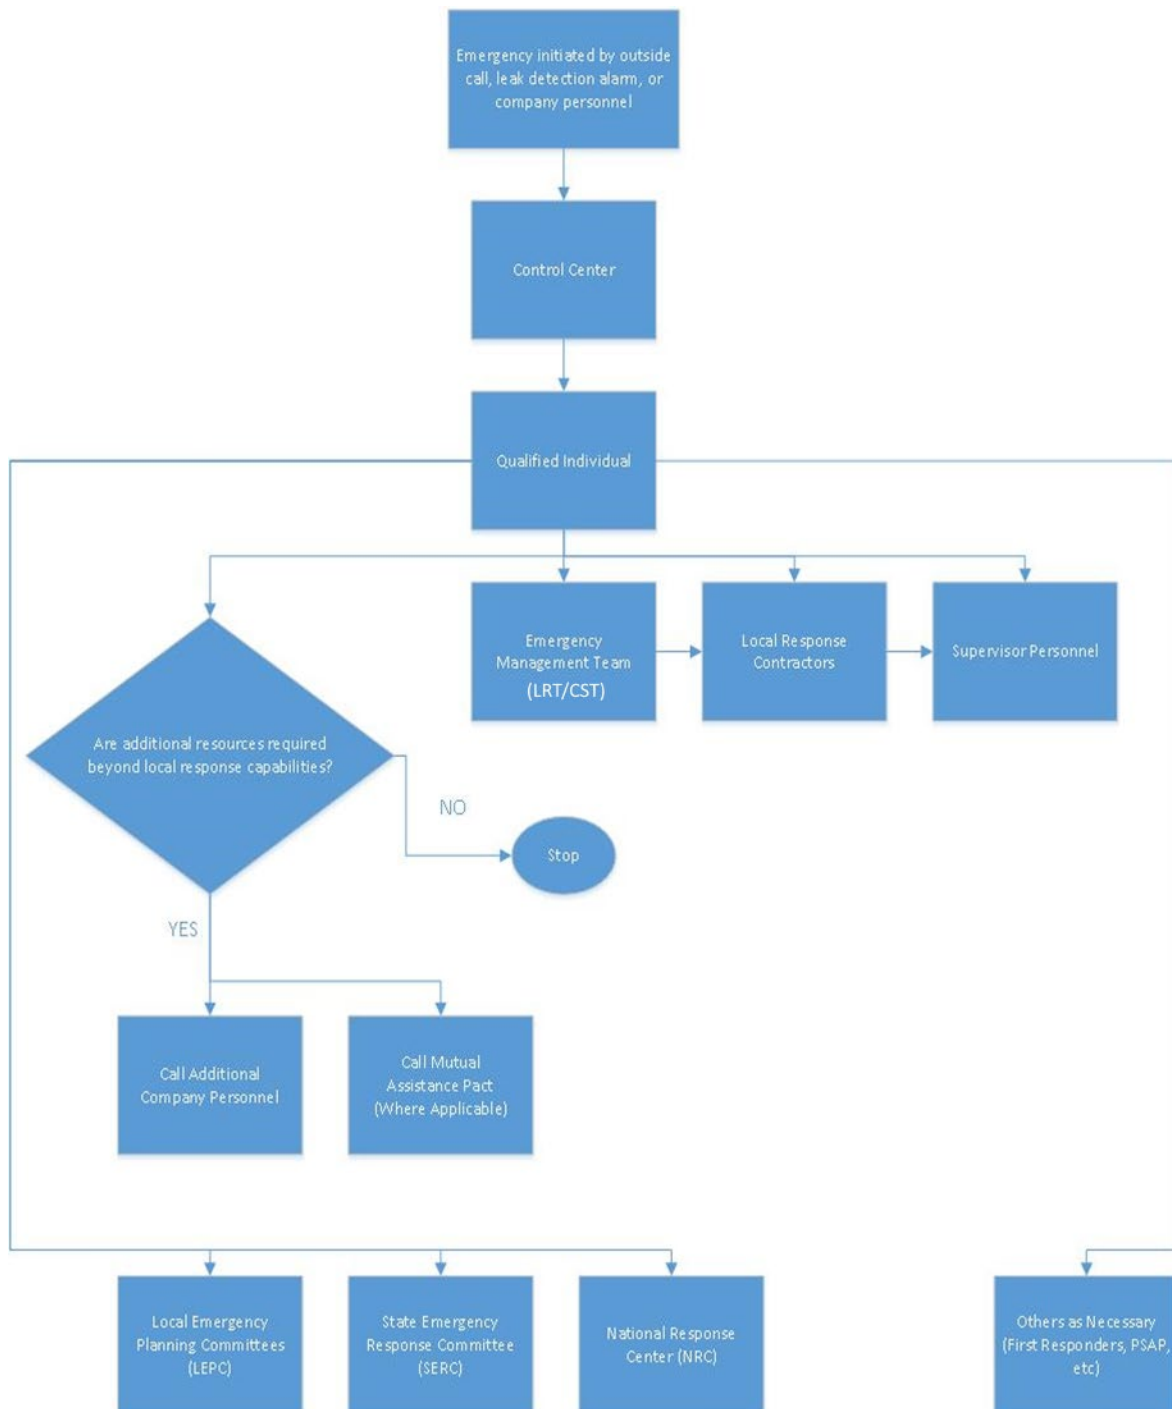

an emergency is reported, SCS will shut down the impacted system and make immediate notifications to ensure protection of the public and company personnel.

Incident Classification	
Low Risk	<p>Incidents that will not need to involve outside agencies, such as Police, Fire, etc.</p> <p>Incidents that can be secured by the Pipeline Operations field personnel that do not impact the public or environment.</p> <p>Examples may include:</p> <ol style="list-style-type: none">1. Incipient stage fires addressed with hand-held extinguishers2. Small spills of fuel, lube oil, or other regulated materials that remain in containment or small releases that disperse immediately into the atmosphere3. Minor injuries not requiring hospitalization
High Risk	<p>Incidents that require an immediate response by the Pipeline Controller and Pipeline Operations Field personnel, such as:</p> <ol style="list-style-type: none">1. Accidental/uncontrolled release of CO₂ from the pipeline2. Fire beyond the capabilities of a handheld extinguisher or explosion occurring near or directly involving a pipeline facility3. Operational failure causing a hazardous condition

4.2 Communicating to Appropriate Operator Personnel

Should notification of an event relating to a pipeline leak or potential emergency which requires immediate response be received, the following Emergency Notification Flowchart, located in Figure 3, provides guidance regarding notification of appropriate operator personnel, contractors, emergency, and public officials.

Figure 3: Emergency Notification Flowchart

4.3 Prompt and Effective Response

A prompt and effective response to each type of incident identified in Section 4.1 is critical to minimizing any adverse effect to public health, the environment, and property.

- All immediate response events (high risk) identified in Section 4.1 should be mitigated by shutting down the pipeline segment(s) involved as soon as possible.
- If the notification is taken by the Pipeline Controller, the pipeline segment(s) involved will be shut down immediately.
- Any other individual receiving notification will immediately notify the Pipeline Controller for immediate shutdown of the affected pipeline segment(s).
- The Control Center shall determine the external notification that need to be made based on the incident type and severity. See Section 6 for the public safety answering point (PSAP) for each county and Section 7 for regulatory notifications, both federal and state, including the public.

Initial response actions are those taken by local personnel immediately upon becoming aware of a discharge or emergency incident before the LRT Team (described in Section 3) is formed and functioning.

The first SCS employee on-scene will function as the IC until properly relieved. The person functioning as the IC during the initial response period has the authority to take the steps necessary to control the situation and must not be constrained by these general guidelines.

Initial Response Actions

Initial Response Action Checklist	
<input type="checkbox"/>	Take appropriate personal protective measures and utilize CO ₂ monitoring equipment to ensure public and responder safety, as the situation demands.
<input type="checkbox"/>	Confirm Control Center has been notified.
<input type="checkbox"/>	Call for medical assistance if an injury has occurred.
<input type="checkbox"/>	Restrict access to the incident site and adjacent areas as the situation demands. Take additional steps necessary to minimize any threat to health and safety. Contact local police or fire to assist as needed.
<input type="checkbox"/>	Assess the magnitude of the incident and quantity released.
<input type="checkbox"/>	Advise public/personnel in the area of any potential threat and/or initiate evacuation procedures.
<input type="checkbox"/>	Use testing and sampling equipment to determine potential safety hazards, as the situation demands.
<input type="checkbox"/>	Identify/Isolate the source and minimize the loss of product, as appropriate.
<input type="checkbox"/>	Take necessary fire response actions and/or contact the local fire department to assist as needed
<input type="checkbox"/>	Notify Management of the incident.
<input type="checkbox"/>	Utilize the ICS 201 form to begin logging all field activities and decisions.

Incident Specific Response Actions

Should notification be received of high risk incident, the following procedures will be followed.

- Accidental/Uncontrolled release of CO₂ from the pipeline.
 - Confirmation will be made by personnel on-scene that Pipeline Control is aware of the incident to effectuate shut down of the pipeline and closure of mainline valves to isolate the release and minimize the amount of CO₂ released.
 - Consideration should be given to notifying and evacuating the public downwind of the release and closing roads. Coordinate with nearby fire departments and law enforcement to aid in any evacuation efforts.
 - Pipeline Control will call the appropriate PSAP and nearby fire departments, law enforcement, and other appropriate agencies. See Section 6 for a listing of PSAPs and Section 7 for agency contacts. Personnel on-scene during an incident may call 911 directly.
 - Pipeline Control dispatches Company Response Crew to investigate the incident and notifies the QI.
 - Company Response Crew arrives at the incident site and completes initial response actions. A designated Company person from the response crew will fill the initial IC position.
 - The IC will conduct a risk assessment and coordinate with the QI to determine what ICS positions need to be filled for the LRT.
 - The QI or IC will establish liaison with the local emergency coordinating agencies, such as the 911 emergency call centers or county emergency managers in lieu of communicating individually with each fire, police, or other public entity.
 - If the response exceeds local capabilities, the IC will coordinate with the QI to determine the need for mobilization of a CST.
- Fire or explosion occurring near or directly involving a pipeline facility. Note, CO₂ is not flammable, combustible, or explosive.
 - Call for assistance from nearby fire departments and company personnel as needed. Take all possible actions to keep fire from spreading to pipeline equipment. If fire still threatens the pipeline, activate shutdown procedure and depressurize threatened pipeline segments as practical.
 - For an explosion involving a pipeline facility, shut down the pipeline.
 - The IC will conduct a preliminary assessment of the situation upon arrival at the scene. Evaluate scene for potential hazards. Determine what product is involved.
 - Assemble the LRT at the Command Post.
 - Coordinate response efforts with on-scene fire department.
- Operational failure causing a hazardous condition.
 - Confirmation will be made by personnel on-scene that Pipeline Control is aware of the incident to effectuate shut down of the pipeline and closure of mainline valves to isolate the release and minimize a hazardous condition.

- Consideration should be given to evacuating the public downwind of the release and closing roads. Coordinate with nearby fire departments and law enforcement to aid in any evacuation efforts.
- Pipeline Control will call the appropriate PSAP and nearby fire departments, law enforcement, and other appropriate agencies. See Section 6 for a listing of PSAPs and Section 7 for agency contacts. Personnel on-scene during an incident may call 911 directly.
- Pipeline Control dispatches LRT to investigate the incident and notifies the QI.
- Company Response Crew arrives at the incident site and completes initial response actions. A designated Company person from the response crew will fill the initial IC position.
- The IC will conduct a risk assessment and coordinate with the QI to determine what ICS positions need to be filled for the LRT.
- The QI or IC will establish liaison with the local emergency coordinating agencies, such as the 911 emergency call centers or county emergency managers in lieu of communicating individually with each fire, police, or other public entity.
- If the response exceeds local capabilities, the IC will coordinate with the QI to determine the need for mobilization of a CST.
- Fire or explosion occurring near or directly involving a pipeline facility. Note, CO₂ is not flammable, combustible, or explosive.
 - Call for assistance from nearby fire departments and company personnel as needed. Take all possible actions to keep fire from spreading to pipeline equipment. If fire still threatens the pipeline, activate shutdown procedure, and depressurize threatened pipeline segments as practical.
 - For an explosion involving a pipeline facility, shut down the pipeline.
 - The IC will conduct a preliminary assessment of the situation upon arrival at the scene. Evaluate scene for potential hazards. Determine what product is involved.
 - Assemble the LRT at the Command Post.
 - Coordinate response efforts with on-scene fire department.

4.4 Personnel and Equipment

SCS will provide personnel, equipment, instruments, tools, and material as needed to respond to an emergency incident.

- All local company personnel are available for call-out as needed for duty on a 24-hour basis to support public safety agencies.
- Additional personnel, if required, will be acquired from agency responders from public safety agencies and/or response contractors.
- If public authorities are involved, they will be given full cooperation and assistance. In no event shall such cooperation and assistance violate safety rules or consist of actions that would endanger the public or employees.
- Company employees, contractors, and agency responders will be equipped with tools, supplies, and equipment available to be used in cases of emergency conditions existing on or near the pipeline system. CO₂/oxygen monitoring devices should be used in the event of an accidental/uncontrolled release of CO₂. Self-contained breathing apparatus may be required pending results from on site-specific hazards and monitoring results.

4.5 Release of Carbon Dioxide

In the event of a breach of pipeline integrity resulting in an uncontrolled release of CO₂, following actions will be coordinated to minimize hazards to public health, the environment, and property.

Pipeline Control will immediately identify any possible rupture and fully close any remote mitigation valves to minimize the volume of CO₂ released from the pipeline.

Pipeline Control will notify the PSAP and/or other agencies such as fire and law enforcement as well as aerial patrol to assist in identifying the location of the release. Aerial patrol will look for:

- blowing soil;
- presence of frost near the pipeline right of way;
- vapor cloud similar to that produced by dry ice; and
- dead or dying vegetation on or near the pipeline right of way in an otherwise green area.

Based upon the estimated volume of the release, topography, proximity of habitable structures, and weather conditions, work with the local emergency response agencies to effect orderly evacuation of the public. The safety of the public and the response team comes first.

Notify emergency agencies to help control traffic, establish danger zones to control sightseers, and determine if it is advisable to set up roadblocks. Roadblocks may be needed for pedestrian, automotive, and train traffic. If active train tracks are near or crossing the area of potential impact, the railroad dispatcher will be notified (telephone numbers of railroad dispatchers are included in Section 6 of this procedure).

As appropriate, deploy outside assistance such as construction contractors or additional air monitoring services.

If roadblocks are set up, advise the controlled points of any resources which have been contacted so they may be admitted to the controlled area.

To enhance cooperation during an incident response, SCS will liaise with agency responders and public officials including participating in emergency tabletop exercises, coordinating meetings to discuss hazards and emergency response, and conducting facility tours or open houses. These and other public outreach activities will be included in the Public Awareness Program that will be developed and implemented prior to commencing operation of the pipeline.

Pipeline Control actions during emergency response actions will be detailed in the Control Room Management Plan to be developed and implemented prior to commencing pipeline operations. Generally, the actions will include:

- ## 5 SCS Internal Contacts

[illegible]

6 Public Safety Answering Points and Railroad Contact Information

Public Safety Answering Points (PSAPs) - MINNESOTA	
Otter Tail County	218-998-8555 - Otter Tail County Sheriff's Office
Wilkin County	218-643-8544 - Wilken County Sheriff's Office

Railroad Emergency Contact – 24/7	
BNSF Railway	1-800-832-5452; then press 1 for emergency
Otter Tail Valley	866-527-3499 (will be answered as Genesee and Wyoming Railroad but this is the emergency number for Otter Tail Valley as well)

7 Federal and State Agency Notifications

7.1 Federal Agencies

FEDERAL PIPELINE SAFETY REPORT NATIONAL RESPONSE CENTER	
c/o United States Coast Guard (CG-5335) – Stop 7581 Washington, DC 20593-0001	
24 Hour Phone	(800) 424-8802
<p>REPORTING REQUIREMENTS: The National Response Center (NRC) is the sole federal point of contact for reporting CO₂ releases which enter or threaten to enter the navigable waters of the United States and for pipeline related incidents/ accidents as defined by the U.S. Department of Transportation, Office of Pipeline Safety. If you have a release or a pipeline incident/accident to report, contact the NRC at the earliest practicable moment (within 1 hour) via the toll-free number, or visit the NRC website (https://nrc.uscg.mil/) for additional information on reporting requirements and procedures. For those without 800 access, please contact the NRC at 202-267-2675.</p> <p>Type: Any discharge that has impacted or threatens to impact navigable waters or a release that meets the criteria of PHMSA's reporting requirements under 49 CFR 195 (see PHMSA reporting requirements on the next page).</p> <p>Verbal Notification: Immediately (not later than one (1) hour of confirmation discovery to meet 49 CFR 195.52(a)). See PHMSA notification for follow-up NRC notification criteria within 48 hours).</p>	
Telephonic Reporting Must Include the Following Information:	
1	Name and address and operator identification number (OPID) of SCS
2	Name and telephone number of the reporter
3	The location of the failure
4	The time of the failure
5	The fatalities and personal injuries (if any)
6	All other significant facts known by SCS that are relevant to the cause of the failure or extent of the damages or extent of the damages.

PIPELINE AND HAZARDOUS MATERIALS ADMINISTRATION (PHMSA)

U.S. Department of Transportation
1200 New Jersey Avenue, SE. Washington, DC 20590
(800) 424-8802 – 24 hours to NRC/emergency number
202-373-2428

REPORTING REQUIREMENTS

Type:

In addition to the reporting of accidents to the NRC as noted below, a written accident report (PHMSA Forms 7000-1 via the online PHMSA Portal) must be submitted for releases resulting in any of the following:

- Explosion or fire not intentionally set by SCS.

- Release of five gallons or more of CO₂, except that no report is required for a release of less than five barrels resulting from a pipeline maintenance activity if the release is:
 - not one described under the NRC's reporting conditions
 - confined to company property or pipeline right-of-way; and
 - cleaned up promptly.

- Death of any person.

- Personal injury necessitating hospitalization.

- Estimated property damage, including cost of clean-up and recovery, value of lost product, and damage to the property of the operator or others, or both, exceeding \$50,000

Written reports are required to be submitted as soon as practicable but **no later than 30 days** after discovery of the accident on PHMSA Form 7000-1. Reports shall be filed by the Manager, EHS or designee. Changes or additions to the original report (PHMSA Form 7000-1) must be filed as a supplemental report within 30 days.

Verbal Notification:

Call to the NRC, within one (1) hour of confirmed discovery and within 48 hours revise or confirm initial report, meets the required verbal notification under PHMSA reporting requirements.

Written Notification:

As soon as practicable, an accident meeting any of the above criteria must be report via the PHMSA Portal at the following link:

<https://portal.phmsa.dot.gov/portal>

OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA)	
OSHA Hotline	(800) 321-6742
Basic requirement. ALL fatalities (regardless if they are work related or not) must be reported to OSHA within 8 hours of occurrence. Work-related inpatient hospitalizations, amputations and losses of an eye occurring within 24 hours of the incident must be reported to OSHA within 24 hours.	

7.2 State Agencies

MINNESOTA OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (MNOSHA)	
Reporting of workplace fatalities and certain injuries	877-470-6742 800-321-6742 (After hours, weekends, holidays)
Reporting Requirement: Verbal	
MNOSHA must be notified for work-related incidents resulting in:	
<ol style="list-style-type: none">1. Fatalities within eight hours2. Inpatient hospitalizations, amputations, or loss of an eye within 24-hours	

MINNESOTA POLLUTION CONTROL AGENCY	
Spill reporting – 24/7 Immediately report	651-649-5451
Normal business hours	(800) 422-0798
<p>Reporting Requirement: Verbal Immediately notify the Minnesota Pollution Control Agency for:</p> <ul style="list-style-type: none"> I. Any release that might cause environmental damage II. Any amount of any substance that is released into the environment that could cause pollution of waters of the state 	

MINNESOTA DEPARTMENT OF PUBLIC SAFETY OFFICE OF PIPELINE SAFETY (MNOPS)	
Spill reporting 24/7 emergency	(800) 422-0798 statewide 651-649-5451 metro and out of state
<p>MNOPS has authority for pipelines operated in the State of Minnesota. In the event of a release, if the spill is required to be reported to PHMSA/NRC, it should also be immediately reported to the MNOPS.</p> <p>Telephonic: Notification should be made as soon as possible and within 1 hour. A follow-up call shall be made within 48 hours of the initial notification to update and/or confirm information.</p> <ul style="list-style-type: none"> - All emergency releases - All reportable accidents as required by PHMSA - Any discharge of any substance or material which may cause water pollution <p>Written: A copy of the 7000-1 report required by PHMSA shall be sent to the Minnesota Office of Pipeline Safety.</p>	

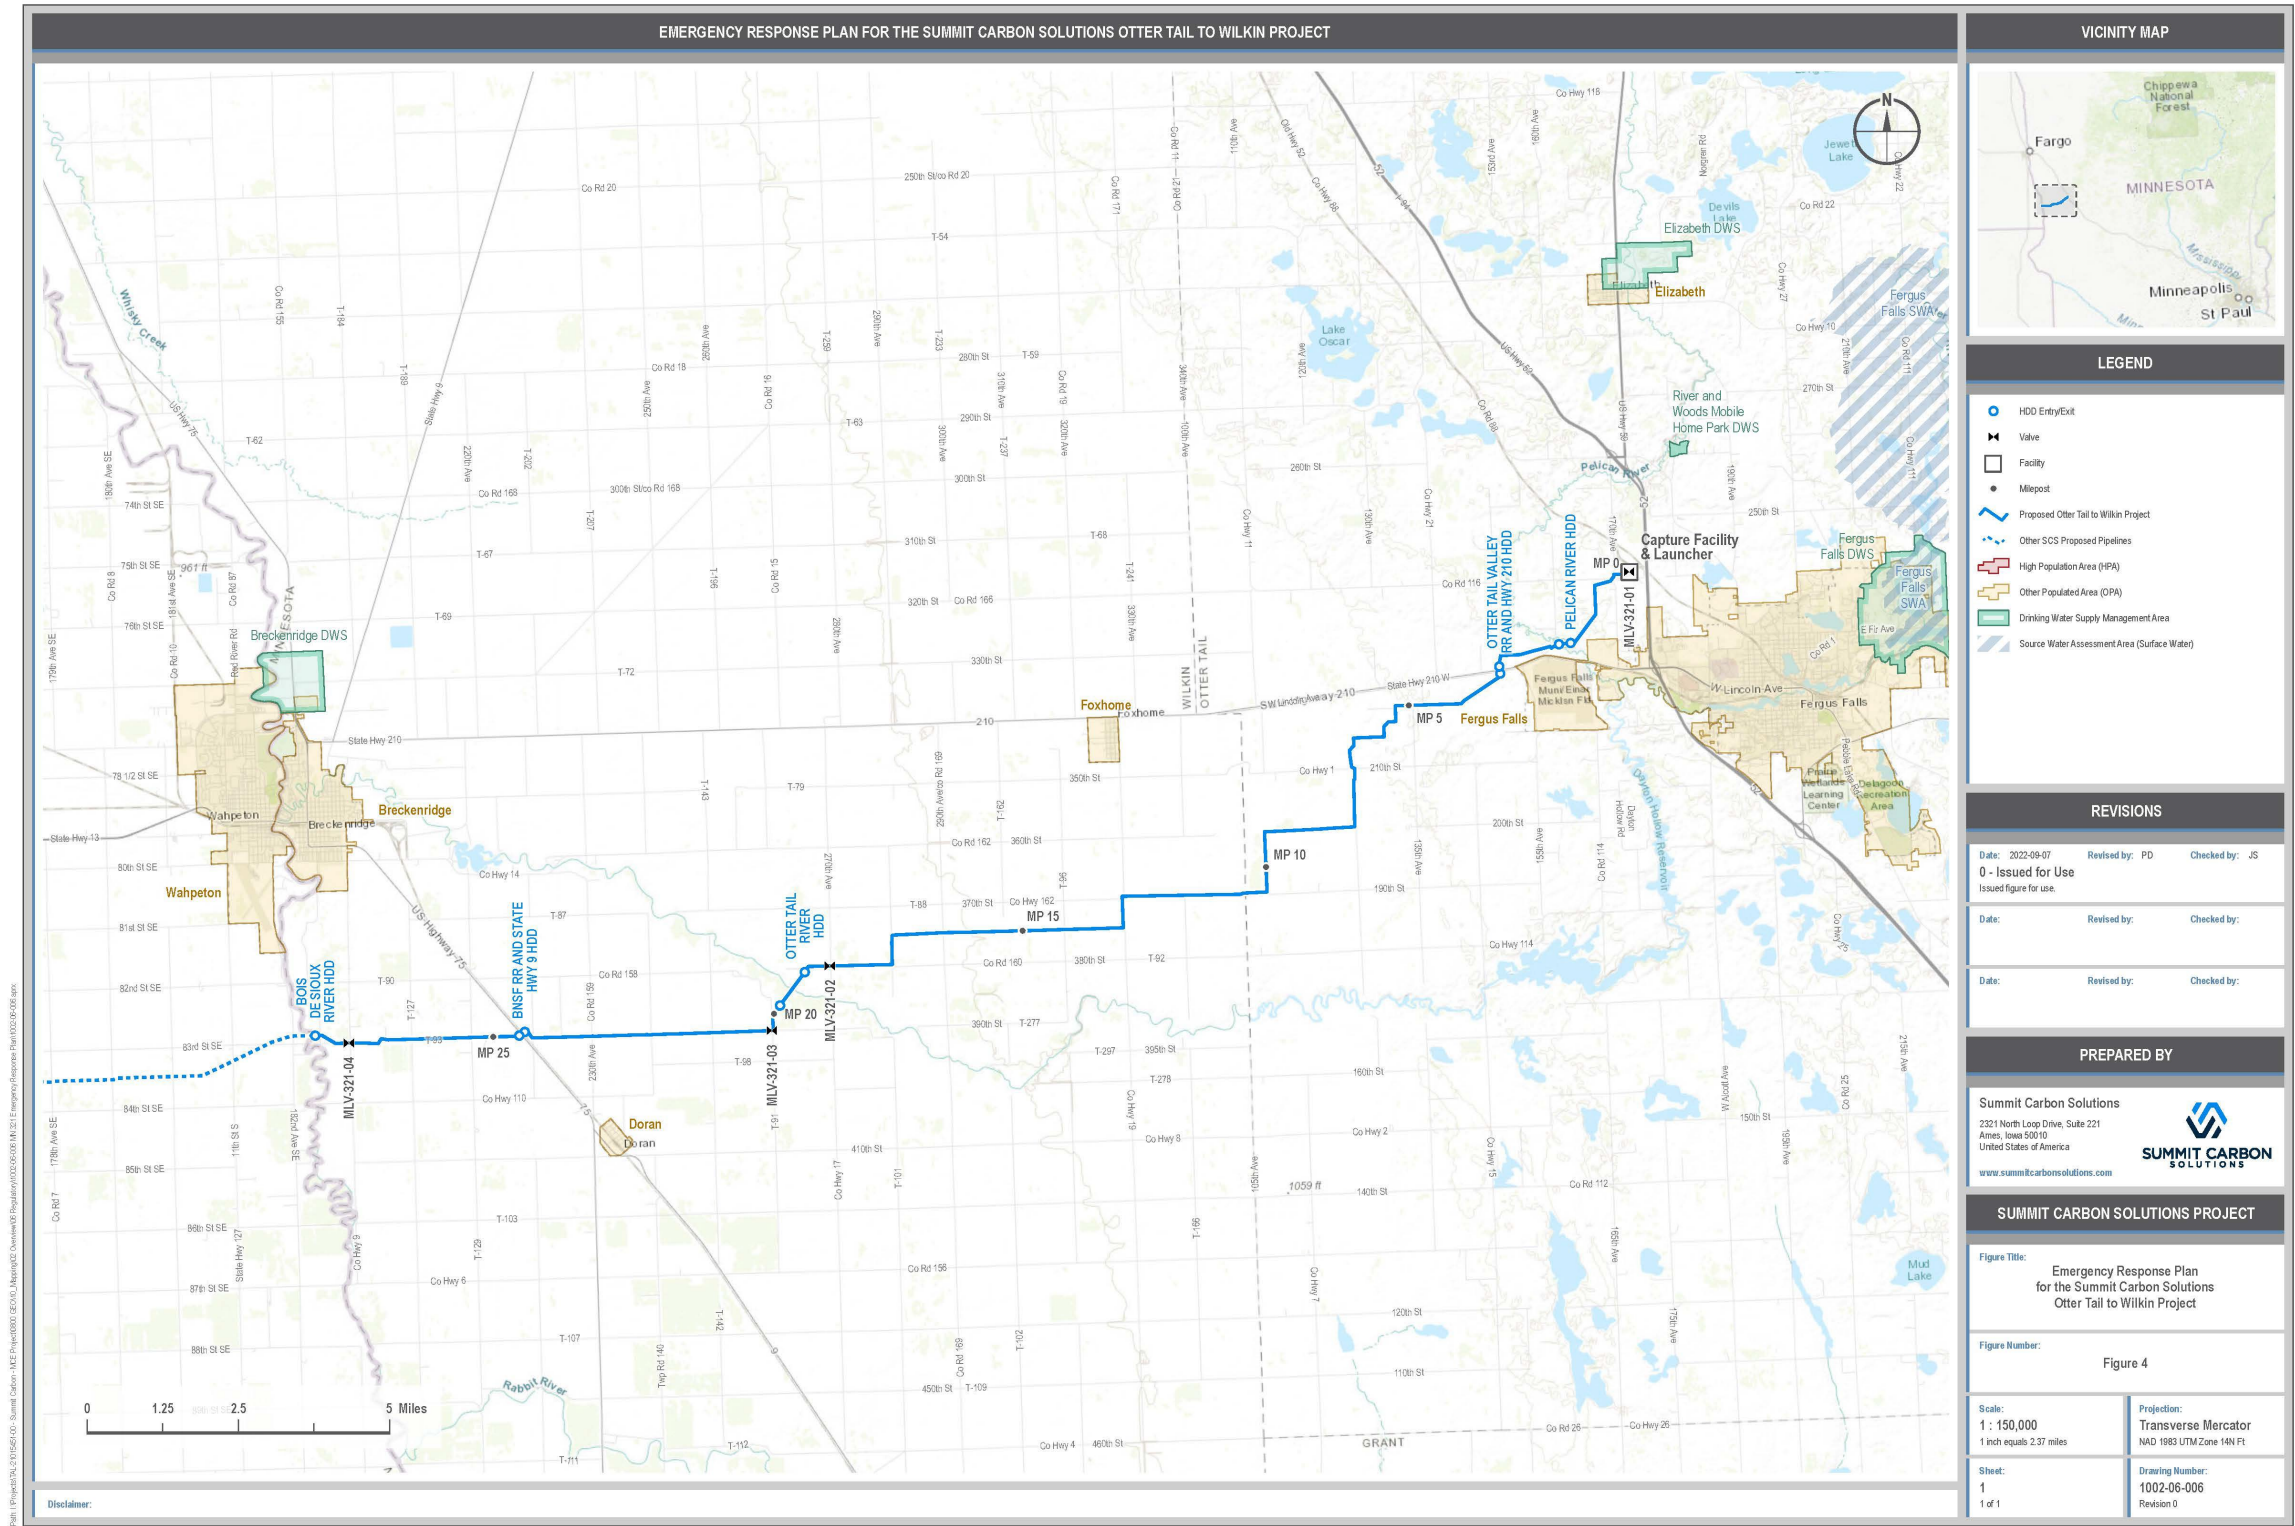

8 Contractor Contact Information

SCS to provide listing of contractors prior to operations.

Contractor Resources		
Company	Capability	Telephone
TBD		

9 Mapping

Figure 4: Project Overview Map

10 Training and Exercises

10.1 Training

The Director, Regulatory Compliance shall ensure that all required Company personnel have received Incident Command training and that all Company personnel working within the ICS response organization understand their roles and responsibilities and the chain of command.

Company personnel shall receive specialized initial training for their roles and will also receive annual training as required by the Company's training program. To remain active, all Company response personnel must meet all training requirements to maintain current certifications and response readiness.

As part of the training program, the Company will meet with agency personnel to discuss response preplanning and preparedness.

10.2 Exercises

A tabletop exercise is a facilitated discussion about what the Company would do in response to an emergency incident. The exercise leads participants through a simulated scenario and prompts them to examine plans, policies, and procedures without disrupting the work environment. It allows for a facilitated discussion of roles, procedures, and responsibilities in the context of a simulated scenario.

The goals of the tabletop exercise include:

- Evaluate the ability to prepare and respond using current plans, policies, procedures, and resources.
- Identify and document improvements for plans, policies, procedures, etc.

The tabletop should be designed to help identify strengths and areas for improvement. Example tabletop objectives may include:

- Evaluate the facility's response organization and operation within the response management system.
- Evaluate internal notifications and alerts, procedures, and training needs.
- Evaluate internal and external communications, including notifications to agencies and the public.
- Evaluate designated staging areas and other emergency response support locations, including activation of Company personnel.
- Evaluate response plans and procedures.
- Evaluate responder and equipment readiness.

Agency personnel will be given an opportunity to attend and participate in these exercises to help facilitate response actions, team integration, and agency expectations.

11 Operator Qualification Tasks

To comply with the Operator Qualification program requirements in 49 CFR 195 subpart G, an Operator must have written description of the processes used to determine the qualification of persons performing operations and maintenance tasks. These descriptions will be maintained in the following documents.

AOC	Abnormal Operating Condition (Field)
AOC	Abnormal Operating Condition (Control Center)
CT 63.1	Start-up of a Liquid Pipeline (Field)
CT 63.2	Shutdown of a Liquid Pipeline (Field)
CT 64.1	Start-up of a Liquid Pipeline (Control Center)
CT 64.2	Shutdown of a Liquid Pipeline (Control Center)

12 Records/Forms

Employees involved in emergency response should keep logs documenting the times of contacts and actions taken during the emergency. These logs may be useful when conducting the post- accident review.

- PHMSA Form 7000-1 Accident Notification Report
- Incident/Accident Investigation
- SCS Safety Manual

13 References or Related Documents

[Reference and Related Documents to be added]

14 Plan Maintenance

Responsibility

Single point accountability for the ERP development and maintenance rests with the Director, Regulatory Compliance. Accountabilities include:

- Development and maintenance of the ERP;
- Ensure systems (ex: ICS) and response structure can meet the requirements specified herein;
- Ensure the ERP is reviewed at least annually and revised/updated as necessary; and
- Ensure SCS employees, contractors, and responders are trained on and provided a copy of the ERP.

Plan Revisions

Initially, and at regular intervals, SCS will perform hazard assessments to identify possible incidents that have the potential to negatively impact people, the environment, and/or property. This plan will be updated to address any changes to or new hazards identified in the hazard assessments.

Initiating Revisions

All requests for change must be made through the Director, Regulatory Compliance using the Revision Request Form incorporated in this document.

Revision Distribution

Plan revisions are issued with an Acknowledgement of Receipt Form and a brief description of the itemized changes. The Acknowledgement of Receipt Form must be signed and returned to the Director, Regulatory Compliance. A revised date is shown at the bottom of each updated or new page. The original date of the manual is August 18, 2022.

Distribution List	
Copy Number	Plan Holder
1	Director, Regulatory Compliance Summit Carbon Solutions 2321 North Loop Drive, Suite 221 Ames, IA 50010
2	TBD Emergency Management/Response Agency Representative(s)
3 (Electronic)	TBD

In the event SCS experiences an incident, or conducts an exercise or training session, the effectiveness of the plan will be evaluated and updated to include lessons learned as necessary. After each incident or exercise, a post incident/exercise review will be conducted in a timely manner. The Plan will be evaluated to determine its usefulness during the incident/exercise. Items discussed after an incident include but are not limited to effectiveness of detection and detection equipment, proper and timely notifications, initial and ongoing incident assessments, mobilization of resources, and/or response effectiveness. Consideration will be given to including agency responder personnel in the post-incident or training session review.

If an operating condition changes that would substantially affect the implementation of the plan, SCS will modify the Plan to address such a change. Updates would be implemented prior to the change or interim operating provisions would be instituted until the update is fully implemented.

DRAFT

Appendix O

Comments on Draft EIS and Responses

Appendix O

Comments on the Draft EIS and Responses

This appendix contains the written and verbal comments received on the draft Environmental Impact Statement (EIS) for the Otter Tail to Wilkin Carbon Dioxide Pipeline Project (project), and responses to these comments by Department of Commerce, Energy Environmental Review and Analysis (EERA) staff. The draft EIS was issued January 23, 2024. Comments on the draft were solicited through public meetings and a public comment period. The public comment period ended on February 23, 2024. Approximately 176 written comments were received during this time from individuals, companies, agencies, Tribes, and organizations.

During this same public comment period, the Minnesota Public Utilities Commission (Commission) received testimony regarding the project from parties to the hearing. Where this testimony includes comments on the draft EIS, these comments are included in this appendix and responses are provided (see comment-response table in **Attachment 1**).

Written Comments

Written public comments are compiled and presented in the attached comment-response table (**Attachment 1**). The comment-response table also includes EERA staff's responses. Some of the responses include modifications to the EIS, as indicated in the responses. All modifications to the text of the EIS are denoted by a vertical line in the margin next to the text that has been modified.

The comment-response table in **Attachment 1** presents comments from agencies, Tribes, and organizations first, followed by individuals in alphabetical order. The comment-response table also includes the date that the comment was received and the eDocket identification number.

After receiving Minnesota Department of Natural Resources (DNR) comments on the draft EIS, EERA staff obtained Conservation Planning Reports for the RA-North and RA-Hybrid route alternatives. These Conservation Planning Reports are included in **Attachment 2**.

Attachment 3 includes the response from EERA staff (dated February 28, 2024) to an information request from CURE. This response was not filed to the project eDocket and is included here to help clarify comment responses.

Verbal Comments

During the Draft EIS comment period, the public was invited to provide verbal comments at the following in-person and virtual public meetings:

- February 6, 2024, 6:00 p.m., Breckenridge, Minnesota
- February 7, 2024, 1:00 p.m., Fergus Falls, Minnesota
- February 7, 2024, 6:00 p.m., Fergus Falls, Minnesota
- February 8, 2024, 6:00 p.m., virtual

Transcripts of these public meetings are provided in **Attachment 4**. During the meetings, EERA staff and its consultants provided responses to most comments raised during the meetings. Thus, the responses to these comments are included in the transcripts. EERA staff identified five comments from the public meetings where an additional response is appropriate. These comments and responses are as follows:

- In response to a question about use of eminent domain, as indicated in Section 3.5, the applicant cannot exercise the power of eminent domain for the project.
- In response to comments about capture facility water usage calculations, Section 5.7.8.2 was revised to clarify the applicant's calculation of approximately 13 million gallons per year.
- A figure showing the three alternative routes has been added to the Executive Summary, as suggested by a commenter.
- In response to comments that figures attached to the applicant's Minnesota Environmental Construction Plan (ECP) in Appendix D refer to a pipeline diameter of 4 to 24 inches, the cover page for the ECP has been revised to clarify that the proposed Otter Tail to Wilkin CO₂ pipeline would be 4 inches. The figures in question are "typical" and are used to convey best management practices for a range of pipeline diameters.
- In response to comments about whether the volume of water needed for operation of the capture facility is sustainable, additional information has been added to Section 5.7.8.2 to address the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to including a contingency plan as part of its DNR appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a request from the DNR, when necessary.

Appendix O

Comments on the Draft EIS and Responses

Attachment 1

Comments on the Draft EIS and Responses

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
American Carbon Alliance	Buis, Tom	2024-02-08	On behalf of the American Carbon Alliance (ACA), I am writing to express my unequivocal support for the Summit Carbon Pipeline project and to encourage the Minnesota Public Utilities Commission to approve its implementation. The Summit Carbon Pipeline represents a pioneering effort to address the challenges associated with carbon emissions, providing an effective and scalable solution for the capture and transport of CO ₂ from various industrial sources to secure storage sites. The technological advancements, strategic partnerships, and effort to obtain voluntary easements, made by the Summit team underscore the project's commitment to cutting edge practices and its potential to make a substantial positive impact on Minnesota's carbon footprint.	Thank you for your comment.	20243-204403-01
American Carbon Alliance	Buis, Tom	2024-02-08	The ACA believes this transformative pipeline project represents a significant milestone in our nation's agricultural landscape. This project isn't merely about environmental sustainability but bolstering the agricultural economy, preserving generational farming, and ensuring a stable foundation for ethanol production. Connecting ethanol plants to a CO ₂ pipeline to enable the creation of sustainable aviation fuel further underscores the ingenuity and forward-thinking approach that benefits both our farmers and the broader energy industry. The successful implementation of this project will not only lower carbon intensity scores but foster an environment where American-produced liquid fuel remains competitive in a rapidly evolving global marketplace. It will create new opportunities for job growth within our communities, drive up land values for farmers, and increase the price of corn. I urge the Commission to consider the long-term benefits of the Summit Carbon Pipeline and to prioritize the advancement of projects that contribute to both environmental stewardship and economic growth. By supporting initiatives like this, we can position Minnesota as a leader in responsible energy practices and contribute to the ongoing global efforts to combat climate change. Thank you for your time and consideration. I trust that the Commission will make a well-informed decision that reflects the best interests of our state and its residents.	Thank you for your comment.	20243-204403-01
American Carbon Alliance	Peterson, Collin	2024-02-08	I am writing to express my wholehearted support for the Summit Carbon Pipeline project, which is slated to have a positive impact on Minnesota's energy landscape and contribute significantly to the state's efforts in carbon capture and storage. Embracing innovative solutions such as this pipeline is crucial for addressing the challenges posed by climate change and provides Minnesota farmers and producers with new markets. The Summit Carbon Pipeline aligns with Minnesota's commitment to reducing greenhouse gas emissions. The project's focus on carbon capture and sequestration not only demonstrates a forward thinking approach to environmental sustainability but also emphasizes the importance of collaboration between the public and private sectors.	Thank you for your comment.	20243-204403-01
American Carbon Alliance	Peterson, Collin	2024-02-08	The Summit Carbon Pipeline is not only an investment in cleaner energy but also a step towards supporting economic growth and job creation throughout the Midwest. This would mean the creation of jobs and revenue for local communities, and a generational opportunity for family farms and rural economies. Connecting ethanol plants to a CO ₂ pipeline to enable the creation of sustainable aviation fuel further underscores the ingenuity and forward-thinking approach that benefits both our farmers and the broader energy industry. I urge the Minnesota Public Utilities Commission to carefully consider the facts presented by Summit Carbon Solutions and to support the Summit Carbon Pipeline project. By endorsing initiatives like this, we can position Minnesota as a leader in sustainable energy practices, setting an example for other states and contributing to the global fight against climate change. Thank you for your attention to this matter, and I trust that you will make a decision that prioritizes the long-term environmental and economic well-being of our state.	Thank you for your comment.	20243-204403-01
City of Lamberton	Halter, Valerie	2024-02-21	Dear Members of the Minnesota Public Utilities Commission, I am writing to express the deep concerns of the City of Lamberton regarding Docket 22-422 and the proposed carbon pipeline projects that may affect our community. The City Council appreciates your time and consideration in addressing the following concerns, which pertain to the potential impacts on our Emergency Medical Services (EMS) personnel, water supply, and local recreational spaces.	Thank you for your comment.	20243-204403-01
City of Lamberton	Halter, Valerie	2024-02-21	1. EMS Personnel Concerns: The safety and preparedness of our EMS personnel are paramount. In the event of a pipeline failure, it is crucial that our volunteers are adequately trained and equipped with the necessary tools to handle such situations. The City of Lamberton, like many communities, faces challenges in staffing our emergency services, and we fear that the perceived hazard associated with potential pipeline failures may discourage individuals from joining our EMS or fire departments. Given the volunteer nature of our EMS, compensating them at a level commensurate with the associated risks is unfeasible. Additionally, the lack of training for our EMS personnel is a pressing concern, and we request that training initiatives commence before any construction begins.	Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to respond safely to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a carbon dioxide (CO ₂) rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				plan would be revised as required by the Pipeline and Hazardous Materials Safety Administration (PHMSA) if the project is approved. Additionally, Energy Environmental Review and Analysis (EERA) staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.	
City of Lamberton	Halter, Valerie	2024-02-21	<p>2. Water Supply Concerns:</p> <p>Our city is currently dependent on a single well with limited backup well availability. During the summer months, we have had to restrict water usage for businesses within our community due to the inability to meet demand. We are apprehensive about the potential impact on our municipal water facilities if they are required to supply water to the pipeline. Moreover, concerns regarding the effects on surrounding aquifers, coupled with limited options for water access, necessitate careful consideration to safeguard the essential needs of our residents.</p>	Thank you for your comment. Water resources are described in Section 5.7.8 of the Environmental Impact Statement (EIS). The commenter references an area in Redwood County. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01
City of Lamberton	Halter, Valerie	2024-02-21	<p>3. Recreational Space and Economic Impact:</p> <p>The presence of a pipeline poses a threat to our local parks, particularly the one located on the Cottonwood River. This park not only serves as a recreational space for residents but also attracts visitors from surrounding areas. The associated construction activities could disrupt the natural landscape, affecting the camping sites and revenue generated from them. This, in turn, may deter individuals from enjoying the park due to perceived risks associated with the pipeline.</p> <p>In conclusion, the City Council of the City of Lamberton urges the Minnesota Public Utilities Commission to thoroughly assess and address these concerns before proceeding with any decisions related to Docket 22-422. Our community's safety, water security, and recreational spaces are integral to our residents' well-being and the vitality of Lamberton as a whole.</p> <p>Thank you for your attention to this matter, and we look forward to a comprehensive evaluation of the potential impacts on our community.</p> <p>Sincerely, Valerie Halter City Clerk on Behalf of the City Council</p>	Thank you for your comment. The commenter references an area in Redwood County. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01
Consumer Energy Alliance	Ventura, Chris	2024-02-16	<p>On behalf of Consumer Energy Alliance (CEA), I write today to thank the Minnesota Department of Commerce and the Minnesota Public Utilities Commission for receiving public comments on the draft environmental impact statement regarding the Otter Tail to Wilkin Carbon Dioxide Pipeline Project.</p> <p>Founded in 2006, CEA is a nonpartisan, nonprofit organization advocating for a balanced energy policy and responsible access to resources. CEA represents virtually every sector of the U.S. economy – from the iron and steel industry to truckers, airlines, agriculture, labor organizations, restaurants, chemical manufacturers, small businesses, and families across the nation – that are concerned about U.S. energy policies, energy security, and long-term price and supply stability.</p> <p>Since our founding, CEA and its members have strongly supported actions that thoughtfully advance our nation towards a cleaner, more environmentally responsible energy future. This includes emissions reductions that help meet our nation’s climate goals.</p> <p>As put forth in the Department of Commerce’s Draft EIS, the Otter Tail to Wilkin Carbon Dioxide Pipeline Project will contribute to helping both Minnesota and our nation meet these climate goals. As stated in the Draft EIS, “The project would have a net beneficial effect on climate change as it would capture and store CO₂ emissions,” from ethanol being produced in state. This is because the proposed pipeline is designed to be a carbon management solution that would allow for the capture of up to 12 million tons of CO₂ each year – the equivalent of removing the emissions of 2.6 million vehicles from our roads.</p>	Thank you for your comment.	20243-204403-01
Consumer Energy Alliance	Ventura, Chris	2024-02-16	<p>Safely capturing, transporting, and storing the CO₂ emissions from Minnesota’s ethanol plants will ensure that Minnesota’s ethanol industry will be able to continue to supply fuel that will meet new regulations calling for minimized emissions as our country looks to aggregate cumulative impact.</p> <p>As a result, it will also ensure Minnesota’s corn farmers will be able to market their harvests locally, as ethanol production in 2022 generated \$8 billion of economic activity in Minnesota, which includes \$1.9 billion of income for Minnesota residents. More than</p>	Thank you for your comment.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>meeting our environmental goals, the proposed project will allow families, farmers, and local businesses across the state to continue having access to affordable, reliable fuel and ensure the stability of the industry that provides it. The stable and predictable energy supplies supported by investments in projects like this will help people power their lives, make payroll, and support local communities. We appreciate the opportunity to offer these comments and urge the Minnesota Department of Commerce and the Minnesota Public Utilities Commission to consider not just the economic benefits projects like the Otter Tail to Wilkin Carbon Dioxide Pipeline Project will deliver but also the environmental benefits these projects will provide to Minnesota.</p> <p>Sincerely, Chris Ventura Executive Director Consumer Energy Alliance-Midwest</p>		
CURE	Dolph, Christy	2024-02-13	<p>Q. Please summarize your conclusions.</p> <p>A. The DEIS does not provide enough information to allow me to determine which route alternative is least damaging to water resources and soils in a comprehensive way. In particular, the DEIS does not provide sufficient geotechnical evidence to allow for an assessment of the comparative risks presented by the three route alternatives to 1) disruption of sensitive groundwater resources and 2) the likelihood of inadvertent spills of drilling fluid to the environment. According to the DEIS, this lack of evidence is because geotechnical investigations have not been completed for critical areas along the route alternatives. However, given the existing information that is available in the DEIS, RA-North would appear to have lesser potential impacts on soil and surface water resources compared to RA-South and RA-Hybrid.</p> <p>Overall, the available scientific evidence on the subject of impacts of pipeline installation on soil and water resources points to the likelihood of lasting impacts from pipeline construction. And, as pipeline infrastructure continues to grow, the impacts of single projects accumulate, and together with other stressors such as agricultural intensification and environmental contamination, likely create thresholds in environmental degradation and habitat loss that can't be easily reversed.</p>	The applicant would complete a geotechnical evaluation of each horizontal directional drill (HDD) location along the pipeline prior to the start of construction. As described in Chapter 5, soils and geology along the three routes are generally similar. Because soils and geology are similar, geotechnical investigations, with the associated time and costs, would be unlikely to aid the Commission in its decision.	20242-203381-02
CURE	Dolph, Christy	2024-02-13	<p>Q. What does the DEIS generally conclude about the potential environmental impacts of the proposed project?</p> <p>A. In general, the DEIS concludes that many of the potential environmental impacts will be “minimal,” “temporary,” or “negligible.”</p> <p>Q. Do you agree with these conclusions?</p> <p>A. No. The science regarding the impacts of pipeline installation and operation on ecosystems has not remotely kept pace with large increases in pipeline infrastructure installed in the United States in recent decades. (1) Given the lack of data regarding impacts arising from pipeline installation, repeated characterization in the Executive Summary of the DEIS of potential environmental impacts from the proposed project as ‘minimal’, ‘temporary’, or ‘negligible’ cannot be based on much evidence. Moreover, the scientific evidence that does exist points to the likelihood of lasting environmental impacts to ecosystems and soil.</p> <p>(1) <i>Brehm, Theresa, and Steve Culman. 2023. "Soil degradation and crop yield declines persist 5 years after pipeline installations." Soil Science Society of America Journal 87 (2):350-364.</i></p>	Thank you for your comment. As indicated by the definitions found on Page 5-1 of the draft EIS, “long-term impacts extend beyond the end of construction and are generally associated with operation of the project.” Disturbance to soils and crops from construction can result in impacts that extend beyond the construction phase, and the text in the final EIS has been revised to indicate that impacts can be long term.	20242-203381-02
CURE	Dolph, Christy	2024-02-13	<p>Q. How would you describe the groundwater resources along the routes presented in the DEIS?</p> <p>A. In this region, unconsolidated permeable glacial deposits and recent alluvial deposits are the most important sources of groundwater. These deposits consist of glacial sand and/or gravel outwash, ice-contact deposits, or sand and gravel alluvium deposited along existing streams. There are both surficial and buried glacial aquifers in the project area. Glacial aquifers are classified as surficial when the water table is in the deposit. Glacial aquifers are classified as buried when they are separated from the ground surface or from overlying surficial glacial aquifers by some continuous barrier to vertical flow. The DEIS states that most lakes, rivers, and many wetlands near the project are hydrologically connected to the water table. In Otter Tail County, the depth to water table is on average less than 20 feet below ground surface. In Wilkin County, the depth to water table is on average less than 10 feet below ground surface.</p>	Thank you for your comment.	20242-203381-02
CURE	Dolph, Christy	2024-02-13	<p>Q. Are there specific construction methods that pose significant risks to groundwater resources?</p> <p>A. Yes. As the DEIS notes, the planned construction methods, such as using sheet piling to reinforce the pipeline trench, represent a substantial risk to sensitive groundwater resources that can have “significant long-term impacts.” (Page 5-136). This is consistent with accepted scientific knowledge.</p>	Thank you for your comment.	20242-203381-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
CURE	Dolph, Christy	2024-02-13	<p>Q. What specific type of aquifers are likely to be impacted by the planned construction methods?</p> <p>A. On p. 5-133 the DEIS notes that RA-South has been confirmed by the applicant to cross a sensitive artesian groundwater aquifer in an area with complex and highly variable groundwater. An artesian aquifer is a type of confined aquifer characterized by its natural ability to release water under pressure without the need for external pumping. This pressure arises from the geological confinement of the aquifer between relatively impermeable layers of sediment, causing water to rise above the aquifer's surface when a well is drilled into it. The DEIS further notes that is it is possible RA-North and RA-Hybrid cross this aquifer, though that has not been evaluated directly or confirmed.</p>	Thank you for your comment.	20242-203381-02
CURE	Dolph, Christy	2024-02-13	<p>Q. What are your concerns about the risk to confined artesian aquifers from construction of the project?</p> <p>A. As noted in the DEIS, planned construction methods (i.e., using sheet piling to reinforce the pipeline trench) represents a substantial risk to these types of aquifers that can have “significant long-term impacts.” (Page 5-136). If sheet piling punctures the sediment cap of the aquifer it can create an aquifer “breach” where water flows uncontrollably out of the punctured location. Such a breach could drain or partially drain the aquifer, which could have long term or permanent effects on this groundwater resource. The uncontrolled flow of this water to the surface in new locations could also change the temperature and water chemistry of existing surface waters near the aquifer. If the aquifer is currently welling up to the surface naturally in some locations (i.e., existing artesian springs), then puncturing the aquifer in other locations could cause loss of water to the surface in these existing locations where it may currently support important freshwater ecosystems.</p> <p>Q. Have these kinds of impacts occurred in other pipeline projects?</p> <p>A. Yes. Most notably, the recently constructed Line 3/93 pipeline in Northern Minnesota has caused ongoing damage and groundwater impacts at multiple locations along the pipeline route via this mechanism—specifically, sheet piling puncturing into confined aquifers. This highlights the risk of pipeline construction methods, especially in areas with abundant shallow groundwater that is vulnerable to disturbance.</p> <p>Q. Can these aquifer breaches be corrected after they occur?</p> <p>A. In the case of Line 3/93 it has been the case that aquifer breaches are very difficult to plug or remedy after they have been caused. The attempts to repair damaged aquifers have resulted in additional environmental impacts, such as insertion of thousands of gallons of grout concrete into the subsurface environment in an effort to plug ruptured aquifer caps. The only real way to avoid damage from aquifer breaches is to avoid breaching in the first place.</p>	Thank you for your comment.	20242-203381-02
CURE	Dolph, Christy	2024-02-13	<p>Q. Does the DEIS recommend or identify any other mitigative measures?</p> <p>A. Yes, the DEIS mentions that geotechnical investigations will be conducted prior to construction to assess the proximity to aquifers.</p> <p>Q. Do you believe this method will adequately protect aquifers from construction damages?</p> <p>A. It could, but this approach seems backwards in regards to resource protection. Investigations conducted after route approval are not useful in determining the best route alternative for the project that would minimize groundwater impacts.</p> <p>Q. Do you have any recommendations regarding process?</p> <p>A. Yes. In order to best protect water resources, detailed geotechnical investigations should be conducted along all route alternatives prior to route approval, and routes that cross vulnerable aquifer areas should be avoided.</p>	<p>Minnesota Rule 4410.2300(H) indicates that an EIS shall include “a thorough but succinct discussion of potentially significant adverse or beneficial effects generated” by the proposed project and each major alternative with “[l]ess important material ... summarized, consolidated, or simply referenced.” Factors to be considered include “the impact and the relevance of the information to a reasoned choice among alternatives” and “the relationship between the cost of data and analyses and the relevance and importance of the information.”</p> <p>The groundwater resources that could be affected by the project would be similar for all three route alternatives; therefore, potential impacts would be similar. The time and costs associated with performing an additional study on groundwater resources would not be expected to aid the Commission in its decision.</p>	20242-203381-02
CURE	Dolph, Christy	2024-02-13	<p>Q. Which alternative presents the lowest risk to groundwater resources?</p> <p>A. The No Action Alternative presents the lowest risk to groundwater resource. Otherwise, the DEIS does not contain the requisite information needed to evaluate the comparative risks posed by the remaining route alternatives to groundwater, although RA-South does present a confirmed risk to a vulnerable aquifer. The DEIS shows that RA-South presents a known and confirmed risk to a vulnerable aquifer system and that the other route alternatives have not been evaluated for their risk to similar aquifers. (Page 5-133). Without a fully informed comparison of groundwater conditions across the route, a comparable evaluation of risk to vulnerable water resources across all routes is not possible.</p>	Minnesota Rule 4410.2300(H) indicates that an EIS shall include “a thorough but succinct discussion of potentially significant adverse or beneficial effects generated” by the proposed project and each major alternative with “[l]ess important material ... summarized, consolidated, or simply referenced.” Factors to be considered include “the impact and the relevance of the information to a reasoned choice among alternatives” and “the relationship between the cost of data and analyses and the relevance and importance of the information.”	20242-203381-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				The groundwater resources that could be affected by the project would be similar for all three route alternatives; therefore, potential impacts would be similar. The time and costs associated with performing an additional study on groundwater resources would not be expected to aid the Commission in its decision.	
CURE	Dolph, Christy	2024-02-13	Q. Based on the available information do you think that RA-South would have the least impact to groundwater resources? A. No. Based on available information RA-South has a significant risk of groundwater impacts that could be difficult or impossible to avoid or remediate.	Thank you for your comment.	20242-203381-02
CURE	Dolph, Christy	2024-02-13	Q. Are there risks associated with the HDD method? A. Yes. HDD involves drilling a tunnel underneath a river or wetland, often at considerable depth (e.g., ~50 ft deep) and then installing prefabricated sections of pipe into the tunnel. To drill these tunnels, contractors lubricate a large drill bit with something called drilling fluid or drilling mud. This fluid is typically a mix of bentonite clay and other unknown chemicals that are typically not disclosed to the public and are listed as “proprietary”, or trade secret. As noted in the DEIS, “during HDD installation it is possible to encounter existing weak areas in the ground where pressurized drilling mud can escape into the surrounding matrix. These can include unconsolidated gravel, coarse sand, soil fissures, and fractured bedrock.” (Page 5-104). In other words, when HDD is used to drill through sensitive sediments beneath rivers and wetlands, the tunnels can lose structural integrity and develop leaks. These leaks are known as ‘frac outs’, and result in drilling fluid spills into the surrounding environment. Leaks happen initially in the subsurface, and can spread all the way to the land or water surface, or to other subsurface locations and aquifers. Notably, conditions that create vulnerability for frac outs (i.e., the presence of unconsolidated gravel and sand) are prevalent in the proposed project region as noted by the DEIS, indicating a risk for HDD-related inadvertent releases. Bentonite clay (one of the primary constituents of drilling fluid) is a very fine sediment that represents a stressor to aquatic life if spilled into streams, rivers or wetlands. Fine sediments can clog the gills and suffocate aquatic life like mussels, insects, and fish. Fine sediments can also degrade habitat for these life forms. There have been relatively few scientific studies of drilling mud toxicity to the environment. Most of the available scientific studies were conducted for coastal environments. In coastal settings, drilling muds have demonstrated toxicity for fish, crustaceans, mollusks and other organisms.	The EIS discloses the potential for an inadvertent release of drilling mud and describes potential impacts in Chapter 5.	20242-203381-02
CURE	Dolph, Christy	2024-02-13	Q. Is there any potential additional risk to aquatic life from the chemicals used in drilling fluid? A. The DEIS notes that chemical additives may be mixed with drilling fluid to lubricate the drill or improve viscosity. (Page 5-136). Ecotoxicity data for potential drilling fluid additives are not presented in the DEIS. Without more information on the additional chemicals used in the drilling fluid it is not possible to fully assess the extent of risk to aquatic organisms from this chemical mix. It is reasonable to assume that drilling fluid mixes have acute toxicity to aquatic life, but the lack of information in the DEIS makes further analysis exceedingly difficult to complete. Q. Do you have any recommendations for mitigating these risks? A. There is no way to completely mitigate the potential risks associated with HDD. Given the likely risk of inadvertent drilling fluid release at river crossing locations where HDD is used and the potential impact of these releases on water quality and ecosystem health, the applicant should be required to document and report the amount of drilling fluid lost to the environment in each release. Ideally, the applicant should be required to disclose all chemicals used for HDD and the amounts used in its drilling fluid so that there is more clarity on potential toxicity to aquatic life. Geotechnical investigations should also be conducted along all route alternatives prior to route approval. In the DEIS, no geotechnical investigation is listed for the Red River crossing for RA-North, and the investigation for the Pelican River has not been completed. Without this information, we cannot evaluate the comparative risks associated with HDD for the different routes. These investigations are critical to informing route selection and crossing method. Construction of the recent Line 3/93 pipeline project in northern 1 Minnesota resulted in ‘frac outs,’ or an inadvertent releases of drilling fluid to the environment at a majority (67%) of river locations crossed using HDD, in part because the pipeline company conducted crossings in geologic conditions that were unsuitable for the HDD crossing method.	As described in Section 5.7.8.2, an additive approved by the Minnesota Department of Health (MDH) or meeting NSF International/American National Standards Institute (ANSI) Standard 60, Drinking Water Treatment Chemicals – Health Effects, might need to be mixed with the drilling mud for viscosity or lubricating reasons and to reduce the potential for an inadvertent release or failed HDD. The specific additive used would depend on the conditions at the crossing location and would be determined by the HDD contractor. The EIS discloses the potential for an inadvertent release of drilling mud and describes potential impacts in Chapter 5. The applicant would conduct a geotechnical investigation and prepare a site-specific HDD engineering design before implementing any HDD at waterbody crossings. As described in Chapter 5, soils and geology along the three routes are generally similar. Because soils and geology are similar, geotechnical investigations, with the associated time and costs, would be unlikely to aid the Commission in its decision.	20242-203381-02
CURE	Dolph, Christy	2024-02-13	Q. What are typical crossing methods for smaller rivers, streams, and other surface waters? A. Often, for smaller surface waters, construction companies will use the “open cut” trenching method for crossing. This method	Thank you for your comment.	20242-203381-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>involves digging a trench directly across the stream banks and stream bed. If water is flowing through the stream, methods such as temporary dams or continuously pumping water out of the channel are used to dewater the stream during construction.</p> <p>Q. Is this kind of crossing method proposed in the DEIS?</p> <p>A. Yes, this is listed in the DEIS as the proposed crossing method.</p> <p>Q. Are there risks associated with the open cut trenching crossing method?</p> <p>A. There are several risks associated with open cut trenching. Risks include permanent loss of riparian habitat along the pipeline right-of-way, potentially resulting in loss of stream bank stabilization. Open cut trenching can also increase stream channel erosion and entry of eroded sediments into waterways due to construction activities prior and subsequent to the actual digging of a trench across a stream, including excavation of intake pits, placement of barriers, installation, and removal of temporary bridges and stream stabilization efforts. This method of stream crossing, especially if the streams are dewatered for dry trench construction, can result in a loss of in-stream habitat and death of any aquatic organisms in the length of the dewatered stream. Finally, the disturbance of the bed and banks of streams during open cut trenching can result in instability and potential future vertical or lateral erosion (i.e., the stream channel migrating to the side or up and down), in turn resulting in additional turbidity and potential degradation of water quality.</p>		
CURE	Dolph, Christy	2024-02-13	<p>Q. Which alternative presents the lowest risk to surface water resources?</p> <p>A. The No Action Alternative presents the lowest risk to surface water resources. Otherwise, because of the lack of geotechnical investigations for all potential HDD crossings as described above, the DEIS does not contain the requisite information needed to evaluate the comparative risks posed by the remaining route alternatives to surface water. However, based on the existing information provided in the DEIS, RA-South and RA-Hybrid would appear to impact more surface waters than RA-North. RA-South and RA-Hybrid cross more surface waters than RA-North. The Regions of Influence (ROI) for RA-South and RA-Hybrid also intersect more perennial streams than the ROI for RA-North. Perennial streams are typically wet all year long, and water quality and aquatic life in these streams are more likely to be impacted by pipeline construction activities, compared to intermittent streams or ditches that may be dry during construction. Even if streams are not directly crossed by the project, sediment-laden water from construction activities in the ROI can enter these waterways and cause pollution.</p> <p>Q. Does RA-South demonstrably reduce risk to surface water resources?</p> <p>A. No. Based on the available information RA-South will have significant negative impacts on surface water resources.</p>	Thank you for your comment. As shown in Table 5-48, Table 5-49, and Table 5-50, impacts on perennial waterbodies would be mitigated by the use of HDD. Impacts on surface water resources are not characterized as significant for any of the route alternatives.	20242-203381-02
CURE	Dolph, Christy	2024-02-13	<p>Q. How would you describe the wetland resources along the routes presented in the DEIS?</p> <p>A. Throughout much of the state of Minnesota, including the area crossed by the route alternatives for this project, the large majority of naturally occurring wetlands have been eliminated from the land as the result of European colonization and the wholesale conversion of land from a grasslands/wetland/forest complex to intensive agriculture.</p> <p>Q. Does Minnesota have special protections for wetlands?</p> <p>A. Yes, in fact, the state’s Wetland Conservation Act states that protecting the state’s remaining existing wetlands is critical to the goal of no-net-loss for wetland ecosystems.</p> <p>Q. How do we protect wetlands?</p> <p>A. The best way to protect the function of wetland ecosystems is to prevent their degradation in the first place, as these functions typically can’t be readily restored once damaged. For example, a recent report by the MPCA entitled Status and Trends of Wetlands in Minnesota: Vegetation Quality Baseline concludes that “Ultimately, a greater emphasis on protection would be an appropriate approach to further promote the no-net-loss of wetland quality and biological diversity of Minnesota’s wetlands. The plant community changes that occur (i.e., increased abundance of non-native invasive species) when wetlands are exposed to virtually any variety of impact are typically not self-correcting. Direct management of the vegetation itself is often required—in addition to correcting external impacts—to reestablish native composition and abundance distributions. Enhancing degraded plant communities is typically time consuming and requires a significant financial investment.” (2) Similar research based on a meta-analysis of the available scientific literature found that restoration activities typically do not restore the structure and functional attributes of wetlands that are lost or damaged during development projects. (3) For example, both wetland plant assemblages and biogeochemical functioning in terms of carbon storage in wetland soils remained critically reduced even 100 years post-restoration of damaged wetlands. This study is attached as Schedule CD-2.</p>	Thank you for your comment.	20242-203381-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>(2) Minnesota Pollution Control Agency, <i>Status and Trends of Wetlands in Minnesota: Vegetation Quality Baseline</i> (Sept. 2015), https://www.pca.state.mn.us/sites/default/files/wq-bwm1-09.pdf.</p> <p>(3) Moreno-Mateos, D., Power, M. E., Comín, F. A., & Yockteng, R. (2012). "Structural and functional loss in restored wetland ecosystems." <i>PLoS Biology</i> 10(1), e1001247. https://doi.org/10.1371/journal.pbio.1001247.</p>		
CURE	Dolph, Christy	2024-02-13	<p>Q. What does this mean for this DEIS?</p> <p>A. Because conserving existing wetlands is critical to maintaining key ecosystem functions and an existing state policy goal, and because degraded wetlands cannot be readily restored once damaged, evaluating comparative impacts of route alternatives to wetland health is an important consideration.</p> <p>Q. Which alternative presents the lowest risk to wetlands?</p> <p>A. The No Action Alternative presents the lowest risk to existing wetland health. When evaluating comparative wetland impacts among the route alternatives as summarized in the DEIS, RA-South impacts more than twice as many wetland acres (44.6 acres) as RA-North (20.9 acres), and RA-South impacts nearly twice as many wetland acres as RA-Hybrid (24.7 acres). This comparative difference is not noted in the Executive Summary of the DEIS. RA-South and RA-Hybrid also impact comparatively more acres of forested wetlands and riverine wetlands than RA-North. These wetland types are especially sensitive to disturbance and more difficult to restore.</p> <p>Q. Is RA-South protective of wetland resources?</p> <p>A. No. Other alternatives would seem to be preferable in terms of protecting wetland resources.</p>	The acres referenced in this comment from Table 5-53 are the total acres within the region of influence (ROI), which is the route width, not the anticipated acres of impacts. Additionally, the route width for RA-South has been increased to allow for additional study and the potential need to make modifications to the alignment, while a similar increase has not been included for the other route alternatives, contributing to the greater acres within the ROI for RA-North. Text has been added to Table 5-53 noting this. Table 5-54 reports the anticipated temporary and permanent impacts, which are greatest for RA-South but similar across the three alternatives. Text has been added to the Executive Summary noting this difference.	20242-203381-02
CURE	Dolph, Christy	2024-02-13	<p>Q. What is your opinion on the DEIS's conclusions about the impacts of flooding on the operation of the project?</p> <p>A. The DEIS states, "Because the pipeline would be underground, flooding would not impact operation of the project." (Page 5-96). This statement is blatantly inaccurate, as flooding represents a known risk to pipeline operation and safety, and increases the risk of pipeline exposure via erosion and subsequent potential for rupture and leaks. As stated by the U.S Pipeline and Hazardous Materials Safety Administration (PHMSA), "Operators should be aware that severe flooding, river scour, and river channel migration may create unusual operating conditions that can adversely affect the safe operation of a pipeline, and may require corrective action." (4)</p> <p>(4) <i>Pipeline Safety: Potential for Damage to Pipeline Facilities Caused by Flooding, River Scour, and River Channel Migration</i>, 84 Fed. Reg. 14715 (Apr. 11, 2019).</p>	The text in Section 5.7.2 has been expanded to clarify that the pipeline would be buried underground with sufficient cover to protect it from flooding. The minimum depth of cover would be 54 inches, extended to 60 inches at waterbody crossings, and the depth would be greater at the waterbody crossings installed via HDD. All perennial streams would be crossed by HDD or bore, as shown in Tables 5-48 through 5-50. Other streams that would be crossed are intermittent or ephemeral streams, many of which are drainage ditches, and they would not be at significant risk of flooding-related problems like scour.	20242-203381-02
CURE	Dolph, Christy	2024-02-13	<p>Q. Does pipeline installation impact the health of the soil in which it is installed?</p> <p>A. According to the existing scientific literature, pipeline installation is likely to have lasting permanent effects on soil health. A recent review of the scientific literature identified 34 studies reporting pipeline impacts on agricultural and natural ecosystems from eight countries. (5) They concluded that pipeline installation typically results in degraded soils and degraded vegetation resources (including diminished crop yields) that can persist for many years following installation. These researchers found that even current best management practices of pipeline installation and remediation employed by three different companies in Ohio (including soil 'double lift' and 'deep ripping' practices) were insufficient to mitigate widespread soil degradation and crop yield loss along pipeline routes. (6)</p> <p>(5) Brehm, Theresa, and Steve Culman. 2022. "Pipeline installation effects on soils and plants: A review and quantitative synthesis." <i>Agrosystems, Geosciences & Environment</i> 5 (4):e20312. doi: https://doi.org/10.1002/agg2.20312.</p> <p>(6) Brehm, Theresa, and Steve Culman. 2023. "Soil degradation and crop yield declines persist 5 years after pipeline installations." <i>Soil Science Society of America Journal</i> 87 (2):350-364.</p>	The impacts of pipeline construction on soils are addressed in Section 5.7.6. As indicated by the definitions found on Page 5-1 of the draft EIS, "long-term impacts extend beyond the end of construction and are generally associated with operation of the project." Disturbance to soils and crops from construction can result in impacts that extend beyond the construction phase, and the text in the final EIS has been revised to indicate that impacts can be long term.	20242-203381-02
CURE	Dolph, Christy	2024-02-13	<p>Q. In general, what kind of soils do the route alternatives cross?</p> <p>A. The DEIS identifies the large majority of soils crossed by all three route alternatives as especially prone to disturbance and sensitive to compaction, and as representing prime farmland.</p> <p>Q. How would you characterize the potential impacts of the construction of the proposed project on soils?</p> <p>A. The Executive Summary of the DEIS describes the soil impacts as "minimal and temporary." (Page ES-8). This is likely inaccurate. Degradation of sensitive soils from pipeline installation can cause changes in soil that can damage the germinating and growing environment for crops and native vegetation, alter nutrient cycling and water movement in the soil, and increase the potential for wind and water erosion for years following the disturbance. (7)</p>	As indicated by the definitions found on Page 5-1 of the draft EIS, "long-term impacts extend beyond the end of construction and are generally associated with operation of the project." Disturbance to soils and crops from construction can result in impacts that extend beyond the construction phase, and the text in the final EIS has been revised to indicate that impacts can be long term. Section 5.7.6 includes the acreages of various soil characteristics along each route alternative as well as the total footprint for each route alternative.	20242-203381-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>Q. Which alternative presents the lowest risk to soils?</p> <p>A. Based on the soil characterization data in Table 5-42 (p.5-117), RA-North appears to present the least risk to soil degradation (other than the No Action option, which would present no risk to soil degradation). RA-North has the smallest project footprint of all route alternatives in total acres affected (17% smaller than RA-South). Compared to RA-South, RA-North crosses fewer acres that are prone to soil compaction (19% fewer), fewer acres of wet soils that are susceptible to compaction (i.e., hydric soils, 6% fewer), substantially fewer acres that are susceptible to water erosion (92% fewer), fewer wind erodible acres (14% fewer), and substantially fewer acres with revegetation concerns (35% fewer). RA-Hybrid appears to be intermediate in these impacts between RA-South and RA-North.</p> <p><i>(7) Brehm, Theresa, and Steve Culman. 2023. "Soil degradation and crop yield declines persist 5 years after pipeline installations." Soil Science Society of America Journal 87 (2):350-364.</i></p>		
CURE	Dolph, Christy	2024-03-14	<p>Q. Mr. Zoller describes the applicant’s proposed actions to mitigate damage from horizontal directional drilling (HDD). Do you believe these activities will adequately protect impacted waterbodies?</p> <p>A. No. If soils are not amenable to HDD, that route should not be selected. But from Mr. Zoller’s testimony, it seems like the applicant will still try to cross water bodies with HDD in non-amenable places and instead just have a contingency plan for spills. Once drilling fluid is spilled to subsurface environments or waterways, it is impossible to remove, and may have negative impacts on surface or subsurface water quality.</p> <p>Q. Do you agree with Mr. O’Konek’s opinion that RA-North 1 and RA-Hybrid do not avoid or minimize potential impacts?</p> <p>A. No. First, not all routes have been assessed equally. In particular, necessary geotechnical investigations to evaluate impacts to groundwater and suitability for HDD crossings have not been completed for RA-North and RA-Hybrid. Because not all routes have been equally assessed, it is impossible to evaluate and compare the potential impacts of all the routes. Second, where routes have been evaluated (in terms of impacts to wetland acres, vulnerable soils, and surface waters), RA-South appears to have larger impacts than RA-North and RA-Hybrid. Even if these differences are argued by the applicant to be “small,” less impact is less impact. Our wetlands and native prairies were removed from the pre-settlement landscape one by one, after all.</p>	<p>Alternatives are not required to be studied in the same level of detail. Minnesota Rule 4410.2300(H) indicates that an EIS shall include “a thorough but succinct discussion of potentially significant adverse or beneficial effects generated” by the proposed project and each major alternative with “[l]ess important material ... summarized, consolidated, or simply referenced.” Factors to be considered include “the impact and the relevance of the information to a reasoned choice among alternatives” and “the relationship between the cost of data and analyses and the relevance and importance of the information.”</p> <p>As described in Chapter 5, soils and geology along the three routes are generally similar. Because soils and geology are similar, geotechnical investigations, with the associated time and costs, would be unlikely to aid the Commission in its decision. The applicant would complete a geotechnical evaluation of each HDD location along the pipeline prior to the start of construction.</p>	20243-204360-02
CURE	Dolph, Christy	2024-03-14	<p>Q. Do you have any response to Mr. O’Konek’s comments about the applicant’s groundwater investigations?</p> <p>A. Yes. I am concerned that the applicant appears to only have groundwater investigations underway for the RA-South route and not RA-North or RA-Hybrid.</p> <p>Q. Why does this matter?</p> <p>A. Without detailed investigations, it is impossible to determine what impacts RA-North or RA-Hybrid may have on groundwater resources along the route. Without that information, it is also impossible to adequately assess whether one route is better or worse than another.</p> <p>Q. Do you have any response to Mr. O’Konek’s statement about sheet piling?</p> <p>A. Yes. The applicant’s commitment to not using sheet piling in beach ridge areas is good practice. Sheet piling is used to support the walls of the pipeline trench as the pipeline is being installed, preventing collapse of the trench or soil erosion. However, this raises the question about how the applicant will construct the pipeline in these areas instead. It is important to know this because the groundwater is complex and prevalent in the beach ridge areas, and it is unclear how the applicant will construct a trench or perhaps drill through a groundwater-rich area that may be unstable, without harming this sensitive groundwater resource. Without more detail on the proposed construction method for this region, it is difficult to anticipate how construction— whether via HDD or open cut trenching method—might impact those resources.</p>	<p>Minnesota Rule 4410.2300(H) indicates that an EIS shall include “a thorough but succinct discussion of potentially significant adverse or beneficial effects generated” by the proposed project and each major alternative with “[l]ess important material ... summarized, consolidated, or simply referenced.” Factors to be considered include “the impact and the relevance of the information to a reasoned choice among alternatives” and “the relationship between the cost of data and analyses and the relevance and importance of the information.”</p> <p>The groundwater resources that could be affected by the project would be similar for all three route alternatives; therefore, potential impacts would be similar. The time and costs associated with performing an additional study on groundwater resources would not be expected to aid the Commission in its decision.</p> <p>In surrebuttal testimony on March 28, 2024, the applicant indicated that, should trench wall stability be a concern in beach ridge system areas, the applicant would use trench boxes to stabilize the trench walls, which would not result in additional excavation.</p> <p>Additionally, as part of its coordination with the Department of Natural Resources (DNR), the applicant has agreed to use ground penetrating radar to study the depth of the confining layer through the entire beach ridge system area crossed by the pipeline to further define existing conditions and advise on construction methodology. Furthermore, EERA staff recommends that the applicant develop, in coordination with DNR, a plan for pipeline construction in areas crossing the beach ridge system</p>	20243-204360-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				area. The plan would include, at a minimum, measures to minimize the potential for breaching a shallow confined aquifer during trenching and contingency measures to mitigate the impacts of a breach, should one occur. This information has been added to Section 5.7.8.2.	
CURE	Dolph, Christy	2024-03-28	<p>Q. In rebuttal testimony, Mr. DeJoia critiques the Brehm and Culman studies you referenced in direct testimony. What is your response?</p> <p>A. In his testimony, Mr. DeJoia argues that the Brehm and Culman studies are unreliable for a number of reasons. I disagree with his assessment.</p> <p>First, Mr. DeJoia argues that the study by Brehm and Culman (2023) only evaluates pipeline construction impacts at year 2 and 3 post construction. But Mr. DeJoia does not acknowledge the time that was required for pipeline construction itself in the total duration of impact. The study authors measured soil impacts during a period of 4 to 5 years following the inception of pipeline construction. The time required for pipeline construction itself does represent a time of impact and decreased crop yield, as the right of way is being actively disturbed during this time and is not able to be planted or harvested.</p> <p>Second, although Mr. DeJoia takes issue with the conclusions drawn by Brehm and Culman (2023), he also indicates that there will likely be impacts to agricultural soils for several years after the project, in concurrence with the general findings of these papers. As Mr. DeJoia states in his testimony regarding Ohio farm fields impacted by pipeline construction that were studied by Brehm and Culman (2023): “The yield losses for 2020 and 2021 (years 2 and 3) were reported to be 21% and 14% respectively. These average yield losses are consistent with what a reclamation scientist would expect yield losses to be after 2- and 3-years post-construction completion.” (Page 3). Thus, Mr. DeJoia’s testimony indicates that, based on his own experience, there are likely to be significant and measurable impacts on agricultural yields in the years following pipeline construction, in agreement with the analysis by Brehm and Culman (2023). Notably, this conclusion is further supported by a separate study in Iowa by Tekeste et al., attached as Schedule CD-3, which showed that even after best management practices were implemented to help reclaim soil after pipeline construction, crop yields in a pipeline right of way were still substantially lower after two years (25% decrease in soybean yield, 15% decrease for corn yield).</p> <p>Mr. DeJoia also argues that approximately 50% of fields studied by Brehm and Culman (2023) showed no significant impacts to crop yields following pipeline construction. His testimony appears to offer this as evidence of limited impact. But half of all measured farm fields exhibiting significant impacts to crop yields does indicate substantial impact, especially if this impact is scaled up along the entire length of a large linear infrastructure project, such as the one proposed by the applicant.</p> <p>Next, Mr. DeJoia raises the concern that farmers whose fields were damaged by pipeline construction were more likely to self-identify for inclusion in the study. These comments are speculation and cannot be verified one way or the other. It also stands to reason that all farmers will be broadly concerned about potential damage to farm fields from any large infrastructure project and would wish to know what the longer-term impacts to their agricultural production might be.</p> <p>Mr. DeJoia also raises the concern that only a small proportion of fields out of the total number impacted by pipeline construction were studied by Brehm and Culman (2023). I agree that the long-term impacts associated with pipeline construction have been wildly understudied compared to the extent of their (ever increasing) footprint on the landscape. However, rather than find reassurance from this lack of data, lack of information about potential harm should invoke the precautionary principle, in which our society and governance structures have a responsibility to protect the public (including farmers) from harm, where there is plausible scientific risk. In my opinion, the studies by Brehm and Culman (2022; 2023) and Tekeste et al., have indicated there is certainly a plausible risk of longer-term degradation of soil from pipeline construction.</p> <p>Finally, Mr. DeJoia’s testimony does not provide evidence about how soils are expected to recover in time periods beyond 3 years following construction. Indeed, few to no long-term studies have been conducted regarding the impacts of pipeline construction to soils over a time frame exceeding 5 years. Again, I do not generally find this lack of data reassuring with regards to our understanding of the long-term impacts of pipeline construction. However, it is reasonable to assume the impacts to soil measured in years 2 and 3 following the completion of construction do not immediately disappear over longer time frames. Thus, there are likely to be longer term impacts to soil and crop yield following pipeline construction, even with implementation of best management practices.</p>	<p>As indicated by the definitions found on Page 5-1 of the draft EIS, “long-term impacts extend beyond the end of construction and are generally associated with operation of the project.” Disturbance to soils and crops from construction can result in impacts that extend beyond the construction phase, and the text in the final EIS has been revised to indicate that impacts can be long term.</p>	20243-204752-02
CURE	Dolph, Christy	2024-03-28	<p>Q. Do you agree with Mr. DeJoia’s assertion that impacts on soil will primarily be the same across route alternatives?</p> <p>A. No. Mr. DeJoia argues that “soils data included in the DEIS is critical to evaluate potential impacts to soils.” (Page 5). However, he then argues paradoxically that measures of soil data in the DEIS are not an important consideration when evaluating route</p>	Section 5.7.6 includes the acreages of various soil characteristics along each route alternative as well as the total footprint for each route alternative.	20243-204752-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			alternatives, because construction practices will be the most important factor determining soil health outcomes. While pipeline construction practices are the main driver of soil degradation in the proposed project, evaluating the extent of potential impacts is critical when comparing route alternatives, which is why this information is presented in the DEIS. As stated in my original testimony, RA-North presents the lowest total potential impact on soil conditions among route alternatives (other than the No Build Alternative, which of course would have no impact on soils). RA-North has the smallest project footprint of all route alternatives, crosses fewer acres that are prone to soil compaction, fewer acres of wet soils that are susceptible to compaction (i.e., hydric soils), substantially fewer acres that are susceptible to water erosion, fewer wind erodible acres, and substantially fewer acres with revegetation concerns. RA-Hybrid appears to be intermediate in these impacts between RA-South and RA-North.		
CURE	Dolph, Christy	2024-03-28	Q. Do you have any other responses to Mr. DeJoia’s rebuttal testimony? A. It is also important to consider the potential soil impacts of a single pipeline in the context of future planned CO ₂ pipeline infrastructure. If CO ₂ pipelines become widely adopted, the installation of a vast new network of CO ₂ pipelines across Minnesota would have a cumulative impact on some of the richest and most productive agricultural soils in the country.	Installation of other pipelines is outside the scope of this EIS.	20243-204752-02
CURE	Dolph, Christy	2024-03-28	Q. Mr. Zoller states in rebuttal testimony that the applicant will not use sheet piling in beach ridge areas and would conduct exploratory borings where sheet pile will be used elsewhere along the route. What is your response? A. From this testimony, it is not clear what alternative construction methods will be used in the beach ridge areas or in any groundwater-rich areas if the work/trench area is unstable and the pipeline is not able to be inserted without the use of sheet pilings. More detailed information on how construction will be conducted in these areas is needed to assess potential impacts to groundwater in these cases. According to water table data from the Minnesota Natural Resource Atlas, the depth to groundwater for the majority of the RA-South construction workspace is estimated to be 0-10 feet (Attached as Schedule CD-4). (1) This indicates that construction will likely intersect surficial groundwater given the ground disturbance depths listed by Mr. Zoller for construction either without sheet piling (disturbance depths of 5-6ft) or with sheet piling (disturbance depths of 10-15 ft). (1) <i>Minnesota Natural Resources Research Institute, Minnesota Natural Resources Atlas, https://mnatlas.org/resources/water-table-depth/.</i>	In surrebuttal testimony on March 28, 2024, the applicant indicated that, should trench wall stability be a concern in beach ridge system areas, the applicant would use trench boxes to stabilize the trench walls, which would not result in additional excavation. The applicant currently has an ongoing groundwater investigation underway to further inform construction practices and is continuing to consult with DNR. As part of its coordination with DNR, the applicant has agreed to use ground penetrating radar to study the depth of the confining layer through the entire beach ridge system area crossed by the pipeline to further define existing conditions and advise on construction methodology. Furthermore, EERA staff recommends that the applicant develop, in coordination with DNR, a plan for pipeline construction in areas crossing the beach ridge system area. The plan would include, at a minimum, measures to minimize the potential for breaching a shallow confined aquifer during trenching and contingency measures to mitigate the impacts of a breach, should one occur. This information has been added to Section 5.7.8.2.	20243-204752-02
CURE	Dolph, Christy	2024-03-28	Q. Does Mr. Zoller’s rebuttal testimony address the issues you raised in direct testimony regarding horizontal directional drilling (HDD)? A. No. From Mr. Zoller’s testimony and from the original DEIS, it is clear that HDD methods are proposed for all three route alternatives (apart from the No Build alternative). But Mr. Zoller’s testimony does not provide additional information about whether geotechnical investigations as to the suitability of HDD have been conducted for proposed HDD crossings for all three route alternatives. In the DEIS, geotechnical investigations had only been conducted for a portion of HDD crossings in all route alternatives, with no geotechnical investigations listed for the Red River crossing for RA-North, and the investigation for the Pelican River listed as not yet completed. Without evidence from these geotechnical investigations, it is difficult to assess the comparative risk to water bodies presented by HDD in the different route alternatives.	The applicant would complete a geotechnical evaluation of each HDD location along the pipeline prior to the start of construction. As described in Chapter 5, soils and geology along the three routes are generally similar. Because soils and geology are similar, geotechnical investigations, with the associated time and costs, would be unlikely to aid the Commission in its decision.	20243-204752-02
CURE	Dolph, Christy	2024-03-28	Q. What is your response to Mr. Zoller’s comments about the DEIS’s calculation of expected impacts to wetlands crossed by RA-South? A. Mr. Zoller explains that he believes the expected impacts to wetlands reported in the DEIS are overstated. He argues that this is due partly to the use of the National Land Cover Dataset (NLCD), which has a 30m resolution (i.e., it presents the landscape in 30m x 30m pixels). Mr. Zoller is correct that land cover data of this resolution often does not adequately capture wetland cover. However, the occurrence of small wetlands (smaller than 30m x 30m) is also very likely to be <i>underestimated</i> by the NLCD. Thus, there is the possibility that the land cover data currently used in the DEIS is actually undercounting wetlands crossed by the route alternatives. An alternative approach to evaluating wetland cover would be to use the Minnesota National Wetland Inventory (NWI) dataset. As stated by the Minnesota Department of Natural Resources, the updated National Wetland Inventory for Minnesota has recently been remapped using lidar and high-resolution aerial imagery, making it the most comprehensive, current and accurate wetland inventory in the country. (2) If there are concerns about accurately measuring wetland impacts across route alternatives, the Minnesota-specific	Clarification regarding National Wetlands Inventory (NWI) and National Land Cover Database (NLCD) data sources has been added to Tables 5-3, 5-4, 5-53, and 5-54. The widening of the route for future routing flexibility is “for additional route study and the potential need to make modifications to the pipeline alignment,” not for future construction.	20243-204752-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>NWI is likely a better resource than the NLCD. I would argue that the DEIS should be improved by including wetland estimates from the updated Minnesota NWI into estimates of wetland impact across route alternatives (note the distinction between the Minnesota NWI and the national NWI from U.S. Fish and Wildlife Service, the latter of which may not contain recent updates).</p> <p>Mr. Zoller also notes that some of the potential impact of RA-South to wetlands occurs because of a part of the route that has been widened to account for future routing flexibility, and that this area is highly populated with wetlands. This statement seems to imply that this area is intended to incur future construction impacts. Having a widened area intended for future construction located in an area of especially high wetland density seems likely to indicate potential future wetland impacts in this area and raises the question of why a wetland-dense area was selected for this purpose.</p> <p><i>(2) Minnesota Department of Natural Resources, National Wetlands Inventory Update, https://www.dnr.state.mn.us/eco/wetlands/nwi_proj.html.</i></p>		
CURE	Dolph, Christy	2024-03-28	<p>Q. Do you agree with Mr. Zoller’s assessment that all three route alternatives will have the same environmental impacts?</p> <p>A. I agree with Mr. Zoller’s testimony that all three route alternatives apart from the No Build Alternative will result in environmental degradation associated with construction. However, Mr. Zoller argues that the environmental impacts from RA-South, RA-North and RA-Hybrid are equivalent in terms of their extent of impact. I disagree with this assessment. As summarized in the DEIS and noted in my direct testimony, there are numeric differences in impact across the route alternatives. Based on the existing information provided in the DEIS, RA-South and RA-Hybrid would appear to impact more surface waters than RA-North, RA-South appears to intersect more wetland acres than the other route alternatives, and RA-South also crosses more soils that are prone to degradation, compaction, and erosion.</p>	Thank you for your comment.	20243-204752-02
CURE	Dolph, Christy	2024-03-28	<p>Q. Does Mr. Zoller’s rebuttal testimony address issues you raised in direct testimony regarding the assessments of comparative impacts to sensitive groundwater areas between the route alternatives?</p> <p>A. Mr. Zoller’s comments do not address the concern identified in my direct testimony that all route alternatives have not received the same level of assessment with regards to potential and comparative impacts to sensitive groundwater areas. Without this assessment, it is difficult to determine which routes will have the least impact to groundwater resources. Mr. Zoller notes that routes RA-North and RA-Hybrid are “within one mile” of sensitive confined aquifers that RA-South has been confirmed to cross (i.e., the beach ridge aquifer areas). (Page 2). One mile is a considerable distance and the exact proximity of these routes to beach ridge aquifer areas should be assessed directly, with regards specifically to the construction workspace.</p>	<p>Section 5.7.8.1 has been revised to clarify that all three routes would cross the beach ridge system area. Minnesota Rule 4410.2300(H) indicates that an EIS shall include “a thorough but succinct discussion of potentially significant adverse or beneficial effects generated” by the proposed project and each major alternative with “[l]ess important material ... summarized, consolidated, or simply referenced.” Factors to be considered include “the impact and the relevance of the information to a reasoned choice among alternatives” and “the relationship between the cost of data and analyses and the relevance and importance of the information.”</p> <p>The groundwater resources that could be affected by the project would be similar for all three route alternatives; therefore, potential impacts would be similar. The time and costs associated with performing an additional study on groundwater resources would not be expected to aid the Commission in its decision.</p>	20243-204752-02
CURE	Gorman, John	2024-02-13	<p>Q. What is the purpose of your testimony in this proceeding?</p> <p>A. I am providing a review of the Accidental Release Dispersion Reports found in Appendix G of the Draft Environmental Impact Statement for Summit Carbon Solutions’ Otter Tail to Wilkin County Carbon Dioxide Project.</p> <p>Q. Please summarize your conclusions.</p> <p>A. I conclude that it is impossible to determine the overall quality of the modeling work presented because of the lack of details and discussion provided.</p>	Thank you for your comment.	20242-203381-03
CURE	Gorman, John	2024-02-13	<p>Q. Please summarize your experience with modeling software that estimates the dispersion of supercritical CO₂ or similar substances.</p> <p>A. Over the course of the last 10+ years, I have used a wide range of modeling software that has the ability to estimate the dispersion of supercritical CO₂ or similar substances. The majority of the relevant modeling software I have used employed Computational Fluid Dynamics (CFD). These programs are generic in the sense that they can model a diverse range of situations and are not limited to only estimating the dispersion of CO₂ or similar substances. My most relevant software experience includes ANSYS-CFX and ANSYS-FLUENT (ANSYS Inc, Southpointe 2600, Ansys Drive Canonsburg, PA 15317 USA), COMSOL (COMSOL, Inc., 100 District Avenue, Burlington, 1 MA 01803, USA), and OpenFOAM (OpenCFD Ltd, owner of the OpenFOAM Trademark, is a wholly owned subsidiary of ESI Group). ANSYS3</p>	Thank you for your comment.	20242-203381-03

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			CFX, ANSYS-FLUENT, and COMSOL are all commercially available CFD software. OpenFOAM is the free open source CFD software package. All of the aforementioned software has the ability to estimate the dispersion of CO ₂ or similar substances using CFD, and I have used them on countless occasions. My relevant experience includes modeling supercritical CO ₂ and other substances (gases, pollution, particles (solid and liquid), etc.) being dispersed into the atmosphere over different terrains (with trees, windbreaks, hills, houses, etc.) and within urban cities (such as New York and Beijing, China). The purpose of these various activities was to estimate the dispersion of substances, predict the outcomes, and find solutions to mitigate the effects.		
CURE	Gorman, John	2024-02-13	Q. Are there other variables described in the report or missing from the report that would impact the outcomes of the modeling? A. Yes. None of the governing model equations were provided, so it is difficult to know what precisely was included in the model or the limitations of the model. Also, it is unclear how the CO ₂ was modeled, that is, what equations of state may have been used to account for phase changes (not all equations of state have the same accuracy or validity). There also is no discussion of determining the real-world, worst-case conditions, such as wind speed or CO ₂ in the pipe (amount, phase, etc.). These details have a significant impact on the dispersion of the CO ₂ and are important parameters to study for finding worst-case results (maximum impact distances).	As Dr. Gorman has stated, the CO ₂ was modeled as starting in a liquid phase. The CANARY model automatically calculates the phase based on temperature and pressure. The liquid phase was used for modeling because the aerial dispersion modeling and report (Appendix G) determined a worst-case temperature and pressure indicating the product in a liquid state. The angle of release is addressed in detail in Appendix G.	20242-203381-03
CURE	Gorman, John	2024-02-13	Q. What is Verification and Validation? A. Verification and Validation (often referred to as V&V) are independent procedures that are used together to check that something (a device, software, or model) fulfills its intended purpose. In terms of simulation and modeling, verification is a process to ensure the underlying mathematical model is implemented correctly and then accurately solved. Verification can be separated into two activities: code verification and calculation verification. Validation is the process of assessing the degree to which the model is an appropriate representation of reality. Validation activities are concerned with demonstrating the correctness of the underlying model assumptions and the degree to which sensitivities and uncertainties of the computational model are understood. Validation is generally demonstrated by comparing model predictions with the results from appropriate real-world data (e.g., physical results, experiments). Q. Why is Verification and Validation important? A. The outcome of performing V&V activities is to show agreement between actual real-world data and model prediction, as well as the predictive accuracy of the model. Without performing and presenting results related to V&V activities, it is impossible to know how accurate the results presented from any modeling activity are. In other words, without V&V activities, it is impossible to know if the results from the CANARY software (or any other model) have any basis in reality.	Thank you for your comment.	20242-203381-03
CURE	Gorman, John	2024-02-13	Q. Does the report adequately describe the assumptions or inputs used, and why is it important? A. The report does not adequately describe the assumptions or inputs used; this includes both the CANARY software and the model's results being presented. Any result from any model is only as good as the assumptions and inputs used. Without knowing the assumptions, it is impossible to frame the results as they might apply to real-world situations. In terms of the inputs, those also directly affect the outcome of the results. For example, this report demonstrated the results change notably by ~19.1% (or 107.9 ft) when they changed inputs and got a maximum impact distance of the 40,000-ppm of CO ₂ to be 617.5 ft instead of 509.6 ft. Q. Does the report state what phase the modeled CO ₂ was assumed to be in? A. No. It's not clear from the report that the conditions of the CO ₂ within the pipe are fully known. Q. Why does the phase of the CO ₂ matter? A. The initial phase (liquid, vapor, supercritical) will impact its dispersion (the jet) leaving a pipe rupture. Based on the report, it's not clear what impact the initial phase of the CO ₂ within the pipeline would have on the dispersion. For CO ₂ to be in the supercritical phase, it has to be above both the critical pressure and the critical temperature. For instance, CO ₂ at 2,200 psi for temperatures in the range of -20F and 30F would be in the liquid phase and not supercritical.	As Dr. Gorman has stated, the CO ₂ was modeled as starting in a liquid phase. The CANARY model automatically calculates the phase based on temperature and pressure. The liquid phase was used for modeling because the aerial dispersion modeling and report (Appendix G) determined a worst-case temperature and pressure indicating the product in a liquid state.	20242-203381-03
CURE	Gorman, John	2024-02-13	Q. Does the report state what angle of release was modeled? A. Yes. The report states that the angle of CO ₂ release is 19 degrees from horizontal. Q. Why does the angle of release matter? A. According to the Aerial and Thermal Dispersion Analysis report, within the CANARY software, the angle of release can have a great impact on the predicted dispersion (Table 6, page 8). However, the report does not describe how the angle relates to a ruptured pipe and the rupture diameter, which, according to the report, the rupture diameter is identical to the pipe diameter (Table 7, page 11). It is also not clear if this angle would represent a real-world worst-case or merely the worst-case result that can be generated within the CANARY software.	The angle of release is addressed in detail in Appendix G.	20242-203381-03

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
CURE	Gorman, John	2024-02-13	<p>Q. Does the report state what the assumed flow rate at the time of rupture?</p> <p>A. Yes. The Aerial and Thermal Dispersion Analysis report states that for the results being presented they assumed a mass flow rate of 13.34 lbs/sec of CO₂ at the rupture (Table 7, page 11). However, the value listed in the CO₂ Pipeline Sensitivity Analysis Report is listed as 10.36 lbs/sec (Table 2, page 9).</p> <p>Q. Why does the flow rate at the time of release matter?</p> <p>A. The flow rate is the amount of CO₂ being released into the air and directly affects the size of the resulting plume, the concentration levels, and the impact distance.</p> <p>Q. How does missing or unclear information about the flow rate impact the DEIS analysis?</p> <p>A. It is unclear from the report why this mass flow rate was chosen, how it was determined, and if this value represents the maximum possible value. It is unclear whether any consideration was given to the initial rupture/breakage or if the mass flow rate was assumed to be a constant value over the modeling time period.</p>	<p>The value of 10.36 lbs/sec is for a theoretical pipeline and does not differ significantly from the 13.34 lbs/sec used for the EIS modeling. The sensitivity study shows relationships between key inputs used in aerial dispersion and is not modeling the project pipeline, as explained in Appendix G.</p>	20242-203381-03
CURE	Gorman, John	2024-02-13	<p>Q. From your review of Appendix G, was there any validation and verification of the CANARY software?</p> <p>A. No.</p> <p>Q. What did the report in Appendix G conclude?</p> <p>A. For the portion of the report dedicated to the CANARY analysis, Allied Solutions concludes an earlier analysis (by Summit Carbon Solutions using the CANARY software) was valid but could have been more conservative. This report, by Allied Solutions, found the maximum impact distance of the 40,000-ppm of CO₂ using CANARY to be 617.5 ft from the rupture. In contrast, the original analysis by Summit Carbon Solutions found 509.6 ft. They also conclude that conducting a CFD analysis would provide better insight into the effects of local terrain, windbreaks, and exposure times related to different concentration levels.</p> <p>Q. Do you agree with these conclusions?</p> <p>A. With regard to the two separate analyses performed using the CANARY software, there is not enough information to make a conclusion. With regard to the maximum impact area, it is impossible for me to know without performing an independent analysis. In terms of conducting a CFD analysis, I agree that conducting a CFD analysis would be advantageous and provide better insight, assuming it was performed properly.</p>	<p>Computational Fluid Dynamics (CFD) and CANARY are validated together and discussed in the CFD Analysis Report dated January 15, 2024 (in Appendix G of the draft EIS). Quest Consultants, the developers of CANARY, provide validation of the software in the CANARY User Guide for each analysis module. Quest Consultants address verification through the release and dispersion models contained in the QuestFOCUS package (the predecessor to CANARY by Quest), which were reviewed in a United States Environmental Protection Agency (EPA) sponsored study (TRC [1991], Evaluation of Dense Gas Simulation Models. Prepared for the U.S. Environmental Protection Agency by TRC Environmental Consultants, Inc., East Hartford, Connecticut, 06108, EPA Contract No. 68-02-4399, May, 1991) and an American Petroleum Institute (API) study (Hanna, S. R., D. G. Strimaitis, and J. C. Chang [1991], Hazard Response Modeling Uncertainty (A Quantitative Method), Volume II, Evaluation of Commonly-Used Hazardous Gas Dispersion Models. Study cosponsored by the Air Force Engineering and Services Center, Tyndall Air Force Base, Florida, and the American Petroleum Institute; performed by Sigma Research Corporation, Westford, Massachusetts, September, 1991). In both studies, the QuestFOCUS software was evaluated on technical merit (appropriateness of models for specific applications) and on model predictions for specific releases. One conclusion drawn by both studies was that the dispersion software tended to overpredict the extent of the gas cloud travel, thus resulting in too large a cloud when compared to the test data (i.e., a conservative approach).</p> <p>Also, a third study prepared for the Minerals Management Service (Chang, et al. 1998) reviewed models for use in modeling routine and accidental releases of flammable and toxic gases. CANARY by Quest received the highest possible ranking in the science and credibility areas. In addition, the report recommends CANARY by Quest for use when evaluating toxic and flammable gas releases (Chang, Joseph C., Mark E. Fernau, Joseph S. Scire, and David G. Strimaitis [1998], A Critical Review of Four Types of Air Quality Models Pertinent to MMS Regulatory and Environmental Assessment Missions. Mineral Management Service, Gulf of Mexico OCS Region, U.S. Department of the Interior, New Orleans, November, 1998).</p>	20242-203381-03

				Appendix C of Allied's Aerial and Thermal Dispersion Analysis Report (in Appendix G of the EIS) has been updated with the above validation information.	
CURE	Gorman, John	2024-02-13	<p>Q. Can you describe the typical steps used for performing and presenting a CFD analysis?</p> <p>A. Yes, it typically involves a process where a scientist or engineer will:</p> <ul style="list-style-type: none"> • Check and present assumptions that are 1 inherent to the model and model parameters, (such as boundary conditions (inputs), flow regimes, relevant physical phenomena, etc.) and explaining how they were determined/chosen. • Determine, create, describe, and show the geometry being modeled or represented (e.g., terrain, structures, pipe rupture, etc.). • Discuss and show the numerical methods being used, including the governing equations, constitutive equations, fluid properties, etc., to know precisely what was modeled. • Discretize the model into calculation points, often called the grid, mesh, nodes, or cells. Perform an analysis to ensure the grid/mesh/cells (calculation points) are sufficient for obtaining an accurate simulation result. • Discuss and use reliable convergence criteria for the numerical methods. The convergence criteria is the condition chosen to ensure the error in the solution to all the mathematical equations is acceptably small. • Perform validation and verification activities to show that the numerical model can accurately represent the desired situation and that the obtained results are realistic. • Present the results in a clear manner with accompanying discussion. <p>Q. Did the CFD modeling in Appendix G follow these steps?</p> <p>A. I am unable to determine that.</p> <p>Q. Why are you unable to determine that?</p> <p>A. The report does not describe or discuss any of the important details needed regarding these steps or to fully evaluate the CFD model and analysis.</p>	<p>Appendix A of the Aerial and Thermal Dispersion Analysis Report dated January 11, 2024, (in Appendix G of the draft EIS) explains how the CFD modeling was done and validated. While the processes explained in Appendix G may not have been organized the same way that Dr. Gorman explained he would organize it, it covers all of the material points needed for correctly modeling CFD.</p> <p>CURE filed Information Request No. 2 on February 15, 2024, after Mr. Gorman's testimony was filed on February 13, 2024. The Minnesota Department of Commerce, Energy Environmental Review and Analysis Unit provided a response on February 28, 2024, which is attached to this comment matrix (Appendix O). See the answer to question 17 of the CURE IR 002 EERA ("Was any validation or verification of the CFD model performed? Please provide records of the verification and validation.")</p> <p>In the response to CURE Information Request No. 2, Allied answered: Yes, we validated the CFD model (Scenario 2 in the CFD report) against the CANARY model (Scenario 1 in the CFD report). Using two different modeling software applications with completely different computational approaches, we applied them to the same scenario and validated the CFD model against the CANARY model on a macro level—comparing the final result of one model to the final result of another model—which accounts for any and all variations in data, assumptions, and modeling between the two approaches. As is shown in the CFD report, the results of Scenarios 1 and 2 are very close, which validates that both approaches are reasonable and appropriate. If the results of Scenarios 1 and 2 would not have been reasonably close, neither model would have been validated, and a different validation approach would have become necessary. Furthermore, CANARY is the accepted industry standard for aerial dispersion modeling, thereby providing a reasonable standard by which to compare and validate the CFD model in Scenario 2.</p>	20242-203381-03
CURE	Gorman, John	2024-02-13	<p>Q. What important details did you think were missing from the report?</p> <p>A. In general, the CFD modeling approach is vastly different from the CANARY analysis approach. There are many more steps and details involved with CFD modeling that need to be explained in order to understand and interpret the results. In my professional opinion, the following questions remain unanswered in the report:</p> <ul style="list-style-type: none"> • What were the boundary conditions? (e.g., was an atmospheric boundary layer profile used or a flat/uniform wind velocity? Was there thermal radiation? How was the CO₂ introduced (phase)? How were the winter conditions (snow) taken into account?). • How large was the solution domain compared to the area of interest? (e.g., were the boundary conditions far enough away so as not to artificially affect the results?) • What was the ruptured pipe geometry, and was it created to match the scenario analyzed by the CANARY software? • What is the justification for using such a simplified model (Darcy's Law approach) to account for the windbreaks? Were any steps taken to ensure this simplified model and the values for the porous media used were accurate and appropriate for modeling trees? • Regarding the modeled terrain and geometry, what was upstream of the pipe rupture? Images or diagrams to illustrate the scenarios seem appropriate. • How were the fluids modeled (laminar or turbulent flow regimes)? And how was the flow regime determined for the wind and the CO₂ rupture? What turbulence model was used if the fluid flow was treated as turbulent? • Were phase change, variable material properties, and buoyancy (natural convection) included in the analysis? And how were they 	<p>CURE filed Information Request No. 2 on February 15, 2024, after Mr. Gorman's testimony was filed on February 13, 2024. The Minnesota Department of Commerce, Energy Environmental Review and Analysis Unit provided a response on February 28, 2024, which is attached to this comment matrix (Appendix O). The Minnesota Department of Commerce and Allied responded to these comments in questions 3-6, 8, 9, 13, 14, 16, and 17 of the CURE IR 002 EERA.</p>	20242-203381-03

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>implemented?</p> <ul style="list-style-type: none"> • Was there a grid/mesh/cells study performed to ensure it was sufficient to model the scenario and get accurate results? Similarly, was a time-step sensitivity study used to ensure the relevant physical phenomena were modeled accurately? • What were the convergence criteria used for determining if the simulation was acceptable? • Was any validation or verification of the CFD model performed? 		
CURE	Gorman, John	2024-02-13	<p>Q. Based on the conclusions and modeling described in Appendix G, do you agree with the potential impact areas identified?</p> <p>A. Because of the lack of detail in this report, it is impossible to determine whether the conclusion about potential impact areas is correct.</p> <p>Q. Are you able to conclude anything about the safety of the proposed project based on the results described in Appendix G?</p> <p>A. No. There is not enough detail about the modeling to determine whether the conclusions it reaches are correct.</p> <p>Q. Are you able to conclude whether any of the routes—RA-North, RA-Hybrid, or RA-South—pose fewer risks to humans and animals than the others?</p> <p>A. No.</p> <p>Q. Does the information provided in Appendix G demonstrate that any of the routes—RA-North, RA-Hybrid, or RA-South—is safe for public health or the environment when considering possible CO₂ plume impacts?</p> <p>A. No.</p>	Thank you for your comment. Modeling was not used to determine if one pipeline route is safer than another route.	20242-203381-03
CURE	Gorman, John	2024-02-13	<p>Q. What is CANARY?</p> <p>A. CANARY is analysis software created by Quest Consultants (908 26th Avenue N.W., Norman, OK 73069-8069, USA).</p> <p>Q. What does it calculate or analyze?</p> <p>A. The CANARY software uses a simplified approach to estimate/analyze where a plume of a potentially hazardous substance, such as CO₂, might spread in the event it is released by a leak or rupture.</p> <p>Q. Are there limits to what the CANARY software can analyze?</p> <p>A. Yes. The terms ‘modeling’ and ‘simulation’ are generic and can refer to a wide range of analysis activities. Not all analysis activities are equal in terms of accuracy, detail, and capability. The type of analysis the CANARY software performs is a simplified form of modeling based on solving mathematical algorithms to predict outcomes. This type of analysis should not be confused with other modeling approaches, such as CFD. CFD is a more advanced form of modeling, and when performed correctly, is far more accurate and precise.</p> <p>Q. What are the specific limitations of CANARY that render it less useful for this type of modeling?</p> <p>A. The CANARY software modeling approach does not take into account critical factors such as: 1.) effects due to spatial or temporal variations in the local windspeed; 2.) changes in terrain or obstacles (such as buildings or trees); 3.) dynamic three-dimensional thermal-fluid phenomena (such as natural convection or entrainment); and 4.) ruptures where the released jet of CO₂ is primarily in the vertical direction. This modeling approach also relies on certain assumptions, such as the resulting shape of the CO₂ plume and how it travels in the wind with a uniform velocity.</p> <p>Q. Do you have additional concerns about this type of software and the lack of information about how it was used to complete the reported modeling?</p> <p>A. Yes. The report does not discuss the actual equations being solved or the assumptions the software uses to perform the analysis. Other software in the same category of the CANARY software cannot accurately handle a situation with low wind speeds (at or near zero). This is particularly relevant since low wind speeds tend to have the worst outcome.</p>	The equations used in CANARY are available in the CANARY User Guide for licensed users. There is one set of predetermined equations for each type of analysis within the CANARY software. The assumptions used by Allied in the CANARY model were described in Appendix A of the Aerial and Thermal Dispersion Analysis Report dated January 11, 2024 (in Appendix G of the draft EIS). The industry standard looks at 4.5 miles per hour as an acceptable wind speed for this type of analysis, and Allied used 4.0 miles per hour in the CANARY modeling. To address concerns that the CANARY software cannot accurately handle a situation with low wind speeds (at or near zero), Allied completed additional aerial dispersion modeling using CFD and 1.0 mile per hour wind speeds. Allied has now modeled this (at or near zero wind speed) case using CFD to supplement the previous modeling efforts to also cover this particular scenario. Chapter 8 of the EIS has been updated, and the detailed results of this supplemental modeling are included in Appendix G.	20242-203381-03
CURE	Gorman, John	2024-03-14	<p>Q. Do you have a response to Mr. Lange’s discussion of frost heave and soil temperature as it relates to dispersion of CO₂ in the event of a rupture?</p> <p>A. While the temperature chosen might be conservative for potential issues such as “frost heave,” the DEIS did not demonstrate that the temperatures were conservative for issues of dispersion or how changes in the ambient soil and air temperatures affect dispersion (regardless of the initial CO₂ phase) exiting from a pipe rupture. The issue of what might cause a pipe rupture (like frost heave) is a separate issue from modeling the dispersion after it hypothetically occurs.</p> <p>Q. Mr. Lange states that computational fluid dynamics (CFD) modeling has many shortcomings which make it less useful for predicting the potential dispersion of CO₂ in the event of a pipeline rupture. Do you agree?</p> <p>A. No. I do agree with Mr. Lange that CFD modeling requires many input values and complex parameters, which are identified by the</p>	Appendix A of the Aerial and Thermal Dispersion Analysis Report dated January 11, 2024, (in Appendix G of the draft EIS) explains that the temperatures chosen for this project were done based on worst-case dispersion impact distance. All inputs are detailed in the Aerial and Thermal Dispersion Report and in the CFD Analysis Report. Supplemental information about the CFD model was provided by the Minnesota Department of Commerce in response to CURE's Information Request Number 2, which is attached to this comment matrix (Appendix O).	20243-204360-03

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			analyst. This is why it is necessary to know the input values and complex parameters used by Allied Solutions in its modeling. Without that information, it is not possible to do a detailed analysis. And if the analyst does not have that information, it is unclear how a thorough analysis can be done or how an analyst could expect a tool, such as a simplified analysis program (like CANARY), to provide a relevant analysis alone.		
CURE	Gorman, John	2024-03-14	<p>Q. Is CFD modeling unable to model or less useful when modeling long linear infrastructure projects like the one proposed by the applicant?</p> <p>A. Not necessarily. In terms of a pipe rupture, as Allied Solutions attempted to demonstrate, CFD models can be used to gather more detailed results relevant to the issues of dispersion. Therefore, employing a select number of CFD models would provide a more thorough analysis, augmenting existing means of studying the entire infrastructure.</p> <p>Q. Mr. Lange states that the applicant and Allied Solutions used “extremely conservative” inputs for the CANARY model and that CFD modeling using the same data would result in less conservative dispersion distances. Do you agree?</p> <p>A. Assuming the chosen inputs are indeed conservative for the basis of conversion, it is not possible to say a CFD model would result in less conservative distances without actually performing the CFD analysis. Also, a conservative input for a CANARY model has not been demonstrated to be a conservative input for a CFD model. For example, dispersion models similar to that employed by CANARY have been shown to underpredict concentrations after 30 meters (approximately 98 feet) from the CO₂ source. This study is attached as Schedule JG-2. Other studies, like the one attached as Schedule JG-3, have shown that CFD models are more adaptive and provide better predictions than dispersion modeling software. Therefore, CFD may result in more conservative predictions.</p>	<p>The JG-2 paper referenced addresses the results of a specific experiment done on DNV's PHAST dispersion model. The validation or comparison is specific to the experiment and the PHAST model predictions. The results of this validation only apply to PHAST. This paper does not reflect on a class or category of dispersion models—nor does not claim to. The paper specifically refers to PHAST in the title and throughout the paper. Any findings or conclusions in this paper may apply to PHAST, but should not be applied to other dispersion models or a class of models. PHAST was not used in modeling for the EIS, but CANARY was used instead.</p> <p>The JG-3 paper references a project that compares a Gaussian dispersion model, a "tuned" Gaussian dispersion model, and a CFD model. The paper goes on to say that the "tuned" Gaussian is very close to the CFD model for low momentum releases, which is what Gaussian models are appropriate for. The paper does not reflect on any other types of models besides a Gaussian model. CANARY uses equations that include Gaussian equations, but are more than Gaussian equations, enabling CANARY to account for high momentum/velocity during a rupture. While the JG-3 paper may indicate that Gaussian models have difficulty at predicting concentrations as distances increase—a specific distance is not actually stated in the JG-3 paper, but is generally indicated in a non-specific graph—it is difficult to see how the paper materially comments on models that do account for high product momentum/velocity during a rupture.</p> <p>Recognizing the limits of CANARY, Allied supplemented the aerial modeling with CFD modeling, as shown in Appendix G.</p>	20243-204360-03
CURE	Gorman, John	2024-03-14	<p>Q. Do you agree that the CANARY software allows for conservative results?</p> <p>A. No. In addition to the studies referenced above which suggest that CFD models may be able to provide better and more conservative predictions, there does not appear to be supporting evidence in the DEIS or related documents that demonstrates the CANARY model would provide “very conservative” results compared to an actual pipe rupture or compared to real-world data.</p> <p>Q. How long will it take for harmful concentrations of CO₂ to dissipate?</p> <p>A. It is not possible to know with any certainty. There are many assumptions made by the applicant and in the DEIS with regard to the time it takes CO₂ to dissipate, including a constant wind speed. For example, it might be possible the ambient air is stagnant, allowing a concentration of CO₂ to build up, and then a brief gust of wind moves the cloud of higher concentration CO₂ to another location.</p>	<p>Given that the CANARY software is valid/verified and that reasonably conservative inputs were used for modeling, one can conclude that the modeling results will also be reasonably conservative. The term "very conservative" is not used in the EIS. The purpose of the modeling is to be reasonably conservative—to model reasonable worst-case scenarios.</p> <p>Allied modeled four reasonable worst-case conditions, which requires certain assumptions to be made and scenarios to be modeled. These assumptions and scenarios are discussed in Appendix G of the EIS. Making these assumptions and modeling these scenarios provides reasonably conservative estimates for the extent of CO₂ concentrations and the time required for these concentrations to dissipate. The assumption of a constant wind speed is an industry accepted practice for modeling a worst-case scenario. The commenter, Dr. Gorman, brings up a particular scenario that does not use a constant wind speed. Dr Gorman suggests a scenario in which a release occurs with no wind, which is then followed by a gust of wind. Allied has modeled this scenario using CFD; results are presented in Appendix G of the final EIS.</p>	20243-204360-03

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
CURE	Gorman, John	2024-03-28	Q. Mr. Lange states in rebuttal testimony that the CANARY model has been validated but does not state whether the model has been verified. Do you have any response? A. Yes. First, if the CANARY software has been validated, the results of that validation should be provided by the applicant and the Department of Commerce’s Energy Environmental Review and Analysis (EERA) Unit in this proceeding or in the DEIS. Second, it is imperative that the applicant and/or EERA state whether there has been any verification of the CANARY software model. As I stated in my direct testimony, verification is a process to ensure an underlying mathematical model is implemented correctly and then accurately solved. Without both of these crucial steps, it is not possible to know how accurate the results from any modeling are.	Appendix C of the Aerial and Thermal Dispersion Analysis Report dated January 11, 2024, (in Appendix G of the draft EIS) has been revised to provide additional information about the verification and validation of the models. Also see the Minnesota Department of Commerce answer to question 17 of the CURE Information Request Number 2 for additional verification and validation information.	20243-204752-03
CURE	Gorman, John	2024-03-28	Q. In rebuttal testimony, Mr. Lange addresses your previous testimony regarding the conditions of the CO ₂ within the pipeline. What is your response? A. Mr. Lange states that “although the report does not explicitly state what phase the CO ₂ was modeled in, the phase can be determined based on the content in the report...” (Lange Rebuttal, Page 2). According to Appendix G of the DEIS, for the CANARY analysis, Table 6 lists the values of pressure and temperature to be 2,197.89 psi and -20 °F, making it liquid CO ₂ . However, for the CFD analysis, and as clarified by CURE IR 002, “Mr. Prascher and Dr. Ward did not model a phase change. Mr. Prascher and Dr. Ward assumed that the all the CO ₂ in the pipeline became gaseous, which is more conservative than what happens in reality. This simplifies the modeling process. At the same time, the downwind results are not affected because they set the release CO ₂ mass to be the same as the mass released in the CANARY model.” (Attached as Appendix JG-4). This means the CANARY model used liquid CO ₂ , and the CFD analysis used gaseous CO ₂ without phase change. The report does not justify or explain the reasons for this difference. But again, as I stated in my direct testimony, the phase of the CO ₂ will greatly impact the dispersion from the rupture and must be accurately modeled. Concerningly, if the CANARY model was using liquid CO ₂ and the CFD was using gaseous CO ₂ , there is no way those things could have been validated against each other. If the mass flow rate of 13.34 pounds per second was used for both CANARY and the CFD, there is a large density difference between the gas and liquid phase. Liquid CO ₂ leaving the 4.5” pipeline diameter rupture would have a velocity of around 1.75 feet per second, whereas gaseous CO ₂ leaving the same rupture would have a velocity of around 881.9 feet per second, or approximately 600 miles per hour. The discrepancy here must be addressed.	Dr. Gorman acknowledges the modeling approach Allied took was more conservative than reality, which is the goal of such modeling. The Minnesota Department of Commerce addressed Dr. Gorman's other concerns in its answer to question 13 of the CURE Information Request Number 2, which is attached to this comment matrix (Appendix O).	20243-204752-03
CURE	Gorman, John	2024-03-28	Q. Do you have any other concerns you would like to raise? A. Yes. Although the applicant has provided some rebuttal to my direct testimony identifying issues with the modeling in the DEIS, EERA, who oversaw the contractors conducting the modeling, has not responded to my direct testimony. Therefore, the key questions and concerns I raised there about the validity and reliability of the modeling results remain unanswered by the party that initially offered the information.	EERA addressed Dr. Gorman’s questions and concerns through its responses to CURE Information Request Number 2.	20243-204752-03
CURE	Grubert, Emily	2024-02-13	Q. What are your findings? A. Optimizing carbon dioxide pipeline infrastructure around ethanol plants is not an effective use of resources. It is not clear that this project will be subject to updated federal standards for carbon dioxide pipelines once a widely expected update is issued, given that current standards are widely understood to be inadequate. The Otter Tail to Wilkin Carbon Dioxide Pipeline Project Draft Environmental Impact Statement (DEIS) does not accurately or adequately estimate the carbon intensity of the proposed project, which is problematic because the project justification is largely on the basis of the impacts on carbon intensity.	Thank you for your comment. The draft EIS discusses PHMSA rules and regulations, and the pending rulemaking process it is undertaking for CO ₂ pipelines, and acknowledges pending PHMSA changes to such regulations (see draft EIS, Chapter 3, Chapter 8, and Appendix G). The carbon intensity of the project is discussed in Chapter 6.	20242-203381-04
CURE	Grubert, Emily	2024-02-13	Q. Are all CO ₂ pipelines specifically regulated at the federal level? A. No. The Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory jurisdiction over CO ₂ pipelines, but specific rules are only in place for pipelines that transport CO ₂ as a supercritical fluid rather than as a liquid or a gas. Q. Are the current federal regulations generally accepted to be adequate? A. No. The lack of specific and updated regulations for CO ₂ pipelines is widely recognized as a gap. Currently, a first draft of updated rules on CO ₂ pipelines from PHMSA is expected in late 2024, but final rules will likely not be in place until much later. Although the DEIS notes that the pipeline contemplated in this project would be managed in accordance with PHMSA minimum federal safety standards, it is important to know that the existing PHMSA minimum federal safety standards for CO ₂ pipelines are widely considered inadequate and are currently being updated by PHMSA. (1) For the full context I am including a report by Pipeline Safety Trust on this topic as Schedule EG-2. (1) Pipeline and Hazardous Materials Safety Administration, PHMSA Announces New Safety Measures to Protect Americans From Carbon Dioxide Pipeline Failures After Satartia, MS Leak, May 26, 2022, https://www.phmsa.dot.gov/news/phmsa-announces-new-safety-measures-protect-americans-carbon-dioxidepipeline-failures ; Mike	Thank you for your comment. PHMSA regulations (that is, their appropriateness) and related standards for CO ₂ pipelines are outside the scope of the EIS (Appendix A). The draft EIS discusses PHMSA rules and regulations, and the pending rulemaking process it is undertaking for CO ₂ pipelines, and acknowledges pending PHMSA changes to such regulations (see draft EIS, Chapter 3, Chapter 8, and Appendix G). The Applicant has stated its proposed CO ₂ pipeline would be designed, constructed, and operated to meet PHMSA regulations, including any operational changes to PHMSA regulations that may occur in the future. To the extent applicable, and in response to this and similar comments, Section 3.6 and Appendix G of the EIS have been updated to include this information.	20242-203381-04

			Soraghan, Midwest CO ₂ Pipeline Rush Creates Regulatory Chaos, Mar. 3, 2023, https://www.eenews.net/articles/midwest-co2-pipeline-rush-creates-regulatory-chaos/ .		
CURE	Grubert, Emily	2024-02-13	<p>Q. What is a carbon intensity (CI) score?</p> <p>A. A carbon intensity, or CI, score is defined by the DEIS as “the amount of CO₂e [carbon dioxide equivalent] emissions per unit of energy produced.” (Page 6-3). This value is calculated on a life cycle basis, and requires accounting for both new sources of greenhouse gas emissions (e.g., energy inputs to carbon capture and storage; emissions associated with oil production from CO₂-driven enhanced oil recovery) and any sequestration, among other components.</p> <p>Q. Does the DEIS adequately evaluate the CI score for the Green Plains Ethanol Plant 10 project?</p> <p>A. No. In particular, the DEIS overstates the CI score benefit of carbon capture and sequestration applied to the Green Plains Ethanol Plant. The DEIS claims that capturing 0.19 million metric tonnes per annum (mmtpa) of CO₂ from the ethanol plant would reduce the project’s CI score from 76 g CO₂/MJ ethanol to 36.3 g CO₂/MJ ethanol. (Page 6-6). The calculation provided on Page 6-6, however, has two major flaws. First, the calculation suggests that the CI score for ethanol across its life cycle would be 0.19 mmtpa CO₂ (the amount of CO₂ proposed for capture) divided by the total energy contained within the ethanol, or 36.3 g CO₂/MJ. This is incorrect: this equation gives the amount of CO₂ captured per MJ of ethanol, not the life cycle CI score for ethanol. I also note that the DEIS inappropriately rounds 0.185454 mmtpa CO₂ captured (Table 5-39) prior to making this calculation: the value presented should be 35.4 g CO₂/MJ captured, not 36.3. Further, the DEIS inconsistently refers to CO₂ versus CO₂e (which accounts for the CO₂ equivalent climate impact of other greenhouse gases emitted over the life cycle of the analyte), despite defining CI score in CO₂e terms. (Page 6-3).</p> <p>Q. What other flaw in the assumptions about CI scoring renders the DEIS analysis questionable or invalid?</p> <p>A. The second flaw is that the DEIS is not estimating the amount of CO₂ abated per MJ of ethanol, but rather the amount captured: an abatement value would need to account for any additional life cycle GHG emissions associated with energy and other inputs to the carbon capture and storage process. Table 5-39 does not provide sufficient information to assign emissions to the capture and storage processes specifically (particularly as emissions from operation of the capture facility are combined with emissions from fermentation that are not captured), but illustratively, this Table suggests that net capture from the plant is actually 0.14 mmtpa, not 0.19 mmtpa CO₂ – 25% lower than the DEIS credits the project with. Further, this abatement value would need to account for any losses (e.g., leaks) of CO₂ between capture and storage, and after storage.</p> <p>Q. How should the CI score be recalculated to be valid?</p> <p>A. The Project CI Score should not be calculated (g CO₂/MJ captured) as is presented in the DEIS, but as (CI score without CCS) – (g CO₂/MJ abated).</p> <p>Q. What other errors in the analysis make the CI score difficult to validate and assess?</p> <p>A. In general, the DEIS fails to consistently distinguish between the amount of CO₂ captured and the amount of CO₂ permanently stored, and does not address the level of net CO₂ abatement, which would require careful evaluation of the emissions associated with energy inputs for the carbon capture and storage.</p> <p>Q. Why is it a problem that the DEIS does not adequately evaluate the CI score for the Green Plains Ethanol Plant?</p> <p>A. The stated rationale for the project evaluated in the DEIS, a CO₂ capture facility and 28.1 miles of pipeline that would transport captured CO₂, is that it “would reduce the carbon intensity of the ethanol produced and thereby improve the ethanol plant’s ability to compete in low carbon fuel standard (LCFS) markets.” (Page ES-1). Without an accurate CI score for the project, it cannot be verified that the project would successfully deliver this benefit. One particularly relevant point is that the DEIS contemplates the possibility that CO₂ from the project might be used for enhanced oil recovery (EOR) (Page 5-101), which would significantly reduce any CI score benefits and thus fundamentally alter the rationale for the project.</p> <p>Q. Based on the available information, has the applicant or the DEIS provided sufficient information to recalculate and verify the CI score?</p> <p>A. No. An accurate CI score cannot be estimated without a clear understanding of the fate of captured CO₂, including pipeline leakage, storage leakage, and failure to permanently store CO₂.</p>	<p>The carbon intensity score (CI Score) metric used in the draft EIS reflects the net emissions of the full life cycle analysis according to the United States Department of Energy Argonne National Laboratory's Greenhouse gasses, Regulated Emissions, and Energy use in Technologies (GREET) model, and results are current as of the release date of the draft EIS. The California Air Resources Board's (CARB) Low Carbon Fuel Standard (LCFS) may require CA-GREET results to calculate greenhouse gas (GHG) emissions to participate in the program. Argonne has developed this full fuel-cycle model to estimate energy use and emissions from transportation fuel/vehicle technology systems. The model includes detailed information on corn farming and chemical manufacturing. The model and its documents are posted at http://greet.anl.gov. Section 2.1 has been revised to clarify that the amount of CO₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and that commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios of 100 percent, 70 percent, 40 percent, and 10 percent. The equation presented in Section 6.1.4. has been revised to estimate the impact of the proposed project on the net CI score as suggest: (CI score without CCS) – (gCO₂/MJ abated). Table 6-2 has been added to include a range of net CI scores for various capture rate scenarios and a footnote has been added to clarify unit conversions such as the CO₂ captured presented in units of CO₂e since the Global Warming Potential (GWP) for CO₂ is 1.</p>	20242-203381-04
CURE	Grubert, Emily	2024-03-28	<p>Q. Do you agree with Mr. Nelson’s carbon intensity score calculations?</p> <p>A. Based on the information he provided, I do not disagree with Mr. Nelson’s calculations or the conclusion that the project would have a carbon intensity of 46.5 g CO₂e/MJ, instead of 36.3 g CO₂e/MJ as reported in the DEIS. However, I disagree with Mr. Nelson’s</p>	Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and that commenters have questioned the	20243-204752-04

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>assessment that this is a “small inaccuracy.” (Nelson Rebuttal, Page 5). The updated carbon intensity is 28% higher than the value actually presented in the DEIS, which is not a minor or insignificant error for the core value being used to justify this project. It is essential to demand high quality analysis for these key metrics.</p> <p>Q. Mr. Nelson states that your statement that the project would not deliver benefits is “baseless.” What is your response?</p> <p>A. Although this project might be able to deliver a fuel with CI lower than that of gasoline (though most ethanol is blended with gasoline and thus reinforces ongoing use of that infrastructure), it does not deliver a fuel with a CI lower than that of the most likely alternative in a climate policy-aware setting, which is electricity. I do not dispute that the project lowers the emissions associated with ethanol. I do dispute the applicant’s claims that the project provides climate benefits at a system level, a claim that would need to be evaluated in the context of alternative fuels like electricity.</p>	<p>feasibility of this capture rate given the performance of existing capture facilities. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios of 100 percent, 70 percent, 40 percent, and 10 percent. As indicated by the scoping decision, the EIS reviewed existing studies of the human and environmental impacts of ethanol production and provide a synthesized analysis of potential impacts on human and environmental resources. The CI score range presented in Chapter 6 includes potential direct and indirect emissions associated within the proposed design and construction of the project. Table 5-39 has been updated to provide a summary of GHG emissions from the initial construction as well as the proposed ongoing annual operations at the capture facility, CO₂ capture (abated), and electricity use.</p>	
CURE	Grubert, Emily	2024-03-28	<p>Q. Mr. Powell states that the applicant does not intend to ship captured CO₂ for enhanced oil recovery (EOR). What is your response?</p> <p>A. It is good to hear that the applicant does not intend to use CO₂ transported via the project for EOR. But I would reiterate the concerns I expressed in my direct testimony that intent is not a binding commitment, and the DEIS does contemplate this possibility (Page 5-101). Additionally, because the CO₂ is going to be put into a system of networked infrastructure (i.e., pipelines), claiming that the project is distant from existing oil production does not prove a physical impossibility for the CO₂ to be used for EOR. Furthermore, Mr. Powell himself acknowledges in his rebuttal testimony that it is the shipper, not the applicant, who “ultimately determine[s] the purpose and end use for CO₂ transported on their behalf.” (Powell Rebuttal, Page 2).</p>	<p>Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO₂ transported by the project could be used for enhanced oil recovery (EOR).</p>	20243-204752-04
CURE	McKinney, Zeke	2024-03-14	<p>Q. What is a safe level of exposure to CO₂ for humans?</p> <p>A. Because each person is different in how they may respond to different levels of CO₂, it is best practice to follow the exposure limits established by various regulatory and guidance agencies, such as NIOSH, the U.S. Environmental Protection Agency (EPA), the American Conference of Governmental Industrial Hygienists (ACGIH), and the Minnesota Department of Health (MDH) to minimize potential harms from CO₂ exposure. It is generally accepted that human beings will not experience discomfort from carbon dioxide exposure at levels around 1,000 ppm CO₂ (0.01% CO₂). The variability in human response was emphasized in the Discussion section of the article by van der Schrier et al., in which they state, “When individuals are exposed to an excess of CO₂ in ambient air, an important question is at what levels of CO₂ inhalation does the human body maintain its ability to adequately function to, for example, escape from the incident scene or to perform a cognitively challenging task. An answer to this question is not only dependent on the results of our current study in healthy young volunteers but is certainly also dependent on the age and more importantly the physical condition of the exposed individual as well as presence of underlying cardiac or pulmonary disease. Our current results indicate that during exposure to 9% CO₂ the body retains its ability to function for 10 min, albeit with large variability in tolerance with some subjects able to withstand 30 min and one subject 60 min of exposure.... Note that we expect CO₂ tolerance to decrease rapidly in older individuals with lower resilience and those with existing cardiac or pulmonary disease.” In general, indoor air quality studies suggest that humans experience discomfort and symptoms with prolonged exposure to carbon dioxide at levels of 1,000 ppm CO₂ (0.1% CO₂). A relatively recent study of cognitive performance testing in young, healthy, male subjects by Tu et al. (2020), attached as Schedule ZM-3, where subjects were exposed to varying concentrations of CO₂ in a controlled setting, demonstrated that at or below CO₂ levels of 12,000 ppm (1.2% CO₂) subjects reported “higher rates of headache, fatigue, agitation, and feeling depressed,” in addition to decreasing cognitive performance in parallel with evident changes in physiologic parameters (decreased systolic blood pressure and increased diastolic blood pressure). A recent review of low-level indoor CO₂ exposures by Azuma et al. made strong conclusions from available evidence, including that “recent studies show clear linear physiological changes in circulatory, cardiovascular, and autonomic systems, including an increase of pCO₂ in the blood, elevated blood pressure, increased heart rate, increased peripheral blood circulation, and increased sympathetic stimulation at CO₂ exposures in the range of 500 to 5000 ppm”, and that “several experimental studies on humans suggest that CO₂ may affect cognitive performance (decision making, problem resolution, speed of addition, number of correct links) starting at concentrations of approximately 1000 ppm for short-term exposure to CO₂.” (Attached as Schedule ZM-2).</p>	<p>A review of the science concerning CO₂ toxicity levels is not necessary for a reasoned choice among alternatives. The EIS continues to use CO₂ concentration levels defined by federal agencies in its discussion.</p>	20243-204360-04

CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>[This comment letter includes the following attachments:</p> <ul style="list-style-type: none"> • Accufacts’ Perspectives on the State of Federal Carbon Dioxide Transmission Pipeline Safety Regulations as it Relates to Carbon Capture, Utilization, and Sequestration within the U.S. • PHMSA letters • CO₂ EOR Potential in North Dakota • Should Transportation Be Transitioned to Ethanol with Carbon Capture and Pipelines or Electricity? A Case Study] <p>This is the first ever carbon dioxide (CO₂) pipeline proposed to be routed by the Minnesota Public Utilities Commission (Commission), and EERA has far more experience with analyzing impacts of other kinds of large energy infrastructure, such as centralized power generation and transmission infrastructure. That said, this first CO₂ pipeline DEIS lacks large amounts of necessary information and does not yet constitute a hard look at the foreseeable impacts of the proposed pipeline.</p>	See the responses to CURE's more detailed comments below.	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	I. The DEIS Mischaracterizes the Impacts of the Proposed Project to Human and Environmental Resources Over-reliance on the applicant or a failure to secure the assistance of sufficiently experienced contractors for this analysis does not obviate or relieve the Commission of its duties as a Responsible Governmental Unit. In order to provide the necessary information EERA must make significant and substantial changes to the DEIS in order to assure an adequate analysis of the significant impacts attributable to the human environment for this first-of-its-kind project. Wishing that impacts are minimal and transitory does not make it so.	See the responses to CURE's more detailed comments below.	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	a. Human Settlement The DEIS concludes that the project’s potential impacts on human settlement—including environmental justice, land use and zoning, populated areas, property values, public health and safety, public services and infrastructure, socioeconomics, and Tribal treaty rights—will be “minimal” to “moderate.” The potential impacts on these aspects of human settlement, however, will likely be more long-term and substantial than the DEIS currently states. The DEIS should be revised/rewritten to include the following considerations.	See the responses to CURE's more detailed comments below.	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>i. Environmental Justice</p> <p>Environmental justice is broadly understood by regulatory agencies and is not a mapping exercise alone. The U.S. Environmental Protection Agency defines environmental justice as “the just treatment and meaningful involvement of all people, regardless of income, race, color, national origin, Tribal affiliation, or disability, in agency decision-making . . . activities that effect human health and the environment so that people . . . are fully protected from disproportionate and adverse human health and environmental effects (including risks) and hazards . . .” Similarly, the MN Pollution Control Agency defines environmental justice as “the right of communities of color, indigenous communities, and low-income communities, to the enjoyment of a health environment and to fair treatment with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies.” According to the MPCA, “fair treatment” as used in this way “means no group of people should bear a disproportionate share of the negative environmental consequences resulting from industrial, governmental and commercial operations or policies. The DEIS concludes that “EJ impacts from construction and operation of the project would not result in disproportionate adverse impacts for EJ areas of concern within the ROI.” The “EJ area of concern” appears to be limited by a rigid understanding of a census tract map and doesn’t admit that the project is proximate to Indian Country and tribal communities. This statement also appears to be based on the assumption that the only environmental-justice-related impacts that might occur are limited to traffic, noise, and air pollution. But we know that the health and environmental risks associated with the project go beyond these issues and limited geography. The rest of the DEIS confirms this. Limiting consideration of potential impacts to traffic, noise, and air pollution ignores the many other impacts a project can have on overburdened individuals and communities.</p>	Chapter 8 has been revised to include a new section (8.3.1.2) describing effects on environmental justice populations in the event of an accidental release of CO ₂ .	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>i. Environmental Justice (cont. 1)</p> <p>The DEIS also fails to consider the mental health impacts of hosting this kind of infrastructure. Although more research should be done in this area, studies have shown that there are tangible mental health impacts for those who live near industrial projects.¹ The project asks the communities along the route to bear the burden of the mental health impacts—namely the stress and anxiety associated with a potential leak or rupture—that comes with hosting this kind of infrastructure. The community closest to the existing ethanol plant will be especially impacted by further concentration of industrial impacts.</p>	Section 8.3.1.4 has been revised to acknowledge that people in the vicinity of the project may experience stress and anxiety related to fear of the effects of a potential leak or rupture. However, mental health impacts associated with the project would not be anticipated to be of the same magnitude as those experienced by those living near a large petrochemical complex in Texas City, Texas, as reported in the study cited by CURE.	20242-203795-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>i. Environmental Justice (cont. 2)</p> <p>The DEIS fails to link its EJ analysis to Indigenous cultural practices and the importance of a clean and abundant ecosystem for people who rely on native species for sustenance and traditional practices, such as collecting and preparing medicinal plants. As with the other part of the DEIS regarding treaty rights, the DEIS fails to adequately discuss and acknowledge that all of Minnesota is the historical homeland of Indigenous peoples, and all natural landscapes have some potential to be significant to communities that use these areas for cultural practices. The DEIS could be read to say that EERA only meaningfully consulted the Sisseton-Wahpeton Oyate regarding archeological resources, without providing opportunity for tribal members or staff to speak more broadly to impacts to living resources close to their reserved lands on the Lake Traverse Reservation. The DEIS should fully memorialize any and all concerns voiced by Tribal Nations regarding their access to cultural resources and practices, including any ongoing access to species and habitat in the project footprint.</p>	<p>Thank you for your comment. The EIS acknowledges that the project area was most recently occupied by the Dakota and Ojibwe. Other Tribes with historic cultural interest or ancestral ties to the project area are also noted. The EIS does, in the treaty rights discussion, state that the project area has been home to various peoples and cultures since time immemorial.</p> <p>The landscape within the project area, post-European contact, has been greatly altered toward a predominantly agricultural use. “Natural” landscapes are uncommon in the project area. The current project area is mainly private agricultural land and not available for public access. Native Minnesota plants and wildlife of potential significance to Tribes are discussed in Section 5.4.2 of the EIS. The project would temporarily impact the portions of the project area containing plant and wildlife habitat of potential Tribal significance during construction until restoration of disturbed areas is complete.</p> <p>Outreach to Tribal governments has been conducted throughout the environmental review and permitting process for the project. Tribes were provided an opportunity to comment on the content of the draft EIS while it was being prepared (Appendix J). Additionally, Tribes provided comment on the draft EIS after issuance (see Appendix O).</p>	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>ii. Land Use and Zoning</p> <p>The summary of land cover provided in the DEIS states that zero acres of open water would be impacted by the RA-South route, but that RA-Hybrid and RA-North would impact 1.3 and 1.6 acres, respectively. Based on the definition of “open water” used in the DEIS, which references “surface water” generally, this seems inconsistent with the more detailed surface water impacts information presented later in Chapter 5. The DEIS states that activities which could impact open water include clearing and grading, dewatering and trenching, access road construction, waterbody crossings, surface water withdrawals and discharges, fueling and use of hazardous materials, and restoration or reclamation of construction areas.</p> <p>Per Chapter 5.7.8 of the DEIS, all three routes might result in “clearing and grading of stream banks, topsoil disturbance, in-stream trenching, trench dewatering, backfilling, and expansion of access roads,” which “can increase sedimentation and erosion, modify hydrological flow, release chemical and nutrient pollutants from sediments, and introduce chemical contaminants such as fuel and lubricants.”² And all three routes might use surface water withdrawals for hydrostatic testing.³ The DEIS also confirms that all three routes cross more than 100 surface waters within the project area.⁴ Given this apparent discrepancy, EERA should revisit its statements and calculations of open water crossed by the routes to ensure their accuracy.</p>	<p>Although more than 100 surface waters are within the ROI for each route alternative, many fewer would actually be crossed by the project, because the ROI is larger than the construction workspace and because some waterbodies within the ROI would be crossed or avoided by HDD or bore technique, as shown in Tables 5-48, 5-49 and 5-50, thereby mitigating impacts on surface waters. Further mitigation for impacts on surface waters is addressed in section 5.7.8.3. Note: NLCD dataset resolution is often not sufficient to pick up small surface waters that would be included in the DNR Hydrography Dataset. Section 5.7.8.1 was revised, and a note was added to Table 5-47.</p>	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>iii. Populated Areas</p> <p>The way in which the DEIS discusses potential impacts on populated areas conflicts with how other potential impacts are described. This seems to stem in part from the decision to consider the ROI for populated areas to only be the local vicinity (within 1,600 feet of the route width) instead of the project area (within one mile of the route width) or even the entirety of Otter Tail and Wilkin Counties. Because there are no census-designated places or incorporated places directly within the route or in the local vicinity, the DEIS concludes that “there would be no impacts on populated areas.” Yet, at the same time, the DEIS acknowledges that construction personnel and employees of the capture facility would rely on and use resources in the cities of Fergus Falls and Breckenridge during construction and operation of the project. These cities are therefore impacted populated areas, and the analysis of impacts should be scoped properly to include foreseeable impacts to populated areas.</p> <p>More importantly, the Department heard from residents living along and near the route at the public meetings in May 2023 and February 2024. These residents expressed disappointment over the Department’s decision to consider the places along the route as being not “populated.” If there is no population impacted by this project, then who exactly did EERA invite to the public meetings to learn about it? It is inconsistent and dismissive to describe rural areas as depopulated simply because the immediate area next to the applicant’s preferred route doesn’t include a high-density housing development.</p> <p>Given the above, the Department should expand the ROI for populated areas to at least within one mile of the route width, but more</p>	<p>Minnesota Rule 7852.1900, Supb. 3(A) requires the Commission to consider the impact of a pipeline to, among other considerations, the "existence and density of populated areas." Minnesota Rule 7852 provides no definition of "populated area." As described in Section 5.4.6, the EIS defines populated areas using United States Census Bureau data for incorporated areas and census-designated places. As stated in Section 5.4.6.1, the ethanol plant is near, but not within, the incorporated city of Fergus Falls.</p> <p>The EIS does not state that no population is impacted by the project, and does not state that rural areas are not populated. Section 5.4.6.1 has been revised to more clearly define "Populated Areas" as analyzed in the EIS. Minnesota Rule 7852.1900, Supb. 3(A) requires the Commission to consider the impact of a pipeline to, among other considerations, the "existence and density of populated areas." Minnesota Rule 7852 provides no definition of "populated area." Section 5.4.6 has been</p>	20242-203795-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			reasonably within five to ten miles of the route width to capture more accurately who might be impacted by the proposed project. This should at the least capture Fergus Falls, Foxhome, Sunnyside, Doran, and Breckenridge.	revised to clarify the definition used in the EIS for populated areas and to note that the EIS describes potential impacts on the human environment, regardless of whether they would or would not occur within defined populated areas.	
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>iv. Property Values</p> <p>As direct testimony from Silvia Secchi explains, (5) the DEIS’s conclusion that the presence of the proposed project “would not be expected to affect the value of residential properties during project operation,” is based on outdated studies. (6) More recent research from 2023 found that “[p]roximity to an RMP [Risk Management Plan] facility, irrespective of any incidents, is associated with significantly lower home values.” (7) Another study concluded that “pipeline incidents on average dampen housing prices within 1,000 meters (3,280 feet)” of the pipeline. (8) Given the public knowledge of the Satartia, Mississippi incident, it is reasonable to assume these effects might also be significant for those living along the proposed project route for this proposed CO₂ pipeline.</p> <p>As such, the DEIS should be amended to acknowledge these more recent studies and address the possibility that the presence of the project will impact property values. In doing so, the DEIS should realistically discuss the impact of lowered property values throughout the project area on the local economy. To the extent that EERA lacks this economic expertise and information, it should engage additional outside experts to assess the negative impacts on property values. Without accurate information on the economic costs of this project, the DEIS’s rosy assessment of economic benefits is inaccurate and inadequate.</p> <p>(5) CURE – Exhibit ____, Secchi Direct, eDockets Document No. 20242-203381-05.</p> <p>(6) DEIS, at 5-38.</p> <p>(7) Dennis Guignet et al., <i>The property value impacts of industrial chemical accidents</i>, <i>Journal of Environmental Economics and Management</i>, https://doi.org/10.1016/j.jeem.2023.102839 (2023). <i>The study only considered RMP facilities, which are stationary sources. But there are many similar characteristics between RMP facilities and the proposed project that make comparison and reference to this study relevant.</i></p> <p>(8) Nieyan Cheng et al., <i>Pipeline Incidents and Property Values: A Nationwide Hedonic Analysis</i>, SSRN, https://papers.ssrn.com/sol3/papers.cfm?abstract_id=4116305 (2023).</p>	A new section on property value impacts related to pipeline incidents has been added to Chapter 8.	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>v. Public Health and Safety</p> <p>The majority of CURE’s comments about public health and safety will be addressed below, in Sections IV and V, in the discussion about Chapter 8 and Appendix G. Here, we raise concerns about DEIS’s failure to consider the possibility of human trafficking and an increase in incidences of violence against community members as a result of the increase of temporary, transient construction workers. This is a difficult subject to discuss and brings up many emotions for all impacted by this work, including nearby communities and the workers themselves. But given the well-documented history of violence perpetrated against communities in the vicinity of similar projects—especially violence against Indigenous women and children—it is unacceptable to ignore the very real potential for these kinds of human health and safety impacts.</p> <p>It is especially concerning given the applicant’s decision to hire the same contracting company, Precision Pipeline, LLC, that worked on the Line 3 pipeline.⁹ Two of the men employed by Precision Pipeline to work on Line 3 were arrested during a human trafficking sting operation in Itasca County.¹⁰ Crisis centers also reported receiving an increase in reports about Line 3 workers harassing and assaulting women and girls living near the pipeline.¹¹ These incidents occurred, despite Enbridge being required to create a Human Trafficking Plan—noticeably absent from discussion in this DEIS—and Enbridge confirming that “each worker goes through ‘human trafficking awareness training’” before beginning work on Line 3.¹² The applicant has made similar promises here, notably only via direct testimony and not in its application or the DEIS: “Summit will require that all of its employees and contractors complete a Human Trafficking Prevention Training prior to construction work.”¹³</p> <p>The health and safety of the workers themselves is also of concern. The same contractor has a checkered history with safety, according to incident report data from the Occupational Safety and Health Administration (OSHA).¹⁴ The final EIS should take a close look at the contractor’s history of workplace incidents and discuss how this might impact the construction workers who would work on the project.</p>	<p>Section 5.4.8.2 has been revised to note the potential for violence associated with the presence of temporary workers. The applicant's commitment to educating all employees and contractors about prevention of human trafficking has been added to Section 5.4.8.3. In addition, Section 5.4.8.3 has been revised to add an EERA staff recommendation for a special permit condition requiring the applicant to provide its Human Trafficking Prevention Training for Commission review 30 days prior to submittal of the Plan and Profile.</p> <p>The decision to be made by the Commission does not include the specification of a specific contractor.</p>	20242-203795-01
CURE	Sarah Mooradian,	2024-02-23	The DEIS contains little information or analysis regarding the energy demand of the project that shows the full anticipated impacts to the grid and other member-owners of the relevant power provider. There is a minor discrepancy in the DEIS regarding the potential electricity use of the project that should be resolved in the final EIS. In discussing potential impacts to electric utilities, the DEIS	Section 5.4.9.1 has been updated to include the natural gas and electricity usage at the existing ethanol plant. The GHG Emissions Summary table, Table 5-39, has been updated to use 38,501,733 kWh to	20242-203795-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Hudson Kingston		<p>reports that the applicant anticipates the project’s operational needs to be approximately 38,501,733 kilowatt hours (kWh) per year.¹⁵ The GHG Emissions Summary table, however, states the annual project electricity use would be 39,297,360 kWh.¹⁶</p> <p>The DEIS assumes without support that the project “is anticipated to have negligible impacts” on electric utilities. But the DEIS doesn’t provide for a clear comparison of existing electric use at the facility and the additional demand from the project. In fact, the only mention of existing electricity use is found in Appendix I. Over the last two years, the Green Plains Ethanol Plant has averaged 3,171,885 kWh per month, or a total of 38,062,620 kWh per year. So, the proposed project is anticipating using the equivalent of an additional ethanol facility in terms of electricity – the project will roughly double electrical usage at an already energy-intensive industrial plant. For even more context, it is helpful to compare the proposed use to Lake Region Coop’s existing electricity sales. According to the Coop’s December 2023 financial report, the coop sold approximately 470,000,000 kWh of electricity in 2022 and 2023.¹⁷ The new addition of the capture facility’s electricity would be about 8% of those sales. Most importantly, this additional electricity puts a new demand on the grid that is not otherwise needed. Despite the above, the DEIS did not consider whether there would be rate impacts on Lake Region Coop member-owners.</p> <p>EERA should revisit the potential for impacts to the electrical system and other Lake Region Coop customers and member-owners. It is important to know both the total expected energy use as well as the variable demand that is anticipated by the project’s additional electric usage. Will the project’s use spike at the same time as the existing plant’s demand? Will Lake Region Coop have to implement peak-shaving policies and technologies elsewhere to manage this new intense use? Even if no immediate upgrades are required to deliver energy to the plant, will this increase member-owners’ exposure to power outages or brown-outs in times of peak demand?</p>	be consistent. Per the applicant, Lake Region Electric Cooperative (LREC) has not indicated that the additional load would necessitate implementing peak-shaving policies (see Appendix I, Supplemental Information Inquiry 13 response and email from LREC).	
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>The DEIS is also lacking a thorough discussion about how the project may impact emergency services, especially in light of consistent evidence that emergency medical services in rural Minnesota are facing significant challenges when it comes to staffing, funding, and coverage.¹⁸ The legislature recently established a Joint Task Force on Emergency Medical Services, and just last week, legislators introduced a bill seeking funding for EMS services across the state.¹⁹ The final EIS should take a hard look at the existing EMS services in the project ROI, including number of personnel and whether those individuals are volunteers or paid employees, average response times, and whether the departments have adequate funding. The final EIS should then discuss whether these services will be able to respond to a potential leak or rupture in a timely manner and with the necessary equipment.</p>	The existing conditions of, and potential impacts and mitigations on, infrastructure and public safety, including emergency services, are discussed in Sections 5.4.8 and 5.4.9. Table 5-12 provides a list of emergency services in Otter Tail and Wilkin Counties. Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to respond safely to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. Additionally, the applicant’s draft emergency Response Plan is included in Appendix N of the EIS. EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3. Section 8.5.1.5 has been revised to address Emergency Medical Services (EMS) staffing shortage problems.	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>As the DEIS correctly notes, all routes have the potential to impact recreation during construction. However, the DEIS only considers the potential impacts to these resources during normal operations and does not address what might occur in the event of a rupture or leak. The final EIS should specifically address how a rupture in, say, the Fergus Falls Fish & Game Club’s parcel or near the Orwell 9 unit, would impact recreation at those locations. Furthermore, abandoned pipeline infrastructure has the potential to have ongoing environmental impacts and the DEIS should fully assess the foreseeable impacts to recreation from this project after it has been decommissioned and abandoned in place by the company.</p>	Impacts of a CO ₂ release on recreation have been addressed in Section 8.3.1.5.	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>CURE agrees with the DEIS’s conclusion that the economic impacts of the project would be minimal, if not entirely negative when considering the property value losses due to the hazardous nature of this project. It is clear that the economic benefits being reported externally by the applicant are not accurately describing all the foreseeable economic impacts. This raises important questions about why the DEIS reports the applicant’s estimated tax revenue and overall economic benefits, without any analysis or independent verification of those amounts. As Dr. Secchi notes in her direct testimony, “there is robust literature that shows that these applicant reports are rhetorical devices that use inappropriate methods.”²⁰ The applicant’s report itself acknowledges the limits of its usefulness: <i>This report is intended solely for use by Summit Carbon Solutions...we make no representation as to the sufficiency of the report and our work for any other purposes. Any third party reading this report should be aware that the report is subject to</i></p>	The EIS discloses the results of a socioeconomic analysis performed by a third party contracted by the applicant. EERA staff concludes that socioeconomic impacts are anticipated to be minimal, short term to long term, and similar across the three route alternatives. A full, independent economic analysis is outside the scope of this EIS, and it is not implied that one was conducted. Chapter 6 describes alternative technologies for decreasing CO ₂ emissions.	20242-203795-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p><i>limitations, and the scope of the report was not designed for use or reliance by third parties for investment purposes or any other purpose.</i>²¹</p> <p>Importantly, these kinds of applicant-funded and applicant-supplied economic “studies” only look at benefits, not costs. Conspicuously absent is a discussion about opportunity costs, such as alternative use of public funds the projects depend on.²² A recent study compared the applicant’s project with building wind farms at the same cost. The study concludes that “investing in wind turbines to provide electricity for BEVs [battery electric vehicles] is far more beneficial in terms of consumer cost savings, CO₂e emissions, land use, and air pollution than making the same investment in a plan to capture CO₂ from ethanol refineries, pipe the CO₂ to an underground storage facility,” and use the ethanol for consumption in vehicles.²³</p> <p>Given that the report relied upon to determine economic impacts of the project is supplied by the applicant and has not been independently verified, EERA cannot use the applicant’s report as an accurate, full economic analysis. This is especially true since the report itself cautions against this exact type of false reliance. It is essential that the final EIS either entirely remove and replace the applicant’s estimations, or independently verify or vet those estimations. The final EIS should also consider the opportunity cost of the project. This may require EERA to redo a significant amount of analysis, which is necessary in order to have an accurate assessment of the actual economic impacts likely to flow from this project.</p>		
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>The DEIS recites the horrifying dispossession of land that occurred in 1863 along with the shameful history of promises made and broken, as well as the forced signing of land cessions under duress. It would be helpful for the DEIS to specifically acknowledge any experts who contributed to this part of the environmental analysis. Treaties between the federal government and Indian Nations are inherently difficult to interpret without fully understanding the intention of the tribal leadership at the table, which generally requires proper consultation with experts in the affected tribal communities. The DEIS should acknowledge any preparers who supplemented EERA’s staff on this analysis.</p> <p>It is incorrect to state that simply because land was stolen, and the treaties were abrogated in 1863 there is no potential for impacts to treaty rights. For example, to the extent that this project perpetuates the ethanol industry it also increases inputs to concentrated animal feeding operations, also known as “factory farms.” Ethanol distillers grains are regularly used as cheap feed for animals in factory farms.²⁴ Such facilities are being proposed on the doorstep of tribal communities in the same region as this project, such as White Earth’s reservation.²⁵ As a result, an analysis of treaty rights that ends in the 1800s is incomplete and all Dakota and Ojibwe Tribes with historic connections to this land should be given the opportunity to add information to the EIS regarding foreseeable impacts to their air, water, wildlife, and cultural interests from this project.</p>	Thank you for your comment. A list of preparers is included in Chapter 12. The ROI for Tribal Treaty Rights is the project area; therefore, the EIS describes treaties that overlap this geographical area. Tribes have had the opportunity to provide comment on potential impacts analyzed in the EIS throughout the environmental review and permitting process (see, e.g., Appendices J and O).	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>Tribes also have significant responsibility for emergency response and public safety, and that staff is not limited by arbitrary laws from 1863 that seek to hem them into small geographic spaces. To the extent that Tribal EMS staff may be called on to deal with a rupture of this pipeline that should be viewed as impacts to relevant tribal resources and fully analyzed in the EIS with the input of the foreseeably impacted governments. At minimum, the same Tribes who contributed staff time and expertise to the archeological studies for the DEIS should also be consulted regarding their concerns, and Tribal EMS capabilities that could be impacted by any part of the proposed pipeline network attached to this project.</p>	Given the proposed pipeline route and associated facilities would be located in Otter Tail and Wilkin Counties and would be in proximity to the city of Breckenridge and the city of Fergus Falls, these local governmental EMS services and personnel would likely be the first responders called upon in the event of an unanticipated release associated with the project. Tribal reservations and lands are not located in proximity to the proposed project, and Tribal EMS staff would not likely be called to respond to an unanticipated release. Section 8.3.1.5 has been updated to indicate that impacts on Tribal EMS services are not anticipated.	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>The DEIS concludes that the economic impacts of the project on agriculture over the long term would be minimal. This appears to be in part because the DEIS believes any impacts to crop productivity will last for two to three years, on average. But recent research summarizing studies in this area contradicts this assumption and suggests that impacts from construction may be much more long-term.²⁶ For example, one study found that corn grain yields were reduced by up to 50% during the first two years after the installation of the pipeline, but that even after ten years, “ROW crops were only yielding 77% of control area yields.”²⁷ Another study confirmed that “silking was delayed, corn plants were stunted, and yields were decreased on ROW,” and persisted even with the use of fertilizer.²⁸ In short, “published research has demonstrated a general consensus that pipeline installations have resulted in lasting soil physical and chemical degradation and subsequent decreases in plant productivity.”²⁹ This remains true, even with more contemporary construction practices that aim to separate topsoil and subsoil.³⁰ The final EIS must reconcile the fact that</p>	As indicated by the definitions found on Page 5-1 of the draft EIS, “long-term impacts extend beyond the end of construction and are generally associated with operation of the project.” Disturbance to soils and crops from construction can result in impacts that extend beyond the construction phase. The text in the final EIS has been revised to indicate that impacts can be long term.	20242-203795-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			“contemporary pipelines installation still results in sustained soil degradation and crop yield losses,” with its assumption that any economic impacts to agriculture will be short-term and minimal.		
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	While the DEIS goes through the motions of listing impacted resources, it appears that information provided by the applicant generally leads to overly optimistic analysis. In order to adequately analyze the foreseeable impacts of this project, EERA must acknowledge the technological limitations and recent history of the carbon capture industry. It does not work well and it generally is used to extract oil, not reduce climate emissions. Given the widely available facts about this project and others in the U.S., the DEIS should be updated and put in the larger context of the existing industry. Similarly, the DEIS cannot assume total mitigation of other impacts by other state agencies when the available evidence shows that regulatory enforcement is lacking and ineffective.	Thank you for your comment. The sources of information used to prepare the draft EIS are included at the end of each chapter. Section 5.7.2.3 has been revised to further discuss EOR and provide estimated volumes of produced oil and CO ₂ emissions from EOR for different CO ₂ capture rate scenarios.	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	By this point, it is widely accepted that climate change is happening, and that the impacts of a warming climate are here to stay. Our unseasonably warm and relatively snow-free winter and the previous few years of drought and wildfires are just the most immediate symptoms of these changes. ³¹ Many of us have good-faith desires to stop climate change by reducing greenhouse gas emissions, including the emissions of carbon dioxide. But because carbon dioxide removal is a limited resource, how we choose to make those GHG emissions reductions is extremely important. ³² Carbon capture applied to ethanol refineries is not the best use of these resources. As Dr. Grubert notes in her direct testimony, projects like the one proposed by applicant rely on pipelines, which are extremely long-lived, ³³ “with serious implications for host communities, landscapes, and long-term land use options.” Furthermore, corn ethanol itself is highly land and water intensive and provides limited benefits to the energy system. It has a high carbon intensity relative alternative fuels like renewable-generated electricity, even with the addition of carbon capture and storage. Of course, the DEIS is not intended to consider the merits of a particular project. But the DEIS must accurately describe the potential impacts of that project. And in this case, the DEIS has failed to do so when it comes to describing and estimating the climate change impacts of the proposed project.	Thank you for your comment.	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<i>1. The DEIS Erroneously Assumes 100% Capture and 0% loss of CO₂ Captured at the Green Plains Ethanol Plant</i> The DEIS assumes, without any evidence of independent verification, that the proposed project is capable of and will capture 100% of the CO ₂ emitted by the Green Plains ethanol plant: “By capturing and sequestering the CO ₂ underground, the project would provide a net benefit to GHG emissions and lower the carbon intensity of the ethanol plant because the emissions sequestered from ongoing annual operations would outweigh the capture facility’s construction and operation emissions.” ³⁴ This assumption is apparently based only on the applicant’s own statement that “the capture facility is designed to capture 100 percent of the CO ₂ produced by the ethanol plant.” ³⁵ But there is significant gap between what a facility is designed to capture and what it is actually capable of capturing. In reality, no carbon capture facility has produced publicly available information that supports the conclusion that the technology can and consistently does capture 100% of the target emissions. ³⁶ For example, the Illinois Industrial Carbon Capture and Storage project in Decatur, IL, has been in operation since 2017. ³⁷ Originally designed to capture one million metric tons of CO ₂ per year from the Archer Daniels Midland ethanol facility, the project has never been able to meet that goal. ³⁸ In fact, it has consistently been underperforming by about 48%. ³⁹ The only other example of a “large-scale” carbon capture facility at an ethanol plant is the Red Trail Energy facility in Richardton, North Dakota. The facility started capturing and sequestering CO ₂ from the adjacent ethanol facility in June 2022, claiming it is capable of capturing 100% of the plant’s emissions. ⁴⁰ But publicly available information about its first full year of operation has yet to be released. More recently, the Blue Flint ethanol facility in Underwood, North Dakota, began capture and sequestration of facility emissions and has reported, without evidence, a 100% capture rate. ⁴¹ Press releases aside, there is no available proof that any ethanol plant can capture as much CO ₂ as the DEIS assumes without proof will be captured at this project. Even if the applicant is able to defy what current technology has proven it is capable of accomplishing in other ethanol plants and captures 100% of the emissions from the Green Plains ethanol plant, the DEIS still assumes that no CO ₂ is lost throughout the transportation or sequestration process and that the CO ₂ will be stored for a climate-relevant (1,000 years) period of time. There is no evidence to support that assumption. Additionally, other carbon capture facilities attached to CO ₂ pollution sources have been turned on and off depending on the need for CO ₂ and the upkeep of the capture technology. For example, the Petra Nova plant in Texas stopped capturing CO ₂ for three years before its owner announced it may begin again. ⁴² Similar to the examples noted above, Petra Nova never met its goals for tons of CO ₂ captured over the years it did operate. ⁴³ It is not realistic to assume that the project will operate without any breakdown or updates for the entire lifetime of the ethanol plant. The DEIS must assess the excess pollution potential for regular or unplanned shutdowns of	Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. Text has been added to Section 2.1 describing the suitability of the Broom Creek Formation in North Dakota for CO ₂ sequestration, as well as the monitoring and testing that would be done to verify that the CO ₂ is contained in the storage reservoir. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios of 100 percent, 70 percent, 40 percent, and 10 percent.	20242-203795-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>the carbon capture technology while ethanol is still being produced.</p> <p>What the DEIS fails to capture is the lifecycle CO2 emissions reduction—or increase—that the project will actually accomplish. This is confirmed by Dr. Grubert’s direct testimony, in which she concludes that “the DEIS fails to consistently distinguish between the amount of CO2 captured and the amount of CO2 permanently stored and does not address the level of net CO2 abatement.”⁴⁴ The final EIS must reflect the lack of evidence for the project’s ability to capture, transport, and permanently store all of the emissions from the facility.</p>		
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>2. The DEIS Ignores the Potential for Enhanced Oil Recovery</p> <p>The DEIS does briefly address the issue of enhanced oil recovery (EOR) in the larger discussion of GHG emissions from the project. But the DEIS makes several significant errors. First, it asserts that “production of oil through EOR would not be dependent on the availability of CO2 produced by the ethanol plant.”⁴⁵ North Dakota regulators and businesses with an eye on CO2-EOR say otherwise. Indeed, a consultant report presented to the North Dakota Legislature in 2016 went into great depth of the link between CO2 brought to North Dakota and EOR potential. It found: <i>If the Bakken is to realize its full EOR potential, the CO2 EOR projects in North Dakota will have to rely primarily on anthropogenic sources of CO2 supply....The development of CO2 EOR in the Bakken will require about 35 MMt of CO2 per year by 2035. That would require a combination of sources of supply within the state and from states nearby.</i>⁴⁶</p> <p>Plans to expand CO2 supply from anthropogenic sources have been on the radar for the oil and gas industry and their lobbyists for many years. This 2017 report from the Great Plains Institute explains the relationship: <i>Natural geologic supplies of CO2 are constrained and gradually depleting, so the potential to grow the EOR industry hinges upon increasing the supply of anthropogenic CO2, thereby also reducing net carbon emissions. In that context, low-cost, high-purity biogenic CO2 from fermentation in ethanol production represents a key early target for making additional anthropogenic CO2 available for EOR.</i>⁴⁷</p> <p>Lyn Helms, the Director of North Dakota Mineral Resources, also recently reiterated the need for external sources of CO2 for North Dakota CO2-EOR production: <i>Carbon dioxide has got to come to North Dakota from somewhere, if we’re going to stabilize and sustain Bakken oil production. So, we’ve got to find a way for carbon capture and utilization to become a part of North Dakota’s economy, or we will leave billions of barrels of oil in the ground.</i>⁴⁸</p> <p><i>In short, the relationship between EOR and CO2, especially CO2 produced by ethanol plants, are well-documented and expected to continue. And as the DEIS acknowledges, “it is possible” for CO2 captured by the project will be used for EOR. Statements made by the applicant’s Chief Organizational Officer, Jimmy Powell, confirm this point: “If another carrier decided to use, or ask us to transport CO2 for another purpose, like enhanced oil recovery, then that’s a possibility.”⁴⁹ Powell also confirmed that the applicant will be maintaining 10% of their capacity for other shippers.⁵⁰ The Petra Nova plant, mentioned above, went offline for three years due to the price of oil and the direct link between its carbon capture facility and its income from EOR,⁵¹ which was how the carbon capture was funded and made profitable in years of higher oil prices.</i></p> <p><i>Given the above, and the uncertainty of whether the CO2 sent to North Dakota will be stored or used for EOR, the DEIS must consider the very real possibility that all of the CO2 captured at the facility will be used for EOR. The 190,000 tons of CO2 proposed to be captured is about 2% of the contracted amount of CO2 the applicant has reported. It’s about 1% of the maximum capacity of CO2 the applicant has reported being able to capture and transport. This is dwarfed by the 10% that the applicant says can be used for any purpose after it is shipped in the pipeline. In short—all of the CO2 captured at the Green Plains facility could be used for EOR, and then some.</i></p>	<p>The text questioned by the commenter in Section 5.7.2.3 was prefaced with the following: "if all the CO2 produced by the ethanol plant is sequestered as proposed, EOR would likely continue in North Dakota using other sources of CO2, other gases, thermal methods, or chemical methods." Revisions are not necessary. However, Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO2 transported by the project could be used for EOR.</p>	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>Despite this, the DEIS concludes that “given the number of variables, quantifying this amount could not be done with any reasonable certainty, and a generalized formula to predict oil extraction could not be identified,” and that therefore, “it would be speculative to conclude whether the availability or absence of CO2 from the ethanol plant would have a significant effect on future oil production.”⁵² But data from the EPA, International Energy Agency (IEA), and the Carnegie Endowment provide clear information which the DEIS can and should use to estimate the GHG emission impacts of CO2-EOR. First, the IEA reports that between “300 kg CO2 and 600 kg CO2 is injected in EOR processes per barrel of oil produced in the United States.”⁵³ The EPA estimates that an average carbon dioxide coefficient of one 42-gallon barrel of oil is 426.10kg CO2.⁵⁴ The Carnegie Endowment’s Oil-Climate Index confirms this general average and estimates an average carbon dioxide coefficient of 471kg CO2-e per barrel of crude oil for Bakken No-Flare-produced oil and 532 kg CO2-e per barrel for Bakken Flare-produced oil.⁵⁵ Clearly, the information is available for EERA to estimate the potential GHG emissions impacts of the project’s CO2 being used for EOR.</p>	<p>Section 5.7.2.3 has been revised to include an estimate of emissions from oil produced with EOR using the CO2 captured from the ethanol plant.</p>	20242-203795-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	Following the pipeline rupture near Satartia, Mississippi, the Pipeline and Hazardous Materials Safety Administration (PHMSA) issued an advisory bulletin related to the risks of land-movements and geohazards for pipelines. Chapter 8 of the DEIS mentions this advisory bulletin, but does not address whether the applicant has followed the recommended procedures outlined in the bulletin. The final EIS must include that information, as well as evidence supporting any claims by the applicant that it has followed those guidelines. If the applicant has not followed those guidelines, the final EIS should include an explanation from the applicant as to why it did not and an analysis of the failure to comply with best practices identified by federal expert agencies.	Text has been added to Section 5.7.3.4 describing geohazard assessments for the project designed to comply with PHMSA Advisory Bulletin 2022-01. As noted in Section 5.7.3.4 and Section 8.1, the applicant has committed to conducting a Phase I Geohazard Assessment to identify areas surrounding the pipeline that may be prone to large earth movement, as recommended by PHMSA in its June 2022 Advisory Bulletin, and EERA staff recommends that the results of the Phase I Assessment, and any subsequent assessments, should be provided to the Commission.	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	The DEIS fails to include an analysis of the potential impacts, both short- and long-term of the proposed project on public and designated lands in the event of a leak or rupture. General impacts of a leak or rupture are of course described in Chapter 8. But the specific impacts that might occur in these unique public and designated lands are ignored. This is especially concerning as the DEIS lists federally- and state-listed endangered/threatened/special concern species without any meaningful discussion of how impacts to their habitat would harm their ability to continue to live in the area. The final EIS should look at each of the Waterfowl Production Areas within at least 1,000 feet of the ROW, given what the rupture modeling in Appendix G estimates about the potential impact radius of a rupture. Furthermore, a more in-depth analysis of the potential impact on aquatic ecosystems on public lands is necessary to better understand potential impacts to aquatic life long-term.	As described in Chapter 8, operation of the proposed pipeline would include integrated systems for detecting leakage, as well as protocols for addressing leaks promptly. Minor CO ₂ leaks from operation of the proposed pipeline would not elevate ambient CO ₂ to a level that is detrimental to waterfowl and other wildlife within Waterfowl Protection areas (WPA). RA-South would cross the corner of an unnamed WPA and be near other WPAs, including the Orwell 9 Unit and Ridgeway WPA in Otter Tail County. If a leak or rupture occurred within a WPA, wildlife habitat could be affected in the same way as described above. RA-North and RA-Hybrid would cross the same unnamed WPA, but would not cross any other WPAs.	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>The DEIS identifies lake sturgeon as a species potentially impacted by the project and that is under consideration by the U.S. Fish & Wildlife Service for listing in mere months. No further discussion is given to the potential impacts of the project on these fish, because it is assumed that “documented occurrences in the Otter Tail River [are] well upstream of all three route alternatives.”⁵⁶ But the DNR has recently tagged and released sturgeon into the lower Otter Tail River, below the Orwell Dam in Fergus Falls, which totally refutes the assumption that the fish only exist upstream.⁵⁷ The DEIS’s silence on this runs counter to state government’s ongoing and important conservation and research activities regarding this species.</p> <p>Lake sturgeon (<i>Acipenser fulvescens</i>) is a large, long-lived, freshwater fish species that historically inhabited rivers and lakes throughout three major North American watersheds: the Hudson Bay, the Great Lakes basin, and the Mississippi River.⁵⁸ This includes the Red River Basin.⁵⁹ Lake sturgeon’s preferred habitats are large shallow lakes, rivers, and near-shore areas.⁶⁰ Lake sturgeon feed by using their protruding mouths to suction up bottom-dwelling organisms such as crayfish and other crustaceans as well as insect larvae.⁶¹ Lake sturgeon have a low reproductive rate and may not begin to spawn until they are fifteen to twenty-five years old.⁶² Mature males spawn on average every other year and females spawn on average every three to four years.⁶³</p> <p>Sturgeons are highly vulnerable to habitat alteration because of their specialized habitat requirements, the long time it takes them to reach breeding maturity, and their episodic reproductive success. Temporary impediments, changes to behavior, temporary loss of habitat, and/or the alteration of water quality could increase the stress rates, injury, and/or mortality experienced by fish. If a pipeline rupture, spill, or other inadvertent release occurs within a waterbody, the resulting turbidity could impact water quality and impede fish movement, potentially increasing the rates of stress, injury, and/or mortality experienced by fishes.</p> <p>Because of the project’s potential to “increase sedimentation and erosion, modify hydrological flow, release chemical and nutrient pollutants from sediments, and introduce chemical contaminants such as fuel and lubricants,” the final EIS should include a detailed discussion of how the proposed project may impact this vulnerable species—including what may happen in during construction, operation, and in the event of a leak or rupture. The DEIS should more generally have sufficient information regarding all the listed species noted to assure that any potential take is foreseen and mitigated. Merely naming species and assuming they will be fine is not an analysis of potential impacts.</p>	The United States Fish and Wildlife Service (USFWS) recently announced (on April 23, 2024) that listing of the lake sturgeon is "not warranted" at this time. Therefore, the draft EIS discussion of potential impacts on all fish species potentially present applies to the lake sturgeon as well. However, additional language regarding lake sturgeon presence in the upper and lower reaches of the Otter Tail River was added to the Rare and Unique Resources section (5.7.5) and to the Wildlife section (5.7.10.1) in order to more fully describe the extent of lake sturgeon presence in the river.	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	The DEIS incorrectly states that potential impacts on soil and corresponding vegetation would be expected to be short-term, lasting between two and three years, and potentially up to five years after restoration. ⁶⁴ As discussed in section I.b.i. above, studies suggest that the impacts of pipeline construction on soil and vegetation can last well beyond two to three years. The final EIS must include a more robust discussion of this issue and either adjust its estimates or explain why this project will be different from those studies and	Section 5.7.6 explains that the applicant would comply with required permits and implement its Minnesota Environmental Construction Plan (ECP) and Minnesota Agricultural Protection Plan (APP), which would minimize impacts on soils. The text in Section 5.7.6 has been revised to	20242-203795-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			able to ensure it will not have long-lasting impacts on soil health and plant productivity. EERA should also respond to concerns raised by Dr. Secchi and Dr. Dolph in direct testimony in PUC Docket No. 22-422.	indicate that while most impacts on soils during construction would be minimal and temporary, some impacts could be longer term.	
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>Water is a precious resource, one that is threatened by climate-change induced drought and deluge making water availability and quality uncertain, even in the land of 10,000 lakes.⁶⁵ The DEIS provides a cursory discussion of the amount of water that might be needed during construction and operation of the project, but assumes that because the Department of Natural Resources (DNR) has regulatory authority over water appropriations, it is not necessary at this time to require clear answers from the applicant about total water use, evidence for those estimates, and an analysis of how existing water use would be impacted by the proposed project. This is incorrect and ignores the clear directives of the Minnesota Environmental Protection Act (MEPA).</p> <p>DNR has famously and consistently failed to enforce groundwater appropriation limits, both across agricultural areas in Minnesota as well as against pipeline companies, namely Enbridge and its ongoing aquifer breaches caused by Line 3. Both the Star Tribune and New York Times have reported on the state’s failure to make any meaningful efforts to rein in over-pumping of groundwater by well permit owners in recent years.⁶⁶ “During the 2021 drought, nearly 800 Minnesota farmers with high-capacity wells pumped 6.5 billion more gallons of water than their permits allowed, state records show.”⁶⁷ In response DNR merely acknowledged that that was a lot of water and said they were “trying” to get people to comply with their permits.⁶⁸ The reporting of over use is said to be an “honor system” with no compliance checks by DNR.⁶⁹ Minimal fines are often given, and frequently forgiven before they are fully paid, but are not sufficient to deter violations in any case.⁷⁰</p>	Thank you for your comment.	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	Closer to EERA’s expertise and experience, the Line 3 pipeline has repeatedly been shown to have caused aquifer breaches that resulted in millions of gallons of groundwater lost for no economic purpose. ⁷¹ Although Enbridge was charged criminally for three of the breaches, more breaches are still being discovered ⁷² and criminal enforcement clearly had no deterrent effect on what was already a fait accompli when the pipeline construction repeatedly punctured aquifers leading to uncontrolled leaks. Environmental review and mitigation before construction is the only viable opportunity for preventing such breaches and misappropriations, reliance on DNR rather than proper analysis in the DEIS is a mistake that has demonstrably not protected groundwater resources in the past.	Thank you for your comment.	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	EERA must revisit its discussion about water resources and include a detailed discussion about where the applicant’s water appropriations will come from (what water source), what the existing water use conditions are for that source, and how the proposed use will impact nearby wells (ROI should be at least at the County level, given the intricate and interconnected nature of water resources). Additionally, the DEIS should discuss what available mitigation measures for fixing aquifer breaches would be sufficient to cure construction mishaps when they occur. To the extent that aquifer breaches cannot be fixed after the fact, the DEIS should discuss this and fully lay out the foreseeable impacts of these water appropriations that are known to occur when pipelines are constructed through Minnesota aquifers.	Additional detail regarding water appropriations has been added to Section 5.7.8.2. Section 5.7.8.2 acknowledges that damage to aquifers is a serious problem and indicates that an uncontrolled flow of water from a shallow confined aquifer could have a significant, long-term impact on groundwater. Furthermore, text has been added to Section 5.7.8.2 to indicate EERA staff recommends the applicant develop, in coordination with DNR, a plan for pipeline construction in areas crossing the beach ridge system area. The plan would include, at a minimum, measures to minimize the potential for breaching a shallow confined aquifer during trenching and contingency measures to mitigate the impacts of a breach, should one occur.	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	Additionally, CURE would like to incorporate by reference all of Dr. Christy Dolph’s direct testimony as it is also relevant to the inadequacy of the DEIS analysis regarding water and soil impacts. Dr. Dolph’s points about the failure to assess different routes’ potential impacts on the relevant aquifer should be addressed in the final EIS.	Thank you for your comment.	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	The DEIS does acknowledge that horizontal directional drilling (HDD) may negatively impact soils and waterbodies in which installation occurs. But the DEIS does not provide an adequate discussion of the potential impacts to water quality and overall ecosystem harms that may occur in the event of “frac outs,” from either bentonite clay or additives mixed with drilling fluid for lubrication purposes. Furthermore, the DEIS fails to discuss whether or how the risk of frac outs can be mitigated or explain why the risk cannot be mitigated. As noted above, this is especially important to consider given the record of numerous frac outs that occurred during construction of Line 3. ⁷³	The EIS discloses the potential for an inadvertent release of drilling mud and describes potential impacts in Chapter 5.	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	Despite comments submitted by CURE and others during the scoping process, ⁷⁴ the DEIS does not address the potential impacts of a CO ₂ leak or rupture in water during winter conditions, and particularly, when there may be ice covering open waters or wetlands. The final EIS must include information about this issue.	Sections 8.3.1 and 8.3.4 have been revised to discuss the potential impacts of ice covering waters or wetlands at the point of a rupture. In general, if CO ₂ released from the pipeline was trapped by ice, then the CO ₂ would release more slowly into the atmosphere as it traveled	20242-203795-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				laterally under the ice until it escaped through cracks or gaps in the ice, thereby decreasing the impact distance (the distance the CO ₂ would travel through the air). The EIS modeled the worst-case scenario where the CO ₂ is not trapped by ice. In the event of a pipeline rupture that caused CO ₂ to be trapped by ice covering a waterbody, CO ₂ could remain in contact with the water for more time, and the concentration of carbonic acid could increase. In other words, the water and aquatic species could experience a greater impact from the CO ₂ , but the atmosphere would experience less CO ₂ , and the risk to humans and other terrestrial species would be lower.	
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>Wetlands ecosystems are among the most valuable in the world because they provide critical ecosystem functions like carbon sequestration, biodiversity conservation, fish production, water purification, and erosion control.⁷⁵ In general, most of the state’s naturally occurring wetlands have been eliminated, in large part due to the conversion of that land to agricultural purposes.⁷⁶ But wetlands are also difficult to restore once damaged and often never recover their original functions. This means that remaining wetlands are even more important to protect from degradation. As a result, Minnesota has “adopted a broad policy goal to achieve no-net-loss” of remaining wetlands and promote “increases in the quantity, quality, and biological diversity of wetlands.”⁷⁷</p> <p>There appears to be a discrepancy in how the DEIS reports the potential wetland impacts of the project. In one place, the DEIS asserts that “the loss of wetlands would be less than 0.01 acre, resulting in minimal change in water resource land cover.”⁷⁸ But in Table 5-44, the DEIS reports that acres of wetland impact within the construction workspace alone for all three routes would be between 0.8 acres and 4.7 acres for both construction and operation of the project.⁷⁹ And in Table 5-51, the acres of wetlands within the ROI (route width), are even larger—20.9 acres for RA-North, 24.7 acres for RA-Hybrid, and 44.6 acres for RA-South.⁸⁰ The final EIS must identify which of these totals is most accurate in estimating potential wetland impacts and losses and explain why it reaches that conclusion.</p>	Discrepancies between Table 5-4 and Table 5-54 result from different datasets and the associated resolutions. Table 5-4 uses NLCD data to analyze land cover, and Table 5-54 uses NWI data to analyze wetlands. Table 5-40 has been edited to be consistent with discussions of impacts on wetlands in Section 5.7.9 and Table 5-53 and Table 5-54.	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	As explained above, the DEIS lacks a detailed discussion about the potential impact on lake sturgeon, which is up for federal listing consideration this year. Additionally, the DEIS assumes without support that in the event of a rupture, any mobile animals would simply move away from the point of rupture. This is inconsistent with the rupture modeling in Appendix G, which suggests that the rate at which CO ₂ is released in the event of a rupture would make it difficult for even highly mobile animals to escape quickly enough to avoid harm or death. ⁸¹	<p>USFWS recently announced (on April 23, 2024) that listing of the lake sturgeon is "not warranted" at this time. Therefore, the draft EIS discussion of potential impacts on all fish species potentially present applies to the lake sturgeon as well. However, additional language regarding lake sturgeon presence in the upper and lower reaches of the Otter Tail River was added to the Rare and Unique Resources section (5.7.5) and to the Wildlife section (5.7.10.1) in order to more fully describe the extent of lake sturgeon presence in the river.</p> <p>The data presented in Appendix G describes models of dispersal patterns in the immediate vicinity of a rupture. These models support the statements in Chapter 8 that wildlife in the immediate vicinity of a rupture might be exposed to high levels of CO₂, which could be toxic for species or individuals unable to leave the area of the release.</p>	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>On February 6, 2023, the Commission denied CURE’s petition for an EAW for the entire Minnesota footprint of the Midwest Carbon Express. According to the Commission, because there is no application currently before it on the Jackson to Kandiyohi and Martin County portions of the MCE, it cannot consider the impacts of those routes. CURE petitioned for reconsideration and the Commission again disagreed, maintaining its denial of CURE’s petition for an EAW.</p> <p>Since then, the applicant has made multiple public statements about its intent to submit applications for the Jackson to Kandiyohi and Martin County portions of its MCE project. The DEIS also recognizes the inevitability of those applications, saying: The project would connect to a larger CO₂ system known as the MCE Project....the applicant expects to submit additional routing permit applications in the future. The applicant anticipates having permits for all pending applications in hand to start construction for portions of the project by first quarter 2025 and plans to begin operation by early 2026.⁸²</p> <p>Undeniably, the Otter Tail to Wilkin project is the MCE Project. As CURE has stated multiple times, the MCE is a phased project, and</p>	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20242-203795-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			the environmental, human, economic, and other impacts of all 241.8 miles of the project must be considered cumulatively now, not through piecemeal environmental review over the next two years. ⁸³		
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>III. <i>The DEIS does not adequately consider the full environmental impacts of corn ethanol.</i></p> <p>The Greenhouse gas, Regulated Emissions, and Energy Use in Transportation (GREET) model was developed by the Argonne National Laboratory to “examine[] the life-cycle impacts of vehicle technologies, fuels, products, and energy systems.”⁸⁴ The GREET model can offer some insight into how to quantify and compare the carbon intensity of products, but is not designed to provide a comprehensive overview of all the impacts, including water quality and soil health.⁸⁵ The final EIS should more explicitly explain the externalities associated with ethanol production, not only the fuel’s carbon intensity.</p> <p>Additionally, as explained by Dr. Grubert in direct testimony, the DEIS incorrectly calculates the carbon intensity score of ethanol at the Green Plains plant with the project.⁸⁶ Not only does the DEIS use the wrong calculations, it also only measures the amount of carbon captured instead of the amount of CO₂ abated per megajoule (MJ) of ethanol. Because “an accurate CI score cannot be estimated without a clear understanding of the fate of captured CO₂, including pipeline leakage, storage leakage, and failure to permanently store CO₂,” the final EIS must estimate the amount of CO₂ abated instead of only the amount captured.⁸⁷</p>	<p>The EIS has been revised to include the proposed changes presented by Summit's response to commenters’ suggestion: (1) The draft EIS states, “[t]he project would reduce the ethanol plant’s CI score to 36.3.” The following sentence states, “The following equation shows how the project would change the CI score of the ethanol plant by serving as a credit that can be deducted from the overall score.” Those two statements are in conflict with each other. However, by changing “to” to “by” in the first sentence, they would no longer be in conflict. Accordingly, this language has been revised in the final EIS to more accurately reflect the Project’s impact on the CI score by stating, “[t]he project would reduce the ethanol plant’s CI score by 36.3.” (2) The calculations provided in the draft EIS (Chapter 6, Page 6-7) represent the CI score impact of capturing and storing fermentation CO₂ from the Green Plains Ethanol plant. The CI score determined in the draft EIS includes the direct and indirect emissions associated within the proposed design and construction of the project. Table 5-39 provides a summary of GHG emissions from the initial construction as well as the proposed ongoing annual operations from capture (abated), capture facility, and updated values for electricity use. Electricity use in the draft EIS was estimated to be 26,893 (MT CO₂e/yr) and was calculated using the California GREET model emission factor of 684.35 g CO₂e/kWh for the Midwest Reliability Organization West region, which includes Otter Tail and Wilkin Counties. The draft EIS estimated an annual project electricity use of 39,297,360 kWh. [CO₂e (metric tpy) = 39,297,360 kWh x 684.35g CO₂e/kWh x 0.0022046 lb CO₂/g CO₂/2000 lb/ton x 0.907185 metric ton/ton]. The annual project electricity use has been updated to reflect the design for 100 percent electrical use from an updated source at about 38.5 million kilowatt hours (kWh), an about 0.8 percent reduction in kWh (the 38.5 million kWh assumption is updated to reflect Summit’s response to Question 6 in Summit’s Response to Supplemental Information Inquiry 5). Utilizing the GREET emission factor for LREC of 132.2 g CO₂e/kWh, this results in emission sources of 5090 MT CO₂e (about 3 percent of the 0.19 metric tons per annum at 100 percent capture design rate). The equation in Section 6.1.4 has been edited to estimate the impact of the proposed project on the net CI score as suggested: (CI score without CCS) – (g CO₂/MJ abated). Table 6-2 has been added to include a range of net CI scores for various capture rate scenarios. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios for 100 percent, 70 percent, 40 percent, and 10 percent.</p>	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>IV. <i>The Rupture Analysis Does Not Provide Enough Information to be Relied Upon</i></p> <p>CURE is appreciative of the Department’s work to find and coordinate with an analyst to create the rupture study in Appendix G. Minnesota is the only state in the footprint of the applicant’s MCE project to have conducted independent modeling and made it publicly available. However, there are several issues with the analysis that must be addressed in the final EIS and prior to any decision the Commission makes on the route permit. The final EIS must “show its work” and prove the validity of its analysis.</p>	<p>Thank you for your comment.</p>	20242-203795-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p><i>IV. The Rupture Analysis Does Not Provide Enough Information to be Relied Upon (cont.)</i></p> <p>At public meetings in Breckenridge and Fergus Falls in February 2024, commenters identified a discrepancy in the reported estimated time for closing mainline valves (MLVs) during an emergency. The applicant states that it will be able to respond to an emergency situation and close the relevant valves within ten minutes of a rupture or release occurring. The final EIS should scrutinize the applicant’s assertions on this issue and require applicant to provide evidence supporting those assertions.</p>	<p>Text in Section 4.5 on valve closure time has been revised from 25 minutes to 10 minutes. Elsewhere in the EIS, including the rupture analysis, valve closure time is listed/calculated as 10 minutes. Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that is not outdated but would be revised, as required by PHMSA, if the project is approved. Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.</p>	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p><i>IV. The Rupture Analysis Does Not Provide Enough Information to be Relied Upon (cont.)</i></p> <p>As noted by Dr. John Gorman in direct testimony submitted on behalf of CURE, the CANARY software used in Appendix G does not apparently account for critical factors related to pipeline ruptures, including spatial or temporal variations in local windspeed, changes in terrain or obstacles, dynamic three-dimensional thermal-fluid phenomena like convection, and ruptures where the angle of release is primarily vertical.⁸⁸ Beyond the limitations of the model itself, Dr. Gorman notes that “any result from any model is only as good as the assumptions and inputs used.”⁸⁹ Unfortunately, Appendix G fails to “discuss the actual equations being solved or the assumptions the software uses to perform the analysis,” and does not appear to have undergone verification and validation activities to determine how accurate the results of the model may be.⁹⁰ Dr. Gorman identifies similar gaps in information for the Computational Fluid Dynamics model included in the rupture report.⁹¹ In sum, Dr. Gorman ultimately concluded that because of lack of detailed information, “it is impossible to determine whether the conclusion about potential impact areas is correct.”⁹²</p> <p>Because EERA has never conducted this type of environmental review before, and because this analysis is so important to the public’s overall understanding of this new technology, it is imperative that the EIS transparently demonstrate the validity of the modeling it purports to present. At this point there is not enough information in the DEIS for experts to be able to understand what is being presented, this undercuts the purpose of environmental review because neither decision makers nor the public can be confident of the results proffered.</p>	<p>The rupture analysis performed for the EIS by Allied uses CANARY software developed by Quest Consultants. CANARY uses publicly available equations. These equations along with a discussion of how they are applied are in the CANARY User Guide.</p> <p>Critical factors were accounted for in the Aerial and Thermal Dispersion Analysis Report and the CFD Analysis Report dated January 15, 2024 (Appendix G of the EIS). CURE filed Information Request No. 2 on February 15, 2024, after Dr. Gorman's testimony was filed on February 13, 2024. The Minnesota Department of Commerce, Energy Environmental Review and Analysis Unit provided a response on February 28, 2024, which is attached to this comment matrix (Appendix O). In the February 28, 2024, response, the Minnesota Department of Commerce and Allied responded to further questions about "critical factors" in questions 3-6, 8, 9, 13, 14, 16, and 17 of the CURE IR 002 EERA.</p> <p>The CFD Analysis Report in Appendix G explains how Allied validated the CANARY model against the CFD modeling. This is not the approach Dr. Gorman explained he would take, but it is a valid way to vet a model. Allied has provided additional information about the verification and validation of CANARY in Appendix C to the Aerial and Thermal Dispersion Analysis Report (Appendix G of the EIS).</p>	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p><i>V. The DEIS Inaccurately Describes the Role of PHMSA and the Commission in Regulating the Project</i></p> <p>The DEIS makes a number of errors in describing the potential human health impacts of a leak or rupture. This starts with the incorrect summary about the role PHMSA plays in regulating CO₂ pipelines included in both Chapter 8 and Appendix G. PHMSA is the federal agency tasked with regulating “the safe and secure movement of hazardous materials to industry and consumers by all modes of transportation, including pipelines.” PHMSA does not issue permits to individual operators to transport hazardous materials, though it does issue permits when an operator seeks a variance to the standard Hazardous Materials Rules. Instead, PHMSA sets standard regulations for various elements of pipeline construction and operation—most of which explicitly reference industry-established standards.</p> <p>PHMSA did not regulate CO₂ transported via pipeline until 1991, following a 1988 Congressional directive that was prompted by concerns over a massive natural carbon dioxide release in Lake Nyos, Cameroon in 1986. Ultimately, PHMSA decided not to set standards specifically applicable to supercritical CO₂, because there were so few CO₂ pipelines in existence at the time, and those that</p>	<p>Thank you for your comment. PHMSA regulations (that is, their appropriateness) and related standards for CO₂ pipelines are outside the scope of the EIS (Appendix A). Section 3.6 acknowledges that PHMSA is currently conducting rulemaking proceedings on proposed amendments to its pipeline safety rules, and the Commission states it would be prudent for EERA staff and the applicant to take that information into account, even if the updates have not been finalized. Appendix G of the EIS further summarizes the extensive and detailed PHMSA CO₂ pipeline regulations applicable to the construction, operation, and maintenance of such pipelines, and the status of pending PHMSA changes to such (see draft EIS, Appendix G.2 and G.3).</p>	20242-203795-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			were in operation were almost exclusively used for enhanced oil recovery. The limits of PHMSA’s rulemaking are now more apparent than ever, as more and more companies line up to put CO ₂ pipelines in the ground across the country. A 2022 report from the Pipeline Safety Trust explains these various gaps in regulation and why they are important to resolve before permitting the thousands of miles of CO ₂ pipelines currently proposed. Most important for this discussion is the fact that “current federal pipeline safety regulations do not provide any methodology for assessing the hazard zone for CO ₂ pipelines or require that pipeline operators adequately address this risk.”	EERA staff has been following PHMSA CO ₂ pipeline rulemaking proceedings before and since issuance of the draft EIS. As of July 5th, 2024, PHMSA has not published the Notice of Proposed Rulemaking that will describe the scope of new and amended regulations, and changes to existing rules and regulations are not known. Therefore, as ordered by the Commission, it is not possible for the EIS to include a “discussion of mitigation strategies and measures to ensure public safety including, but not limited to, measures consistent with the proposed and final federal rules to the extent available” (Commission. September 26, 2023. Order Approving Scope of Environmental Review and Denying Stay. eDockets No. 20239-199149-01). Section 3.6 and Appendix G of the EIS have been updated with the above information.	
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>There is also uncertainty about whether PHMSA’s regulatory authority extends to all CO₂ pipelines. PHMSA’s current definition of “carbon dioxide” does not include pipelines transporting CO₂ in liquid or gaseous phases, or streams that contain less than 90% CO₂. Here, the applicant has stated that the pressure and temperature of the pipe will be between 30 and 115 degrees Fahrenheit. The supercritical point for CO₂, or the pressure and temperature at which it enters a supercritical phase, is 88 F and 1070 pounds per square inch (psi). At temperatures below the supercritical point, “part of the fluid will condense to liquid with a higher density than the fluid.” And if pressure drops below 1070 psi, “part of the CO₂ will convert to a gas/liquid mixture depending on the temperature.” Based on the applicant’s provided information, the CO₂ in its pipeline may vary between a supercritical state and some combination of a liquid or gaseous state. Thus, it is unclear whether PHMSA regulations even apply to the applicant’s pipeline. But more importantly, because PHMSA regulations are designed with only supercritical CO₂ in mind, it is unclear whether the regulations are adequately protective in instances where CO₂ is not consistently held in a supercritical phase in the pipeline. The final EIS must acknowledge and discuss this discrepancy and what it might mean for the health and safety of those living along or near the applicant’s pipeline. The final EIS must clearly identify which Code of Federal Regulations provisions it relies upon if it is in fact asserting that this project will be covered by relevant PHMSA regulations. If EERA cannot cite any relevant law that would apply standards to a pipeline carrying liquid or gaseous CO₂, the environmental review should explain this and discuss the potential impacts of routing a liquid/gaseous CO₂ pipeline that is built without applicable federal standards.</p> <p>It is also worth noting that when announcing its intent to update its regulations, PHMSA specifically identified a need to update its emergency preparedness and response standards. To the extent that the DEIS assumes there are federal standards for emergency response, it should discuss how the lack of current standards will impact public safety in the pendency of PHMSA’s regulatory updates. Appendix G and the DEIS do correctly note that while PHMSA is in the process of updating its CO₂ pipeline regulations, those rules will likely not be complete for some time. And there are no assurances from the applicant, nor any condition proposed in the DEIS that construction on the project—if permitted—should not begin until PHMSA has completed its rulemaking. Given the gaps that currently exist in PHMSA’s regulation, it is unconscionable to consider permitting the proposed project and subject people, places, and environments in the vicinity of the project to the potentially life-threatening impacts of a CO₂ pipeline.</p>	<p>Thank you for your comment. The appropriateness and adequacy of PHMSA regulations and related standards for CO₂ pipelines is outside the scope of the EIS ordered by the Commission. (Appendix A).</p> <p>To EERA staff’s understanding, PHMSA’s regulatory authority extends to the project. PHMSA defines carbon dioxide as a <i>fluid</i> consisting of more than 90 percent carbon dioxide molecules compressed to a supercritical state (see 49 CFR Part 195.2) (emphasis added). The Applicant’s Route Permit Application (RPA) includes a description of the proposed project design specifications and operating parameters (see Table 2, Page 8, of the RPA) indicating an operating pressure of 1,200 pounds per square inch gauge (psig) to 2,150 psig (which is above the 1,070 psi [or 1,084.7 psig converted relative to atmosphere] noted by the comment, below which “part of the CO₂ will convert to a gas/liquid mixture depending on the temperature”) and an operating temperature of 115 to 30 degrees Fahrenheit. Section 3.2.1 of the RPA describes the proposed capture facility and how it would operate (see Page 10 of the RPA). The feed gas (emissions from the ethanol plant’s fermentation process) would be cooled, compressed, and dehydrated until it reaches a dense phase or supercritical state prior to entering the pipeline to allow the product to be transported more efficiently, with less energy, and in a smaller pipe relative to gas phase transportation. Since the CO₂ would enter the proposed pipeline in a supercritical state, it would meet the PHMSA definition of “carbon dioxide” and thus would be subject to PHMSA regulations.</p> <p>The Applicant indicates the proposed project will meet or exceed state and federal safety requirements and will be designed in accordance with 49 CFR Part 195, because the pipeline will be an interstate pipeline project (see Section 4.6, Page 25, of the RPA). The Applicant also states that operations and maintenance programs and integrity management programs (IMP) developed under 49 CFR Part 195 Subpart F (and associated Appendix C) will also be performed (see Section 4, Page 18, of the RPA).</p> <p>In Section 4.6.2 of the RPA, the Applicant states the project will comply with emergency response requirements set forth in 49 CFR Part 195.401(e) and included a draft Emergency Response Plan (ERP) with the</p>	20242-203795-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				RPA that would be finalized prior to placing the project in service (see Section 4.6.2, Page 26, and Appendix 6, of the RPA).	
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p>Finally, the DEIS incorrectly states that “EERA staff reiterates that the Commission cannot set safety standards.” While it is true that certain elements of pipeline safety are the exclusive jurisdiction of PHMSA—see the discussion above—the DEIS makes an improper and erroneous leap to conclude that the Commission is unable to consider and act upon any safety concerns related to the project. PHMSA itself has explicitly responded to this federal preemption issue in letters to the applicant and other pipeline companies, saying: <i>"PHMSA cannot prescribe the location or routing of a pipeline and cannot prohibit the construction of non-pipeline buildings in proximity to a pipeline. Local governments have traditional exercised broad powers to regulate land use, including setback distances and property development that includes development in the vicinity of pipelines. Nothing in the federal pipeline safety law impinges on these traditional prerogatives of local—or state—government."</i></p> <p>Minnesota statutes indicate that this kind of regulatory authority rests solely with the Commission:</p> <p>The issuances of a pipeline routing permit under this section and subsequent purchase and use of the route locations is the only site approval required to be obtained by the person owning or constructing the pipeline. The pipeline routing permit supersedes and preempts all zoning, building, or land use rules, regulations, or ordinances promulgated by regional, county, local, and special purpose governments.</p> <p>Therefore, the Commission—and only the Commission—has the authority to not only consider health and safety when routing a pipeline, but to also establish safety requirements or conditions for that pipeline, so long as the issue being regulated is not preempted by federal law. The final EIS must accurately reflect this relationship between the Commission and PHMSA in addressing the health and safety impacts of CO₂ pipelines and consider mitigative measures to ensure public safety, including setbacks and depth-of-cover. For these reasons it is inaccurate for the DEIS to say that state and local regulators cannot set safety standards, and the EIS should be amended to more accurately state the limited preemption that was clarified by PHMSA as stated above.</p>	<p>Although the Commission cannot set safety standards for pipeline construction or operation, state or local units of government may, to the extent authorized by law, set land use requirements that indirectly contribute to pipeline safety by regulating the activities of third parties located in the pipeline’s vicinity. The Commission’s obligation is to identify a pipeline route consistent with the criteria found in statutes and the applicable administrative rules. Federal law, by contrast, exclusively prescribes pipeline safety requirements. Section 3.4 of the EIS has been revised with this information.</p> <p>The appropriateness of PHMSA regulations and related standards for CO₂ pipelines is outside the scope of the EIS (Appendix A).</p> <p>In PHMSA’s letter to CO₂ pipeline companies (dated September 15, 2023), which is referenced in the comment, it states: “Congress vested PHMSA with authority to regulate the design, construction, operation, and maintenance of pipeline systems, including carbon dioxide pipelines, and to protect life, property, and the environment from hazards associated with pipeline operations.” The letter also stated that Congress determined pipeline safety is best promoted through PHMSA’s development of nationwide safety standards; PHMSA has promulgated comprehensive safety regulations at 49 CFR Parts 190-199, as summarized in the draft EIS (see Chapter 8 and Appendix G). In the September 2023 letter, PHMSA also clarifies that federal safety standards apply to both interstate and intrastate pipeline facilities, only PHMSA can regulate the safety of interstate pipelines, and federal pipeline safety laws expressly prohibit states from enacting or enforcing pipeline safety standards with respect to interstate pipelines (except one-call notification program regulations).</p>	20242-203795-01
CURE	Sarah Mooradian, Hudson Kingston	2024-02-23	<p><i>VI. The No Action Alternative is Preferable</i></p> <p>Although several issues need to be resolved before the final EIS, CURE does note that at this point, the No Action Alternative would have fewer negative impacts than any of the proposed alternatives and would create significant benefits. First, by not building the project, the state retains acres of wetlands, agricultural land, and native plant communities. As explained above, wetlands offer essential ecosystem and climate change benefits and once degraded, are extremely difficult to regain. Second, by not building the project, additional burdens on the local water supply will not be realized. Third, the No Action Alternative will ensure that there will be no project-related decreases in soil health or crop productivity/yield.</p> <p>None of the alternatives can stack up to the No Action Alternative, but even amongst the losers, RA-South seems to be an exceptionally poor choice. It crosses the greatest number of public and designated land, crosses the greatest number of wetlands and the second greatest number of surface waters, uses the least amount of existing ROW or ROW sharing and paralleling, and is located within one mile of 76 wells (as opposed to 56 wells and 42 wells for RA-North and RA-Hybrid, respectively).</p>	<p>Thank you for your comment.</p>	20242-203795-01
CURE	Secchi, Silvia	2024-02-13	<p>Q. What is the purpose of your testimony in this proceeding?</p> <p>A. My testimony provides a review of the socioeconomic, soil, and climate change impacts of the proposed project as presented in the Draft Environmental Impact Statement (DEIS).</p> <p>Q. Please summarize your conclusions.</p> <p>A. My overall conclusion is that the DEIS takes the project’s socioeconomic impacts directly from the applicant’s economic impact study. The study itself has a disclaimer that it should not be used for this purpose, and these types of studies are well known to overestimate benefits of pipeline projects. The soil impacts in the DEIS do not consider recent evidence from Iowa and Ohio that find</p>	<p>Section 5.4.11.2 has been revised to clarify that the conclusions in the EIS are not based on the conclusions of the Ernst and Young study prepared for the Midwest Carbon Express project. Information from the Ernst and Young study, as well as another study on the socioeconomic impacts of the Midwest Carbon Express project that was prepared by North Star Policy Action, is presented in Section 5.4.11.2. Information from these studies is presented but was not used to determine impacts.</p>	20242-203381-05

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			longer-term negative effects. The DEIS also does not consider recent compelling evidence that disputes and puts in question the climate change benefits of corn ethanol. As a result, the DEIS presents an unreasonably favorable picture of the impacts of the project.		
CURE	Secchi, Silvia	2024-02-13	<p>Q. What does the DEIS conclude about the proposed project’s potential impact on property values?</p> <p>A. The DEIS states that: “Although no studies related to the impacts of CO₂ pipelines on property values have been identified, there are several studies that assess the effects of natural gas pipelines and compressor stations on property values. While research demonstrates that property value impacts vary, most studies indicate that the presence of an underground natural gas transmission pipeline does not affect the sales price or value of residential properties.” (Page 5-40).</p> <p>Q. Do you agree with this conclusion?</p> <p>A. No. The most recent study presented in Table 5-11 in the DEIS is from 2016. But a more recent study has found that the proximity to facilities that can cause accidental chemical releases is associated with significantly lower home values. (1) It is important to note that this is regardless of whether incidents have occurred. The property value reduction is associated with the risk of an accident.</p> <p>(1) Guignet, Dennis, Robin R. Jenkins, James Belke, and Henry Mason. 2023. "The property value impacts of industrial chemical accidents." <i>Journal of Environmental Economics and Management</i> 120:102839. doi: https://doi.org/10.1016/j.jeem.2023.102839.</p>	A new section on property value impacts related to pipeline incidents has been added to Chapter 8. EERA staff does not agree with the relevance of the Guignet et al. study, as described in Section 8.3.1.3.	20242-203381-05
CURE	Secchi, Silvia	2024-02-13	<p>Q. In the study, were lower home values seen only after an incident had occurred?</p> <p>A. No. Home values were lower regardless of whether incidents occurred.</p> <p>Q. Why is that?</p> <p>A. The property value reduction is associated with the risk of an accident. Another recent study found that learning about the location of a pipeline negatively impacts a homebuyer’s willingness to pay for a house. (2) So the general conclusion of these more recent studies is that when the public is alerted to presence of pipelines and the risk associated with them, before incidents or through incidents, the values of impacted properties decreases.</p> <p>Q. What about pipeline incidents, do they also reduce property values?</p> <p>A. Most likely yes, because they inform the public about the risk associated with pipelines. A recent paper based on a national dataset that includes 864 incidents and 17 million house sales, comparing pre- and post-incident transactions, finds that the value of homes within 1 kilometer (km) decline by 4–6% compared to a control group of houses 1–2 km from an explosion. (3)</p> <p>Q. Were these differences short-term?</p> <p>A. No. Those conducting the study found that price divergence persisted for almost two years. And the risk of accidents is, of course, a permanent one, for as long as the pipeline is in operation. The risk of accidents is a separate issue from the negative effects of pipelines post-operations, which should also be considered.</p> <p>(2) Hilterbrand Jr, Charles M. 2020. "The Potential Impact Radius of a Natural Gas Transmission Line and Real Estate Valuations: A Behavioral Analysis." <i>Muma Business Review</i> 4:087-089.</p> <p>(3) Cheng, Nieyan, Minghao Li, Pengfei Liu, Qianfeng Luo, Chuan Tang, and Wendong Zhang. 2022. <i>Pipeline Incidents and Property Values: A Nationwide Hedonic Analysis</i>. SSRN.</p>	A new section on property value impacts related to pipeline incidents has been added to Chapter 8.	20242-203381-05
CURE	Secchi, Silvia	2024-02-13	<p>Q. What does the DEIS conclude about the potential socioeconomic impacts of the proposed project?</p> <p>A. The DEIS concludes that, based on a report commissioned by the applicant in 2022, the project’s total capital expenditures would be \$39,193,000 in Otter Tail County and \$42,631,000 in Wilkin County. The DEIS also states that the purchase of goods and services across the project footprint during construction would have “moderate short-term and negligible to minimal long-term beneficial impact on the local economy.” (Page 5-60). Finally, the DEIS concludes that the project would increase tax revenues in the short- and long-term, estimated to be \$894,000 in Otter Tail County and \$972,000 in Wilkin County during the first year of operation, resulting in minimal beneficial impacts on the counties.</p> <p>Q. Do you agree?</p> <p>A. I agree with the general conclusions that project would have negligible to minimal long-term beneficial impact on the local economy. I do not agree that is it appropriate to use the specific numbers of the applicant’s economic impact study in the DEIS.</p> <p>Q. Can you explain why you disagree with this conclusion?</p> <p>A. There is robust literature that shows that these applicant reports are rhetorical devices that use inappropriate methods. According to Professor Crompton at Texas A&M University, for example, these studies use “mischievous procedures that produce large numbers that study sponsors seek to support a predetermined position” coupled with “explicit and extensive qualifying statements”, with the</p>	Section 5.4.11.2 has been revised to clarify that the conclusions in the EIS are not based on the conclusions of the Ernst and Young study prepared for the Midwest Carbon Express project. Information from the Ernst and Young study, as well as another study on the socioeconomic impacts of the Midwest Carbon Express project that was prepared by North Star Policy Action, is presented in Section 5.4.11.2. Information from these studies is presented but was not used to determine impacts.	20242-203381-05

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			intent to buy “the aura of respect and integrity that accompanies the consultant’s name, anticipating that this will enhance the credibility and public and political acceptance of the results and quell any questioning of the procedures used.” (4) These studies of course only look at benefits and do not consider costs at all, and particularly opportunity costs, including alternative uses of the public funds the projects depend on. (5) It is inappropriate to use the applicant’s reported numbers without independent verification or vetting. (4) Crompton, John L. 2006. "Economic Impact Studies: Instruments for Political Shenanigans?" <i>Journal of Travel Research</i> 45 (1):67-82. doi: 10.1177/0047287506288870. (5) Crompton, John L, and Dennis R Howard. 2013. "Costs: The rest of the economic impact story." <i>Journal of Sport Management</i> 27 (5):379-392.		
CURE	Secchi, Silvia	2024-02-13	Q. Why is independent verification important? A. When independent experts perform rigorous analysis of the economic impacts of this type of project, the estimates of benefits are much lower. In the case of Keystone XL, for example, where the State Department performed a separate assessment, their job estimates “were nearly two-thirds lower than the first Keystone XL study”, as observed by my esteemed colleague Dave Swenson. (6) Q. Did independent experts verify the conclusions from the report referenced in the DEIS? A. No. Q. Is the applicant’s economic report reliable and sufficient evidence to support the economic cost and benefit of this project? A. No, by its very terms the report cannot be used as a full economic analysis. The report referenced included a specific disclaimer that read: “The report is intended solely for use by Summit Carbon Solutions. [...] we make no representation as to the sufficiency of the report and our work for any other purposes. Any third parties reading the report should be aware that the report is subject to limitations, and the scope of the report was not designed for use or reliance by third parties for investment purposes or any other purpose. We assume no duty, obligation, or responsibility whatsoever to any third parties that may obtain access to the report.” (7) Q. What are specific concerns regarding these studies that the public should be aware of? A. These studies depend largely on information provided by the applicant, which the consultant uses, assuming they are correct. This can be a problem in terms of job numbers, job characteristics and duration, purchases of materials and other project-specific information that is critical to the accuracy of the study. These studies also do not consider alternative uses of the public funding that the project will receive. (7) Ernst & Young, <i>Economic Contributions of Summit Carbon Solutions</i> , 1, https://summitcarbonsolutions.com/wpcontent/uploads/2022/04/Full-Report.pdf (Apr. 2022).	Thank you for your comment.	20242-203381-05
CURE	Secchi, Silvia	2024-02-13	Q. Does pipeline construction impact soil productivity? A. Yes. Q. How do you know this? A. Recent independent research—some of it from Iowa following the deployment of the Dakota Access pipeline—show that impacts can be long term. One such review study, attached here as Schedule SS-2, concludes that “from our quantitative synthesis that pipeline installation typically results in degraded soil and vegetation resources, and this can persist for many years following installation.” (8) The same authors last year found that soil degradation persisted 5 years after the installation of pipelines. (9) This study is attached as Schedule SS-3. The scientific evidence shows that the long-term impacts on soils—particularly if there is tile drainage— should not be discounted. Q. How does tile drainage relate to the potential impacts of the project on soil productivity? A. Tile drainage is important to keep soils dry so the crops can grow. In Otter Tail County, there are over 53,000 acres of land under tile drainage, and 34,000 in Wilkin County. If the pipeline impacts areas of tile drainage, the effects could be long-lasting and expensive for farmers to address. Such negative impacts to soils may also not be immediately apparent, and it might be difficult for the farmers to find recourse if the effects do not manifest soon enough to alert landowners and give them time to respond. (8) Brehm, Theresa, and Steve Culman. 2022. "Pipeline installation effects on soils and plants: A review and quantitative synthesis." <i>Agrosystems, Geosciences & Environment</i> 5 (4):e20312. doi: https://doi.org/10.1002/agg2.20312 . (9) Brehm, Theresa, and Steve Culman. 2023. "Soil degradation and crop yield declines persist 5 years after pipeline installations." <i>Soil Science Society of America Journal</i> 87 (2):350-364.	As indicated by the definitions found on Page 5-1 of the draft EIS, “long-term impacts extend beyond the end of construction and are generally associated with operation of the project.” Disturbance to soils and crops from construction can result in impacts that extend beyond the construction phase, and the text in the final EIS has been revised to indicate that impacts can be long term. Section 2.4.6 states that any drain tiles damaged during pipeline construction would be repaired before backfilling the trench. Section 6.7 of the applicant's Minnesota APP (Appendix E) specifies the procedures and timelines for repair of drain tiles disturbed during construction. The APP notes that tiles disturbed or damaged by pipeline construction would be repaired to their original or better condition, and in accordance with the applicant's Minnesota ECP (Appendix D), permanent repairs would be completed within 21 days after the pipeline is installed. Section 5.5.1.3 has been revised to include a reference to this mitigation measure. Timeframes associated with landowner easement agreements are outside the scope of the EIS.	20242-203381-05

CURE	Secchi, Silvia	2024-02-13	<p>Q. Will the proposed project have a significant effect on greenhouse gas (GHG) emission reductions?</p> <p>A. Based on available information it is too speculative to conclude the project will have any significant effect on GHG emission reductions.</p> <p>Q. Why are you unable to determine that?</p> <p>A. There is no guarantee that the applicant—or subsequent buyers of the carbon dioxide the company captures and transports—will permanently sequester the captured carbon dioxide (CO₂) in geologic storage.</p> <p>Q. How else might the captured CO₂ be used or disposed of?</p> <p>A. The applicant could sell some of the captured CO₂ for enhanced oil recovery (EOR) at any point after the pipeline would become operational.</p> <p>Q. What is EOR?</p> <p>A. Enhanced oil recovery, or EOR, is a process that allows for the recovery of additional oil from a depleted oil well. CO₂ is injected into a depleted well, where it is miscible, or able to mix in all proportions, with the trapped oil. When the oil and CO₂ are miscible, the physical forces holding them apart disappear, enabling the CO₂ to displace the oil from the reservoir and pushing the oil to a producing well. The oil would not otherwise be obtainable if it were not for the CO₂ being injected.</p>	Section 5.7.2.3 addresses the possibility that the captured CO ₂ transported by the project could be used for EOR.	20242-203381-05
CURE	Secchi, Silvia	2024-02-13	<p>Q. Why would the applicant or others use the captured CO₂ for EOR?</p> <p>A. The federal government has created tax credits, most often referred to as “45Q” credits after their section of the tax code, for all kinds of carbon capture, transportation, and sequestration activities. Both EOR and geologic sequestration are eligible for 45Q credits, with EOR’s credit being less generous but accompanying the extra income from potential oil sales. The differential in 45Q credits makes it plausible that, for high enough oil prices, EOR would be a more profitable use of the CO₂ than permanent sequestration.</p> <p>Q. Has this historically been the case with 45Q tax credits for geologic storage or EOR?</p> <p>A. Yes. Existing incentives for carbon sequestration and EOR largely led to CO₂ to be used for EOR and very little has historically been sent to geologic sequestration that does not produce oil.</p>	Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	20242-203381-05
CURE	Secchi, Silvia	2024-02-13	<p>Q. How would the CO₂ being used for EOR influence the GHG emission reductions impact described in the DEIS?</p> <p>A. Because the potential for the CO₂ in this project to be used for EOR, and because EOR directly relates to oil production—and specifically of oil that would have otherwise been unavailable— it is reasonable to conclude that the potential GHG emission reductions are much lower than reported in the DEIS. Worse, in some circumstances, there may even be a net GHG emission increase from CO₂ used in EOR activities.</p> <p>Q. How do GHG emissions relate to the carbon intensity score of ethanol?</p> <p>A. As the DEIS states, the project’s purpose is to “capture CO₂ from the ethanol plant and transport it to the North Dakota border, enhancing the marketability of the ethanol produced at the ethanol plant.” (Page 1-1).</p> <p>Q. How does the carbon intensity score increase the marketability of ethanol?</p> <p>A. The marketability is enhanced because California is willing to pay a premium for ethanol that has lower GHG emissions, as measured by lower carbon intensity score. The lower the emissions as measured by the carbon intensity score, the higher the premium offered by California’s gasoline producers regulated by this system.</p> <p>Q. What is a carbon intensity score?</p> <p>A. A carbon intensity score is the metric used to measure the lifecycle GHG emissions of a fuel per unit of energy, from cradle to grave. So, in the case of ethanol, this includes emissions from farm level operations to production, distribution, and consumption.</p>	While the EIS addresses the possibility that the captured CO ₂ transported by the project could be used for EOR in Section 5.7.2.3, the applicant indicates the project as proposed would permanently sequester the CO ₂ underground. The CI score was determined accordingly.	20242-203381-05
CURE	Secchi, Silvia	2024-02-13	<p>Q. How was carbon intensity measured in the DEIS?</p> <p>A. The DEIS uses the Greenhouse gases, Regulated Emissions, and Energy use in Transportation, or GREET model to calculate the carbon intensity score of the ethanol produced by the Green Plains Ethanol facility in Otter Tail County.</p> <p>Q. Do you believe this is an accurate way to measure the carbon intensity of ethanol?</p> <p>A. No. Recent scientific evidence shows that the GREET model underestimates land use changes and therefore overestimates the benefits of corn ethanol. (10) In fact, the GHG emission impacts of corn ethanol are under such dispute that the Environmental Protection Agency Science Advisory Board is concerned about the continuation of the Renewable Fuel Standard. (11) In light of all these considerations, and the absence of these details about the questionable carbon intensity scoring in the DEIS, it is legitimate to</p>	Section 6.1.3 has been revised to discuss the debate between Lark et. al. and GREET model authors.	20242-203381-05

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>be concerned that the DEIS is presenting a biased picture that overestimates the climate benefits of ethanol and the climate change mitigation potential of the pipelines.</p> <p>Q. Do you believe the proposed project will provide the socioeconomic and GHG emission reduction benefits as described in the DEIS?</p> <p>A. No. In my professional opinion, there is substantial uncertainty on both those categories of benefits, and the DEIS is presenting results from the upper end of those ranges. The public should be aware that both sets of benefits could be substantially lower, and that there are alternative uses of the 45Q subsidies that would negate any reductions in GHG emissions.</p> <p><i>(10) Lark, Tyler J., Nathan P. Hendricks, Aaron Smith, Nicholas Pates, Seth A. Spawn-Lee, Matthew Bougie, Eric G. Booth, Christopher J. Kucharik, and Holly K. Gibbs. 2022. "Environmental outcomes of the US Renewable Fuel Standard." Proceedings of the National Academy of Sciences 119 (9):e2101084119. doi: doi:10.1073/pnas.2101084119.</i></p> <p><i>(11) Science Advisory Board to the U.S. Environmental Protection Agency, Commentary on the Volume Requirements for 2023 and Beyond under the Renewable Fuel Standard Program (RIN 2060-AV14), EPA-SAB-23-008, Sept. 29, 2023.</i></p>		
CURE	Secchi, Silvia	2024-03-14	<p>Q. Do you have any concerns about how Mr. Powell characterized the potential long-term agricultural impacts of the proposed project?</p> <p>A. Yes. Mr. Powell states that “permanent impacts to agricultural land (including cropland/pasture/hay/range lands) are only anticipated at aboveground facility locations that will be fenced and removed from current use.” (Powell Direct, page 6). But as I stated in my direct testimony, new research about the impacts of pipeline construction on agricultural lands has shown that it can extend well beyond the two-to-three-year period for crop loss payments anticipated by the applicant. To reiterate what those studies concluded: “pipeline installation typically results in degraded soil and vegetation resources, and this can persist for many years following installation.” (See Schedule SS-2 attached to my direct testimony). Mr. Powell’s testimony mischaracterizes the potential long-term or even permanent impacts of the proposed project along the entire route, not just at aboveground facility locations.</p>	As indicated by the definitions found on Page 5-1 of the draft EIS, “long-term impacts extend beyond the end of construction and are generally associated with operation of the project.” Disturbance to soils and crops from construction can result in impacts that extend beyond the construction phase, and the text in the final EIS has been revised to indicate that impacts can be long term.	20243-204360-05
CURE	Secchi, Silvia	2024-03-14	<p>Q. Will the applicant permanently store CO₂ captured from the Green Plains Ethanol Plant?</p> <p>A. Mr. Powell states in his direct testimony that the project “will capture and permanently store” CO₂ from the Green Plains Ethanol Plant. (Powell Direct, page 4). But this contradicts what Mr. Powell has said previously before the Iowa Utilities Board. In September 2023, Mr. Powell stated that “if another carrier decided to use – or ask us to transport CO₂ for another purpose, like enhanced oil recovery, then that’s a possibility.” (Attached as SS-4, Page 1628). Because of this, I cannot say with any certainty that any of the CO₂ captured at the Green Plains Ethanol Plant will be permanently sequestered instead of being used for enhanced oil recovery.</p>	Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	20243-204360-05
CURE	Secchi, Silvia	2024-03-28	<p>Q. Mr. Powell explains in his rebuttal testimony how Summit worked with Ernst & Young to complete an economic impact analysis of its project. What is your response?</p> <p>A. I appreciate that Mr. Powell agrees with what I expressed in my direct testimony—that Summit provided Ernst & Young with the “key assumptions,” such as the job numbers, job characteristics and duration, and purchases of materials, among other data, to conduct the economic impact analysis. Helpfully, Mr. Powell also confirms that no independent party has verified either the conclusions in the Ernst & Young report or the assumptions that inform the report. Mr. Powell’s rebuttal testimony also does not respond to my comment regarding the disclaimer in the Ernst & Young report itself that “Any third parties reading the report should be aware that the report is subject to limitations, and the scope of the report was not designed for use or reliance by third parties for investment purposes or any other purpose.” (1)</p> <p><i>(1) Ernst & Young, Economic Contributions of Summit Carbon Solutions, 1, https://summitcarbonsolutions.com/wpcontent/uploads/2022/04/Full-Report.pdf (Apr. 2022).</i></p>	Section 5.4.11 has been revised to clarify that the conclusions in the EIS are not based on the conclusions of the Ernst and Young study prepared for the Midwest Carbon Express project. Information from the Ernst and Young study, as well as another study on the socioeconomic impacts of the Midwest Carbon Express project that was prepared by North Star Policy Action, is presented in Section 5.4.11. Information from these studies is presented but was not used to determine impacts.	20243-204752-05
CURE	Secchi, Silvia	2024-03-28	<p>Q. Do you agree with Mr. DeJoia’s critiques of the Brehm and Culman studies you referenced in your direct testimony?</p> <p>A. No. The Brehm and Culman studies are not the only ones which provide strong evidence that pipeline construction has long-term impacts on crop yields and soil productivity. (2) Also, although Mr. DeJoia seems to take issue with the metanalysis in Brehm and Culman (2022), that analysis shows that reduced soil production and/or crop yield due to pipeline construction is a widespread issue.</p> <p>Q. Mr. DeJoia notes that Summit’s Agricultural Protection Plan is similar to those used in other states. Does that reassure you with regard to the potential impacts to soil and crops?</p> <p>A. Not at all. In fact, it does the opposite. As the research I have referenced here and in my direct testimony shows, existing methods for mitigating damage to soils and crops have in many instances been unsuccessful. The fact that Summit’s APP is apparently no different than what has been previously done should, in my opinion, give people pause.</p>	As indicated by the definitions found on Page 5-1 of the draft EIS, “long-term impacts extend beyond the end of construction and are generally associated with operation of the project.” Disturbance to soils and crops from construction can result in impacts that extend beyond the construction phase, and the text in the final EIS has been revised to indicate that impacts can be long term.	20243-204752-05

Fergus Falls Area Chamber of Commerce	Workman, Lisa	2024-02-21	<p>As the President of the Fergus Falls Chamber of Commerce, I am happy to support Summit Carbon Solutions’ proposed pipeline in Fergus Falls, Minnesota.</p> <p>The construction and operation of Summit’s proposed pipeline will stimulate our local economy.</p> <p>As heard at the public meetings in February, Summit plans to hire local workers during both the construction and operational phases of the project. These workers will in turn spend a portion of their incomes at other local businesses in our community.</p> <p>Once the pipeline is operational, economic benefits will continue to pour into Otter Tail County via property taxes, which will be paid by Summit. This new tax revenue can be used to improve infrastructure and fund projects in Otter Tail County.</p> <p>The proposed pipeline will also support the Green Plains ethanol plant and its employees in Fergus Falls. By capturing the emissions from the ethanol plant, Summit will open the low-carbon fuel market for Green Plains’ ethanol, ensuring the plant and its employees are secure for decades to come.</p> <p>Summit’s proposed pipeline will bring millions of dollars of economic revenue to the Fergus Falls area. I urge the Public Utilities Commission to approve application and I look forward to the pipeline becoming operational in Fergus Falls.</p>	Thank you for your comment.	20243-204403-01
Green Plains Inc.	Mogler, Devin	2024-02-09	Sections 7.1.1 and 7.1.2 suggest that stable or decreasing ethanol production would lead to farming practices changes including no-till, cover cropping and precision farming. To the contrary, if the carbon capture and storage (“CCS”) project was implemented, the carbon intensity (“CI”) of the facility would be lowered to a point where it would be in the best interest of the ethanol producer and farmer to lower CI of production practices to capture more value from low-carbon markets, e.g. if the CCS reduces the CI of the plant from 54 to 25, every marginal reduction in CI would have value, whereas in a scenario where CCS is not in place, the ethanol produced at the plant may not be able to participate in low carbon fuels markets, and there would be little or no monetary incentive to expand regenerative agricultural practices.	With the passage of the Inflation Reduction Act, and in particular the creation of the Clean Fuel Production Credit under section 45Z, biofuel producers are eligible for a tax credit of \$0.02 per gallon for every CI point below 50 kgCO ₂ e/MMBtu, up to \$1.00 per gallon. The basis for the CI score calculation under this program is the most recent Argonne GREET model, as measured in kilograms of CO ₂ e per Metric Million British Thermal Units, or MMBtu. The current estimated (2023) Argonne GREET CI score of the Otter Tail ethanol facility is 59 kgCO ₂ e/MMBTU (equivalent to 56 gCO ₂ e/MJ). The RFS requires that a renewable fuel (or conventional biofuel; typically refers to ethanol derived from corn starch) must meet a 20 percent lifecycle GHG reduction compared to a 2005 petroleum baseline. The 2005 EPA average gasoline baseline for CI is 93.08 gCO ₂ e/MJ. The current estimated (2023) Argonne GREET CI score of the Otter Tail ethanol facility is meeting this requirement at an estimated 40 percent reduction.	20243-204403-02
Green Plains Inc.	Mogler, Devin	2024-02-09	Sections 7.1.1 and 7.1.2 contend that local corn prices to farmers would not be impacted from losing the ethanol plant as a market for their grain, with the exception of freight costs to ship the crop elsewhere, and alternatively that expanded ethanol production would not impact local crop prices. This does not take into consideration the basis impact, a cursory review of which clearly demonstrates that ethanol production positively impacts local corn bids. This is also refuted in Section 7.2.2.1.	Section 7.1.1 has been revised to better communicate the impact of ethanol production on crop pricing.	20243-204403-02
Green Plains Inc.	Mogler, Devin	2024-02-09	Section 7.1.1 suggests that the ethanol plant would remain in operation and compete in standard fuel markets outside of LCFS markets if the project is not constructed, which is possible in the short run, but given macroeconomic trends towards lower-CI fuels, including expanded policies at the state, federal and international level, it is unreasonable to assume the facility would continue operating in perpetuity without reducing the CI of the ethanol.	Section 7.1.1 has been revised to better communicate uncertainty associated with the ethanol plant.	20243-204403-02
Green Plains Inc.	Mogler, Devin	2024-02-09	Section 7.2.2.1 rightfully points out the socioeconomic value of agricultural communities, and the benefits they have derived from increased ethanol production over the past two decades. The uplift to corn prices, the wealth creation in rural communities and the reduction in government farm program payments cannot be overstated.	Thank you for your comment.	20243-204403-02
Green Plains Inc.	Mogler, Devin	2024-02-09	Section 7.2.2.2 infers that land, including grasslands, wetlands and conservation reserve land, is being converted to crop land to produce corn for ethanol production. This is both inaccurate and misleading. According to the Renewable Fuels Standard (“RFS”) statute, corn produced on converted crop land is not eligible for producing ethanol. ² None of the corn we process into ethanol comes from land converted to cropland from forests, grasslands or wetlands, in compliance with the RFS. Land use change in the U.S. is almost entirely attributable to urban sprawl, not agriculture. While corn production in the U.S. has increased over the past 100 years,	Section 7.2.2.2 has been revised to convey that while cropland has been in decline for Otter Tail County and Wilkin County, an increase in ethanol production would likely result in either direct or indirect land use change toward an increase in cropland. CARB’s LCFS program includes the assumption that ethanol production generates an indirect land use	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			the amount of land used to grow corn has actually decreased over time. Scientific and agronomic advances, notably precision agriculture and better seed genetics have contributed to marked increases in yield per acre. These increased yields have been accompanied by reductions in chemical, fertilizer and water inputs for every kernel grown, including a 50% reduction in the amount of nitrogen application since the 1970s, and the EIS is silent on this point, but rather points to potential negative impacts of fertilizer use on water quality. The inferences around neonicotinoid impacts on bee populations have not been definitively proven.	change impact. Since this project is attempting to reduce the CI score of the ethanol plant, assumptions consistent with LCFS guidance were made.	
Green Plains Inc.	Mogler, Devin	2024-02-09	Section 7.2.2.2 goes on to attribute land use change to GHG emissions, which again, does not come from agriculture. The section rightfully points to a study highlighting how conservation reserve program enrollment actually increased in areas with ethanol production after the federal renewable fuels mandate went into effect	Thank you for your comment.	20243-204403-02
Green Plains Inc.	Mogler, Devin	2024-02-09	Section 7.2.3.1 rightfully points out the economic impact that ethanol plants have on rural communities’ tax bases, employment and overall economic activity.	Thank you for your comment.	20243-204403-02
Green Plains Inc.	Mogler, Devin	2024-02-09	Section 7.2.3.2 discusses risks of ethanol leaks and impacts that would have on soil and groundwater. These impacts are largely speculative and leaks from corrosion of storage tanks occur rarely if ever. This section also discusses water usage for ethanol production. Our Otter Tail facility has reduced water consumption by 33% from 2019 to 2023, and recently installed a controlled backwash system that returns water previously discharged back into the process, further improving water efficiency. This section points out that upstream and on-site emissions for corn ethanol production is higher than that of gasoline, but is silent on the impact of the fossil carbon that is released from the combustion of gasoline. The section rightfully points out the improvements made to plant efficiencies from 2005 to 2019, the improvements made in on farm practices, and the most recent science around land use change according to Argonne National Laboratories. The section mentions coal powered ethanol plants having higher emissions, and Green Plains Otter Tail does not utilize coal, nor do our other biorefineries. Recent investments to further improve the efficiency of our Otter Tail facility have led to a 23% reduction in Natural Gas usage and a 27% reduction in electrical consumption (2019-2023).	Thank you for your comment.	20243-204403-02
Green Plains Inc.	Mogler, Devin	2024-02-09	Section 7.2.4.2 rightfully points out that ethanol spills during transport are very rare, and that when they do occur, the nature of the product allows it to biodegrade rapidly in soil, and completely dissolve in water. The section contemplates ethanol transport in a vacuum, rather than comparing it to the environmental impacts of transporting the alternative – fossil fuels and refined fuels – which can be more harmful to ecosystems in the event of a spill.	Thank you for your comment.	20243-204403-02
Green Plains Inc.	Mogler, Devin	2024-02-09	Section 7.2.5.1 rightfully points out that when ethanol is added to petroleum gasoline, it reduces emissions of harmful and toxic pollutants including CO, NOx, PM, VOCs and CO ₂ .	Thank you for your comment.	20243-204403-02
Health Professionals for a Healthy Climate	Schuler, Kathleen	2024-02-23	I am writing today on behalf of Health Professionals for a Healthy Climate to comment on the Draft Environmental Impact Statement (DEIS) for the Otter Tail to Wilkin CO ₂ Pipeline Project in Otter Tail and Wilkin Counties (Docket Number: 22-422). Health Professionals for a Healthy Climate (HPHC) is a network of over 500 nurses, doctors, public health experts, and allied health professionals across the state of Minnesota, dedicated to inspiring and activating health professionals to address climate change through interprofessional education, clinical practice, and public advocacy	Thank you for your comment.	20243-204403-01
Health Professionals for a Healthy Climate	Schuler, Kathleen	2024-02-23	HPHC is very concerned that CO ₂ pipelines are a false climate solution and we do not support installing CO ₂ pipelines in the ground in Minnesota. The urgency of the climate crisis requires that we pursue the most cost-effective strategies to reduce greenhouse gasses (GHGs). Fossil-fuel caused air pollution is responsible for 350,000 premature deaths in the U.S. each year. The faster we get to a zero-carbon economy, the faster we clean up air pollution, which results in more lives saved. The Intergovernmental Panel on Climate Change (IPCC) states, “The continued installation of unabated fossil fuel infrastructure will ‘lock-in’ GHG emissions.” The IPCC has also analyzed the cost-effectiveness of carbon capture and storage (CCS) and found that the cost per ton of GHGs reduced (GHG reductions per Gt CO ₂ equivalent) is \$100-200 compared with a cost of close to zero for solar, wind, and natural carbon sequestration. ¹ CO ₂ pipelines are sold as a climate solution, when in reality new CO ₂ pipelines are new fossil fuel infrastructure needed for enhanced oil recovery (EOR).	Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	20243-204403-01
Health Professionals for a	Schuler, Kathleen	2024-02-23	Specific to the Summit pipeline DEIS, we ask that the Public Utilities Commission and Department of Commerce consider the following serious issues with the draft EIS to ensure a robust environmental review to protect the interests of all Minnesotans, especially communities impacted by these pipelines, first responders, and health professionals. While we are concerned about the adverse	Thank you for your comment.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
Healthy Climate			impacts of this project on land, water, and local economies, we will limit our comments to two areas of public health interest: CO ₂ emissions and health and safety.		
Health Professionals for a Healthy Climate	Schuler, Kathleen	2024-02-23	A. The DEIS consistently fails to properly account for the real CO ₂ emissions and climate impacts of the project. 1.Lifetime of Project: The applicant states that the anticipated lifetime of this project is 25 years. This means at the end of its life, the project could stop capturing the CO ₂ from the ethanol plant. Unless the ethanol plant will also cease operations at that point in time, it will continue to emit CO ₂ unabated into the future.	Section 2.7 describes project decommissioning. If the ethanol plant continues to operate beyond the life of the proposed project, its CO ₂ emissions would not be captured.	20243-204403-01
Health Professionals for a Healthy Climate	Schuler, Kathleen	2024-02-23	2. 100% CO ₂ Capture Rate: Summit states that the capture facility “is designed to capture 100% of the CO ₂ produced by the ethanol plant.” There is no carbon capture facility in the world, ethanol or otherwise, that captures carbon at a rate of 100%. This claim is not supported by any data/information or verified by a third party. Additionally, the DEIS should emphasize that any CO ₂ capture is solely associated with emissions from the ethanol fermentation process and provides zero reductions on the significant emissions from the facility’s electricity use.	Section 2.1 has been revised to clarify that the captured CO ₂ is produced by the ethanol plant as part of its fermentation process, that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and that commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. Section 6.3 describes energy efficiency and energy alternatives that could reduce emissions from the ethanol plant's electricity and process fuel use.	20243-204403-01
Health Professionals for a Healthy Climate	Schuler, Kathleen	2024-02-23	3. Added CO ₂ from electricity use: Carbon capture technologies are highly energy intensive and will significantly increase the carbon emissions at the facility from electricity use. The DEIS uses the Midwest Reliability Organization West Region average to calculate these emissions, which is unnecessarily inaccurate given the availability of the actual emissions factor from Great River Energy.	The CI from electricity use has been updated to reflect the grid mix from LREC in Sections 5.7.1.3, 6.1.4, 6.3.2, and 6.3.3.4. LREC serves the ethanol plant and represents the most localized data source available for the electricity use. The emission factor calculated for LREC is 291.4 lb CO ₂ e/MWh. GHG emissions were calculated using the projected electricity consumption of 38,501,733 kWh per year, as modeled by Summit Carbon Solutions. Historically, from 2021 to 2023, the Green Plains Ethanol Plant used 3,171,885 kWh of electricity on average per month over the past 24 months. This equates to an average annual electricity use of 38,062,620 kWh.	20243-204403-01
Health Professionals for a Healthy Climate	Schuler, Kathleen	2024-02-23	4. CO ₂ Storage: The DEIS assumes 100% of captured CO ₂ is being permanently stored underground. There is no guarantee that this will occur and no explanation of the monitoring and verification protocols that would ensure it.	Text has been added to Section 2.1 describing the suitability of the Broom Creek Formation in North Dakota for CO ₂ sequestration, as well as the monitoring and testing that would be done to verify that the CO ₂ is contained in the storage reservoir.	20243-204403-01
Health Professionals for a Healthy Climate	Schuler, Kathleen	2024-02-23	5. Enhanced Oil Recovery: The DEIS fails to explain whether the applicant can sell any of its captured CO ₂ to others for alternative uses instead of permanent sequestration and what the impacts of that would be. The DEIS incorrectly states that “Production of oil through EOR would not be dependent on the availability of CO ₂ produced by the ethanol plant.” This claim is contradicted by countless public statements from public officials in North Dakota and oil industry representatives.	The text questioned by the commenter in Section 5.7.2.3 was prefaced with the following: "if all the CO ₂ produced by the ethanol plant is sequestered as proposed, EOR would likely continue in North Dakota using other sources of CO ₂ , other gases, thermal methods, or chemical methods." Revisions are not necessary. However, Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	20243-204403-01
Health Professionals for a Healthy Climate	Schuler, Kathleen	2024-02-23	B. We are concerned about the safety and health impacts of the Summit pipeline, including how this project will affect the health of workers in impacted communities. The DEIS consistently underplays the known and unknown risks of transporting large amounts of CO ₂ at high pressures through a pipeline. CO ₂ is a hazardous material in high concentrations and CO ₂ pipelines pose unique problems for first responders and healthcare providers. 1. CO ₂ Rupture Impact Zone: According to the analysis in the DEIS, the potential impact radius for levels of CO ₂ that would be “immediately dangerous to life or health” is 617 feet. This expands to 910 feet for lower concentrations that cause dizziness, drowsiness, severe muscle twitching, and unconsciousness within a few minutes. Although Summit indicates that it will take 25 minutes for the system to shut off the relevant valves in the event of “abnormal operation,” the DEIS does not mention any meaningful safety measures for a rupture and instead suggests that it is “reasonable” for Summit to simply supply indoor CO ₂ detectors for residences within 1,000 feet of the project. But the rupture report in Appendix G states that “a full rupture results in	Text in Section 4.5 on valve closure time has been corrected from 25 minutes to 10 minutes. Elsewhere in the EIS, including the rupture analysis, valve closure time is listed/calculated as 10 minutes. Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>impact distances too quickly for an early warning device, such as an oxygen detector, to be effective.” This pipeline should not be approved without a clear understanding of the risks to human health and meaningful measures to ensure the safety of people and animals in the area.</p> <p>2. First responders and health professionals: CO₂ pipelines pose unique problems for first responders and health care providers. Because CO₂ is colorless and odorless, both victims and first responders have no way of knowing what is causing the health problems. In addition, first responders require special equipment, including non-internal combustion engines, to respond to a CO₂ disaster. The DEIS does not consider the burdens this will put on local EMS and health providers in the case of a pipeline rupture or accident or an assessment of how they should be prepared to respond given the unique needs. The DEIS includes Summit’s September 2022 Emergency Response Plan (Appendix N). This plan is not only outdated but also unclear as to how local EMS and first responders will interact with the applicant in the event of a leak or rupture. Though the plan talks of multiple company personnel as playing roles in an emergency response, it ignores the fact that the applicant only plans on having one full-time employee at the capture facility. Local first responders deserve more clarity about how they will be expected to respond to an emergency situation and what the applicant will do to ensure they are adequately equipped and informed for such an event.</p> <p>3. Compliance with PHMSA Rules: The DEIS accepts Summit’s assurances that it will “comply with federal emergency response requirements,” but as noted in a Pipeline Safety Trust report and by the Pipeline Hazardous Material Safety Administration (PHMSA) itself, the current emergency response requirements are dangerously outdated.</p> <p>4. Setbacks: The DEIS states that the PUC “cannot set safety standards” for Summit’s proposed pipeline. PHMSA has expressly said in public letters to CO₂ pipeline companies like Summit that state and local authorities can exercise their powers to regulate land use—including setback distances—and that “nothing in the federal pipeline safety law impinges on these traditional prerogatives of local—or state—government.” The PUC must consider where the pipeline is placed and what is the safest option for Minnesotans, which means the PUC can and should determine what routing, setback, and depth requirements are necessary to adequately protect Minnesotans.</p> <p>Thank you for your careful consideration of these critical concerns with the draft EIS.</p>	Response Plan included as Appendix N is a draft plan that is not outdated but would be revised as required by PHMSA, if the project is approved. Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.	
Land Stewardship Project	Koehler, Amanda	2024-02-23	Land Stewardship Project concurs with the comments offered by CURE and MN Interfaith Power & Light.	Thank you for your comment.	20242-203795-01
LIUNA Minnesota & North Dakota	Pranis, Kevin	2024-02-23	LIUNA Minnesota & North Dakota (“LIUNA”) appreciates the opportunity to offer comments on the Draft Environmental Impact Assessment for a Routing Permit for a carbon dioxide (“CO ₂ ”) pipeline that Summit Carbon Solutions LLC (“Summit”) has proposed to build in Otter Tail and Wilkin County.	Thank you for your comment.	20242-203792-01
LIUNA Minnesota & North Dakota	Pranis, Kevin	2024-02-23	We want to begin by thanking the Department of Commerce Energy Environmental Review and Analysis (“EERA”) staff and consultants for producing a Draft Environmental Impact Statement (“DEIS”) that thoroughly reviews the potential impact of the project and proposed alternatives and mitigation measures. While the direct impacts of installing just over 28 miles of four-inch pipeline in Minnesota are quite minor, the DEIS also provides context for understanding how this piece of pipe segment fits into a larger strategy for avoiding greenhouse gas (“GHG”) emissions, as well as what local communities unfamiliar with carbon management infrastructure need to know about local risks and mitigation measures.	Thank you for your comment.	20242-203792-01
LIUNA Minnesota & North Dakota	Pranis, Kevin	2024-02-23	LIUNA members strongly support the development of carbon management technologies, and believe that pipeline infrastructure on the scale proposed by Summit will be necessary to achieve climate goals, and to underpin the long-term economic success of Minnesota businesses and communities. Leading experts and institutions focused on climate agree that successful deployment of carbon capture and sequestration technologies is essential to meet state, national and international climate goals. The International Energy Agency, for example, projects that 8.6 billion tons of annual emissions reductions are needed from carbon capture by 2050, while the Intergovernmental Panel on Climate Change estimates that the cost of reaching net-zero would be 140 percent higher without use of carbon capture.	Thank you for your comment.	20242-203792-01
LIUNA Minnesota	Pranis, Kevin	2024-02-23	While Minnesota and the nation as a whole have made substantial progress toward decarbonizing electric power generation and have identified paths forward, decarbonization of transportation remains a substantial challenge. The DEIS provides evidence that strongly supports the potential for the proposed project to reduce carbon emissions associated with production of ethanol, therefore lowering the carbon intensity of E10 and other ethanol-blend fuels. As Table 5-39 shows, the project is expected to safely capture and store	Thank you for your comment.	20242-203792-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
& North Dakota			roughly 140,000 metric tons of carbon dioxide (“CO ₂ ”) on an annual basis with lifetime avoidance of nearly 3.5 million tons. These figures are net of CO ₂ -equivalent emissions associated with construction and operation of the proposed facilities.		
LIUNA Minnesota & North Dakota	Pranis, Kevin	2024-02-23	The DEIS considers a wide range of alternatives, including No Action, alternative routes and alternative technologies for reducing carbon emissions such as adoption of climate-friendly agricultural practices for feedstock and implementation of process efficiency and energy use changes at the ethanol plant. Unsurprisingly, EERA’s analysis finds none of the alternatives meet the need to avoid CO ₂ emissions without comparable impacts, and that proposed technologies could supplement, but do not replace, carbon capture, transportation and storage.	Thank you for your comment.	20242-203792-01
LIUNA Minnesota & North Dakota	Pranis, Kevin	2024-02-23	Beyond reviewing climate impacts, the DEIS also carefully evaluates the potential impact of the project on environmental resources and human health. The DEIS finds that the proposed facilities can be expected to operate well within the state’s limits for a wide range of air pollutants as depicted in Table 5-38.	Thank you for your comment.	20242-203792-01
LIUNA Minnesota & North Dakota	Pranis, Kevin	2024-02-23	EERA also conducted dispersion modeling in order to assess the potential impact of an unplanned release of CO ₂ . Using the worst case scenario, a full “guillotine rupture” resulting in an uncontrolled release and assuming the worst possible atmospheric conditions (“a temperature of -22°F and a humidity level of 74.3 percent”) the DEIS found that the outside range of immediate danger to life and health would be 617 feet, which is well short of the minimum distance between the pipeline and any inhabited dwellings. The DEIS further identifies regulatory requirements and best practices that minimize the likelihood and potential impact of an unplanned release, and shows that the incidence of any type of release is extremely low for hazardous liquids pipelines in Minnesota (0.0013 incidents per mile).	Thank you for your comment.	20242-203792-01
LIUNA Minnesota & North Dakota	Pranis, Kevin	2024-02-23	In addition to climate, other environmental and safety concerns, the DEIS also comprehensively considers socioeconomic impacts to local communities and to the state. Based on our industry experience, we generally agree with the DEIS characterization of construction employment opportunities that would be associated with the project – at least half of which would be available to local residents based on the applicant’s commitment to use of local union labor.	Thank you for your comment.	20242-203792-01
LIUNA Minnesota & North Dakota	Pranis, Kevin	2024-02-23	We also generally agree with the summary of economic benefits provided by the applicant. While a North Star Policy Action (“NSPA”) analysis found that the Ernst & Young (“E&Y”) report likely overestimates local workforce share compared to the levels common for such projects, NSPA also finds that “E&Y” understates the value of jobs by assuming wage levels below those typically earned by union pipeline construction workers and neglecting the economic value of fringe benefits entirely. 1 1 https://northstarpolicy.org/capturingthemoment/	Section 5.4.11.2 has been revised to clarify that the conclusions in the EIS are not based on the conclusions of the Ernst and Young study prepared for the Midwest Carbon Express project. Information from the Ernst and Young study, as well as another study on the socioeconomic impacts of the Midwest Carbon Express project that was prepared by North Star Policy Action, is presented in Section 5.4.11.2. Information from these studies is presented but was not used to determine impacts.	20242-203792-01
LIUNA Minnesota & North Dakota	Pranis, Kevin	2024-02-23	While generally accurate, we believe that the DEIS could be strengthened by addressing the role of the project in creating opportunities for local workers to improve their earnings, skills and career prospects. Today, the median construction laborer working in Northwest Minnesota earns \$22.36 in hourly wages and based on anecdotal information from worker surveys, many receive little or nothing in fringe benefits.2 By contrast, a construction laborer working on the proposed project would earn at least \$37.02 per hour in taxable wages with full family health coverage, defined benefit pension and training benefits that bring hourly compensation up to \$55.13. As a consequence, the typical construction laborer living in Otter Tail County who secures a new job on the project could conservatively be expected to double his or her hourly compensation while gaining they experience and training needed to secure similar family-supporting wages and benefits once the project is complete. 2 https://mn.gov/deed/data/data-tools/oes	Section 5.4.11.2 has been revised to clarify that the conclusions in the EIS are not based on the conclusions of the Ernst and Young study prepared for the Midwest Carbon Express project. Information from the Ernst and Young study, as well as another study on the socioeconomic impacts of the Midwest Carbon Express project that was prepared by North Star Policy Action, is presented in Section 5.4.11.2. Information from these studies is presented but was not used to determine impacts.	20242-203792-01
LIUNA Minnesota & North Dakota	Pranis, Kevin	2024-02-23	We thank EERA for their work on the DEIS and the Commission for its consideration.	Thank you for your comment.	20242-203792-01
Lower Sioux Indian	Larsen, Robert	2024-02-24	The Summit CO ₂ pipeline project's proposed route is within Dakota Homelands. Lower Sioux Indian Community is directly associated to many areas of cultural importance and/or religious significance identified within the project area. The proposed route is located within an archaeologically dense area with a high volume of known cultural resources and/or significant sites. These resources and sites had, and continue to have, a significant cultural and spiritual role in the identity of Mdewakanton Dakota practices and lifeways,	Thank you for your comment. Potential impacts on cultural and archaeological resources are discussed in Sections 5.4 and 5.6 of the EIS.	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
Communit y			We request that meaningful and diligent evaluation of project need be carefully considered. Such sites and resources are irreplaceable.		
Lower Sioux Indian Communit y	Larsen, Robert	2024-02-24	The Dakota Peoples have a strong spiritual connection to the lands and waters within the ancestral territories of the Dakota. Protection of natural and cultural resources is critically impottant not only now but for seven generations. Therefore, projects that impact the Waters, Air, Lands, wildlife and plant life need a thorough assessment as not to contaminate or destroy the natural environment. Further projects involving relatively new technology are patticularly concerning and should be thoroughly researched to avoid issues or consequences. The Lower Sioux Indian Community provided a letter (dated 05-16-2023) to the Dept of Commerce with our concerns reading the scoping EAQ and the draft scoping decision for the route permit application for this project (see attachment). We continue to have concerns and questions upon our review of the DEIS.	Thank you for your comment.	20243-204403-02
Lower Sioux Indian Communit y	Larsen, Robert	2024-02-24	The purpose of DEIS is to provide an overview of affected resources and discuss potential human and environmental impact and mitigation measures. We have concerns that the proper review hasn't been accomplished and have identified gaps in the impacts and mitigation measures. The following are the concerns regarding the impact to Cultural resources, waters, safety, land, climate change and greenhouse gas emissions, and cumulative impacts.	See responses to detailed comments on each topic below.	20243-204403-02
Lower Sioux Indian Communit y	Larsen, Robert	2024-02-24	Tribes are tasked with evaluating impacts to known cultural resources and cultural sites without relevant case studies, scientific analysis, and precedent to guide informed determinations on CO ₂ pipeline impacts. To consider for example subsurface artifacts, human remains or any organic material and how exposure and interaction to CO ₂ would affect them, yet such studies are not available and even more detrimental are not being required in the EIS. The purpose of an EIS is to provide such studies and info1mation. The Summit Carbon Solution pipeline route is a large-scale project, with many complex variables to consider when evaluating cultural resource impact, it is unreasonable for THPO's to review such considerations when key infonnation is absent. The DEIS fails to address cumulative landscape impacts as well as exposure and interaction studies (as cited above).	Thank you for your comment. A study focused on the interaction of CO ₂ and subsurface artifacts, human remains, or any organic material is outside the scope of the EIS (Appendix A). Potential impacts on cultural resources are discussed in Section 5.4.2. Cumulative potential effects are discussed in Chapter 10.	20243-204403-02
Lower Sioux Indian Communit y	Larsen, Robert	2024-02-24	The proposed project and the identified right-of-way will impact numerous streams, rivers, wetlands, aquifers, and other waterbodies. This includes the Pelican River, the Otter Tail River, and the Bois de Sioux River, and up to 44.6 acres of wetlands. We are concerned that the DEIS did not take an in-depth look at how the proposed project will impact the health and abundance of these water resources. The DEIS describes the potential impact of construction activity within or near these waterbodies as being short-term and minimal. But we know from past experiences with other pipelines, like Line 3, that the pipeline construction can have long-term and widespread impacts on both surface water and groundwater resources.	Section 5.7.8 and Section 5.7.9 describe the impacts of the project on water resources and wetlands.	20243-204403-02
Lower Sioux Indian Communit y	Larsen, Robert	2024-02-24	Additional questions that were mentioned in our comments on the scoping (attachment) included the need to identify the amount of water usage that is needed, what will be added to the water, and where will the water be discharged? Further, how will this project impact the medicinal and cultural plants, fish, macroinvertebrates, mammals, macrophytes, human health, surface water quality, wetlands/connected waterbodies, groundwater, etc.? What is the cumulative impact of the project over the course of the route? These are vital questions about this proposed project that have not been sufficiently investigated. In the past, Lower Sioux staff have reviewed the EIS documents of pipeline and renewal energy projects that addressed these types of questions with specific research and studies. It is not evident in the DEIS that these questions were addressed. Merely stating the project will have minimal impact is not adequate for the NEPA EIS process.	Thank you for your comment. Section 2.4 discusses water discharge locations and processes, Section 3.7 discusses water use and discharge permits that would be acquired, Sections 5.4.4 and 5.7.8 discuss impacts on water and water usage, Section 5.7.7 addresses impacts on vegetation, Section 5.7.10 addresses impacts on wildlife and habitats, Section 5.7.9 addresses impacts on wetlands, Section 5.4 addresses impacts on human settlement, and Section 5.4.8 specifically addresses health and safety. Native Minnesota plants and wildlife of significance to Tribes are discussed in Section 5.4.2. The project would temporarily impact the habitats of plants and wildlife of Tribal significance during construction until restoration of disturbed areas is complete. Additional studies on these topics are outside the scope of the EIS. Section 8.3 addresses effects on humans, health, wildlife, and the environment from an accidental release of CO ₂ . Chapter 10 describes the cumulative impacts of the project.	20243-204403-02
Lower Sioux Indian Communit y	Larsen, Robert	2024-02-24	The technology used to capture carbon can also require significant amounts of water. The DEIS states that the average annual water usage for the capture equipment will be 13 million gallons, and that such water will come from on-site wells at the ethanol facility. There is no information in the DEIS about how the additional water use from the ethanol plant will impact surrounding wells or other water resources. Also the DEIS does not consider the water usage in context of the nearby Communities and the impacts from this	Section 5.7.8 addresses impacts on water resources. Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			new water demand on the current, existing water demands of the aquifers that serve as the source water for these Communities. This is particularly a concern as we have seen recent drought conditions the past few years.	addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	
Lower Sioux Indian Community	Larsen, Robert	2024-02-24	Consideration must also be given to the impact on surface and groundwater in the event of a pipeline leak or rupture. It is necessary to state what will be the response to minimize and remediate after such an event.	Potential impacts of a pipeline rupture on water resources are addressed in Section 8.3.4.	20243-204403-02
Lower Sioux Indian Community	Larsen, Robert	2024-02-24	We remain concerned about the potential risks to human and environmental health in the event of a leak or a rupture. High concentrations of CO ₂ are hazardous and can sicken and asphyxiate humans and animals. The DEIS has also confirmed that vegetation and soil near a leak or rupture could be significantly impacted, from slowing plant growth to freezing soils and killing off vegetation, soil microbes, mycorrhizae, and soil animals.	Potential impacts on human health, vegetation, and soils are discussed in Sections 8.3.1.2 and 8.3.4.3.	20243-204403-02
Lower Sioux Indian Community	Larsen, Robert	2024-02-24	Appendix G provides some information about what the potential impact radius of a rupture might be, but overall, the DEIS does not adequately address how the applicant will be able to guarantee the safety of those living along or near the project. The Pipeline and Hazardous Material Safety administration (PHMSA) has issued public statements that their regulations are not adequate to address the safety risks associated with CO ₂ pipelines. CO ₂ pipelines need special considerations because when a pipeline leaks or a rupture occurs it will release an asphyxiant that can suffocate people and prevent combustion-type vehicles from working. The equipment and training needs for Emergency response personnel to respond to a pipeline incident needs to be thoroughly addressed and placed into practice prior to pipeline construction. All responders will need additional training and equipment to safely respond. This includes replacing all the gasoline/diesel vehicles with Electric Vehicles. In many rural areas the first responders/emergency response are often volunteers. Communities near the route of the pipeline should not have to bear the expense of specialized equipment needed for response to a new hazard brought to the area by a commercial entity.	Section 3.6 acknowledges that PHMSA is currently conducting rulemaking proceedings on proposed amendments to its pipeline safety rules, and that the Commission states it would be prudent for EERA staff and the applicant to take that information into account, even if the updates have not been finalized. PHMSA regulations (that is, their appropriateness) and related standards for CO ₂ pipelines are outside the scope of the EIS. Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that would be revised as required by PHMSA, if the project is approved. Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.	20243-204403-02
Lower Sioux Indian Community	Larsen, Robert	2024-02-24	The impact of the proposed project to the land is not fully addressed and needs additional research. Studies on the long-term impacts of Line 3 pipeline on the land have shown that the environment does not always recover as promised after construction and other major disturbances, despite assurances from companies that impacts will be short-lived. The degradation and loss of habitats is noted as one of the main reasons native plants are lost. The sensitivity of native and medicinal plants to disruption that will occur during construction is a concern that needs to be studied further before the project occurs. Also the impact of a leak or rupture of the pipeline to sensitive plants needs to be defined and mitigation measures need to be proposed if this type of event happens.	Section 2.4 discusses water discharge locations and processes, Section 3.7 discusses water use and discharge permits that would be acquired, Sections 5.4.4 and 5.7.8 discuss impacts on water and water usage, Section 5.7.7 addresses impacts on vegetation, Section 5.7.10 addresses impacts on wildlife and habitats, Section 5.7.9 addresses impacts on wetlands, Section 5.4 addresses impacts on human settlement, and section 5.4.8 specifically addresses health and safety. Native Minnesota plants and wildlife of significance to Tribes are discussed in Section 5.4.2. The project would temporarily impact the habitats of plants and wildlife of Tribal significance during construction. Additional studies on these topics are outside the scope of the EIS. Chapter 8 addresses effects on	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				humans, health, wildlife, and the environment from an accidental release of CO ₂ . Chapter 10 describes the cumulative impacts of the project.	
Lower Sioux Indian Community	Larsen, Robert	2024-02-24	In the DEIS, it is assumed that the applicant will be able to capture and permanently sequester 100% of the CO ₂ from the ethanol facility, but there is no evidence to support that assumption. Without the evidence to support 100% sequestration, it is not possible to know what the actual GHG emission reductions (if any) might be.	Text has been added to Section 2.1 describing the suitability of the Broom Creek Formation in North Dakota for CO ₂ sequestration, as well as the monitoring and testing that would be done to verify that the CO ₂ is contained in the storage reservoir.	20243-204403-02
Lower Sioux Indian Community	Larsen, Robert	2024-02-24	Further, it is not stated length of the life of this project. If a project is for 25 years or perhaps 50 years, does this simply move the issue of greenhouse gases down the road for the future generations to deal with?	Section 2.7 describes project decommissioning. As noted in Section 2.7, the life of the project is anticipated to be 25 years.	20243-204403-02
Lower Sioux Indian Community	Larsen, Robert	2024-02-24	<p>The purpose is to make ethanol a green fuel to sell more of it and make it a viable energy source. Summit Carbon Solutions' full proposal is an extensive project with a 239.64-mile footprint in Minnesota, connecting multiple ethanol plants. It aims to impact the State's agricultural and ethanol industry. It is critical that the environmental concerns be addressed now as there may be more permit applications and environmental reviews of this type in the future.</p> <p>The DEIS does not consider the potential environmental and human impacts of the entire Minnesota portion of the applicant's CO₂ pipeline project. Because of this, we do not know the true cumulative impacts of this entire project on the water, soil, air, health, vegetation, and animals. The DEIS should look at all 240+ miles of pipeline the applicant has publicly proposed.</p> <p>The cumulative impacts of the carbon pipeline are more than listed in the DEIS. For example, the fresh gallons of drinking water currently used for ethanol production is around 3-3.5 gallons in the more efficient ethanol plants. In the year 2021 15 billion gallons of ethanol were reportedly produced. Multiply that number by 3 to get a total of 45 billion gallons of fresh drinking water used to produce the ethanol. Additionally, it is necessary to factor in the amount of natural gas used to manufacture ethanol. The current most efficient ethanol plant is using 37,883 btu's of natural gas to manufacture one gallon of ethanol about the equivalent to one cubic meter of natural gas now multiply those times 15 billion.</p> <p>This is an unlikely source of green energy with all the inputs of natural resources and safety concerns with ethanol carbon capture technology. This should also be for the whole "Midwest Carbon Express" pipeline project as the project described in the current DEIS is merely a pipeline to the North Dakota border with no known end connection point.</p>	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS. The appropriateness of federal and state policies regarding carbon capture and ethanol is outside the scope of the EIS.	20243-204403-02
Lower Sioux Indian Community	Larsen, Robert	2024-02-24	Based on the broad-reaching implications of this project, we respectfully request that the Commission appropriately broaden the scope of the DEIS to the Minnesota footprint of the "Midwest Carbon Express" project rather than studying the northern and southern portions of the pipeline in separate reviews. The "Midwest Carbon Express" is Summit's full proposed project- a pipeline across five states, connecting 30 ethanol plants to an underground storage location in North Dakota. In Minnesota, Summit plans to construct approximately 240 miles of pipeline; approximately 212 miles of that pipeline will connect six ethanol plants in southern Minnesota ("Southern Branch"). The project in the DEIS is only the smaller 28.1-mile branch in Otter Tail and Wilkin Counties, that will connect one ethanol plant to the pipeline network ("Northern Branch"). This proposal meets the Minnesota Environmental Policy Act's ("MEPA") definition of a "phased action," and the rules allow the Commission to include the entire Minnesota footprint. By reviewing the entire Midwest carbon express project in one environmental review would allow the Commission to fully understand and evaluate the impact the Carbon pipeline could have on land use conversion, the ethanol industry, environmental impacts, emergency response needs, and climate change.	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-02
Lower Sioux Indian Community	Larsen, Robert	2024-02-24	The Summit project aims to significantly impact our state's ethanol production industry. It would be impossible to clearly evaluate those potential impacts without looking at Summit's full Minnesota footprint and all the ethanol facilities contracted to connect to the pipeline. This type of project has the potential to induce further proliferation of carbon capture facilities across the state, as well as impact land use. And, ultimately, this DEIS is precedent-setting. It would be unwise to examine a 28.1-mile segment out of the context of the planned 240-mile Minnesota footprint.	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			We strongly urge that the Commission re-evaluate and research further into the environmental impact of this new type of project by considering the impacts of the entire MN footprint of the Midwest Carbon Express pipeline including impacts to cultural and natural resources along the proposed route.		
Lower Sioux Indian Community	O'Brien, Joseph	2023-05-18	With this project, the Public Utilities Commission ("PUC" or "Commission") is in the position to review the first proposed carbon capture pipeline in the State. These types of projects are being proposed across the Midwest, by Summit Carbon Solutions ("Summit"), and by other companies who are seeking to complete similar projects. Summit's full proposal is extensive with a 239.64-mile footprint in Minnesota, connecting six ethanol plants. It aims to impact the State's agricultural and ethanol industry. It is critical that environmental concerns be addressed now as there may be more permit applications and environmental reviews of this type in the future.	Thank you for your comment.	20243-204403-02
Lower Sioux Indian Community	O'Brien, Joseph	2023-05-18	Based on the broad-reaching implications of this project, we respectfully request that the Commission appropriately broaden the scope of review to the Minnesota footprint of the "Midwest Carbon Express" project rather than studying the northern and southern portions of the pipeline in separate reviews. The "Midwest Carbon Express" is Summit's full proposal - a pipeline across five states, connecting 30 ethanol plants to an underground storage location in North Dakota. In Minnesota, Summit plans to construct approximately 240 miles of pipeline; approximately 212 miles of that pipeline will connect six ethanol plants in southern Minnesota ("Southern Branch"). Summit proposes to study only the smaller 28.1-mile branch in Otter Tail and Wilkin Counties, which will connect one ethanol plant to the pipeline network ("Northern Branch"). This proposal meets the Minnesota Environmental Policy Act's ("MEPA") definition of a "phased action," and the rules allow the Commission to include the entire Minnesota footprint. Not only would this process be more efficient than studying the segments in separate EISs, but it would also allow the Commission to fully understand and evaluate the impact this project could have on land use conversion, the ethanol industry, environmental impacts, emergency response needs, and climate change.	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-02
Lower Sioux Indian Community	O'Brien, Joseph	2023-05-18	The Summit project aims to significantly impact our state's ethanol production industry. It would be impossible to clearly evaluate those potential impacts without looking at Summit's full Minnesota footprint and all the ethanol facilities contracted to connect to the pipeline. This type of project has the potential to induce further proliferation of carbon capture facilities across the state, as well as impact land use. And, ultimately, this EIS is precedent-setting. It would be unwise to examine a 28.1-mile segment out of the context of the planned 240-mile Minnesota footprint.	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-02
Lower Sioux Indian Community	O'Brien, Joseph	2023-05-18	The Summit CO ₂ pipeline project's proposed route is within Dakota Homelands. The Dakota Peoples have a strong spiritual connection to the lands and waters within the ancestral territories of the Dakota. Protection of natural and cultural resources is critically important not only now but for seven generations. Therefore, projects that impact the Waters, Air, Lands, wild life and plant life need a thorough assessment as not to contaminate or destroy the natural environment. The questions that need to be addressed are many. For example, what amount of water usage is needed, what will be added to the water, and where will be the discharged? How will this impact medicinal and cultural plants, fish, macroinvertebrates, mammals, macrophytes, human health, surface water quality, wetlands/connected waterbodies, groundwater, etc.? What is the cumulative impact of the project over the course of the route? These are vital questions about this proposed project that have not been sufficiently investigated.	Thank you for your comment. Section 2.4 discusses water discharge locations and processes, Section 3.7 discusses water use and discharge permits that would be acquired, Sections 5.4.4 and 5.7.8 discuss impacts on water and water usage, Section 5.7.7 addresses impacts on vegetation, Section 5.7.10 addresses impacts on wildlife and habitats, Section 5.7.9 addresses impacts on wetlands, Section 5.4 addresses impacts on human settlement, Section 5.4.2 addresses cultural resources, and Section 5.4.8 specifically addresses health and safety. Native Minnesota plants and wildlife of potential significance to Tribes are discussed in Section 5.4.2. Chapter 10 describes the cumulative impacts of the project. Applicable updates have been made to these chapters and sections in the EIS.	20243-204403-02
Lower Sioux Indian Community	O'Brien, Joseph	2023-05-18	Another concern is the safety risks associated with CO ₂ pipelines. The Pipeline and Hazardous Material Safety administration (PHMSA) has issued public statements that their regulations are not adequate to address the safety risks associated with CO ₂ pipelines. CO ₂ pipelines need special considerations because when a pipeline leaks or a rupture occurs it will release an asphyxiant that can suffocate people and prevent combustion-type vehicles from working. The equipment and training needs for Emergency response personnel to response to a pipeline incident needs to be thoroughly addressed and placed into practice prior to pipeline construction. All responders will need additional training and equipment to safely respond. This includes replacing all the gasoline/diesel vehicles with Electric Vehicles. In many rural areas the first responders/emergency response are often volunteers. Communities near the route of the pipeline should not have to bear the expense of specialized equipment needed for response to a new hazard brought to the area by a commercial entity.	Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that is not outdated but would be revised as required by PHMSA, if the project is approved. Additionally, EERA staff recommended a special permit	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission.	
Lower Sioux Indian Community	O'Brien, Joseph	2023-05-18	In addition to broadening the scope of review, we request that the forthcoming Environmental Impact Statement ("EIS") contains a more accurate analysis of the expected climate impacts of the proposal. The EA W overestimates the carbon removal that can reasonably be expected from this project. Furthermore, the Draft Decision proposes to exclude any analysis of life-cycle emissions from ethanol. This is not only inconsistent with the purpose statement but will also inhibit Summit and the Commission from understanding the potential impacts of the project. And, finally, we ask the Commission to consider the ways in which the narrow purpose statement inhibits the Commission's ability to explore less harmful alternatives.	Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and that commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios of 100 percent, 70 percent, 40 percent, and 10 percent. As directed by the scoping decision, the EIS reviews existing studies of the human and environmental impacts of ethanol production and provides a synthesized analysis of potential impacts on human and environmental resources. The CI score range presented in Chapter 6 includes potential emissions associated within the proposed project. Table 5-39 has been updated to provide a summary of GHG emissions from the initial construction as well as the proposed ongoing annual operations at capture facility, CO ₂ capture (abated), and electricity use. An alternative that does not include ethanol production was not studied in the EIS because it would not meet the purpose of the project.	20243-204403-02
Lower Sioux Indian Community	O'Brien, Joseph	2023-05-18	We strongly urge that the Commission consider the impacts of the entire MN footprint of the Midwest Carbon Express pipeline including impacts to cultural and natural resources along the proposed route. Thank you for the opportunity to comment on this issue. We hope the Commission will consider our above comments when determining the scope of the EIS.	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-02
MCEA	Hencheck, Abigail	2024-03-26	<p>The new information outlined below is relevant to the FEIS because it demonstrates the high likelihood that the captured carbon will be used in EOR rather than being permanently sequestered. As MCEA outlined in its comments on the DEIS, if the CO₂ is used for EOR, the project could create more CO₂ than it captures,⁸ significantly affecting the potential environmental effects of the project. Because the information constitutes “substantial new information or new circumstances that significantly affect the potential environmental effects from the proposed project,”⁹ a supplemental EIS (“SEIS”) could be required under Minnesota Rule 4410.3000, subp. 3, if the information is not considered in the FEIS. By considering this information now, shortly after the comment period has closed and with considerable time before the FEIS is issued, EERA can eliminate the possibility of a costly and time-consuming SEIS process. This will help to keep the project on track with future deadlines and within budget proposals. Therefore, MCEA respectfully requests that the new information outlined below be added to the DEIS record and considered in preparing the FEIS. New Information Relevant to Summit’s Intent to Provide CO₂ for EOR.</p> <p>On March 11, 2024, Reuters published a news article¹⁰ regarding Summit’s “dual messages” regarding EOR, specifically in the Bakken. The article characterizes Summit’s public message as a pledge that its project won’t be used for EOR. However, the article goes on to describe its private message, saying “Summit has a different message for prospective clients...: If you want to use our project for [EOR]...just write a check.” More important than the article itself is the evidence that supports it. This evidence did not come to MCEA's attention until the article was released. This evidence highlights the increasing likelihood that Summit will use its CO₂ for EOR which would eviscerate the touted climate benefits of the project. The evidence referenced in the article is summarized below:</p> <ul style="list-style-type: none"> · On December 20, 2023, Summit attended an event put on by Friends of Ag and Energy. Friends of Ag and Energy is a North Dakota-based organization that supports the use of Fossil Fuels and advocates for the use of man-made carbon to benefit the oil, gas, and coal industries. At this event, organizers promoted the construction of CO₂ pipelines so they could be converted into transport for EOR purposes in the future. At this event, Summit was asked, “Enhanced Oil Recovery will ultimately be available from this, and Summit is a part of that, right?” Summit responded, “We’re building a common carrier pipeline, right, that will deliver CO₂ for fee. Today, we don’t have any shippers who want to ship CO₂ for EOR. When that changes, we will likely move it for that purpose.”¹¹ This exchange shows how Summit intends to use its captured CO₂ for EOR as soon as it has a buyer. 	Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	20243-204682-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>· On January 19, 2024, Summit filed a Post-Hearing Reply Brief with the Iowa Utilities Board (“IUB”).¹² In this filing, Summit asks the IUB to reject the suggestion that their permit should require sequestration of all CO₂ and prohibit the use of CO₂ for other purposes, including EOR.¹³ Summit argues that: Summit’s Project is a common-carrier pipeline, so it cannot control what future shippers ultimately choose to do with their product. Summit offers pipeline transportation for product meeting its specifications. While the currently contracted ethanol plants all currently seek to sequester all of their CO₂, and the economic realities dictate that is the most valuable decision, Summit does not ultimately control what future shippers may choose to do with their CO₂ shipped on the pipeline. This statement makes it clear that Summit has no intention of preventing its CO₂ from being used in EOR, and will allow it to be used for EOR at any point its customers want to do so.</p> <p>Based on Summit’s own comments, it is clear that using CO₂ for EOR is not only possible but “likely.” Because of the sizable impact this will have on the project’s environmental impacts, it should be fully and thoroughly studied. Therefore, MCEA asks that this information be added to the DEIS record and considered when developing the FEIS.</p> <p>[MCEA provided attachment to the Post-hearing reply brief of Summit Carbon Solutions, LLC Filed with the Iowa Utilities Board on January 19, 2024, HLP-2021-0001]</p>		
MCEA	Hencheck, Abigail	2024-02-23	<p>[attachments include: Attachment 1 EPA GHG Facility Details ADM 2022 Attachment 2 Archer Daniels Midland MRV Plan Attachment 3 Soil Science Soc of Amer J - 2022 - Brehm Attachment 4 to Soil Use and Management - 2020 - Tekeste]</p> <p>CO₂ pipelines are being proposed across the Midwest as a potential climate solution to reduce greenhouse gas emissions from the ethanol industry.² However, the claim that CO₂ pipelines have a net climate benefit is strongly debated³ and the public has raised many concerns about the human and environmental impacts of CO₂ pipelines. Given that this Project is the first of its kind in Minnesota, it is especially important for its environmental review to include a thorough investigation of this technology and its impacts. The public and decision makers need this information to make an informed decision about the propriety of this Project for Minnesota. MCEA appreciates the significant work of the Department of Commerce (“the Department”) in preparing this DEIS which addresses many key issues. However, MCEA believes additional content is needed in the final Environmental Impact Statement (“FEIS”) for it to be complete and legally sufficient under the Minnesota Environmental Policy Act (“MEPA”).</p> <p>Under MEPA, an EIS must provide useable information concerning the primary environmental effects of a proposed project,⁵ explore measures that could mitigate the environmental impacts, and analyze those effects that cannot be mitigated.⁶ Ultimately, the EIS must contain the pertinent information about a project such that it can be used as a guide by decision makers in issuing, amending, or denying a permit and taking other actions to avoid or minimize adverse environmental effects.⁷</p>	<p>The EIS is an analysis of the project to assist the Commission with making a routing permit decision. A study of carbon capture technology is outside the scope of the EIS as it would not aid the Commission's decision on issuing a route permit.</p>	20243-204403-02
MCEA	Hencheck, Abigail	2024-02-23	<p>The DEIS for this Project addresses many key issues, but it fails to adequately address several important impacts and possible mitigations for the Project that must be included pursuant to the requirements of MEPA.</p> <p>Specifically, the DEIS fails to provide a thorough analysis of the Project’s primary environmental effects if less than 100 percent of the CO₂ is captured by the Project, if any of the CO₂ is used for enhanced oil recovery, or if the Plant does not produce or capture enough CO₂ to safely operate the pipeline. The DEIS also does not explore measures that could mitigate the impacts of construction that causes reduced crop yields, nor mitigations for farmers that experience reduced yields over multiple years. In addition to these major concerns, the DEIS also does not fully address the use of an odorant as a possible mitigation, does not include important sources of greenhouse gas emissions in the discussion of the Project’s emissions, does not address the environmental impacts of an accidental release of drilling fluid, and does not do enough to ensure meaningful consultation with tribal governments. This missing information is necessary for the Commission to make a reasoned decision about the potential for, or significance of, the Project’s environmental effects, and the DEIS must be revised accordingly.</p>	<p>See responses to detailed comments on each topic below.</p>	20243-204403-02
MCEA	Hencheck, Abigail	2024-02-23	<p>I. The DEIS Does Not Adequately Discuss the Carbon Capture Feasibility of the Project</p> <p>The DEIS analyzes the Project using a carbon capture rate of 100 percent.⁸ To the best of MCEA’s knowledge, it is unlikely that this capture rate can be realized. To our understanding, the best performing ethanol carbon capture project known to date is capturing a very small percentage of the carbon produced by that plant.⁹ It does not appear that the Applicant is proposing any new technology or operating procedures that would explain such a significant increase in performance for this Project.¹⁰ The DEIS also does not produce any data-driven evidence of this capture rate being possible, despite its claim that the rate is “proven.”¹¹ The DEIS only</p>	<p>The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios for 100 percent, 70 percent, 40 percent, and 10 percent. Section 2.1 has been revised to clarify that the amount of CO₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and that commenters have questioned the feasibility of this capture rate given the performance of</p>	20243-204403-02

			analyzes the Project using the 100 percent carbon capture rate; it does not consider alternatives where less than 100 percent of the carbon from the Plant is captured. ¹² Given the questionable nature of the 100 percent capture rate, the FEIS must provide evidence that capturing 100 percent of the carbon is possible and study the environmental impacts of the Project if it does not achieve the 100 percent capture rate using a high-medium-low framework. [continued below]	existing capture facilities. Finally, Section 5.7.2.3 has been revised to include ranges of the amount of oil that could theoretically be produced with EOR using CO ₂ captured by the project, based on lower capture rates scenarios.	
MCEA	Hencheck, Abigail	2024-02-23	<p><i>A. It Is Improper to Assume a 100 Percent Capture Rate Without Evidence Demonstrating the Feasibility of 100 Percent Capture</i></p> <p>In its Environmental Assessment Worksheet, the Applicant estimates it will capture 185,454 metric tons of CO₂ from the Plant each year.¹³ This is the maximum potential annual CO₂ emissions from the wet scrubber at the Plant.¹⁴ Thus, the Applicant estimates a 100 percent capture rate at its capture facility. Citing the capture facility’s design, the DEIS assumes this capture rate of 100 percent.¹⁵ This capture rate represents an 89 percent increase from the most successful ethanol plant carbon capture rate known to date.</p> <p>MCEA’s understanding is that the most successful known carbon capture project applied to an ethanol plant is at the Archer Daniels Midland ethanol plant in Decatur, IL.¹⁶ That facility emits a little more than 4.1 million metric tons of CO₂ each year.¹⁷ The capture facility, in that case, was designed to capture 26 percent of the overall emissions.¹⁸ In 2022, the Archer Daniels Midland plant captured 428,580 metric tons of carbon, which is only 40 percent of the carbon it was designed to capture.¹⁹ In other words, in the most successful example of carbon capture technology used at an ethanol plant, the project was only able to capture 11 percent of the overall CO₂ emissions. To the best of MCEA’s knowledge, the Applicant is not capturing carbon using any new technology or procedure that would explain an 89 percent increase in the success rate of their carbon capture technology.²⁰ If the Applicant is using new or different technology, this should be made explicit in the FEIS, along with data supporting the ability of this technology to achieve a 100 percent capture rate. At present, the DEIS only explains the Project’s 100 percent capture rate by citing to the capture methodology.²¹ The Project methodology uses a “tie in connection at the CO₂ scrubber stack and then process[es] the CO₂ to the desired chemistry to transport or store the CO₂.”²² It describes this technology as the “industry standard methodology to capture the most CO₂ at an ethanol plant.”²³ The DEIS goes on to explain that the Applicant would capture 100 percent of the CO₂ by “adhering to the standard operating procedures and minimizing equipment downtime through preventative maintenance programs.”²⁴ This is not sufficient to explain how the “industry standard methodology” for carbon capture and the “standard operating procedure” at the capture facility would capture 89 percent more carbon than the most successful capture facility in the industry. In sum, the FEIS must provide support for a 100 percent capture rate. It must show that this capture rate is feasible by producing data-driven evidence that something near this capture rate has been achieved at some point by some project using the technology and operating procedures proposed for this Project. [continued below]</p>	The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios for 100 percent, 70 percent, 40 percent, and 10 percent. Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and that commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. Finally, Section 5.7.2.3 has been revised to include ranges of the amount of oil that could theoretically be produced with EOR using CO ₂ captured by the project, based on lower capture rates scenarios.	20243-204403-02
MCEA	Hencheck, Abigail	2024-02-23	<p><i>B. It Is Improper to Assume a 100 Percent Capture Rate Will Be Achieved When Assessing the Project’s Environmental Impacts</i></p> <p>When assessing the possible environmental impacts of the Project, the DEIS bases its analysis on the assumption the project will achieve a 100 percent capture rate.²⁵ For example, the DEIS relies on the 100 percent capture rate in finding a net decrease in the greenhouse gas emissions for the Project,²⁶ a net positive impact on climate change,²⁷ and the carbon intensity score for the Project.²⁸ All of these assumptions would be impacted in the likely event that the Project does not capture all of the CO₂ produced. The intensity of the impact would, of course, depend on how much CO₂ was captured. However, given the 89 percentage point difference between this Project’s proposed capture rate and the next best-performing ethanol carbon capture project, the impact could be significant; up to 89 percent of the benefits assumed by the DEIS could fail to materialize.</p> <p>Unless there are multiple studies that can confirm the feasibility of the projected 100 percent capture rate for the Project’s capture technology, the FEIS must acknowledge that the actual carbon capture rate of the Project is speculative and that there is a substantial possibility that less than 100 percent of the CO₂ is captured.</p> <p>The FEIS must study how this would affect the environmental impacts of the Project, particularly the Project’s climate impact. To accomplish this, MCEA suggests the FEIS study the impact of a range of potential capture rates using a high-medium- low framework (ex: 10% of emissions captured, 40% captured, 90% captured) to provide the Commission with bookends that show the Project’s impacts if different capture rates come to fruition. The Commission will not have usable information that addresses the Project’s significant environmental issues unless the FEIS contains a complete picture of climate benefits that may or may not be achieved by the Project.³⁰ Without this information, the Commission cannot make a fully informed decision about the Project. Thus, the FEIS must fully support its use of a 100 percent capture rate and study alternatives where less than 100 percent of the CO₂ is captured, using a high-medium-low framework.</p>	The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios for 100 percent, 70 percent, 40 percent, and 10 percent. Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and that commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. Finally, Section 5.7.2.3 has been revised to include ranges of the amount of oil that could theoretically be produced with EOR using CO ₂ captured by the project, based on lower capture rates scenarios.	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
MCEA	Hencheck, Abigail	2024-02-23	<p>II. The DEIS Does Not Adequately Consider that CO₂ May be Used for Enhanced Oil Recovery</p> <p>In this Project, the Applicant proposes to transport the captured CO₂ to North Dakota and inject it underground for permanent sequestration.³¹ However, captured CO₂ can also be used for Enhanced Oil Recovery (“EOR”).³² This is a highly controversial process where CO₂ is injected into oil reservoirs to recover oil that is unreachable by primary recovery processes.³³ The U.S. EPA estimates that, in 2022, approximately 60 percent of all captured CO₂ was, in fact, used for EOR.³⁴ There is evidence that this percentage will increase due to tax credits for carbon capture and the false narrative that EOR supports climate goals by avoiding additional fossil fuel drilling projects.³⁵ But this discounts the risk associated with using CO₂ injection for EOR. EOR projects have raised environmental concerns over leakage into adjacent groundwater and soils, the impacts of chemicals leaching from wells, the high-intensity water usage rates of EOR injection wells, and the impacts on communities surrounding EOR sites.³⁶ The Applicant has stated that it does not propose or plan to use CO₂ from this project for EOR.³⁷ However, there is no permitting mechanism that prevents the Applicant from using the CO₂ for EOR once the Project is built, as the Commission does not retain jurisdiction at the pipeline’s endpoint in North Dakota.</p> <p>Additionally, the Applicant’s parent company has expressed an interest in using the captured CO₂ for EOR.³⁸ Yet the DEIS does not fully investigate how the environmental impacts of the Project would be altered if the CO₂ was used for EOR. A full and robust FEIS must consider the possibility that the CO₂ may be used for EOR by analyzing the climate effects of additional oil production, considering how the environmental impacts of the project change if not all the CO₂ is permanently sequestered, and providing the information needed to determine the likelihood of the CO₂ being used for EOR.</p>	As indicated in Section 5.7.2.3, it is possible that CO ₂ captured from the ethanol plant could contribute to further fossil fuel extraction through its use for EOR; however, it would be speculative to conclude whether the availability or absence of CO ₂ from the ethanol plant would have a significant effect on future oil production. Section 5.7.2.3 has been revised to include an estimate of emissions from oil produced with EOR using the CO ₂ captured from the ethanol plant.	20243-204403-02
MCEA	Hencheck, Abigail	2024-02-23	<p><i>A. The DEIS Fails to Consider the Likelihood that the Applicant Will Use the CO₂ for EOR</i></p> <p>The DEIS acknowledges the connection between carbon capture projects and EOR, including the use of EOR in North Dakota.⁴⁰ The DEIS states, “EOR methods used in the Bakken Formation (the shale oil formation in North Dakota) include CO₂ injection....”⁴¹ However, it fails to acknowledge the proximity of EOR sites in North Dakota to the termination point of this pipeline. The proximity of the pipeline to known EOR sites is concerning because it increases the ease with which the Applicant can divert CO₂ from its sequestration sites to the EOR sites, thus increasing the likelihood that the captured CO₂ is not, in fact, permanently sequestered.</p> <p>This concern is exacerbated by comments from the CEO of the Applicant’s parent company, Summit Agricultural Group. He has publicly stated that Summit is exploring not just storing CO₂ but also using it for EOR.⁴² Given that federal tax credits are available for both sequestration and EOR, these comments raise genuine concerns that the Applicant may use its CO₂ either partially or wholly for EOR.</p> <p>The Commission cannot understand the environmental impact of the Project without understanding the likelihood of it becoming involved with EOR. Therefore, the FEIS must discuss the proximity of EOR sites to the planned sequestration site. This information will be critical for the Commission to understand the significant impact EOR participation could have on the Project’s alleged benefits.</p>	Section 5.7.2.3 has been revised to include ranges of the amount of oil that could theoretically be produced with EOR using CO ₂ captured by the project that are based on several capture rate scenarios. Information regarding the location of the sequestration facilities relative to oil and gas fields has also been added to this section.	20243-204403-02
MCEA	Hencheck, Abigail	2024-02-23	<p><i>B. The FEIS Must Consider the Climate Impacts of Using CO₂ for EOR</i></p> <p>The DEIS does not adequately address the environmental impacts of increased oil production in the event the captured CO₂ is used for EOR. It opines that the climate impacts that would occur if the Project CO₂ is used for EOR are too speculative to analyze because the amount of CO₂ needed to produce a barrel of oil is site-specific.⁴³ While this may be true, the DEIS also provides “for illustrative purposes” that the Project could help produce 316,700 to 633,300 barrels of oil per year if the CO₂ was used for EOR.⁴⁴ This number is based on the estimated amount of CO₂ used for EOR in the United States in 2019.⁴⁵ The DEIS could have used these estimated barrels of oil to study the climate effects of using the CO₂ for EOR, but it did not.</p> <p>According to the EPA, 316,700 to 633,300 barrels of oil annually would produce between 136,181-272,319 metric tons of CO₂ emissions annually.⁴⁶ At best, this Project will capture 185,454 metric tons of CO₂ annually.⁴⁷ And this is only in the unlikely scenario that the Project captures 100 percent of the CO₂ produced.⁴⁸ In other words, if the captured CO₂ is used for EOR, there is a good chance that the Project will result in more CO₂ emissions than it captures. This would render many assertions in the DEIS inaccurate, specifically the assertion that the Project is a net benefit for emissions and the climate.⁴⁹ [49 See DEIS at 5-93, 5-98 to 5-99, 6-6.] Given that the use of the Project’s CO₂ for EOR is not, and will not be prohibited, and that use for EOR would turn the current DEIS findings on their head, the FEIS must study this possibility in order to sufficiently inform the Commission of the possible environmental effects of this Project.</p>	Section 5.7.2.3 has been revised to include ranges of the amount of oil that could theoretically be produced with EOR using CO ₂ captured by the project that are based on several capture rates scenarios. Additionally, statements regarding the net benefit of the project have been clarified as applicable, such as section 5.7.2, which has been revised to note that the project would contribute to a net beneficial effect on climate change as it would capture and store CO ₂ emissions from the ethanol plant.	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
MCEA	Hencheck, Abigail	2024-02-23	<p><i>C. The FEIS Must Consider How Much CO₂ Could Be Released During the EOR Process</i></p> <p>The DEIS acknowledges that the EOR process fails to sequester all the CO₂ injected into oil wells.⁵¹ It states, “[i]f CO₂ was used for EOR, it is likely not all the CO₂ would be sequestered.”⁵² However, the DEIS fails to analyze how much CO₂ would escape sequestration or how that would affect the overall environmental impacts of the Project.⁵³ It states that it cannot complete such an analysis because the amount of CO₂ that would escape is too speculative.⁵⁴</p> <p>Specifically, it states that “[b]ecause there are multiple variables that would affect the retention of CO₂ in the subsurface during the EOR process, the amount of CO₂ that would be released at the surface cannot be quantified with a reasonable degree of certainty.”⁵⁵</p> <p>Given the prevalence of EOR, it is likely that data is available concerning the general amount of CO₂ or a range of CO₂ that is not sequestered during EOR. The Department can use this data or use an estimation to create a reasonable range of the high, medium, and low amounts of CO₂ at risk of not being permanently sequestered through the EOR process. With these scenarios in hand, the FEIS can provide information regarding how the CI score of the Project would change if some or all of the captured CO₂ were used for EOR.</p> <p>Permanent sequestration is a pivotal piece of the Project and central to determining its environmental effects. Understanding the likelihood that the CO₂ is not sequestered, and the environmental impacts of that possibility will be essential information for the Commission. To provide usable information for the Commission in its decision-making, the FEIS needs to provide information regarding the likelihood that the Applicant will participate in EOR, including information regarding the prevalence of EOR and the proximity of EOR to the pipeline and its sequestration site. The FEIS must also analyze the environmental impacts if any of the CO₂ is used for EOR, including the impacts of additional oil production resulting from this Project’s CO₂ and the impacts of CO₂ being released in the EOR process rather than sequestered.</p>	<p>Use of CO₂ for EOR is not purported to be an effective method to sequester CO₂. The discussion in Section 5.7.2.3 is intended to disclose potential impacts in the event that the captured CO₂ is used for EOR rather than being sequestered, as proposed. One of those impacts is that not all of the CO₂ is likely to remain in the subsurface. Text has been added to Section 2.1 describing the suitability of the Broom Creek Formation in North Dakota for CO₂ sequestration, as well as the monitoring and testing that would be done to verify that the CO₂ is contained in the storage reservoir.</p> <p>Section 5.7.2.3 addresses the possibility that the captured CO₂ could be used for EOR instead of being sequestered and includes estimates of the amount of oil that could theoretically be produced based on different capture rates. Additionally, estimates of the amount of GHGs that would result from the produced oil have been added to Section 5.7.2.3.</p>	20243-204403-02
MCEA	Hencheck, Abigail	2024-02-23	<p>III. The DEIS Does Not Consider the Effect that Reduced CO₂ Production or Capture Would Have on the Safety of the Pipeline</p> <p>The DEIS observes that this Project must operate at a minimum pressure in order to be safe.⁵⁶ To obtain this pressure, the Project must collect and transport a minimum throughput to safely operate the pipeline.⁵⁷ The Applicant can shut in or isolate the pipeline and close the mainline valves (“MLVs”) to accommodate temporary reductions in throughput and pressure,⁵⁸ for example, due to maintenance or unforeseen plant closures. However, “[p]ermanent reductions in throughput would result in changes in operational parameters that could impact the ability to safely operate the pipeline. Permanent reductions in throughput could also hamper the ability to perform in-line pipeline integrity inspections because the inspection tool could not move at its designed rate to optimally inspect the pipeline.”⁵⁹</p> <p>In other words, the safe operation of the pipeline requires a minimum amount of CO₂ to be continuously pushed through the pipeline, in turn requiring a minimum amount of CO₂ to be produced and captured at the Plant. The DEIS does not state what minimum pressure would be required for safe operations, nor does it state the metric tons of CO₂ that would be needed daily to support the required pressure.⁶⁰</p> <p>This is concerning because Minnesota’s climate goals (or federal climate policies) could result in reduced ethanol usage and therefore reduced CO₂ production by the Plant, which could undermine the safety of the pipeline. The State of Minnesota has a statutory goal of reducing greenhouse gas emissions to net zero economy-wide, by 2050.⁶¹ In furtherance of these goals, Minnesota is likely to implement policies, regulations, and incentives over the next 26 years that work towards meeting this goal. These actions could have a significant impact on ethanol markets, the amount of ethanol produced in the State, and consequently, the amount of CO₂ produced through ethanol production. For example, the move toward electric vehicles and other alternative means of transportation, as outlined in the Minnesota Climate Action Framework,⁶² could impact the ethanol industry, causing less ethanol to be produced in the State. Additionally, the Plant could choose to or be required to implement technology alternatives, like those considered in the DEIS.⁶³</p> <p>Regardless of the specific policies implemented, the fact remains that Minnesota’s climate goals are likely to bring about a reduction in the amount ethanol produced and therefore the amount of CO₂ produced by this industry. This could mean that the Plant does not produce enough CO₂ to safely operate the pipeline.</p> <p>If there is not enough CO₂ to safely operate the pipeline, there are two potential outcomes, both of which the FEIS must address. First, the pipeline could cease operations much earlier than planned by the Applicant. This would alter the environmental benefits that would be realized by the Project. The intensity of this change would depend on how long the pipeline was operational before it was decommissioned. What are the environmental implications if the pipeline is only operational for five years? Ten years? 15 years? The</p>	<p>If less CO₂ becomes available in the future, it is anticipated that the flow rate would be reduced, not the pressure. Federal law requires that the pressure always remain at levels conducive to safe operations. There are other options that can be exercised to compensate for reduced product flow.</p>	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>answer to these questions will change the risk-benefit analysis for the Project, and the FEIS must answer them in order to provide the Commission with all the information needed to make an informed decision on this Project.</p> <p>Second, the pipeline could continue to operate but in an unsafe manner, increasing the risk of a rupture or other negative environmental effects. The FEIS must consider the potential environmental impacts of the pipeline operating below the minimum safe pressure. Additionally, due to the financial resources required to initiate this Project, the FEIS must consider that the Applicant is at risk of choosing this option in order to operate the pipeline longer and recoup more of its costs. The DOC-EERA should request information from the Applicant to better understand how long the pipeline must remain operational in order to be profitable.</p> <p>The FEIS must fully address the safe operation of the pipeline. To do so, it must address the amount of CO₂ needed to safely operate the pipeline and consider the potential outcomes if that amount of CO₂ is not available.</p>		
MCEA	Hencheck, Abigail	2024-02-23	<p>IV. The DEIS Must Include Information on the Efficacy of Mitigations to Reduce Impacts to Cropland and Crop Yields</p> <p>The DEIS contains information showing the Project’s construction will have a potentially significant impact on cropland that could last for years after construction is complete and could reduce crop yields in a way that would impact the livelihoods of Minnesota farmers. Therefore, pursuant to Minn. Stat. § 116D.04, subd. 2a(a), Minn. R. 4410.0200, subd. 51, Minn. R. 4410.2300(I), and Minn. R. 4410.2800, subp. 4, the FEIS must contain information about the efficacy of discussed and planned mitigation measures to reduce this potentially significant impact. This information must be included in the FEIS in order for it to “provide usable information to the project proposer, governmental decision makers and the public.</p> <p>The DEIS makes clear that if construction of the pipeline were permitted, it would have a potentially significant impact on area cropland. The land that would be disturbed during construction is predominantly cropland.⁶⁶ When construction occurs on cropland, compaction of the soil and mixing of the topsoil with other soils can reduce the ability of that land to successfully grow crops, and these impacts can last for multiple growing seasons after construction has taken place.⁶⁷ Unfortunately, the cropland that would be disturbed by this Project is considered some of the best in the State, as 90% or more of the land along each of the routes is designated as “prime farmland.”⁶⁸, ⁶⁹ Indeed, Figure 5-10 of the DEIS shows that nearly all the land along the 3 routes is either prime farmland, farmland of statewide importance, or prime farmland if drained.⁷⁰</p> <p>In addition to being valuable agricultural land, the DEIS also reports that the croplands impacted by the Project are the type of lands that are especially susceptible to impacts from construction. The DEIS notes that soils that are most susceptible to the negative impacts from construction include: (1) prime farmland, (2) compaction-prone soils,⁷¹ and (3) soils with poor revegetation⁷² among others.⁷³ The routes where proposed pipeline construction would take place are 90% or more prime farmland and have 70% or more acres that are compaction-prone, and 13% or more acres with revegetation concerns where achieving adequate vegetation following construction and restoration may not be possible.⁷⁴ Given these characteristics of the land, if the Project is allowed, the impacts to farmers could be significant.</p> <p>The most basic impact to these lands is lost crop yields during the period of construction— estimated to be approximately one growing season.⁷⁵ However, the DEIS identifies multiple impacts of construction that could alter future agricultural productivity of the land for as long as five years after construction. Moreover, recently published studies show these impacts can last even longer.⁷⁶ The DEIS identifies the following impacts to croplands from construction:</p> <ul style="list-style-type: none">• The removal of topsoil during construction could expose soils that are classified as prime farmland and farmland of statewide importance to wind and water erosion causing this topsoil that is classified as some of the best in the State be lost to erosion.⁷⁷• Mixing of topsoil with other soils during the backfilling process could alter the properties of the soil which in turn could affect the ability of crops to reestablish for multiple growing seasons (up to 5 years) after restoration activities are complete.⁷⁸• Soil compaction and rutting would occur from the use of heavy construction vehicles.⁷⁹ Soil compaction is known to cause reduced crop yields.⁸⁰ Effects typically last for 2 to 3 years but can last up to 5 years (or even longer) depending on impacts on soils from construction disturbance.⁸¹• These impacts from construction have the potential to lead to financial impacts, for example, lost farm revenue.⁸²	<p>As indicated by the definitions found on Page 5-1 of the draft EIS, “long-term impacts extend beyond the end of construction and are generally associated with operation of the project.” Disturbance to soils and crops from construction can result in impacts that extend beyond the construction phase, and the text in the final EIS has been revised to indicate that impacts can be long term.</p>	20243-204403-02
MCEA	Hencheck, Abigail	2024-02-23	<p>Given the potentially serious impacts to the productivity of farmland and farmers’ livelihoods that can last for years, the DEIS must provide more information about how well these conditions can be mitigated. MEPA foundationally requires that the EIS “explore[] methods by which adverse environmental impacts of an action could be mitigated.”⁸³ Mitigation is defined as “avoiding impacts altogether by not undertaking a certain project or parts of a project; . . . rectifying impacts by repairing, rehabilitating, or restoring the affected environment; . . . compensating for impacts by replacing or providing substitute resources or environments; or . . . reducing or avoiding impacts by implementation of pollution prevention measures.”⁸⁴ An EIS is required to contain a section on mitigation</p>	<p>The EIS acknowledges that crop production would be affected by changes to soils from construction disturbance. Text in Chapter 5 has been revised to indicate that impacts on crop production would be long term. Measures to minimize these impacts are described in the applicant's Minnesota ECP and Minnesota APP, which are provided as appendices. These measures include standard best management</p>	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>measures which “shall identify those measures that could reasonably eliminate or minimize any adverse environmental, economic, employment, or sociological effects of the proposed project At present, the DEIS makes reference to multiple other documents and permits the permittee is required to comply with, but it does not actually identify the mitigation measures that can or must be implemented according to those plans and permits, nor does it report whether those mitigation measures can actually minimize the impacts of concern. For example, as a mitigation the DEIS references the terms in the sample routing permit which state, “[c]ompaction of agricultural lands by the Permittee must be kept to a minimum and mitigated in accordance with its agricultural protection plan [if applicable].”⁸⁶ However, given the high sensitivity of the lands on the construction route, 70% of which are designated as compaction-prone, is it even possible for the applicant to “keep compaction to a minimum” or “mitigate it?” The DEIS does not provide further discussion on what mitigation practices could be implemented, and whether they would be effective, especially in this highly sensitive area. Instead, the DEIS says, “[c]onstruction practices that would minimize impacts on soils, such as erosion and mixing of topsoil and subsoil, are described in detail in the applicant’s Minnesota ECP (Appendix D) and Minnesota APP (Appendix E).”⁸⁷</p> <p>Those documents mention some specific actions the Applicant plans to take, for example, the APP mentions the use of deep-tillage to alleviate compaction of the subsoil and/or deep subsoil ripping.⁸⁸ However, the FEIS must indicate whether these practices are effective at addressing soil compaction and decreased crop yields, how effective they are expected to be (25% effective? 100% effective?), and over what timeline. This analysis is especially critical in light of recent studies that have found persistent soils issues years after pipeline installation resulting in reduced crop yields despite the use of best management practices like double-lift excavation to address soil mixing and deep ripping to address soil compaction.⁸⁹</p>	<p>practices (BMP), such as erosion and sediment control, topsoil segregation, and soil decompaction. An analysis of the effectiveness of these BMPs is outside the scope of the EIS. Additionally, impacts on agricultural production can be mitigated through landowner agreements. These agreements are outside the scope of the EIS.</p>	
MCEA	Hencheck, Abigail	2024-02-23	<p>The FEIS must also include information about the applicant’s proposed mitigation to compensate farmers for lost crops due to construction.⁹⁰ Currently, the DEIS states “[c]ompensation for crop loss would be negotiated between the applicant and the landowner. These agreements are outside the scope of this EIS.”⁹¹ This analysis is insufficient given the requirement that an EIS must include a section on mitigation measures that “shall identify those measures that could reasonably eliminate or minimize any adverse environmental, economic, employment, or sociological effects of the proposed project.</p> <p>Given the significant economic and employment impacts from lost revenue to farmers, MEPA requires the FEIS to identify whether the proposed compensation regime is actually a meaningful mitigation such that it would eliminate or minimize the adverse effects of lost crop yield. To provide a legally sufficient analysis, the FEIS needs to include more details about this proposed mitigation, including but not limited to:</p> <ul style="list-style-type: none">• Whether landowners are notified that they can seek compensation for lost crop yields in their easement agreement;• What formulas or methods are used to determine compensation for lost crops, or what are average compensation amounts;• Whether landowners are informed that crop losses could extend for more than just the year of construction, and yields could in fact be impacted as long as 5 or more years after construction;• Whether landowners can be compensated for lost crops or reduced yield beyond the year of construction in easement agreements (does the Applicant plan to allow for this); and• Which state agency (if any) has jurisdiction to address ongoing issues with lost or diminished crop yields after construction has been completed. <p>The purpose of MEPA is to “look before you leap.” The EIS is meant to “provide usable information to the project proposer, governmental decision makers, and the public”⁹³ and to serve as a guide to decision makers in issuing, amending, or denying permits so that adverse effects to the environment and communities can be minimized.⁹⁴ Understanding the true impact to farmers’ livelihoods is key information the public and decision makers require and is undoubtedly information the Commission will want to understand before making a decision on this Project.</p>	<p>Thank you for your comment. Landowner agreements are outside the scope of the EIS. The EIS discusses potential impacts on agricultural production, soils, etc. This information can be used by landowners when negotiating easement agreements. Should ongoing issues with lost or diminished crop values occur, an individual can file a complaint with the Commission. This information has been added to Section 5.5.1.2.</p>	20243-204403-02
MCEA	Hencheck, Abigail	2024-02-23	<p>V. The DEIS Contains Other Inadequacies that Should Be Addressed</p> <p>In addition to the above major concerns, MCEA believes the FEIS would be improved by analyzing whether an odorant is a feasible and effective mitigation, including land use change emissions in the Project’s emissions calculation, further discussing the environmental impacts of an accidental release of drilling fluid, and doing more to reach tribal governments.</p>	<p>See the responses to the more detailed comments on these topics below.</p>	20243-204403-02
MCEA	Hencheck, Abigail	2024-02-23	<p><i>A. The DEIS Did Not Investigate Adding an Odorant as a Possible Mitigation</i></p> <p>Public concerns about the Project have largely centered around the possibility of a pipeline leak or rupture.⁹⁶ The DEIS acknowledges receiving comments about the possibility of adding an odorant to the CO₂ to help mitigate this concern.⁹⁷ However, the DEIS did not adequately address whether this is a feasible or effective mitigation measure.⁹⁸ The FEIS must address the concerns of the public, in</p>	<p>As indicated in the EIS, CO₂ is odorless at low concentrations but has a sharp, acidic odor at very high concentrations, such as would occur in the event of a rupture. EERA staff evaluated the addition of an odorant, as described in Section 8.5.2. Adding an odorant would fall under safety</p>	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			part, by exploring the efficacy in mitigating the effects of a rupture by adding an odorant to the CO ₂ . Rather than addressing whether an odorant can mitigate potential harms from a rupture, the DEIS simply states that “[t]here are no PHMSA regulations that require use of odorants in CO ₂ pipelines . . . and the applicant does not propose to add an odorant.” ¹⁰⁰ While this is true, it is not, on its own, sufficient grounds to not study the mitigation measure. While there may be no PHMSA regulations requiring the use of odorants, it also does not appear to be prohibited. Thus, whether this is a feasible and effective mitigation is relevant, helpful, and requested information. While the DEIS correctly states that only PHMSA can set levels for allowable impurities in CO ₂ pipelines and that the Commission cannot set safety standards, ¹⁰¹ the scope of environmental review is broader than just those mitigations or conditions that the Commission has authority to order. ¹⁰² The purpose of environmental review is to understand the full impacts of a project on Minnesotans’ environment, health, and livelihoods. ¹⁰³ If adding an odorant is possible and effective, but the Applicant has simply chosen not to do so, this is important information for the public and the Commission to consider when assessing whether this Project is safe for Minnesotans. ¹⁰⁴ To know this, the FEIS must provide this information The DEIS currently relies on the Applicant’s vague assertion that it would be too difficult to add an odorant because it would “require multiple injection facilities and would introduce additional logistic and design changes needed for the safe storage and overland transport of the odorant.” ¹⁰⁵ The DEIS does not verify these statements. ¹⁰⁶ The FEIS should fact-check these assertions and consider the feasibility and efficacy of adding an odorant by analyzing whether it is technologically feasible and what impact it would have on reducing the impacts from a pipeline rupture.	standards. The Commission cannot set safety standards for pipeline construction or operation. The Commission’s obligation is to identify a pipeline route consistent with the criteria found in statutes and the applicable administrative rules. Federal law, by contrast, exclusively prescribes pipeline safety requirements.	
MCEA	Hencheck, Abigail	2024-02-23	<p><i>B. The Section on Greenhouse Gas Emissions Must Include Emissions from Land Use Change to Accurately Reflect the Project’s Climate Impact</i></p> <p>The DEIS correctly recognizes that if land is converted from its current use to agricultural land that is growing feedstocks for ethanol, this will emit greenhouse gas emissions.¹⁰⁷ Moreover, the DEIS recognizes that market mechanisms can incent changing a land’s use to growing ethanol feedstocks because market signals provide incentives to grow more feedstocks for ethanol production.¹⁰⁸ The California Air Resources Board (“CARB”) has also identified land use change as a key element in understanding the climate consequences biofuels like ethanol.¹⁰⁹ CARB has found the emissions impacts from land use change are so significant that failing to account for them when assessing the carbon intensity of biofuels would create such an inaccurate picture of their climate consequences that it could actually jeopardize the ability of California’s low carbon fuels market to achieve carbon reductions.¹¹⁰ In studying land use change, CARB found that increasing worldwide demand for biofuels will stimulate a corresponding increase in the price and demand for the crops used to produce those fuels. In order to meet that demand, farmers will either grow more biofuel crops on existing land by reducing or eliminating crop rotations, will convert existing land from food to fuel crop production, will convert non-agricultural land to fuel crop production, or will try to increase yields on existing land.¹¹¹ Many of these changes will result in increased greenhouse gas emissions from the release of carbon sequestered in soils and land cover vegetation.¹¹²</p> <p>The DEIS sections discussing the Project’s greenhouse gas emissions and impact on climate change do not account for the emissions that will occur if land is converted from its current use to fuel crop production for use at the ethanol plant. Low carbon fuel markets are being increasingly proposed in various states (including Minnesota). And this Project plans to make ethanol more competitive in low carbon fuel markets. As such, it is unreasonable to assume that conversion of lands to fuel crop production as a result of this Project over its lifetime will be zero.</p> <p>This is especially true given that the DEIS notes that the capacity of the capture facility was determined based on current ethanol production and “potential growth at the ethanol plant.”¹¹³ If growth of the ethanol facility’s capacity is contemplated, the corresponding land use change needed to feed that growth should also be accounted for. The impact of potential land use change as a result of this Project is also an important impact for the public and decision makers to understand in light of Minnesota’s policy to reduce its greenhouse gas emissions economy-wide to net zero during the lifetime of this Project.¹¹⁴ As the DEIS recognizes, agriculture is one of the top three sectors that produce the most greenhouse gas emissions in Minnesota¹¹⁵ and reducing emissions from this sector is necessary to reach our statewide goals.¹¹⁶ If reducing agricultural emissions is critical to achieving state goals, decision makers need to understand if this Project is actually increasing emissions in this sector as a result of land use change. The DEIS currently states that this Project would have “a net beneficial effect on climate change,”¹¹⁷ but this statement is unsupported by the DEIS in its current form given that the land use impacts are not currently being considered in its greenhouse gas emission calculation. Similar to the DEIS’s recognition that the lifecycle emissions of fuels (expressed as carbon intensity scores) guide stakeholders, policymakers, and industries in their efforts to reduce carbon emissions, so too is this information important to decision makers to understand consequences of this Project on achieving Minnesota’s climate policy objectives.¹¹⁸ The DEIS cannot assert this Project has a net climate benefit when it has only examined a snapshot of the Project’s emissions.</p>	<p>Consistent with the scoping decision, the EIS does not attempt to predict future ethanol production at the ethanol plant, but does discuss variable levels of production under the no action alternative in Chapter 7. As stated in Section 7.1.3, production of corn would not be expected to increase if the ethanol plant were to increase production; rather, a shift in corn sales to the ethanol plant from other markets would likely occur. Section 7.2 states, "impacts from ethanol production are expected to be proportional to the amount of ethanol produced. An increase or decrease in ethanol production would result in a relatively proportional increase or decrease in potential impacts."</p> <p>To analyze impacts of the proposed project (Chapter 5), the EIS assumes the current level of ethanol production is maintained. Chapter 6 analyzes two alternative technologies—a suite of agricultural practices and a suite of energy use and efficiency changes—and assumes the current level of ethanol production is maintained with no land use change associated with expanded crop conversion from forestland, wetlands, or grazing lands. All cropland analyses assume historical persistence of conventional management pre-1980s for the region supplying feedstock to the ethanol plant. Emissions associated with introducing another variable (increase or decrease in ethanol production) would needlessly complicate the analysis of these alternative technologies. Section 6.1.3 has been revised to discuss the debate between Lark et. al. and GREET model authors. In addition, Section 5.7.2 has been revised to note that the project would contribute to a net beneficial effect on climate change as it would capture and store CO₂ emissions from the ethanol plant.</p>	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
MCEA	Hencheck, Abigail	2024-02-23	<p><i>C. The DEIS Does Not Sufficiently Consider the Negative Impacts of an Accidental Release of Drilling Fluid</i></p> <p>The DEIS identifies four locations within the Project area at which the Applicant intends to utilize horizontal directional drilling (“HDD”) to crossroads and rivers. These locations are the Pelican River, Otter Tail Valley Railroad / State Highway 210, Otter Tail River, and BNSF Railway / US Highway 75.119 Accidental releases of drilling fluid are a known risk of HDD construction methods and should be thoroughly analyzed in the FEIS. The recent construction of a crude oil pipeline in northern Minnesota resulted in accidental releases of drilling fluid at 67 percent of the HDD sites. The DEIS states that “[d]rilling fluids and additives used for the HDD would be non-toxic to the aquatic environment and humans.”121 However, non-toxic does not mean non-damaging; independent analysis of inadvertent release sites for previous HDD construction in Minnesota has shown high levels of iron pollution and the Minnesota Pollution Control Agency (“MPCA”) has advised the public that the undisclosed chemicals in previous released slurry had the potential to “cause respiratory and skin irritation.”122 The bentonite clay that makes up the bulk of the slurry “is a very fine sediment that . . . can clog the gills and suffocate aquatic life like mussels, insects, and fish,” as well as degrade the aquatic habitat.123 The MPCA considers the drilling mud (which “can create turbid water/nuisance conditions”) and the chemicals it contains to be pollutants.124 These pollutants should be disclosed and analyzed in the EIS to adequately assess the risks of construction.</p> <p>The DEIS also provides contradictory information about the provision of an inadvertent release contingency plan, stating in Chapter 2 that “[t]he applicant would develop a contingency plan to address an inadvertent release of drilling fluid at the ground surface should one occur during HDD,”125 and in Appendix D that development of this plan would instead be the responsibility of a construction contractor.126 Parties and the public deserve both clarity on what entity will be responsible for producing this report and the opportunity to review it. In light of the above, the following changes should be made to the FEIS:</p> <ul style="list-style-type: none"> • The FEIS should include disclosures from the Applicant about the specific chemicals to be included in the HDD drilling fluid. • The FEIS should include the accidental release plan for review, whether developed by the Company or a contractor, and the plan should contain a commitment to ongoing regular environmental monitoring at any site where an accidental release is suspected following any such incident; and • The FEIS should further analyze the risks of a release at each of the sites. 	As described in Section 5.7.8.2, an additive approved by MDH or meeting NSF International/ANSI Standard 60, Drinking Water Treatment Chemicals – Health Effects, might need to be mixed with the drilling mud for viscosity or lubricating reasons and to reduce the potential for an inadvertent release or failed HDD. The specific additive used would depend on the conditions at the crossing location and would be determined by the HDD contractor. The EIS discloses the potential for an inadvertent release of drilling mud and describes potential impacts in Chapter 5. As stated in Chapter 2, "The applicant is designing the project but would hire contractors to construct the pipeline, restore the right-of-way (ROW), and other activities. Because the applicant would direct the work of the contractors, the EIS refers to the applicant as the entity that would conduct all project activities." The inadvertent release contingency plan would be prepared by the HDD contractor and is not available to include in the EIS. As stated in Section 5.7.3.4, an assessment of the potential for an inadvertent release of drilling mud is part of the feasibility analysis and design for HDDs.	20243-204403-02
MCEA	Hencheck, Abigail	2024-02-23	<p><i>D. The DEIS Lacks Sufficient Input from Tribal Governments</i></p> <p>Finally, the DEIS received input from only one tribal government (Mille Lacs Band of Ojibwe),127 despite acknowledging that the affected land is in the traditional homelands of the Ojibwe and Dakota people, and fourteen tribes—including in Minnesota the Leech Lake Band, Lower Sioux Indian Community, Prairie Island Indian Community, and the six tribal governments encompassed by the Minnesota Chippewa Tribe—have cultural and ancestral ties to the project area.128 This lack of engagement is indicative of an ineffective process, and should not be considered adequate for this caliber of environmental review. The FEIS should be based on input from a variety of affected tribal governments, which may require the DOC-EERA to use engagement methods such as in-person consultation meetings with tribal staff or receiving input via transcribed phone call to achieve adequate meaningful input.</p> <p>For the foregoing reasons, MCEA requests that the EIS for the Project be revised to incorporate the suggestions contained herein.</p>	As described in Section 3.2.2 of the draft EIS, in its scoping Order, the Commission requested EERA staff “coordinate with the Minnesota Office of Pipeline Safety along with other state agencies and Tribal governments to ensure that their expertise is reflected in the EIS.” As detailed in the draft EIS (Appendix J), EERA staff provided the opportunity for all recognized Tribes in Minnesota to provide comments on a preliminary draft EIS. Comments were received from the Shakopee Mdewakanton Community, Mille Lacs Band of Ojibwe, and the White Earth Nation. Section 12.3 of the EIS (Contributing Tribes and Minnesota State Agencies) has been revised to reflect the three Tribes who provided comments on the preliminary draft EIS chapters indicated above. Additionally, Tribes have provided comments on the draft EIS (Appendix O).	20243-204403-02
Midwest AG Future	Franzen, Doug; Schwartz, Craig; Harney, Paul; Bunes, Taylor; Johnson, Scott; Gunderson, Jeremy; Pell, Kenneth; Brown,	2024-02-23	<p>I am writing today in support of the proposed carbon capture pipeline project from the Green Plains Ethanol Plant in Otter Tail County to Wilkin County, along the Minnesota & North Dakota border. Docket Number 22-422. Last year, Governor Walz signed legislation establishing the lofty goal of being carbon-free by 2040. In order to meet those goals and others, it is imperative that we invest in infrastructure that will allow us to reduce carbon emissions and accomplish the carbon-free standards.</p> <p>As the draft EIS states, there is a net benefit to this project with the CO₂ sequestered through the operation of this pipeline would far outweigh any emissions during construction. Additionally, the EIS notes the beneficial impact this carbon capture project would have on climate change.</p> <p>Throughout the draft EIS, there is a common theme: the benefits outweigh any negatives. From minimal impact to communities or farming in the area, to overwhelming benefits once completed, it is evident that this project should be granted its permits and allowed to proceed.</p>	Thank you for your comment.	20242-203761-01

Minnesota Interfaith Power & Light	Wolff, Sara	2024-02-23	<p>Though the permit application by Summit Carbon Solutions says it has no plans to use the CO₂ captured at the ethanol plant for enhanced oil recovery, there is a great deal of evidence that would suggest the captured CO₂ would inevitably be used for enhanced oil recovery to facilitate the extraction of more oil than would otherwise be accessible. Statements made by Summit Carbon Solutions Company representatives have said enhanced oil recovery could be facilitated by this pipeline:</p> <p>“If another carrier decided to use, or ask us to transport CO₂ for another purpose, like enhanced oil recovery, then that's a possibility.”</p> <p>- Jimmy Powell Summit Carbon Solutions COO, Sept. 5, 2023, IUB hearing¹ “Summit is also exploring other options, including injecting the gas into depleted oil fields to boost oil production.”</p> <p>- Bruce Rastetter, CEO of Summit Carbon Solutions AG, March 2, 2021, MPR News article² State Work Group Report (2017) outlining plan for using CO₂ from ethanol plants for EOR</p> <p>A December 2017 report prepared by the State CO₂ - EOR Deployment Work Group articulated the business plan to take CO₂ captured at ethanol facilities through a to-be-built network of pipelines to oilfields so the CO₂ can be used for Enhanced Oil Recovery. The Table of Contents includes the role Low Carbon Fuel Standards play in supporting this business plan [see figures attached].</p> <p>Oil Industry Demand for CO₂ for Enhanced Oil Recovery</p> <p>Representatives of the oil industry in North Dakota and their allies have said they need CO₂ to get more oil from their marginally producing oil fields.</p> <p>President of the North Dakota Petroleum Council, Ron Ness, said: “The use of EOR (enhanced oil recovery) techniques is critical to our future success. By injecting CO₂ in wells as they decline in productivity, EOR will substantially extend the life of a well and the amount of oil that can be recovered from that well.” Ness has also said: "We have the opportunity to extend the life of the Bakken another 30 to 50 years, and produce another 5 to 8 billion more barrels, just because of technology."</p> <p>Covering a decision by the North Dakota Public Services Commission to deny a permit for Summit Carbon Solutions, KFYY-TV reported the Director of the North Dakota State Department of Mineral Resources, Lynn Helms, saying of using CO₂ for enhanced oil recovery: “We’ve got to find a way for carbon capture and utilization to become a part of North Dakota’s economy or we will leave billions of barrels of oil in the ground.”</p> <p>John Harju, Vice President of Strategic Partnerships at the Energy and Environmental Research Center in Fargo, North Dakota, has stated: "I think if we don't get adequate volumes of CO₂ to our Bakken system, we're going to leave 90-plus percent of the oil in the ground." Importantly, industry allies have explicitly stated that North Dakota will need to get this CO₂ from other states.</p>	Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	20243-204403-02
Minnesota Interfaith Power & Light	Wolff, Sara	2024-02-23	<p>Proximity of CO₂ pipeline end points to oil fields</p> <p>The proposed pipeline project will deliver carbon to the direct vicinity of oil wells, as shown in the map below from the ND Public Services Commission/ND Oil and Gas Division [see figure attached]. Map Courtesy of ND Public Services Commission/ND Oil and Gas Division, republished in South Dakota Searchlight, “Critics Allege CO₂ Pipelines Farm the Government for Climate Money While Helping Oil Industry” November 10, 2023.</p> <p>As a pipeline is considered a “Common Carrier,” there is no way to ensure that the CO₂ captured and transported via those pipelines will not end up being used for EOR.</p>	Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR, and a description of the sequestration facility location relative to oil and gas fields was added.	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			To suggest that the CO ₂ captured in Minnesota and taken to North Dakota by pipeline will not have a strong chance of being used for EOR is to ignore the facts of the situation. It is incumbent upon the EIS to acknowledge there is a very strong likelihood that the CO ₂ captured at the ethanol plant in Minnesota will be used for enhanced oil recovery and further perpetuate the burning of fossil fuels.		
Minnesota Interfaith Power & Light	Wolff, Sara	2024-02-23	Emissions Result from the Pipeline Delivering CO ₂ for Enhanced Oil Recovery Must Be Calculated and Attributed to this Pipeline It is imperative that emissions from oil extracted through enhanced oil recovery be included in the emissions assessments and carbon intensity scores for this document and others. The impact of continued burning of fossil fuels has significant environmental implications – not just for our ability to meet climate goals, but also for the communities who suffer from the pollution fossil fuels create – including extraction, refining, transportation and burning.	Section 5.7.2.3 addresses the possibility that the captured CO ₂ could be used for EOR. An estimate of resulting GHG emissions has been added.	20243-204403-02
Minnesota Interfaith Power & Light	Wolff, Sara	2024-02-23	Sequestration Discussion Must Acknowledge CO ₂ Leakage Potential and the Increased Probabilities for Leaks if Not Monitored and Repaired Continuously The DEIS is calculating emissions on the assumption that carbon sequestration will have a positive impact on climate and carbon emissions. This is not an appropriate assumption with accounting for potential leakage during and after the sequestration process. “Sequestered” CO ₂ leaks into the atmosphere in a variety of ways, as shown by the graph below from a Nature study and the carbon emissions from this leakage must be calculated and attributed to this proposed pipeline project [see figure attached]. In addition, the DEIS should note that continued sequestration requires substantial monitoring and maintenance, a responsibility that industry has indicated a desire to discharge. For instance, in the Texas state legislature proposed bills “would allow operators to pass on their liability to the state 10 years after their injections end. Similar laws are already in place in North Dakota and Wyoming”. Monitoring sequestration sites is a massive and expensive job. Without investment in proper and continuous monitoring for hundreds of years, the sequestered CO ₂ is likely to escape.	Text has been added to Section 2.1 describing the suitability of the Broom Creek Formation in North Dakota for CO ₂ sequestration, as well as the monitoring and testing that would be done to verify that the CO ₂ is contained in the storage reservoir.	20243-204403-02
Minnesota Interfaith Power & Light	Wolff, Sara	2024-02-23	Carbon Intensity Values Must Not Be Grounded in Flawed Science. One of the most serious concerns surrounding the establishment of a market framework for reducing emissions is that industry stakeholders might try to rig the game in their favor. It is therefore imperative to demonstrate scientific trustworthiness by rejecting those studies that lack integrity. The Scully et al. study (2021) is deeply flawed and should not be allowed to inform the assignment of carbon intensity scores for the ethanol plants or producers under review in this or other proposals. Two examples illustrate how the Scully study is not a credible review of the state of the science of corn ethanol for purposes of assigning carbon intensity. Scully deconstructs then recombines data ¹² from different studies to arrive at its own estimate for the carbon intensity of land use change to corn production – which is lower than any of the studies in the range of estimates it considered – then labels this new lower number a “central best estimate.” [see attached figure] Figure 1. Boxplot of all the studies initially considered by Scully et al (represented by blue and beige dots), as well as the much lower estimate the Scully et al authors advance after reviewing these studies (represented by the red dot). Each dot shows the total land use change carbon intensity estimate from a particular study. These values were taken from figure 2 of Scully et al. 2) Scully creates its own model to predict that the conversion of pastureland to cropland results in soil carbon sequestration instead of losses. Scully achieves this by assuming the land history to be “50 years as cropland followed by 25 years of pasture and 25 years of cropland” — essentially pre-depleting baseline soil organic carbon stocks then misleadingly calling it conversion from pastureland to cropland. The Scully study was funded by Poet, a large biofuels producer, and has been widely cited by industry interests as determining that corn ethanol is up to 46% less carbon intensive than gasoline. The flawed methodologies and assumptions underlying this study should make its findings ineligible for use in determining carbon intensity scores. For a more detailed analysis of the Scully Study please reference Appendix A or view a full file here. Please note: the DEIS mistakenly states on page 6-5 that the values in Table 6-1 do not account for land use change. In fact, flawed as it is, the Scully Study does portray itself as determining carbon intensity values that incorporate land use change.	Section 6.1.3 has been revised to discuss the debate between Lark et. al. and GREET model authors.	20243-204403-02
Minnesota Interfaith Power & Light	Wolff, Sara	2024-02-23	The EIS Should replace the Scully study findings with the Lark study findings in all tables, graphs, calculations and analysis. The DEIS creates unwarranted confusion about different studies, wrongly suggesting that some incorporate land use changes while others don’t. Table 6-1 should list the two fuels relevant to the analysis of the value of the proposed pipeline: <ul style="list-style-type: none"> ● Corn ethanol ● Gasoline The carbon intensity score should be based on the Lark study which the DEIS references (“Research funded by the National Wildlife Federation and DOE found that ethanol is likely at least 24 percent more carbon-intensive than gasoline due to emissions from land	Section 6.1.3 has been revised to discuss the debate between Lark et. al. and GREET model authors.	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			use change associated with corn cultivation practices”) but fails to apply to the fuels receiving carbon intensity scores (page 6-5). Furthermore, the carbon intensity score found in the Lark study represents a floor, not a ceiling. The statement: “Conventional fuels such as gasoline and diesel, which have the highest CI scores” is not grounded in the research it cited just words before. (Page 6-5) Without the flawed Scully Study, but instead using the DEIS’s acknowledgement of the study indicating that “ethanol is likely at least 24 percent more carbon-intensive than gasoline”: the carbon intensity value assigned in Table 6-1 must reflect that the carbon intensity of corn ethanol is most likely significantly higher than gasoline. Carbon intensity comparisons and emission calculations must be based on credible science.		
Minnesota Interfaith Power & Light	Wolff, Sara	2024-02-23	EIS must acknowledge that the system of creating value for CO ₂ pollution from ethanol production creates a perverse feedback loop: the more you burn, the more you earn. The DEIS should acknowledge that building pipelines for the commodification of CO ₂ pollution encourages the continued production of ethanol and CO ₂ pollution, even in the context of market forces that might otherwise diminish its production. Creating value for pollution creates an incentive to keep creating the pollution: the more you burn, the more you earn.	As described in Section 1.2, the project’s purpose is to capture CO ₂ from the ethanol plant and transport it to the North Dakota border, enhancing the marketability of the ethanol produced at the ethanol plant.	20243-204403-02
Minnesota Interfaith Power & Light	Wolff, Sara	2024-02-23	The DEIS acknowledges the need to minimize impact on groundwater resources, but defers providing information by placing this responsibility on the Department of Natural Resources permitting. Independent calculations should measure the impact of this project on groundwater and this information must be provided as part of the EIS. Making the assumption that the DNR permitting system will stop any long-term impacts on water resources as explained in the DEIS Page 5-126 is not appropriate. In 2021, Enbridge quickly exceeded their water permits and eventually applied for a ten-fold increase for dewatering. The impact on groundwater is important and far-reaching and deserves to be analyzed and reported to the public. Minnesota continues to suffer the consequences of drought and over-commitment of water supplies. The DEIS must have a project specific assessment done on how this project throughout its lifetime, including the carbon capture technologies used, will impact these current drought conditions.	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has also been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-02
Minnesota Interfaith Power & Light	Wolff, Sara	2024-02-23	Communities rely on accurate and quantifiable data to assess the environmental impacts of drilling and pipeline projects. Horizontal Directional Drilling (HDD) is destructive and polluting to ecosystems and it is incumbent on the EIS to fully acknowledge and explain this. Despite Line 3 permit application claims that there was only a “low” probability that HDD drilling would result in a frac-out, it happened: 28 times. From the MPCA spill data shared on August 9, 2021, Enbridge had thus far in the construction caused: - 28 unique spill incidents in 21 water crossings - 63% (12 out of 21) of the HDD crossings were polluted with drilling fluid - 80% of the rivers crossed with HDD were impacted	Thank you for your comment. The EIS discloses the potential for an inadvertent release of drilling mud and describes potential impacts in Chapter 5.	20243-204403-02
Minnesota Interfaith Power & Light	Wolff, Sara	2024-02-23	Aquifer breaches are another outcome from pipeline construction, as we have seen from Line 3. This must be discussed in the EIS.	Aquifer breaches are addressed in Section 5.7.8.2.	20243-204403-02
Minnesota Interfaith Power & Light	Wolff, Sara	2024-02-23	Also, it is simply not accurate for the EIS to portray HDD as being a benefit to wildlife and stream health as it seems to do on page ES-10: “Most impacts on wildlife would be highly localized, short-term, and negligible. Impacts on freshwater species would be minimized by the use of HDD techniques and sediment controls. Operation of the project would have minimal impact on wildlife and their habitats”	Use of the HDD method for crossing waterbodies avoids direct disturbance to streambeds, banks, and riparian vegetation. The applicant would use HDD to cross larger waterbodies, thereby reducing overall construction impacts on aquatic species.	20243-204403-02
Minnesota Interfaith Power & Light	Wolff, Sara	2024-02-23	Drilling mud at the surface of the water is like the tip of an iceberg – it is connected to a whole lot more underwater. Enormous plumes of drilling mud remain in the water unless it is removed. The DEIS should explain how the drilling mud will be tracked and then removed from the water or land when it is inadvertently leaked, not just from the top of the water where the drilling mud surfaces, but from the point of the leak. Merely collecting what is at the surface leaves most of the drilling mud polluting the water, impacting water quality, habitat, vegetation and wildlife. The EIS should discuss the impacts of this drilling mud on ecosystems, including consultation with ecosystem and species specialists about the impact of polluted water on the health of the ecosystem, not just in the immediate area but in the areas that are downstream from and connected to the area of pollution and degradation.	In the event of an inadvertent return to a waterbody, drilling mud would not "float" on the water surface. It would be suspended within the water column, creating turbidity that would be carried downstream and/or settle out, depending on water flow. An inadvertent return in an upland area could be contained and cleaned up more easily. Additional detail regarding inadvertent returns has been added to Section 5.7.8.2.	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
Minnesota Interfaith Power & Light	Wolff, Sara	2024-02-23	<p>Definitions are critically important: they can help us understand or they can serve to camouflage important information. The report uses the term ‘minimal’ over 60 times to describe the estimated impact on agriculture, environmental aesthetic, property value, public health, infrastructure, recreation, socioeconomics, air quality, topography, animal and vegetation habitat loss, soils and ecosystems, and the environment broadly. However, the DEIS defines “minimal” to cover a very broad range of significant impacts, thereby not providing an understandable assessment of what landowners or the public might expect. According to the definitions, even “negligible” impacts are “short-term impacts that affect common resources.” “Minimal” is more than “negligible” and could affect “common resources over the short- or long-term.” It is disingenuous for a long term impact to be called minimal. Using the term “minimal” in this EIS disguises in every instance the nature of the damage and how long it might be expected to last. Quoting from the report on page 5-2: Impact intensity levels are as follows:</p> <ul style="list-style-type: none"> ● Negligible impacts do not alter an existing resource condition or function and are generally not noticeable to an average observer. These short-term impacts affect common resources. ● Minimal impacts do not considerably alter an existing resource condition or function. Minimal impacts might, for some resources and at some locations, be noticeable to an average observer. These impacts generally affect common resources over the short- or long-term. “Minimal,” used dozens of times through the DEIS, varies in its definition. For example, ‘minimal’ means anywhere from 2-3 years to 5 years of interrupted crop production (ES-6). This language is contradictory and confusing. The use of ‘temporary’ suffers from the same problem. The DEIS uses ‘temporary’ over 40 times, with no consistent definition (page 5-38). The point of the EIS is to help people understand the impact of the proposed project: it is incumbent on the EIS to use language that clarifies the range of impacts possible for each category that is explored. Instead of using words like “minimal” or “temporary” the description should say name the impact itself and how long it is possible the impact could be affecting the ecosystem. 	Thank you for your comment. As noted in Section 5.1 of the EIS, the EIS defines the terms used to characterize potential impacts in order to ensure common understanding among readers and to compare potential impacts among alternatives.	20243-204403-02
Minnesota Interfaith Power & Light	Wolff, Sara	2024-02-23	Further investment in ethanol production infrastructure incentivizes its continued use and maintains or grows the environmental consequences associated with that system. Pesticide application to corn crops is one such issue. Pesticide treated seeds also can cause harm, particularly if waste from these seeds are not disposed of properly. An ethanol plant disaster in Mead, Nebraska in 2021 is a poignant example of environmental and human health harm from neonicotinoids in treated corn seed: significant water contamination and poisoning of the ecosystem. The rapid decline of bee colonies near Mead was an early warning sign, prompting investigations that uncovered unsafe levels of neonic compounds. Overall, the Mead ethanol plant disaster underscores the interconnectedness between ethanol production, environmental sustainability, and public health. A complete EIS would consider these risks. Understanding the effects of pesticide contamination on water quality and ecosystem health is important for informed decision-making and effective mitigation strategies.	Thank you for your comment. Impacts of current agricultural practices are outside the scope of the EIS.	20243-204403-02
Minnesota Interfaith Power & Light	Wolff, Sara	2024-02-23	Water is interconnected: depletion in one area can have rippling consequences nationwide. Minnesota's drought and lack of groundwater retention, exacerbated by the depletion of aquifers, have far-reaching implications extending beyond state lines. As we remove water from the ground, soils compress and collapse, leading to sinking land surfaces. This phenomenon especially threatens cities built on drained marshland or fill. Lack of groundwater also impacts surface waters – consequences which are felt from the top to the bottom of a watershed. The decrease of freshwater flow downstream from the Mississippi River is resulting in saltwater creeping upstream. This “slow-motion crisis” has devastating effects on communities and their drinking water and now is merely 25 miles away from New Orleans. Peter LaFontaine with Friends of the Mississippi River, a Minnesota environmental organization, interviewed Matt Rota of Healthy Gulf, an environmental nonprofit working to strengthen environmental justice and protection in Louisiana and the lower Mississippi basin. Rota said that “when it comes to long-term resiliency, the farm landscape of the Midwest has these extensive drainage systems designed to get the water off the ground as quickly as possible. [If] we changed that to make sure the water is held in the ground as long as possible, [it] would buffer against both droughts and floods.” This problem has a clear link to groundwater and drought issues in the Midwest. The design of the Midwest's extensive drainage systems exacerbates groundwater depletion and stifles the downstream flow of freshwater, in turn threatening the accessibility to clean drinking water in Louisiana. Minnesota farms exceeded pumping permits by a staggering 6 billion gallons in 2021, putting into question the state's ability to sustainably manage its water resources. The EIS must acknowledge and analyze the role depleting groundwater resources.	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has also been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-02
MN Department of Natural Resources		2024-02-23	Page 5-112. A Natural Heritage review request was submitted and completed for RA-South only. All route alternatives should have undergone a formal natural heritage review by the DNR prior to writing of the draft EIS. With that said, DNR natural heritage staff reviewed the information within the draft EIS and conducted reviews of the route alternatives discussed.	Section 5.7.5.1 was revised to note that Natural Heritage Information System (NHIS) data for the RA-South route was obtained by EERA staff through a licensed use, as that was the route originally proposed by the applicant. After receiving DNR comments on the draft EIS, EERA staff obtained Conservation Planning Reports for the RA-North and RA-Hybrid	20242-203780-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				routes, which are included in Appendix O. EERA staff also consulted NHIS records through a licensed use to identify listed species in the project area.	
MN Department of Natural Resources		2024-02-23	The following comments apply to the “State-Listed Species section” starting on page 5-112: <ul style="list-style-type: none"> • We recommend modifying the second paragraph to more accurately describe the potential for impacts (suggestions are bolded) “The potential for take of state-listed bird species is confined to highest in native habitat types, especially short-grass prairie, wet-mesic prairie, wet meadows, and marsh areas. Marbled godwits will nest in short crop or roadside ditch cover, if near larger wet prairie/wetland areas. Take of other state-listed bird species in agricultural areas and woodlots is unlikely to occur, as no state-listed species use that they are not likely to nest in these habitats are known to occur within the ROIs of any of the route alternatives.” 	The proposed revisions to the paragraph have been made.	20242-203780-01
MN Department of Natural Resources			The following comment also applies to the “State-Listed Species section” starting on page 5-112: Third paragraph, last sentence. We recommend providing more robust discussion regarding impacts to local bird populations. Since these species are already rare, losing nests may have a local impact, especially if nest loss might happen multiple times, and over a longer duration, such as during the construction phase and during operational maintenance.	Revisions have been made to Section 5.7.5.2.	20242-203780-01
MN Department of Natural Resources			Page 5-113. “The potential for direct take of state-listed plants is confined to native habitat types, specifically wet prairie, mesic prairie, and wet meadows.” This statement needs to be revised, as there are several mapped occurrences of small-white lady’s slipper, a state-listed species of special concern, within the Region of Influence (ROI), and some within a few hundred meters of the project area that are not within native habitat types (as defined by being an Native Plant Community or within an identified Minnesota Biological Survey site of biodiversity significance).	Revisions have been made to Section 5.7.5.2.	20242-203780-01
MN Department of Natural Resources			Pg. 5-113. First full paragraph, second to last sentence. A more robust discussion of the potential impacts to local rare plant populations is needed, accounting for the issue that a decrease of plants that are already rare could have more than a short-term impact on local populations. A discussion on life-cycle of each relevant rare plant species would be helpful in developing a more robust assessment of impacts.	Revisions have been made to Section 5.7.5.2.	20242-203780-01
MN Department of Natural Resources			In addition, the DNR is aware that in 2022 and in 2023, surveys for state-listed butterfly and plant species were conducted. Suitable habitat for Dakota skipper, powesheik skipperling, and western-prairie fringed orchid (all state-listed as endangered) was found to be present within the survey area. Surveys were also conducted for small-white lady’s slipper (state-listed as special concern), with several plants documented within the survey area. The final EIS should discuss these surveys, the results, impacts, and proposed mitigation. (The DNR is currently reviewing the survey report submitted and will provide a response to the applicant.)	The information requested by DNR regarding field surveys for state-listed butterfly and plant species was added to Section 5.7.5.1 .	20242-203780-01
MN Department of Natural Resources			The draft EIS does not seem to discuss the distinction between state-listed species, and state-protected species. Providing this discussion within the EIS could aid in understanding of impacts as they relate to state law, and state-listed species, and in understanding discussion of required mitigations or needs for Take permits from the State of Minnesota.	Revisions have been made to Section 5.7.5.2.	20242-203780-01
MN Department of Natural Resources		2024-02-23	Page 5-116, Chapter 7.7.6. Soils. Soils in parts of the Red River Valley (such as between Detroit Lakes and Fargo) are very corrosive to metals (such as sewer pipes). The EIS should discuss the potential risk of some soil types to cause corrosion of the underground pipeline as well as the proposer’s plans to mitigate or minimize potential for degradation of infrastructure.	Text has been added to Section 5.7.6.2 to address corrosive soils and measures to protect against corrosion.	20242-203780-01
MN Department of Natural Resources		2024-02-23	Page 5-126. The EIS should clearly identify which surface waters are DNR public waters. Table 5-45 includes the numbers of public waters crossed for each route alternative, however, the following tables and discussions on each route alternative do not clearly identify which of those are DNR public waters. This distinction is important for discussion, because regulatory requirements differ between DNR public waters and other surface water types.	Tables 5-48, 5-49, and 5-50 have been revised to add a column indicating whether each listed surface water is on the Public Waters Inventory (and thus a protected public water).	20242-203780-01
MN Department of Natural Resources		2024-02-23	Page 5-136. In addition to the stated potential risk of sheet pile causing a breach in a confining layer, the proposed depth of excavation for the pipeline may also be deep enough to compromise shallow confining layers, if present. This may be of heightened concern through the beach ridge system or near wetlands and surface water features. The EIS should discuss these potential impacts, as well as proposed mitigation.	The applicant currently has an ongoing groundwater investigation underway to further inform construction practices and is continuing to consult with DNR. As part of its coordination with DNR, the applicant has agreed to use ground penetrating radar to study the depth of the confining layer through the entire beach ridge system area crossed by the pipeline to further define existing conditions and advise on construction methodology. This information has been added to Section	20242-203780-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				5.7.8.2. Furthermore, as described in Section 5.7.8.2, EERA staff recommends that the applicant develop, in coordination with DNR, a plan for pipeline construction in areas crossing the beach ridge system area. The plan would include, at a minimum, measures to minimize the potential for breaching a shallow confined aquifer during trenching and contingency measures to mitigate the impacts of a breach, should one occur.	
MN Department of Natural Resources		2024-02-23	Page 5-139. Pipeline construction design should consider the prevention of French drain effects via the pipeline trench across the entire project, and especially in the beach ridge area. At a minimum, Pennsylvania standards for trench breaker placement should be used and additional knowledge gained from more expansive subsurface site characterization may provide further guidance on where to place trench breakers most effectively.	The applicant provided a detailed discussion regarding French drain effects and Pennsylvania standard for trench breaker placement relative to the proposed project in response to Question 5 of Supplemental Information Inquiry 12 (see Appendix I). Text regarding trench breakers has been added to Section 5.7.8.2.	20242-203780-01
MN Department of Natural Resources		2024-02-23	Page 5-146. The discussion on fish and wildlife present within the proposed project area lacks sufficient detail. The Otter Tail River supports a diverse community of native fish and mussel species, so more detailed discussion would better inform how natural features could potentially be impacted from the proposed project.	Text based on a published 1995 North Dakota State University (NDSU) Masters Thesis habitat study describing mussel species abundance and habitat has been added to Section 5.7.10.1. Section 5.7.10.1 discusses the major fish and wildlife species present in the project area. Section 5.7.10.2 discusses potential impacts on fish, mussel, and wildlife populations. Potential impacts on fish, mussels, and wildlife are also discussed in Chapter 8.	20242-203780-01
MN Department of Natural Resources		2024-02-23	Page 5-151. Chapter 5.7.10 Wildlife and their Habitats: In addition to the mitigations discussed in Chapter 5.7.10.3, the DNR recommends that any open trenches incorporate escape routes so that any animals that enter the trench can escape, such as by including moderate grade ramps. The DNR also recommends that trenches are inspected are inspected immediately prior to backfilling, and that any trapped animals present be removed.	Section 5.7.10.3 was updated, based on DNR recommendations and the applicant's commitment, to note that "Plugs of subsoil in the ditch would be left as moderate grade ramps," and "Trenches would be inspected immediately prior to backfilling in order to locate and remove any trapped animals present."	20242-203780-01
MN Department of Natural Resources		2024-02-23	Page 5-137. The EIS describes the purposes of water use needed during construction (such as the installation of HDDs, hydrostatic testing, and dust control), however, it does not clearly describe annual water use during operation at the capture facility. The EIS should include a description of annual operational water use and describe where the 13 million gallons of water would come from. If the 13 million gallons is proposed to be obtained from an existing DNR Water Appropriation Permit, then an application for an amendment to an existing permit may be required. If an amendment is not requested, then a new permit would be needed.	Additional information has been added to Section 5.7.8.2 to address the source of water use for the capture facility as well as the need to amend an existing DNR Water Appropriation Permit, or obtain a new permit, for the capture facility's operational water needs. Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20242-203780-01
MN Department of Natural Resources		2024-02-23	Page 5-138, 5-145, and sample routing permit, Appendix H. The sample routing permit states, "Soil excavated from the wetlands and riparian areas shall be contained and not placed back into the wetland or riparian area." This statement is repeated in the mitigation sections on pages 5-138 and 5-145. However, this statement seems to contradict needed trench restoration. Soil that is excavated from wetlands and riparian areas must be used to restore excavated trench. The DNR recommends that this statement be refined or further explained.	"Soil excavated from the wetlands and riparian areas shall be contained and not placed back into the wetland or riparian area" means that, during construction, the contractor may not store trench soils in wetlands—trench soil must be stored in uplands. When necessary in the construction process, these soils are taken from the upland and used to restore the trench. Text in Section 5.7.8.3 and Section 5.7.9.3 has been revised: "Soil excavated from wetlands and riparian areas shall be contained in uplands and not placed back into the wetland or riparian area until necessary to restore the excavated trench."	20242-203780-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
MN Department of Natural Resources		2024-02-23	Page 8-19. The EIS states that CO ₂ leaks would be unlikely to impact fish and freshwater mussels. The conclusion of this is dependent of limestone buffering ability of soils, which is not applicable to soils within the Red River Basin. The EIS should discuss the alkalinity and chemical characteristics of the waterbodies that would be crossed by the proposed project to assess risks present. The EIS should examine the impacts a change in CO ₂ would have in varying conditions, such as water flows, temperatures, amounts of CO ₂ released, and alkalinity present, and discuss the downstream distances where fish mortality could occur.	Chapter 8 discusses impacts on fish and freshwater mussels from two perspectives—effects from CO ₂ leaks and effects from a CO ₂ pipeline rupture. We defer to the DNR's expertise and authority regarding fish and wildlife. Consistent with this authority, EERA staff believes that a special permit condition requiring the applicant to prepare monitoring protocol to identify potential impacts on fish and wildlife, water resources, and other environmental resources should an accidental release (leak or rupture) of CO ₂ occur is reasonable. This protocol should be developed in coordination with DNR.	20242-203780-01
MN Department of Natural Resources		2024-02-23	Page 9-1 Chapter 9.1.1 Unavoidable Impacts: Construction states that, “Intermittent waterbodies such as drainage ditches would experience temporary and unavoidable increases in turbidity during open cut construction.” Increases in turbidity could be avoided if an isolated crossing technique (e.g. dam and pump) is used under flowing conditions, or, if water is present but not flowing, then temporary dams could be used. The EIS should consider additional options on how to avoid turbidity during open cut construction.	The applicant has clarified that it would use the isolated dry-trench crossing method on delineated waterbodies with perceivable water flow during construction. The flowing open-cut crossing method would not be used for the project. Sections 5.7.8.2 and 5.7.10.2 have been revised accordingly.	20242-203780-01
MN Department of Natural Resources		2024-02-23	Chapter 10. Cumulative potential effects. It is not clear if the Fargo-Moorhead Diversion project was considered for inclusion for discussion on cumulative potential effects, but the DNR offers this suggestion for inclusion.	The Fargo-Moorhead Diversion project was added to Chapter 10 for analysis for potential cumulative impacts.	20242-203780-01
MN Department of Natural Resources		2024-02-23	Appendix D. Environmental construction plan (ECP) • Page 5. The DNR recommends that erosion control mesh be limited to materials that specify only natural fibers, with no plastic.	The applicant has stated, “The Contractor will select wildlife-friendly erosion control fabric that contains biodegradable netting (Category 3N or 4N natural fibers) and will avoid the use of plastic mesh following MnDOT’s 2020 Standard Specifications for Construction (or more recent edition) for rolled erosion control materials that specify only natural fibers with no plastic mesh be used.” See response to Supplemental Information Inquiry 12 in Appendix I (Supplemental Information Inquiries and Responses) and applicant-proposed mitigation in Sections 5.7.5.3 and 5.7.10.3	20242-203780-01
MN Department of Natural Resources		2024-02-23	• ECP Page 7, trench breakers. The DNR previously provided recommendations to follow Pennsylvania standards for trench breaker placement. The draft EIS includes these recommendations in sections 4.6 and 5.7.83, which discuss mitigation measures offered during scoping. The DNR continues to recommend that Pennsylvania standards for trench breakers be utilized, and recommends that the ECP be updated.	The applicant provided a detailed discussion regarding French drain effects and Pennsylvania standards for trench breaker placement relative to the proposed project in response to Question 5 of Supplemental Information Inquiry 12 (see Appendix I). Text regarding trench breakers has been added to Section 5.7.8.2. Trench breaker/plug placement would be tailored to site-specific conditions and would be at least as protective as the Pennsylvania standards.	20242-203780-01
MN Department of Natural Resources		2024-02-23	The ECP should clarify if travel lanes will be used on HDD river crossings. If a travel lane is used across waterbodies, significantly more vegetation removal and disturbance will occur, including bridge construction. The DNR recommends that no travel lanes be utilized across waters that use HDD.	As described in several resource sections in Chapter 5, vegetation between HDD entry and exit points would not be cleared during construction, aside from hand trimming necessary to set the HDD guidewires or a pump for water withdrawal. Text has been added to Section 2.4.8 to clarify that no travel lanes would be used between an HDD entry and exit.	20242-203780-01
MN Department of Natural Resources		2024-02-23	[ECP]• Where trench crossings are used for streams, we recommend segregating the streambed surface material for restoring streambed surface material that is usually courser than underlaying material (similar to how topsoil is segregated in uplands).	In response to comments from DNR, the applicant states that it will add the following statement to Section 4.8 of the Minnesota ECP: “Where trenched crossings were used, the Contractor will restore the stream by first replacing underlying streambed materials in the trench before replacing streambed surface/substrate materials to support the consistency of the disturbed stream bottom relative to undisturbed areas.” Section 5.7.8.3 has been updated.	20242-203780-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
MN Department of Natural Resources		2024-02-23	[ECP]• The DNR recommends not using flowing open cut method for any stream crossing.	The applicant has clarified that it would use the isolated dry-trench crossing method on delineated waterbodies with perceivable water flow during construction. The flowing open-cut crossing method would not be used for the project. Sections 5.7.8.2 and 5.7.10.2 have been revised accordingly.	20242-203780-01
MN Department of Natural Resources		2024-02-23	<ul style="list-style-type: none"> • The ECP should address trench crowning/subsidence. The ECP should address post construction monitoring for topography and crowning/subsidence, vegetation restoration, erosion, and monitoring groundwater expressions along the project route. 	In response to Supplemental Information Inquiry 12, the applicant stated that it would include details in the ECP for preventing excessive crowning or subsidence above the restored centerline. If uneven settling occurs or surface drainage problems develop as a result of pipeline construction, the applicant would provide additional land leveling services after receiving a landowner's written notice, weather and soil conditions permitting. As indicated in Section 8.2 of the ECP, the applicant would monitor areas where stabilization and restoration methods are implemented in accordance with requirements in state permits and landowner agreements. Monitoring would identify areas where remedial measures are required to establish a stable surface for reclamation to be successful. This may include re-grading, re-seeding, re-mulching, and additional monitoring. Monitoring of groundwater expressions was added to Section 5.7.8.2 as a DNR-recommended mitigation.	20242-203780-01
MN Department of Natural Resources		2024-02-23	<ul style="list-style-type: none"> • ECP Page 14. The ECP states that HDD drilling fluids and additives will be nontoxic to the aquatic environment and humans. Toxicity is primarily related to magnitude of release, as larger amounts of even “nontoxic” drilling fluids could be harmful to aquatic life. The contingency plan to address inadvertent release response should include equipment such as a functioning vac-truck on site and other equipment/materials. This contingency plan should be in coordination with the DNR utility license application. 	Section 5.7.8.2 summarizes the components of the contingency plan to address the unintended release of drilling mud to the environment that the applicant would develop prior to conducting HDD. Containment, response, and clean-up equipment would be available at both sides of an HDD crossing location prior to beginning the HDD to assure a timely response in the event of an inadvertent release. Text has been added that the contingency plan should be in coordination with the DNR utility license application at locations where a utility crossing license is required.	20242-203780-01
MPCA	Green, Chris	2024-02-20	<p>Dear: Craig Janezich</p> <p>Thank you for the opportunity to review and comment on the Draft Environmental Impact Statement (DEIS) for the Otter Tail to Wilkin CO₂ Pipeline Project (Project) located in Wilkin, Otter Tail County, Minnesota. The Project consists of approximately 28.1 miles of 4-inch diameter CO₂ pipeline and associated facilities in portions of Wilkin and Otter Tail counties. The Project would capture CO₂ from the Green Plains Ethanol Plant near Fergus Falls and transport it to the North Dakota and Minnesota border south of Breckenridge. The Project would interconnect to a larger proposed CO₂ pipeline network, referred to as the Midwest Carbon Express Project, to transport the CO₂ to a sequestration area in North Dakota. The Minnesota Pollution Control Agency (MPCA) staff has reviewed the EAW and have no comments at this time. We appreciate the opportunity to review this project. Please be aware that this letter does not constitute approval by the MPCA of any or all elements of the Project for the purpose of pending or future permit actions by the MPCA. Ultimately, it is the responsibility of the Project proposer to secure any required permits and to comply with any requisite permit conditions. If you have any questions concerning our review of this DEIS, please contact me by email at Chris.Green@state.mn.us or by telephone at 507-476-4258.</p> <p>Sincerely, Chris Green</p>	Thank you for your comment.	20243-204403-01
Operating Engineers Local 49	Runke, Nathan	2024-02-23	The International Union of Operating Engineers Local 49 (IUOE Local 49) is a construction labor union in Minnesota representing heavy equipment operators and mechanics, along with stationary engineers. Our members have extensive experience constructing and maintaining pipeline infrastructure in the state of Minnesota and we welcome the opportunity to provide comments on the Draft Environmental Impact Statement (DEIS). We appreciate the Department of Commerce's (DOC) work on the DEIS and believe it is a complete and accurate description of the potential impacts of the Summit Carbon project.	Thank you for your comment.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>The construction and maintenance of pipeline infrastructure is an important industry for members of IUOE Local 49. Our members have constructed pipelines for the transportation of oil, natural gas, and other substances. The use of pipelines has consistently been shown to be the safest and most cost effective means of transporting liquids, gasses, and slurries.</p> <p>As Minnesota seeks to reduce its greenhouse gas emissions, carbon capture, utilization and storage (CCUS) technologies will become increasingly important to the ongoing decarbonization efforts. This is especially the case as we seek to decarbonize the transportation and industrial sectors. Carbon dioxide pipelines are a needed component of most CCUS systems and it will be critical to construct these pipelines in Minnesota if we are to achieve the state’s greenhouse gas emission reduction goals. This is reflected in the DEIS discussion of impacts on air quality and greenhouse gas emissions. As the DEIS correctly notes, the use of low-carbon fuels has been identified as one of the strategies in Minnesota’s Climate Action Framework to meet the state’s climate goals. Carbon pipelines are the most effective ways to reduce the carbon intensity of ethanol production and are the most feasible pathway to significant carbon dioxide reductions in liquid fuels.</p>		
Operating Engineers Local 49	Runke, Nathan	2024-02-23	<p>As the DEIS discusses, 100% of the construction workforce for the project will be unionized with most of the workers coming from the local area or within the state of Minnesota. As such the project would be built safely by highly skilled construction workers and the majority of the employment benefits will return to Minnesota workers and their families.</p> <p>We, again, thank the DOC for their work on the DEIS and the opportunity to provide comment. We look forward to continuing to support this project throughout the permitting process.</p> <p>Sincerely, Nathan Runke Regulatory & Political Affairs Coordinator, International Union of Operating Engineers Local 49</p>	Thank you for your comment.	20243-204403-01
SHPO	Beimers, Sarah J.	2024-02-23	<p>Chapter 3 Regulatory Framework</p> <p>On Table 3.1 Potential Federal Permits, Approvals and Consultations – Pipeline Facilities the SHPO, along with our partner agency the Office of the State Archaeologist, is correctly identified as having a consulting role under Minnesota Statutes Chapter 138 (Minnesota Field Archaeology Act and Minnesota Historic Sites Act). Since there may be other possible federal undertakings associated with the Project, and because Section 106 of the National Historic Preservation Act (NHPA) is mentioned in the corresponding “Description” cell, it would be beneficial to include reference to Section 106 of the NHPA in the “Type” cell as well. Also, most importantly, the DEIS is incorrect in stating that consultation with Tribes or the Tribal Historic Preservation Offices is “facilitated by SHPO.” This government-to government tribal consultation, whether it be under Section 106 of the NHPA or pursuant to Minnesota’s tribal consultation statute, is carried out by the lead federal agency and/or the lead state agency which may be providing assistance, approval, permits, or licenses for the Project, not the SHPO.</p>	Section 106 of the National Historic Preservation Act has been added to the "Type" column of Table 3-1, Potential Federal Permits, Approvals, and Consultations – Pipeline Facilities. The text in the "Description" column associated with the State Historic Preservation Office (SHPO) and Office of the State Archaeologist (OSA) has also been updated to clarify that Tribal consultation is carried out by the lead federal agency and/or lead state agency.	20243-204403-01
SHPO	Beimers, Sarah J.	2024-02-23	<p>Chapter 4 Alternatives</p> <p>We understand by this chapter that, along with the No Action Alternative, the DEIS has evaluated the applicant’s proposed route (RA-South) and two (2) alternative routes (RA-Hybrid and RA-North) which are all clearly described and documented on maps included in the DEIS.</p>	Thank you for your comment.	20243-204403-01
SHPO	Beimers, Sarah J.	2024-02-23	<p>Chapter 5 Potential Impacts and Mitigation for Alternative Routes</p> <p>Section 5.6 Archaeological and Historic Resources</p> <p>Although not specifically stated in the DEIS, we acknowledge that our office has consulted with Summit Carbon Solutions (Permittee) since September 2021 as the company and their consultants have completed and submitted to our office for review and comment the archaeological and historic/architectural field surveys within their preferred pipeline route, which is referenced in survey reports as MNL-321 and identified as RA-South in the DEIS. It is important to note that while our office has reviewed and commented on the eligibility of recorded archaeological sites for listing in the National Register of Historic Places (NRHP) within the ROI for RA-South (MNL-321), to date, we have not reviewed or provided comment on the archaeological survey methodology as we have not been asked to do so by the Permittee.</p>	In a letter dated October 14, 2021, SHPO indicates that it reviewed the survey methods proposed in the "Archaeological Survey Methodology and Protocols for Minnesota, Summit Carbon Solutions" (9/20/2021) and assessed them as appropriate for the project. The SHPO letter is included in Appendix G of the Scoping Environmental Assessment Worksheet (EAW) (filed April 10, 2023, eDockets file no. 20234-194670-02). Section 5.6 of the EIS has been updated to reference this previous consultation with SHPO.	20243-204403-01
SHPO	Beimers, Sarah J.	2024-02-23	<p>Section 5.6.1 Archaeological Resources</p> <p>We understand that, for RA-Hybrid and RA-North, the DEIS has utilized recorded archaeological site data from both the SHPO and the OSA, which is appropriate since these two route alternatives have not yet been subject to comprehensive archaeological field survey for the specific Project. It is important to note that there was minimal information provided in the DEIS related to previous archaeological survey area coverage and how it may overlap, or not, with the Project area/route width for each of these alternatives.</p>	<p>Survey coverage for each alternative is summarized in Section 5.6.1.2 of the EIS based on the defined corridor for each alternative (89 percent of RA-South, 60 percent of RA-Hybrid, and 1 percent of RA-North).</p> <p>Since landowner permission is needed to complete surveys, it is not typical to complete surveys and evaluations on all route alternatives other than those proposed by the applicant at the environmental review</p>	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>Based upon information provided in Table 5-23 Archaeological Resources within the RA-North Project Area and Table 5-25 Archaeological Resources within the RA-Hybrid Project Area, we understand that there is one (1) previously recorded site identified within RA-North and there are four (4) previously recorded sites within RA-Hybrid.</p> <p>It would be helpful if Section 5.6.1.1 Existing Conditions provided a detailed assessment of whether the Permittee’s surveys conducted to date were completed to the guidelines and standards outlined in the SHPO’s “Guidelines for Archaeological Projects in Minnesota” and the Secretary of the Interior’s Standards for the Identification of Historic Properties. If the information collected in these surveys was not completed to existing guidelines and standards, there leaves open the question of whether all of the archaeological resources within the proposed route and route alternatives have been identified accurately.</p> <p>Under Section 5.6.1.2 Potential Impacts there are references to the fact that RA-North and RA-Hybrid route widths have only been partially surveyed for archaeological resources. It is important to note that, due to this incomplete survey, a full evaluation of either alternative’s potential to impact archaeological resources cannot be determined until those surveys have been completed.</p> <p>When SHPO was asked to review Permittee’s Phase I archaeological reconnaissance reports for MNL321 (RA-South), we were only asked to comment on/concur with the NRHP eligibility recommendations in the reports. We understand that the survey was completed by one archaeological consultant (Merjent) and the DEIS was prepared by a different archaeological consultant (HDR Inc.). In other states, 3 it is standard practice to have reports independently peer-reviewed by separate archaeological consultants to ensure the survey was complete and carried out consistent with state and federal standards/guidelines.</p> <p>It would also be useful in the final EIS to have complete evaluations for all the archaeological sites within the route width for the three route alternatives evaluated. If RA-South has the most sites, but all of those sites are “not eligible” for listing in the NRHP and RA-North has the fewest sites and the lowest potential for new sites, but one of the sites within the route width had been determined “eligible” for listing in the NRHP, RA-South would be the preferred option to avoid the eligible site (aka the Historic Property). This includes an evaluation of archaeological sites 21WL0029 and 21WL0005. It may be useful to have other sites in the project area evaluated as well if it is possible that these sites will be impacted by the Project. While we understand that the PUC recommends avoidance of all archaeological sites, SHPO would recommend avoidance of NRHP-eligible archaeological sites in preference over sites that have been determined not eligible for listing in the NRHP. SHPO recommends further clarification to the proposed “Commission Sampling Routing Permit” which should also require continued consultation with our office and others to ensure that archaeological field methodology was carried out consistent with state standards and guidelines, and all parties interested in the results of field survey, including THPOs, are given ample opportunity to review and comment on survey reports and results.</p>	<p>stage. Therefore, information regarding known archaeological resources and the potential for unknown archaeological resources to exist is used to inform comparison of the potential impacts of alternative routes being considered. However, as stated in Section 5.6.1.3, survey of the route alternative selected by the Commission is recommended by EERA staff. In addition, the Mitigation Recommended by EERA Staff section has been revised to clarify that the survey should be completed to meet state standards and guidelines. Also, the text has been clarified to reference continued consultation with the OSA, in addition to the Tribes and SHPO, regarding the results of additional survey to determine if additional studies to evaluate the National Register of Historic Places (NRHP) eligibility of the resource are warranted and to develop appropriate avoidance or treatment plans.</p> <p>In a letter dated October 14, 2021, SHPO indicates that it reviewed the survey methods proposed in the "Archaeological Survey Methodology and Protocols for Minnesota, Summit Carbon Solutions" (9/20/2021) and assessed them as appropriate for the project. The SHPO letter is included in Appendix G of the Scoping EAW (filed April 10, 2023, eDockets file no. 20234-194670-02). The survey protocol was designed following Minnesota state methodological guidelines as defined in the Minnesota State Historic Preservation Office Manual for Archaeological Projects in Minnesota (SHPO 2005) and the State Archaeologist's Manual for Archaeological Projects in Minnesota (OSA 2011). Methods used during the archaeological survey align with the protocols SHPO approved prior to survey initiation. Section 5.6.1 of the EIS has been updated to reflect this previous consultation with SHPO.</p>	
SHPO	Beimers, Sarah J.	2024-02-23	<p>Section 5.6.1 Historic Architectural Resources</p> <p>The narrative summary and tables associated with existing conditions appear to accurately reflect data included in our state historic inventory records. Similar to our recommendation above as it relates to archaeological survey, we recommend completion of survey of historic and archaeological resources within the route corridors for each of the Project alternatives Please contact me at sarah.beimers@state.mn.us if you have any questions regarding this comment letter.</p> <p>Sincerely, Sarah J. Beimers Environmental Review Program Manager</p>	<p>Section 5.6.2.2 has been revised to state, "No properties listed in State or National Register of Historic Places, nor the State Historic Sites Network, have been previously inventoried within the route widths for the route alternatives. Therefore, further review pursuant to the Minnesota Historic Sites Act is not warranted. If federal permits are needed, compliance with Section 106 may be required, historic architectural surveys will be completed if determined by the lead federal agency as needed."</p>	20243-204403-01
Sierra Club North Star Chapter	Levin, Margaret	2024-02-23	<p>The Sierra Club North Star Chapter is deeply concerned about the Summit proposal and about carbon dioxide pipeline proposals generally because: they fail to address other emissions and pollution from fossil fuel extraction and industrial agriculture; allow for the extension of fossil fuel extraction through enhanced oil recovery; and because of the risks that a pipeline leak or break could harm surrounding communities and first responders. Specifically:</p>	<p>Thank you for your comment.</p>	20243-204403-01
Sierra Club North Star Chapter	Levin, Margaret	2024-02-23	<p>The DEIS underplays the risks of a pipeline rupture that could endanger first responders and communities, and safety measures that would need to be in place.</p>	<p>Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that</p>	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				would be revised as required by PHMSA, if the project is approved. Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.	
Sierra Club North Star Chapter	Levin, Margaret	2024-02-23	The DEIS discounts the direct and long term impacts of pipeline construction on lands and soil, and fails to accurately assess the risks and dangers to water, wetlands, aquifers, and critical habitat.	Thank you for your comment.	20243-204403-01
Sierra Club North Star Chapter	Levin, Margaret	2024-02-23	The DEIS does not properly and accurately account for the real carbon dioxide and nitrous oxide emissions and climate impacts of the proposed project, including the relationship to enhanced oil recovery and the growing of corn for ethanol.	Thank you for your comment.	20243-204403-01
Sierra Club North Star Chapter	Levin, Margaret	2024-02-23	The DEIS fails to account for the cumulative impacts of the Summit project on Minnesota. The practice of segmenting permitting requests for individual segments will prevent a thorough review.	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01
Sierra Club North Star Chapter	Levin, Margaret	2024-02-23	We ask that the Public Utilities Commission and Department of Commerce take these issues as well as the concerns raised by other commenters into account, in order to ensure that the forthcoming Environmental Impact Statement (EIS) is a factual and thorough account of the project impacts. Minnesotans need a robust environmental review that includes properly weighing the State’s greenhouse gas emissions goals in Minnesota Statute 216H.02. We also need transparency,accountability, and regulatory oversight to ensure the greater public good and interests of communities impacted by these pipelines and across our state are respected and protected.	Thank you for your comment.	20243-204403-01
Summit Carbon Solutions	DeJoia, Aaron	2024-03-14	Q. Do you believe that Summit’s APP adequately addresses impacts to agricultural lands? A. Yes, Summit’s APP represents best practices regarding topsoil separation and replacement, erosion, and revegetation. Summit’s APP is similar to agricultural impact mitigation plans/agreements that I have written, reviewed, and executed in other states throughout the nation including in South Dakota, Iowa, Missouri, Illinois, Wisconsin, Indiana, Ohio, and Pennsylvania. Moreover, I am aware that the Minnesota Department of Agriculture has also reviewed the APP and found that “the treatment of agricultural lands is well addressed in the required Agricultural Impact Mitigation Plan.” (1) <i>(1) Minnesota Department of Agriculture Comments, In the Matter of the Application of Summit Carbon Solutions, LLC, for a Routing Permit for the Otter Tail to Wilkin Carbon Dioxide Pipeline Project in Otter Tail and Wilkin Counties, PUC Docket Number: IP-7093/PPL-22-422 (May 13, 2023), eDockets ID No. 20235-195961-01.</i>	The applicant's Minnesota APP is provided as Appendix E.	20243-204356-06
Summit Carbon Solutions	DeJoia, Aaron	2024-03-14	Q. Please respond to Dr. Dolph’s assertion that the RA-North route alternative is preferable to RA-South because it will present the least risk to soil degradation. A. Having designed and/or implemented reclamation on over 10,000 miles of pipeline right-of way throughout the country, in my professional experience, the potential for soil degradation is more likely due to poor planning and construction techniques than small changes in soil physical and chemical composition identified in USDA-NRCS SSURGO data. The different routes identified have very similar soils characteristics and approximately the same percentage of soil compaction, water erosion, hydric soil, wind erosion, and revegetation soil concerns. In my professional opinion, the differences in soils and potential for soil degradation along the three different routes, based on the SSURGO data, are inconsequential as long as the APP is implemented. The soils data included in the DEIS is critical to evaluate potential impacts to soils, but soil actually disturbed by pipeline construction, weather during construction, and construction practices used are ultimately going to determine if reclamation can be achieved. I am in agreement with the MDA in that if the APP is implemented the soils along the final route will returned to preconstruction productivity and functionality. In my professional opinion based on the information available, there is no difference in soil degradation potential between the route alternatives as long as the APP is followed.	Section 5.7.5 concludes that the route alternatives generally share similar soil characteristics.	20243-204356-06
Summit Carbon Solutions	Lange, Alexander	2024-02-13	Q. The DEIS evaluates both a worst-case rupture scenario and a leak scenario. Are there any clarifications you would like to make regarding Summit’s emergency response actions for a leak (as compared to rupture)? A. Yes. As I was reviewing the DEIS at 8-21, where the DEIS describes Summit’s emergency response actions, I noticed that we had not previously highlighted an important aspect of our response to a small release, or leak. When emergency conditions indicate a small	Thank you for your comment.	20242-203374-05

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			leak, in addition to closing valves and isolating the pipe segment, Summit’s operations team would also open vents and complete a controlled blowdown at the MLV site to safely evacuate the pipeline segment of product such that the duration of the leak would be much shorter than described in the DEIS.		
Summit Carbon Solutions	Lange, Alexander	2024-02-13	How many MLVs are planned along Summit’s Preferred Route (RA-South)? A. When Summit filed its Application, it initially proposed four MLV locations – one at the capture facility and three along the pipeline route. Since filing the Application, Summit has added an additional MLV near milepost (MP) 4.8, bringing the total number of MLVs in Minnesota to five. Each of these MLVs were evaluated in the DEIS.	Thank you for your comment.	20242-203374-05
Summit Carbon Solutions	Lange, Alexander	2024-02-13	Q. Why did Summit add an additional MLV? A. As Summit continued to gather information about resources and potential impacts along its Preferred Route, Summit refined the boundaries of the Other Populated Areas (OPAs, as defined in 49 CFR 195.450) along the Preferred Route and identified that the refined boundary of the City of Fergus Falls created another “could affect” high consequence area (HCA). Summit identified that an additional valve location was then needed to meet the spacing interval requirements of 49 10 CFR 195. The specific location near MP 4.8 was selected because it meets and exceeds federal requirements 49 CFR 195 for maximum valve spacing, is accessible via existing road access, has electric power available to serve the location, and is located on land Summit has under voluntary easement. Q. During the scoping process, members of the public asked why Summit did not propose MLVs on either side of the Pelican River. Can you please discuss why MLVs are not proposed at that location? A. Title 49 CFR 195.260 requires pipeline operators to install valves on each side of one or more adjacent water crossings that are more than 100 feet wide from high water mark to high water mark. Under this regulation, a valve must be placed outside of the 100-year floodplain, and the maximum spacing between the valves that protect multiple water crossings cannot exceed one mile in length. Summit conducted a survey at the Pelican River and found that the ordinary high water mark width of the Pelican River is about 70 feet, thus 49 CFR 195.260 does not require valves at this location. It is important to recognize, however, that valves proposed for the Applicant’s Preferred Route (RA-South) will be able to isolate the segment of the pipeline that crosses under the river as needed.	Thank you for your comment.	20242-203374-05
Summit Carbon Solutions	Lange, Alexander	2024-02-13	Q. Have you reviewed the DEIS? A. Yes. I focused my review on DEIS Chapter 8 and Appendix G related to the potential impacts of an accidental release of CO ₂ . Q. Do you have any comments on the DEIS discussion of accidental releases? A. Overall, the independent evaluation of Summit’s CO ₂ dispersion model in air contained in the DEIS confirmed Summit’s “methodology and results are valid,” and the independent modeling completed by Allied Solutions, while more conservative in some respects than Summit’s analysis, was not materially different than Summit’s dispersion modeling for the Project. I did notice what appear to be several internal inconsistencies in the DEIS and some areas where further information could provide additional context related to the potential impacts associated with an accidental CO ₂ release. Summit is providing separate DEIS comments containing additional discussion of these items. In this testimony, I provide additional explanation and context regarding several of the more significant issues.	Thank you for your comment.	20242-203374-05
Summit Carbon Solutions	Lange, Alexander	2024-02-13	Q. What are your observations regarding the assumptions used in Allied Solutions’ air dispersion modeling? A. For the most part, Allied Solutions used assumptions that are similar to those used by Summit. As discussed in the DEIS, in several instances, Allied Solutions used assumptions that resulted in more conservative (i.e., greater area of potential impact) than Summit’s assumptions. However, these differences did not result in material differences in the modeling results.	Thank you for your comment.	20242-203374-05
Summit Carbon Solutions	Lange, Alexander	2024-02-13	Q. Were any of the modeling assumptions used in the Allied Solutions’ dispersion model unreasonable in your opinion? A. Yes. Allied Solutions assumed a product temperature of -20 degrees Fahrenheit. (1) Summit assumed 30 degrees in its modeling. (2) Q. Why do you believe the product temperature assumption is unreasonable? A. The DEIS justifies this assumption stating, “Due to a measured soil temperature at burial depth being subzero and the existence of aboveground valve sets, this temperature should be nearly the same as the air temperature.” (3) It cites “NOAA. Soil Temperature Maps by Depth: History data in CSV” as the source for this justification. (4) In my experience, only soil surface temperatures can experience temperatures this extreme. The further below grade you go, the better insulated the soil is from air temperature fluctuations. It would take many weeks, if not months, of colder than -20 degrees Fahrenheit days to result in soil temperature near this value, at a depth of 54-inches. Further, I could not confirm a -20 degrees soil temperature assumption in the cited source. To the contrary, when pulling 10-year data from four USDA Natural Resources Conservation Service soil temperature probes (Mandan #1,	Thank you for your comment.	20242-203374-05

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>Glacial Ridge, Crescent Lake, and Eros Data Center), the minimum annual temperature at 40-inch depth ranged between 30-35 degrees Fahrenheit. With Summit’s pipeline proposed depth of cover at 54-inches, it is expected that actual soil temperatures around the pipeline would be slightly above these levels. Once the product enters the pipeline, no additional energy is added and thus the product will begin cooling and ultimately equalizing with surrounding soil temperature. As was discussed in the DEIS, colder ambient conditions result in a more conservative dispersion model, which is why both Summit as well as Allied Solutions utilized winter conditions. However, based on the discussion above, Summit believes a soil temperature and, in turn, product temperature of 30 degrees Fahrenheit represents a “reasonable worst-case temperature”.</p> <p><i>(1) DEIS App. G at Aerial and Thermal Dispersion Analysis at Table 7 (Jan. 23, 2024) (eDocket No. 20241-202530-04).</i></p> <p><i>(2) DEIS App. G at Aerial and Thermal Dispersion Analysis at Table 6.</i></p> <p><i>(3) DEIS App. G at Aerial and Thermal Dispersion Analysis at Table 7.</i></p> <p><i>(4) DEIS App. G at Aerial and Thermal Dispersion Analysis at Table 7.</i></p>		
Summit Carbon Solutions	Lange, Alexander	2024-02-13	<p>Q. Do you believe the Allied Solutions’ dispersion modeling should be revised with an updated product temperature in the FEIS?</p> <p>A. No. The stated objective of the independent modeling was to provide a more conservative worst-case representation of potential release impacts. <i>(5) An overly conservative ground and product temperatures results in very conservative results. Revising this assumption will not materially change the outcome of this conservative modeling analysis.</i></p> <p>Q. Why raise an issue with this temperature assumption if you do not recommend revising the modeling?</p> <p>A. Several individuals have asked about the potential risk to the pipeline related to frost heave. As we have previously stated, frost heave is not a risk to the pipeline because it will be buried at a depth of at least 54 inches for this Project, <i>(6) which under all years and locations reviewed, would be well below the frost line. In addition, as discussed in the Frost Heave Study, in a situation where frost could reach depths below the pipeline, the amount of movement expected at such a depth would be very small given the relation to the thickness of any underlying ice lenses and the unconstrained expansion that would occur above. (7) Today’s materials and construction practices have evolved, including the introduction of more ductile steels, allowing greater allowable deformation (strain) due to external loads (frost heave). (8) I was concerned that if we did not raise this issue, individuals concerned about the risk of frost heave may misinterpret this modeling assumption to suggest that, in fact, the frost line could be significantly below our pipeline. As I stated above, none of the soil temperature data collected by USDA over the last ten years would support this conclusion.</i></p> <p><i>(5) DEIS App. G at Aerial and Thermal Dispersion Analysis at 3.</i></p> <p><i>(6) Route Permit Application at 5 (Sept. 12, 2022) (eDocket No. 20229-189023-02) (Route Permit Application).</i></p> <p><i>(7) DEIS App. I at Response to EERA Inquiry No. 5-2 at Frost Heave Study at 7.</i></p> <p><i>(8) DEIS App. I at Response to EERA Inquiry No. 5-2 at Frost Heave Study at 7.</i></p>	<p>Additional information on frost heave has been added to Section 5.7.6.2. As noted in Section 5.7.6.3, the applicant has committed to conducting a Phase I Geohazard Assessment to identify areas surrounding the pipeline that may be prone to large earth movement, as recommended by PHMSA in its June 2022 Advisory Bulletin, and EERA staff recommends that the results of the Phase I Assessment, and any subsequent assessments, should be provided to the Commission.</p>	20242-203374-05
Summit Carbon Solutions	Lange, Alexander	2024-02-13	<p>Q. Allied Solutions recommended and completed computational fluid dynamics (CFD) modeling as part of its analysis. Why didn’t Summit Carbon complete CFD modeling on the Project?</p> <p>A. While Summit acknowledges and appreciates the value that CFD modeling can provide, the shortcomings are also important to understand. CFD modeling requires a wide range of input values and complex parameters be identified by the analyst. For this reason, CFD models excel at modeling small project models, not long linear infrastructure. There are many inputs and factors that can impact dispersion distances, which is why Summit and Allied Solutions utilized extremely conservative inputs for the CANARY model, such that small scale CFD models would only result in less conservative distances. Summit is required to identify all locations where the pipeline could affect a HCA and include those segments within the Integrity Management Plan as defined under 49 CFR 195.452. In doing so, Summit has elected to utilize a very conservative CANARY air dispersion model.</p>	Thank you for your comment.	20242-203374-05
Summit Carbon Solutions	Lange, Alexander	2024-02-13	<p>Q. The DEIS states that FLO2D software “is not intended to be used for aerial dispersion analyses.” <i>(9) Why did Summit Carbon use this tool?</i></p> <p>A. The DEIS generally misrepresents the applicability of FLO2D utilized by Summit. The DEIS often describes that carbon dioxide is heavier than air and can settle in low-lying areas. Summit recognizes this risk and utilized FLO2D to help identify critical valleys located in close proximity to HCAs to determine how terrain could affect the gravity-assisted transportation of carbon dioxide vapor as well as the pooling effects in low-lying areas. As was discussed in the DEIS, elevation does not greatly impact the dispersion distance. What was not discussed, however, was how to address low-lying areas where carbon dioxide may be more resistant to dispersion through ambient weather conditions. FLO2D allowed Summit to use Digital Elevation Maps across the entire footprint and highlight these low-</p>	Thank you for your comment.	20242-203374-05

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			lying areas for use in our Emergency Management Plan procedures. Although the results from FLO2D did not impact our dispersion distances, it provides valuable insight for Emergency Responders. <i>(9) DEIS App. G at Aerial and Thermal Dispersion Analysis at 9.</i>		
Summit Carbon Solutions	Lange, Alexander	2024-02-13	Q. Do you have any concerns regarding the CFD modeling results presented in the DEIS? A. No. The independent CFD modeling completed by Allied Solutions appears to be reasonable, and the information regarding the mitigating effects of windbreaks in the area provides useful information to the public. It is also helpful for the public to understand that, based on this independent analysis, “regardless of the scenario, the time it takes for the 30,000-ppm concentration CO ₂ release to dissipate is very short—less than 4 minutes. In fact, the total time of the entire event would be less than 7 minutes in a worst-case scenario.” <i>(10)</i> <i>(10) DEIS App. G at CFD Analysis at 9.</i>	Thank you for your comment.	20242-203374-05
Summit Carbon Solutions	Lange, Alexander	2024-02-13	Q. EERA staff recommends a special permit condition requiring Summit it identify locations of fracture arrestors and any locations of thicker-walled pipe on the Plan and Profile filed with the Commission. <i>(11)</i> What are fracture arrestors and how do they impact pipeline integrity? A. Summit will not install fracture arrestors on the 4-inch pipeline. The standard method of ensuring arrest of a running fracture in a pipeline is to ensure that the fracture velocity in the pipeline wall is less than the decompression velocity of the product in the pipeline (CO ₂). The decompression response is a function of the product composition and the pipeline operating conditions. The velocity of a running fracture in a pipeline is dependent on the size of the pipe, the pressure, and the material toughness. As the material toughness increases, the speed of the running fracture decreases. Based on the size of the pipe, pressure, and specified material toughness (above the values prescribed by API-5L), the 4-inch pipeline has been designed to be self-arresting. Q. Will Summit Carbon provide the location of fracture arrestors and thicker-walled pipe for the Project? A. Yes. Summit can provide this information. The Project will be constructed of 4-inch nominal diameter pipeline. The 4-inch pipe is all 0.189 inches thick and is self- arresting. This gives the entire pipeline a design factor of 0.5. The only difference along the pipeline route will be the coating, depending on installation method. Bores and horizontal directional drills will have an additional Abrasion Resistant Overcoat, which has no bearing on the fracture arresting properties of the pipeline. <i>(11) DEIS at 8-26.</i>	Thank you for your comment.	20242-203374-05
Summit Carbon Solutions	Lange, Alexander	2024-03-14	Q. Have you reviewed CURE witness Dr. Gorman’s direct testimony? A. Yes. Q. Dr. Gorman suggests that it is impossible to know if “the results from the CANARY software (or any other model) have any basis in reality” without performing and presenting results related to verification and validation activities.” (Gorman Direct, at 5:9-16.) When selecting the CANARY software for its dispersion modeling, did Summit consider whether the model was subject to verification and validation? A. Yes. The CANARY model has been validated against data obtained from large scale outdoor experiments. These outdoor experiments provide a more accurate validation method than lab-based wind tunnel validation, which is often used to validate other available dispersion modeling. As stated in Appendix G of the Draft Environmental Impact Statement (DEIS), “CANARY has a long and vetted history in the pipeline industry—so much so that some major pipeline operators have it written into their standards that they will use only CANARY when modeling aerial dispersions.” <i>(1)</i> The CANARY model is widely accepted by the Pipeline and Hazardous Material Safety Administration (PHMSA) as well. Q. Dr. Gorman states that it is not clear from the report that the conditions of the CO ₂ within the pipe are fully known (Gorman Direct, at 6:21-22). Do you agree? A. No. Although the report does not explicitly state what phase the CO ₂ was modeled in, the phase can be determined based on the content in the report, which includes composition, pressure, and temperature. <i>(1) DEIS, Appendix G – Aerial and Thermal Dispersion Analysis: Otter Tail to Wilkin CO₂ Pipeline Project, p. 19 of 19.</i>	Thank you for your comment.	20243-204356-04
Summit Carbon Solutions	Lange, Alexander	2024-03-14	Q. Dr. Gorman also points out a presumed difference in the assumed flow rate at the time of rupture (Gorman Direct, at 7:16-20). Do you agree that the report should be clarified regarding what assumed flow rate was used in the modeling? A. No. The dispersion analyses completed both by Summit and Allied use a mass flow rate of 13.34 lbs/sec of CO ₂ . The CO ₂ Pipeline	Modeling was done to confirm Aerial Dispersion analysis, inform emergency response, and provide public awareness. Modeling was not used to determine if one pipeline route is safer than another route.	20243-204356-04

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>Sensitivity Analysis Report appears to be a “sensitivity analysis on a representative pipeline,” (2) not necessarily Summit’s Project. The sensitivity analysis provides information on how different operating and ambient conditions can impact dispersion modeling.</p> <p>Q. Dr. Gorman testifies that information in Appendix G of the DEIS does not demonstrate which route alternative poses fewer risks to humans and animals or which is safer considering the possible impacts of a CO₂ release. Do you agree?</p> <p>A. Conceptually, I agree. Dispersion modeling is not intended to be used as a pipeline routing tool. It is intended to inform the emergency response planning for pipeline facilities as well as Integrity Management Plan prescribed under 49 CFR Part 195.452. Modeling must be performed for whatever route is selected and will be used to inform and update a pipeline operator’s emergency response, public awareness, and similar measures.</p> <p>(2) DEIS, Appendix G - CO₂ Pipeline Sensitivity Analysis Report, p. 5 of 9.</p>		
Summit Carbon Solutions	Lumpkin, Michael	2024-02-13	<p>Q. What is the purpose of your Direct Testimony?</p> <p>A. The purpose of my testimony is to respond to select issues in the Draft Environmental Impact Statement (DEIS) published by the Minnesota Department of Commerce, Energy Environmental Review and Analysis Unit (EERA) on January 23, 2024. (1) My testimony also provides information regarding the toxicological effects of acute (meaning short-term) CO₂ exposures at varying concentrations higher than typically found in ambient air.</p> <p>Q. What schedules are attached to your Direct Testimony?</p> <p>A. The following schedule is provided with my Direct Testimony:</p> <ul style="list-style-type: none">• Schedule 1 – Statement of Qualifications <p>(1) DEIS (Jan. 23, 2024) (eDocket No. 20241-202524-01) (DEIS).</p>	Thank you for your comment.	20242-203374-06
Summit Carbon Solutions	Lumpkin, Michael	2024-02-13	<p>Q. In your opinion, what are the important takeaways from the information presented in that Chapter?</p> <p>A. In my professional opinion as a toxicologist and human health risk assessor, I conclude that the information presented in Chapter 8 of the DEIS demonstrates that the risk of actual toxicological harm or a reduced capacity to escape in the event of an accidental release even under worst-case discharge conditions is small.</p> <p>Q. What is the basis for that conclusion?</p> <p>A. Primarily, even using what in my view are overly conservative measures of CO concentrations and exposure times, which I will discuss further below, the concentrations and exposure time presented in the DEIS are not high and long enough to present an undue risk of adverse effects to human health.</p> <p>Specifically, the DEIS findings that the total impact distance at which CO₂ concentrations would reach 40,000 ppm is 617 feet, (2) and that the total time for release and dispersion was less than 7 minutes, compels a conclusion that human health effects from exposure in even the worst-case scenario presented in the DEIS are minimal. Further, while CO₂ levels would be expected to be higher and at distances closer than 617 feet of the release, the likelihood of an individual being in this area (e.g., the risk of experiencing an exposure higher than 40,000 ppm for 7 minutes) is less than the likelihood of a person being beyond 617 feet of the release.</p> <p>(2) DEIS at 8-14.</p>	Thank you for your comment.	20242-203374-06
Summit Carbon Solutions	Lumpkin, Michael	2024-02-13	<p>Q. Chapter 8 of the DEIS discusses adverse health effects related to potential exposure to CO₂. Can you provide some context for how CO₂, a gas we all exhale every day, has the potential for adverse health effects?</p> <p>A. While normal inhalation and exhalation of CO₂ is part of regular bodily function, at very high levels, CO₂ can be toxic to humans. Toxicity is the ability of a chemical to cause harm to biological tissues, organ systems, or individual organisms. It is widely accepted by toxicologists that there exists some dose or exposure level at which a substance changes from harmless to harmful to an organism. This harm may range from relatively mild and reversible to lethal. This is true for substances ranging from water (a requisite for all living organisms) to botulinum toxin (one of the most potent known neurotoxins).</p> <p>Q. How does the human body respond to inhalation of a gas such as oxygen or CO₂?</p> <p>A. Changes in the human body’s physiological or biochemical conditions due to inhalation of oxygen, CO₂, or other gases include a well-ordered sequence of biochemical adjustments. These adjustments are intended to establish or re- establish optimum use of energy sources so that bodily functions required for survival are maintained. In the case of normal CO₂ production within the body or inhalation of increasing CO₂ concentrations from ambient air, the body responds with neurological messaging that prompts shifts in breathing rates, blood pressure, and proportional blood flow to critical organ systems in an attempt to re-balance the delivery of oxygen and the removal of waste CO₂ from cells. This re-balancing process, called physiological compensation, occurs for many processes in the body in addition to oxygen and CO₂ transport and use. However, there are limitations to the body’s ability to</p>	Thank you for your comment.	20242-203374-06

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			compensate, after which further perturbations of oxygen or CO ₂ inhalation and CO ₂ elimination create conditions in blood and tissues that may not be conducive to normal function.		
Summit Carbon Solutions	Lumpkin, Michael	2024-02-13	<p>Q. Are there published scientific studies regarding the potential health effects of high concentration acute CO₂ exposure?</p> <p>A. Yes, numerous case reports and studies of volunteers and lab animals contain data on the effect of high concentration acute (up to a few hours) CO₂ exposures. Many of these published studies were conducted in the early to mid-1900's. Several of these studies are limited by details regarding the actual CO₂ and oxygen composition of the test atmospheres (in the case of experimental studies) or presence of other unmeasured toxic gases (in the case of occupational case reports of injuries and fatalities). Further, these studies reported rather inconsistent results, with some studies suggesting loss of coordination, dizziness and headaches following exposures of 5,000 to 10,000 ppm while others reported no ill effects from acute and longer duration exposures up to 30,000 ppm. Similarly, some reported exposures at or more than 100,000 ppm indicated lethargy and transient loss of consciousness, while others reported death at these same concentrations.</p> <p>While some study authors have suggested that possible blood acidosis may have led to disruption of electrolyte balance (particularly potassium levels in blood), the details in reporting are lacking to verify this impact. Many authors have opined that the observed effects described in their respective studies are due to "CO₂ toxicity;" however, it is difficult to determine if the observed effects were a result of oxygen deficiency, actual overwhelming of the subjects' blood buffering capabilities, or neurological stimulation of cardiopulmonary changes resulting in secondary effects on mental acuity, coordination, or headaches.</p> <p>These older studies inform the current National Institute for Occupational Safety and Health (NIOSH) Immediately Dangerous to Life and Health (IDLH) limit of 40,000 ppm for healthy people. A NIOSH IDLH limit is an air concentration at or below which healthy workers may be exposed for 30 minutes without risk of permanent harm to health or ability to escape. The DEIS utilizes this 40,000 ppm IDLH limit as an identified level of concern in its analysis. (3) I disagree with the DEIS Appendix G characterization of 15,000, 30,000, or 40,000 ppm CO₂ as a "Toxic Level of Concern" as the weight of evidence from the available scientific literature on human effects do not show exposure to these levels to cause toxic effects.</p> <p>(3) DEIS at 8-12; DEIS App. G at Aerial and Thermal Dispersion Analysis at 5 (Sept. 23, 2024) (eDocket No. 20241-202530-04).</p>	<p>Minnesota Rule 4410.2300(H) indicates that an EIS shall include "a thorough but succinct discussion of potentially significant adverse or beneficial effects generated" by the proposed project and each major alternative with "[l]ess important material ... summarized, consolidated, or simply referenced." Factors to be considered include "the impact and the relevance of the information to a reasoned choice among alternatives" and "the relationship between the cost of data and analyses and the relevance and importance of the information." A review of the science concerning CO₂ toxicity levels is not necessary for a reasoned choice among alternatives. The EIS continues to use CO₂ concentration levels defined by federal agencies in its discussion.</p>	20242-203374-06
Summit Carbon Solutions	Lumpkin, Michael	2024-02-13	<p>Q. Are there more recent studies of the potential health effects of high concentration acute CO₂ exposure?</p> <p>A. Yes. The most detailed and recent study on the subject is by van der Schrier, et al. (2022) (van der Schrier Study). The study authors reported CO₂ exposures from 60,000 to 120,000 ppm (or 6% to 12% CO₂ atmosphere) to healthy male volunteers. The volunteers were exposed for up to one hour. The inspired oxygen levels ranged from 19.7% down to 18.4% as CO₂ exposure levels increased. In the same study publication, rats were exposed from 100,000 to 500,000 ppm CO₂ for up to one hour. At the conclusion of the rat exposures or at the time of death, 3 rats were necropsied for examination of organs, including the lungs. The blood pH values from the human and rat data were used together to develop a mathematical model that could translate (or predict) human and rat blood pH changes over time given various CO₂ inhalation exposures. This is the first time such an intraspecies model of CO₂-induced blood pH changes has been reported.</p> <p>The human and rat data were complimentary, moving from sub-100,000 ppm exposures to up to 500,000 ppm exposures. The human subjects showed high tolerability of 60-minute exposures to up to 75,000 ppm and 10-minutes at 90,000 ppm. Blood pH levels decreased over time at all exposure levels but reached an equilibrium of no less than 7.2 at exposure levels up to 90,000 ppm (blood pH has a typical neutral value of 7.4). Transient changes to cardiac parameters and mental acuity were reported, indicating physiological compensation to increase blood elimination of CO₂. Exposures to 100,000 and 120,000 ppm were stopped early due to subject irritability, anxiety, or loss of consciousness. However, all subjects completely recovered in all aspects within minutes of exposure cessation.</p> <p>Q. Does the DEIS reference the van der Schrier Study?</p> <p>A. Yes, Section 8.3.4 of the DEIS cites the van der Schrier Study as it related to potential impacts on the natural environment, but the cited material focuses only on the impacts on rats at concentrations of 30 percent or higher. The DEIS does not mention the conclusions of the study as it relates to human exposures.</p> <p>Q. What conclusions do you draw from the van der Schrier Study as it relates to the potential human health effects of CO₂ exposure?</p> <p>A. Prior to the publication of the van der Schrier Study, it was difficult to use data from the earlier studies and case reports in humans to distinguish the effects caused by non-toxic physiological compensation to blood CO₂ burdens or actual toxic harm.</p> <p>The detailed effects reported for humans in the van der Schrier Study indicate a lack of toxic effect and the ability to make escape-</p>	<p>A review of the science concerning CO₂ toxicity levels is not necessary for a reasoned choice among alternatives. The EIS continues to use CO₂ concentration levels defined by federal agencies in its discussion. The Executive Summary, Chapter 8, and Appendix G have been revised to remove references to "Toxic Level of Concern" or "toxic impact distances."</p>	20242-203374-06

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>related decisions for exposures between 75,000 and 90,000 ppm in typical, healthy individuals.</p> <p>The database of studies for inhaled CO₂ effects at levels from 2,000 ppm to less than 100,000 ppm are often missing sufficient detail to tease out toxic versus compensatory effects in humans. However, the van der Schrier Study provides the latest details into acute CO₂ tolerability and toxicity. The van der Schrier Study is a solid study on which to base the classification of acutely inhaled CO₂ exposures of less than 100,000 ppm as non-toxic and suggests revisiting the present NIOSH limit of 40,000 ppm for healthy people.</p> <p>Q. Do your comments about the van der Schrier Study change your view of how potential human health effects are addressed in Chapter 8 of the DEIS?</p> <p>A. I think that the van der Schrier Study and information in it will, or at least should, drive a review of the current CO₂ exposure limits. I also think that such an effort would lead to less conservative levels than those used in the DEIS, meaning that the likelihood of effects would be even lower. That said, using those different levels I would not make a material difference in my ultimate conclusion, which is that the DEIS demonstrates there is not an undue risk of adverse human health effects from CO₂ exposures in the event of the worst-case scenario presented in the DEIS.</p>		
Summit Carbon Solutions	Lumpkin, Michael	2024-02-13	<p>Q. Do you have any other comments regarding the DEIS?</p> <p>A. Yes. In Section 8.5.3 of the DEIS, EERA recommends that Summit provide indoor CO₂ detectors to all residences within 1,000 feet of the project. I disagree that provision and installation of indoor CO₂ detectors in these homes will provide meaningful mitigation of health risks in the event of a pipeline failure. Indoor residential CO₂ concentrations are typically above ambient background levels due to a variety of factors, including increasing CO₂ from residents’ exhaled breath, the unventilated portion of combustion gases from use of fireplaces or other wood-burning or gas appliances, tobacco use, or other indoor sources. In homes with relatively low rates of mixing of indoor and outdoor air (particularly in cold weather seasons), typical indoor CO₂ levels may be in the thousands of ppm with no adverse health impact to occupants. Addition of CO₂ detectors with alarm thresholds set close to these levels may likely result in frequent alarms sounding completely independent of the existence of the CO₂ pipeline within 1,000 feet. Conversely, the appearance of an outdoor CO₂ plume due to a pipeline failure in proximity to a residence will not be immediately detected by an indoor detector because of relatively low air changes rates of homes with doors and windows closed. Thus, the addition of indoor CO₂ detectors for the purpose of exposure mitigation from a pipeline failure may result in false alarms and subsequent discontinuation of detector use by the occupants as well as lack of timely alerting of home occupants to a change in outdoor CO₂ levels.</p>	<p>Thank you for your comments. EERA staff continue to believe that applicant-provided indoor CO₂ detectors for residences within 1,000 feet of the project is a reasonable mitigation measure. In addition, EERA staff believes that applicant-provided outdoor CO₂ detectors for residences within 1,000 feet of the project is a reasonable mitigation measure. This distance was chosen based on the area that could reach a concentration of 15,000 ppm CO₂, as described in Appendix G. Section 8.5.3 has been updated to include the recommendation for outdoor CO₂ detectors.</p>	20242-203374-06
Summit Carbon Solutions	Lumpkin, Michael	2024-03-28	<p>Q. Have you reviewed Dr. McKinney’s Rebuttal Testimony?</p> <p>A. Yes.</p> <p>Q. Does anything in Dr. McKinney’s Rebuttal Testimony contradict your conclusion that “the risk of actual toxicological harm or reduced capacity to escape in the event of an accidental release even under worst-case discharge conditions is small”?</p> <p>A. No. Dr. McKinney’s Rebuttal Testimony addresses 1 CO₂ health hazards (the innate potential of CO₂ to produce effects that may damage human tissues or impair escape) but does not address CO₂ health risks (the chance that an adverse effect will occur) associated with hypothetical releases scenarios. The Draft Environmental Impact Statement (DEIS) reports air dispersion modeling predictions of greater than 40,000 ppm CO₂ going no further than 617.5 feet from the release point. Further modeling reported in the DEIS predicted a total CO₂ of greater than 30,000 ppm to exist for less than 7 minutes, extending no further than 711 feet from the release site. These predictions indicate that a worst-case release event would impact a very small distance from the pipeline beyond which CO₂ levels in air would rapidly dissipate to levels that have never been shown to cause tissue damage or impair the ability of a person to egress.</p>	<p>Thank you for your comment.</p>	20243-204748-04
Summit Carbon Solutions	Lumpkin, Michael	2024-03-28	<p>Q. Dr. McKinney’s Rebuttal Testimony claims you assert “that it is reasonable to classify inhaled CO₂ exposures of less than 100,000 parts per million (ppm) as non-toxic. Is that your testimony?</p> <p>A. Yes, I testified that the van der Schrier et al. (2020) study of CO₂ exposures provides a robust data set indicating lack of tissue or physiological system damage resulting from exposures to less than 100,000 ppm (specifically, 90,000 ppm as reported by van der Schrier et al). Dr. McKinney conflates short-lived episodes of physical or mental discomfort reported by van der Schrier and others with toxicity and the inability to make decisions of egress. Indeed, his quotation from the van der Schrier study that “The translational model predicts that at inhaled CO₂ concentrations greater than 9%, pH will rapidly decrease to values that further hamper the capacity to function adequately” ignores data presented in the van der Schrier study that human blood pH from 90,000 ppm CO₂ exposure did not fall below or approach 7.2, which is not an acidotic blood condition and would not be expected to affect the ability to make decisions to escape.</p>	<p>Minnesota Rule 4410.2300(H) indicates that an EIS shall include “a thorough but succinct discussion of potentially significant adverse or beneficial effects generated” by the proposed project and each major alternative with “[l]ess important material ... summarized, consolidated, or simply referenced.” Factors to be considered include “the impact and the relevance of the information to a reasoned choice among alternatives” and “the relationship between the cost of data and analyses and the relevance and importance of the information.” A review of the science concerning CO₂ toxicity levels is not necessary for a reasoned choice among alternatives. The EIS continues to use CO₂ concentration levels defined by federal agencies in its discussion.</p>	20243-204748-04

Summit Carbon Solutions	Lumpkin, Michael	2024-03-28	<p>Q. Are you advocating for revisions to, or a departure from, NIOSH in this proceeding?</p> <p>A. No. As alluded to on page 9 of my Direct Testimony, the van der Schrier Study demonstrates the CO₂ exposure limits currently prescribed by NIOSH are conservative. The van der Schrier Study provides data showing healthy individuals are capable of withstanding much higher CO₂ exposure levels. Neither Summit nor I are advocating that NIOSH values should be revised or disregarded in this proceeding. NIOSH values should, however, be placed in context with other relevant materials such as the van der Schrier Study.</p> <p>Q. Does the debate between NIOSH, the van der Schrier Study, and overall ppm values change your ultimate conclusion in this proceeding?</p> <p>A. No. Though I reference the potential for less conservative tolerances, as I stated in my Direct Testimony “using those different levels would not make a material different in my ultimate conclusion, which is that the DEIS demonstrates that there is not an undue risk of adverse human health effects from CO₂ exposures in the event of the worst-case scenario presented in the DEIS.”</p> <p>Q. Please explain.</p> <p>A. The NIOSH CO₂ IDLH value of 40,000 ppm is not a bright line exposure limit at which toxicity is expected, but is a conservative level based on a range of exposures (30,000 ppm to greater than 100,000 ppm) from older data that do not benefit from more recent and more detailed studies such as van der Schrier et al. (2020). Nevertheless, both the OSHA Short Term Exposure Limit (STEL) of 30,000 ppm and NIOSH IDLH of 40,000 ppm were used as decision points in the air modeling described in the DEIS. This modeling, as I explained previously, predicts that worst-case CO₂ levels greater than 30,000 ppm may only feasibly occur over very short distances for just minutes.</p>	<p>Minnesota Rule 4410.2300(H) indicates that an EIS shall include “a thorough but succinct discussion of potentially significant adverse or beneficial effects generated” by the proposed project and each major alternative with “[l]ess important material ... summarized, consolidated, or simply referenced.” Factors to be considered include “the impact and the relevance of the information to a reasoned choice among alternatives” and “the relationship between the cost of data and analyses and the relevance and importance of the information.” A review of the science concerning CO₂ toxicity levels is not necessary for a reasoned choice among alternatives. The EIS continues to use CO₂ concentration levels defined by federal agencies in its discussion.</p>	20243-204748-04
Summit Carbon Solutions	O'Konek, Scott	2024-02-13	<p>Q. What areas would potentially be impacted by construction of the Project?</p> <p>A. Summit plans to utilize temporary construction workspace that typically varies from 25 to 100 feet wide, plus additional temporary workspace, to facilitate construction. Summit would use temporary roads to access the construction workspace.</p> <p>In addition, several above-ground facilities will also be constructed as part of the Project. These associated facilities are described in Section 3.2 of the Application and Section 2.3 of the DEIS.</p> <p>Following construction, land would be restored to pre-construction conditions and would remain suitable for farming, pasturing, and other activities. Structures and trees over the permanent right-of-way (ROW) would be restricted. Summit would retain a 25 to 50-foot-wide permanent ROW centered over the pipeline for inspection and maintenance access during operations. Permanent roads would also be established to access aboveground mainline valve (MLV) sites.</p>	<p>Thank you for your comment.</p>	20242-203374-03
Summit Carbon Solutions	O'Konek, Scott	2024-02-13	<p>Q. How has Summit incorporated input from landowners, agencies, tribes, and local government officials when developing its Preferred Route?</p> <p>A. Summit has engaged with landowners in the route refinement process to obtain survey permission and to learn more about specific impacts important to area landowners. Summit also held a number of open houses to solicit broader public input on the route. To date, Summit has surveyed over 98 percent of its Preferred Route and is committed to continue to work with landowners along the route to further minimize potential impacts. Summit has been successful in the acquisition of approximately 83 percent of the pipeline route through voluntary easements with nearly 55 landowners.</p> <p>As part of its larger Midwest Carbon Express Project, Summit also contacted sixty-two Native American tribes and offered the opportunity to participate in field surveys, provide review and input and contribute to knowledge of the resources in the area. The following Tribes have participated in archeological surveys for the Project to date: Mille Lacs Ojibwe; the Rosebud Sioux; the Yankton Sioux; and Sisseton, Wahpeton, Oyate of the Lake Traverse Reservation Tribes. Tribes did not identify features or areas of concern during surveys. Summit witness Mr. Jason Zoller provides additional discussion regarding Summit’s tribal engagement efforts.</p> <p>Summit also shared the initial project design with regulatory agencies including the U.S. Fish and Wildlife Service, U.S. Army Corps of Engineers, Minnesota Department of Natural Resources, Minnesota Pollution Control Agency, Minnesota Board of Water and Soil Resources, and Otter Tail and Wilkin counties. Summit has continued to meet with and exchange information with federal, state, and local agencies to address potential impacts from the Project. Based on feedback from these agencies and local units of government, some route variations were proposed, and some route alignments were confirmed.</p> <p>Summit’s evaluation and coordination resulted in a Preferred Route that begins at the Green Plains Ethanol Plant capture facility near Fergus Falls and travels approximately 28.1 miles to the Bois de Sioux River before crossing into North Dakota. The Preferred Route is collocated with existing powerlines, pipelines, and 16 roads for approximately 53 percent of its length. The Preferred Route reflects</p>	<p>A summary of Tribal engagement for the EIS is included in Appendix J.</p>	20242-203374-03

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			Summit’s review of sensitive routing resources, coordination with agencies regarding routing concerns, as well as coordination with affected landowners to cross their private properties to best reflect their preferences.		
Summit Carbon Solutions	O'Konek, Scott	2024-02-13	<p>Q. Has Summit received landowner or agency feedback regarding either of these route alternatives?</p> <p>A. Summit has had limited interaction with landowners and agencies regarding their input on RA-North and RA-Hybrid. However, there would be differences. For example, based upon Summit’s desktop analysis, there are more residences along RA-North versus RA-South within 300 feet (10 vs. 2) and within 500 feet (19 vs. 5) that may experience temporary impacts during construction. Further, based upon where RA-North would cross the Minnesota/North Dakota border, it is likely that the route would continue in between developed areas in and around Wahpeton, North Dakota, which could affect likely infill development in a way that RA-South would not.</p> <p>Q. Have there been any route modifications in North Dakota that would impact any of the route alternatives studied in the DEIS?</p> <p>A. No. Summit’s route in North Dakota begins at the Minnesota/North Dakota border where RA-South and RA-Hybrid end in Minnesota. That is the location of the pipeline route in North Dakota that is currently being evaluated within the North Dakota Public Service Commission’s permitting process. RA-North has no connection point to the rest of Summit’s pipeline system in North Dakota.</p>	Thank you for your comment.	20242-203374-03
Summit Carbon Solutions	O'Konek, Scott	2024-02-13	<p>Q. Based on Summit’s analysis, do any of the Route Alternatives better minimize potential human or environmental impacts as compared to the RA-South, the Applicant’s Preferred Route?</p> <p>A. No. The DEIS demonstrates that RA-North and RA-Hybrid do not avoid or minimize potential impacts related to project construction, they simply shift potential impacts to another location. Importantly, Summit has worked with the landowners on RA-South to address potential impacts on land crossed by the Project and has also surveyed over 98 percent of RA-South for environmental and cultural features, providing strong evidence that potential impacts along RA-South will be avoided or minimized to the extent practicable.</p>	Thank you for your comment.	20242-203374-03
Summit Carbon Solutions	O'Konek, Scott	2024-02-13	<p>Q. Have you reviewed the DEIS?</p> <p>A. Yes.</p> <p>Q. Do you have any comments on the DEIS?</p> <p>A. Summit appreciates EERA’s thoughtful and comprehensive approach to the analysis of potential benefits, impacts, and mitigation related to construction and operation of the Project. Summit appreciates EERA’s thoughtful and comprehensive approach to the analysis of potential benefits, impacts, and mitigation related to construction and operation of the Project. Summit completed a detailed review of the DEIS and is offering written comments on a number of issues that could be added, corrected, or clarified in the final EIS to ensure a complete and accurate record. Summit’s DEIS comments are included as Schedule 2 to my Direct Testimony and were also efiled under separate cover to EERA.</p> <p>Q. Do you have any comments on the recommendations EERA included in the DEIS?</p> <p>A. Yes. I will respond to several of EERA’s recommendations related to construction mitigation.</p>	Thank you for your comment.	20242-203374-03
Summit Carbon Solutions	O'Konek, Scott	2024-02-13	<p>Q. EERA staff recommends that if a route permit for RA-South is granted, Summit should provide documentation of coordination with the Fergus Falls Fish & Game Club. (1) What is your response?</p> <p>A. Summit agrees with this recommendation. As discussed in the Application, Summit is coordinating closely with the Fergus Falls Fish & Game Club to minimize impacts to its land and associated recreational economies during construction and operation of the Project. (2) Summit will continue to coordinate with the Fish & Game Club and, if RA-South is approved, will provide documentation of such coordination prior to construction.</p> <p>(1) DEIS at 5-56, 11-13 (Jan. 23, 2024) (eDocket No. 20241-202524-01).</p> <p>(2) Route Permit Application at 40-41 (Sept. 12, 2022) (eDocket No. 20229-189023-02).</p>	Section 5.4.10.3 has been updated to indicate that the applicant would adopt the EERA-recommended mitigation if issued a route permit for the project.	20242-203374-03
Summit Carbon Solutions	O'Konek, Scott	2024-02-13	<p>Q. EERA staff included in the DEIS a recommendation by the Minnesota Pollution Control Agency (MPCA) that “details be provided in the ECP for preventing excessive crowning or subsidence above the restored centerline, and for addressing excessive crowning or subsidence if it is discovered during post-construction monitoring.” (3) What is your response?</p> <p>A. Summit will include details in the Minnesota Environmental Construction Plan (ECP) for preventing excessive crowning or subsidence above the restored centerline. Summit will restore the construction workspace to as close to the original pre-construction contours as practicable. If uneven settling occurs or surface drainage problems develop as a result of pipeline construction, Summit will provide additional land leveling services after receiving a landowner's written notice, weather and soil conditions permitting.</p>	Section 5.7.9.3 has been updated to indicate that the applicant would adopt the EERA-recommended mitigation if issued a route permit for the project.	20242-203374-03

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			(3) DEIS at 5-145.		
Summit Carbon Solutions	O'Konek, Scott	2024-02-13	<p>Q. EERA staff included in the DEIS a recommendation by the Minnesota Department of Natural Resources (MDNR) that “[e]xploratory borings should be conducted to characterize the shallow subsurface anywhere sheet piling would be used and submitted to DNR groundwater staff for evaluation Exploratory borings should be conducted to at least the maximum depth of any construction impacts.” (4) What is your response?</p> <p>A. Summit agrees with this recommendation and will conduct exploratory borings in coordination with the MDNR anywhere sheet piling would be used, subject to obtaining landowner permission.</p> <p>(4) DEIS at 5-139.</p>	Section 5.7.8.2 has been revised to indicate that the applicant would conduct geotechnical investigations prior to construction anywhere sheet pile would be used.	20242-203374-03
Summit Carbon Solutions	O'Konek, Scott	2024-02-13	<p>Q. EERA staff included in the DEIS a recommendation by MDNR that “[a]t a minimum, Pennsylvania standards for trench breaker placement should be used, and knowledge gained from additional subsurface site characterization may provide further guidance on where to place trench breakers most effectively. Trench breakers should be used at the entrance and exit of every waterbody regardless of slope (except for HDD crossings).” (5) What is your response?</p> <p>A. Permanent trench breaker placement is discussed in Section 2.9.1 of the Minnesota ECP. (6) As committed to the MDNR in Enclosure of its September 1, 2022 Project introduction letter (see Application, Appendix 8), Summit is presently proposing to install trench breakers at the entry and exit from every public water crossing, except for at HDD crossings. In addition, as outlined in Section 5.5 of the Minnesota ECP, trench breakers will be installed at wetland boundaries where the pipeline trench may cause a wetland to drain, or the trench bottom will be sealed to maintain wetland hydrology. (7)</p> <p>Summit plans to select the location of additional trench breakers across the Project based on field conditions at the time of construction and will consider the degree and length of slope, presence of down-slope sensitive resource areas such as wetlands and waterbodies, and proximity to other features such as roads and/or railroads. Generally, slopes are higher in the eastern portion of the Project, while the majority of the Project, and particularly the western portion of the Project, is located in areas where slope is not a concern (0.001-6.71 degree slope; see 18 Figure 11-3 of the Scoping EAW).</p> <p>Summit’s trench breaker plans account for the substantial body of knowledge that its construction staff has regarding the placement of trench breakers. In Summit’s view, those plans are consistent with the intent of the Pennsylvania standards, while also accounting for local, site-specific knowledge to use trench breakers most effectively. Use of this field condition review will ensure that Summit will not install trench breakers where they would not provide the intended benefit (i.e., on steep slopes where trench line erosion has the risk of occurring and at slopes adjacent to wetlands and waterbodies). In other words, while Summit does not intend to specifically implement the Pennsylvania standards, Summit’s plans will achieve the same or greater levels of protection, which is consistent with the Pennsylvania standards regarding the use of alternate best management practices.</p> <p>(5) DEIS at 5-139.; (6) DEIS App. D at Minnesota Environmental Construction Plan at 7 (Jan. 23, 2024) (eDocket No. 20241- 202530-02) (Minnesota ECP).; (7) DEIS App. D at Minnesota ECP at 17.</p>	Text regarding the applicant's proposed use of trench breakers has been added to Section 5.7.8.2.	20242-203374-03
Summit Carbon Solutions	O'Konek, Scott	2024-02-13	<p>Q. EERA staff included in the DEIS a recommendation by MDNR that the “pipeline should be installed deep enough to prevent pipe exposure over time. The DNR’s Area Hydrologists may have specific data on depth of cover for river and stream crossings and should be consulted.” (8) What is your response?</p> <p>A. Summit agrees with this recommendation relative to public waters and will consult with the MDNR when public water crossing designs are prepared for the License to Cross Public Waters application.</p> <p>Q. EERA staff included in the DEIS a recommendation by MDNR that Summit “should continue to consult with DNR on groundwater investigations for the potential routes and on construction methods in relation to groundwater.” (9) What is your response?</p> <p>A. Summit currently has an ongoing groundwater investigation underway relative to the Preferred Route/RA-South and will continue to consult with the MDNR.</p> <p>Q. EERA staff included in the DEIS a recommendation to select a crossing technique that is most appropriate for each waterbody, after consultation with MDNR. (10) What is your response?</p> <p>A. Summit agrees with this recommendation relative to public waters and will consult with the MDNR when designing and selecting public water waterbody crossing techniques as part of the License to Cross Public Waters application.</p> <p>Q. The DEIS states that “[g]eotechnical investigations prior to construction in beach ridge areas would identify areas where sheet pile use should be avoided.” (11) EERA staff also recommended certain procedures prior to sheet piling in beach ridge areas. (12) What is your response?</p>	Text in Section 5.7.8 either already reflected this information or has been revised where needed.	20242-203374-03

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>A. Summit has committed to not using sheet piling in the beach ridge areas. Accordingly, the recommended procedures will not be applicable.</p> <p>(8) DEIS at 5-139.</p> <p>(9) DEIS at 5-139.</p> <p>(10) DEIS at 5-150.</p> <p>(11) DEIS at 5-137.</p> <p>(12) DEIS at 5-139 – 5-140.</p>		
Summit Carbon Solutions	O'Konek, Scott	2024-03-28	<p>Q. Do you agree with Dr. Christy Dolph’s opinion that because all routes have not been equally assessed, it is impossible to evaluate and compare the potential impacts of all the routes?</p> <p>A. No. The Draft Environmental Impact Statement (DEIS) demonstrates that RA-North and RA-Hybrid do not avoid or minimize potential impacts related to project construction, they simply shift potential impacts to another location.</p> <p>Q. Dr. Dolph raises concerns with how construction will be completed in the beach ridge area without use of sheet piling. How will Summit construct the pipeline in beach ridge areas?</p> <p>A. Trench excavation will be limited to a maximum depth of 60 inches. To minimize the likelihood that construction activities will impact this area, Summit has committed to not using sheet piling within the beach ridge area. On RA-South, the beach ridge area is located between mileposts 4 and 9. Should trench wall stability be a concern, Summit will use trench boxes to stabilize the trench walls, which will not result in any additional excavation. If the horizontal direction drill (HDD) method is used outside the beach ridge area, pipe will be installed to a depth of six to ten feet. A shallow bore installed to a depth of six to ten feet will minimize the likelihood of intersecting groundwater. Continued groundwater studies will further inform construction practices in this area, and Summit will continue to consult with the Minnesota Department of Natural Resources.</p>	<p>Text in Section 5.7.8.2 has been revised to reflect that sheet piling would not be used in beach ridge system areas and to describe the use of trench boxes to stabilize trench walls, if needed.</p> <p>As confirmed by the applicant in response to Supplemental Information Inquiry 13, Question 7, the sentence "If the horizontal direction drill (HDD) method is used outside the beach ridge system area, pipe will be installed to a depth of six to ten feet" has an error. "[O]utside the beach ridge system area" should be "inside the beach ridge system area."</p>	20243-204748-02
Summit Carbon Solutions	Piggott, Brad	2024-03-14	<p>Q. Have you reviewed the CURE DEIS Comments and MCEA DEIS Comments?</p> <p>A. Yes.</p> <p>Q. The CURE DEIS Comments state, “[t]he DEIS assumes...the proposed project is capable of and will capture 100% of the CO₂ emitted by the Green Plains ethanol plant.” Similarly, the MCEA DEIS Comments state, “the Applicant estimates a 100 percent capture rate at its facility.” (4) Do you agree with these statements?</p> <p>A. No. It would be more accurate to state that the proposed Project is capable of capturing 100% of the CO₂ emitted by the Green Plains ethanol plant’s CO₂ scrubber stack while the capture facility is online. Other CO₂ emissions from the Green Plains ethanol plant, such as fired heater emissions and yeast growth emissions, are not intended or designed to be captured by the Project.</p>	<p>Section 2.3.1 of Chapter 2 has been revised to include this additional information on the design of the CO₂ capture facility. Section 2.1 has been revised to clarify that the amount of CO₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios for 100 percent, 70 percent, 40 percent, and 10 percent.</p>	20243-204356-07
Summit Carbon Solutions	Piggott, Brad	2024-03-14	<p>Q. The CURE DEIS Comments and the MCEA DEIS Comments discuss the Archer Daniels Midland (ADM) CO₂ capture facility (the Illinois Basin – Decatur Project (IBDP)) in Decatur, IL. Do you agree that it is appropriate to compare the capture rate at the IBDP with the Project?</p> <p>A. No. There are a number of important technical differences between the ADM facility and the Green Plains Ethanol Plant that make this, at best, an apples to oranges comparison.</p> <p>First, ADM processes up to 600,000 bushels of corn per day through the Decatur facility. (5) The Green Plains Ethanol Plant makes 55 million gallons per year of ethanol from corn fermentation, (6) and a modern ethanol plant can convert one bushel of corn into 2.7 gallons of ethanol. (7) Thus, the Green Plains facility, when operating, processes 55,809 bushels of corn per day, or less than 10% of the amount of corn that the ADM Decatur facility can process. Second, the ADM facility in Decatur also contains a coal-fired power plant and soy processing facilities. (8) This ADM facility makes several products in addition to ethanol, such as citric acid, lactic acid, xanthan gum, and corn syrup, (9) none of which are made at the Green Plains Ethanol Plant to the best of my knowledge. All of these additional unit operations at the ADM facility have related energy consumption and resultant CO₂ emissions associated with them that will not be present at the Green Plains Ethanol Plant. Accordingly, comparing the ADM Decatur facility’s emissions to the potential emissions at the Green Plains Ethanol Plant is not a reasonable comparison.</p> <p>Third, while the ADM Decatur CO₂ capture facility captures CO₂ from the ethanol plant’s CO₂ scrubber in a manner similar to that of the Project at the Green Plains ethanol plant, I cannot comment on what fraction of the ADM ethanol plant’s CO₂ emissions were actually captured since the large sequestration operation in Decatur began operations in 2017. This is because the capture facilities operate as auxiliary facilities to the ethanol plant. There are numerous reasons why the ADM ethanol plant may not be running at the</p>	<p>Thank you for your comment.</p>	20243-204356-07

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>full design rate; and when the ethanol plant is not running at full design rates, the CO₂ capture unit is also running below the full design rate. Corn shortages, low profit margins, maintenance issues in the ethanol plant, etc. may all contribute to lower sequestration volumes than design that are not due to problems with the CO₂ capture unit.</p> <p>(5) <i>The Center for Land Use Interpretation, "Archer Daniels Midland Decatur Plant, Illinois," [Online]. Summit Carbon Solutions	Piggott, Brad	2024-03-14	<p>Q. Is there any other information from the IBDP that is more helpful in analyzing the technical capability of the capture facility technology to fully capture CO₂ produced at the ethanol plant?</p> <p>A. Yes. The initial three-year pilot project at the IBDP offers some useful information. Originally, the IBDP was a one million tonne CO₂ storage demonstration project that operated from November of 2011 – 2014. This capture facility was installed in the ADM Decatur plant with the goal of capturing, purifying, and injecting 1,000 tonnes of CO₂ per day to achieve a total injection volume of one million tonnes of CO₂ in a three-year period. This injection goal was achieved within the original timeline of that project. The equipment in the demonstration project is very similar to the equipment designed for the Summit Project. During the three-year operation period, CO₂ was injected for more than 90% of the time. (10) This included equipment downtime in the CO₂ capture unit and equipment downtime in the ethanol facility. The ADM ethanol plant was offline for 37 days during the three-year operation period. (11)</p> <p>I agree with CURE’s comment that “it is not realistic to assume that the project will operate without any breakdown or updates for the entire lifetime of the ethanol plant.” Operating equipment will have unscheduled maintenance needs that are difficult to predict either in terms of when they will occur or for how long the equipment will be offline. However, the above-mentioned operating experience would suggest that when the ethanol plant is operating, it is reasonable to expect that the CO₂ capture facility will be able to capture CO₂ nearly all of the time.</p> <p>(10) <i>R. McKaskle, R. Jones, A. Vance, B. Piggott, K. Fisher and S. Greenberg, "Illinois Basin - Decatur Project: Process Design and Operation of Carbon Dioxide Surface Facilities," Illinois State Geological Survey, Champaign, 2019.</i></p> <p>(11) <i>Id.</i></p>	Thank you for your comment.	20243-204356-07
Summit Carbon Solutions	Piggott, Brad	2024-03-14	<p>Q. CURE’s DEIS Comments also include a paragraph discussing the Petra Nova plant in Texas. Does the Petra Nova facility provide a useful comparison of CO₂ capture rates as compared to the Project?</p> <p>A. No. The Petra Nova facility is a CO₂ capture plant that captures CO₂ from post-combustion emissions from a coal-fired power plant. The CO₂ emitted by the coal-fired power plant is dilute and must be enriched to higher concentrations using a chemical solvent circulation process before the CO₂ can be compressed, dehydrated, and sent to the oil field for injection in an Enhanced Oil Recovery (EOR) operation. The operating history of the Petra Nova plant is unlikely to be a representative comparison to the Summit capture project at the Green Plains ethanol plant for the following reasons:</p> <p>1. The chemical solvent CO₂ capture and enrichment process is a much more operationally complex process than the Summit CO₂ capture process and will be much more likely to experience maintenance issues that are not applicable to the Summit CO₂ capture process. Not all of the CO₂ present in the post-combustion emissions is captured in the chemical solvent; some of the CO₂ in the stream flows out with the rest of the emissions to the atmosphere. The Petra Nova facility, by design, captures 90% of the CO₂ present in the post-combustion emissions. In contrast, the CO₂ emissions captured by Summit do not need to be enriched and no CO₂ flows out of the CO₂ scrubber when Summit’s plant is operating. Summit’s facility, by design, captures >99% of the CO₂ present in the CO₂ scrubber emissions.</p> <p>2.The source gas is coal combustion flue gas and has a very high impurity load associated with it that can be detrimental to operational reliability and uptime for the solvent circulation process. There is no analogous issue in the Summit CO₂ capture process.</p> <p>3.The CO₂ captured at Petra Nova is utilized for EOR, which is subject to different market forces than the Summit Project. The Rebuttal Testimony of Mr. James Powell further addresses the intended use of the CO₂ that will be captured from the Green Plains Ethanol Plant.</p>	Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios for 100 percent, 70 percent, 40 percent, and 10 percent.	20243-204356-07

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
Summit Carbon Solutions	Powell, James	2024-02-13	Q. What is the anticipated schedule for construction and operation of the Project? A. Summit plans to commence construction of the Project in the third quarter of 2025 and complete construction in the fourth quarter of 2026. Summit plans to place the Project into service in late 2026. However, construction timing is contingent on receipt of required permits and authorizations.	Section 2.9 and the Executive Summary have been updated to include the provided information.	20242-203374-02
Summit Carbon Solutions	Powell, James	2024-02-13	Q. What is the status of regulatory approvals for the Midwest Carbon Express Project in other states? A. The Midwest Carbon Express Project is in the permitting phase across the 5-state footprint. In Iowa, hearings before the Iowa Utilities Board are now complete, and a final decision is expected in Q1 2024. In South Dakota, Summit plans to submit a permit application to the South Dakota Public Utilities Commission in Q2 2024. South Dakota’s permitting process is anticipated to take up to one year to complete. In North Dakota, Summit has submitted supplemental information and anticipates a final hearing will be scheduled in Q2 2024 as part of the reconsideration process before the North Dakota Public Service Commission. In Nebraska, permitting is underway and occurs at the county level. Summit anticipates having permits in hand to facilitate a start of construction for portions of the project by Q1 2025 and plans to be operational by late 2026. Q. Have there been any other significant changes to the Midwest Carbon Express Project since Summit filed its Route Permit Application in Minnesota? A. Yes. On January 29, 2024, Summit announced a strategic partnership with POET to add 17 of POET’s biorefining facilities in Iowa and South Dakota to Summit’s pipeline network. The addition of these facilities in neighboring states has no impact on Summit’s proposed facilities in Minnesota which are the subject of this Route Permit Application.	Section 2.1 has been updated to include the provided information.	20242-203374-02
Summit Carbon Solutions	Powell, James	2024-02-13	Q. Please summarize the Project’s benefits. A. The Project provides an important benefit to Minnesota as it moves forward with its clean energy and carbon reduction efforts. Each year, during normal operations, the Project will capture and permanently store approximately 0.19 million metric tons per annum of CO ₂ from the existing Green Plains Ethanol Plant (Plant) that would otherwise be released into the atmosphere under the Plant’s existing air permits. CO ₂ is a leading contributor to climate change. The World Health Organization states that “[c]limate change is the single biggest health threat facing humanity, and health professionals worldwide are already responding to health harms caused by this unfolding crisis” (World Health Organization, 2023). The Centers for Disease Control has identified the following health-related impacts of climate change in the Midwest, including in Minnesota: temperature-related death and illness, air quality impacts, extreme events, vector-borne diseases, water-related illness, and high risks for certain populations of concern (Centers for Disease Control and Prevention, 2021). The Project would contribute in a concrete and meaningful way to reducing CO ₂ in the atmosphere, and, coupled with other CO ₂ capture and clean energy projects and initiatives, is an important tool for slowing or reversing the human health and safety impacts related to climate change. The Project will also provide significant economic benefits to Minnesota, local governments and communities, and landowners, including the following:	Thank you for your comment.	20242-203374-02
Summit Carbon Solutions	Powell, James	2024-02-13	<ul style="list-style-type: none"> Provides additional income to landowners whose land will be crossed by the Project in the form of easement payments. Landowners will be compensated for use of the temporary construction workspace on their land, as well as for Summit’s permanent right of way (ROW) necessary to install and operate the Project. Creates up to approximately 200 construction-related jobs during the construction period, resulting in approximately \$37,411,000 in employment expenditures during the construction phase. Creates two new full-time equivalent (FTE) pipeline technicians and one new FTE capture facility operator once the Project is operational, resulting in approximately \$450,000 per year in employment expenditures. These full-time staff are expected to live in the vicinity of the Project. Construction of the Project would provide temporary increases in revenue through increased demand for lodging, food services, fuel, transportation, and general supplies. Generates personal income by circulation and recirculation of dollars paid out by the Project as business expenditures and state and local taxes, as well as associated increases to the local tax base. Diversifies economic development in Wilkin and Otter Tail counties, while complementing existing economic activities. See Sections 2 and 6.2.1.2 of the Application for further details on the benefits of the Project. 	Section 5.4.11 has been updated to include the provided information.	20242-203374-02
Summit Carbon Solutions	Powell, James	2024-02-13	Q. Has the Project been designed to minimize potential impacts to agricultural production and uses? A. Yes. The Project has been designed to minimize potential impacts to agricultural production and uses. The Project is sited primarily on agricultural land. Following construction, lands impacted by construction will be restored to pre-construction conditions and	Text has been added to section 5.5.1 stating that the pipeline depth is below what would impact normal agricultural operations.	20242-203374-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>existing agricultural activities will resume, except at permanent aboveground facility sites (mainline valve (MLV) sites and access roads). Landowners will be compensated by Summit for losses to crop production during construction. Permanent impacts to agricultural land (including cropland, pasture/hay/range lands) are only anticipated at aboveground facility locations that will be fenced and removed from current use (approximately 0.7 acres).</p> <p>Further, the pipeline will be buried to provide a minimum of 54 inches depth of cover and will not interfere with normal agricultural operations. Landowners will be compensated for use of the temporary construction workspace on their land, as well as for Summit’s permanent right-of-way to operate the Project. Measures within the Minnesota Environmental Construction Plan (DEIS Appendix D) and Minnesota Agricultural Protection Plan (DEIS Appendix E) will be implemented to minimize potential impacts to agricultural lands.</p>		
Summit Carbon Solutions	Powell, James	2024-02-13	<p>Q. Will the Project have a significant impact on community facilities and services?</p> <p>A. No. Summit will ensure medical services are available in the field during construction. Accordingly, existing social and health services should be adequate to support the workforce during construction. The Project is not likely to increase the need for public services, including police and fire protection, due to the short-term duration of the construction activities. Summit will work with local emergency management offices to develop procedures for response to emergencies. No significant increase in the permanent population of local communities would be expected from construction and operation of the Project, and the construction workforce would not create any measurable impact to the local government, utilities, or community services.</p>	Thank you for your comment.	20242-203374-02
Summit Carbon Solutions	Powell, James	2024-02-13	<p>Q. Do you have any comments on the recommendations EERA included in the DEIS?</p> <p>A. Yes. The DEIS discusses a number of mitigation measures recommended by EERA that Summit agrees with. For example:</p> <ul style="list-style-type: none"> • EERA staff recommends requiring Summit to provide indoor CO₂ detectors for residences within 1,000 feet of the Project. (1)While Summit agrees with Dr. Michael Lumpkin’s testimony, Summit is willing to supply CO₂ detectors to residents within 1,000 feet of Project centerline prior to the start of pipeline operations, if required by the Commission. • EERA staff recommends including a special permit condition requiring Summit to file with the Commission its Emergency Response Plan that is filed with Pipeline and Hazardous Materials Safety Administration (PHMSA). (2) <p>As discussed in the Application, Summit has prepared a draft Emergency Response Plan (provided as Application Appendix 6) and will maintain and update its Emergency Response Plan in accordance with PHMSA requirements which will be provided to PHMSA. Summit has no objection to inclusion of a special permit condition requiring Summit to file with the Commission the Emergency Response Plan that is provided to PHMSA prior to the start of operations.</p> <p>(1) DEIS at 8-26, 11-13 (Jan. 23, 2024) (eDocket No. 20241-202524-01).</p> <p>(2) DEIS at 8-26, 11-13.</p>	Thank you for your comment.	20242-203374-02
Summit Carbon Solutions	Powell, James	2024-02-13	<ul style="list-style-type: none"> • EERA staff recommends including a special permit condition requiring Summit to provide its public education plan for Commission review 30 days prior to submittal of the Plan and Profile. EERA staff notes that the public education plan could include specific safety information for neighboring landowners, including what to do in case of a rupture. (3) <p>Summit has no objection to a special permit condition requiring it to provide its public education plan for Commission review 30 days prior to submittal of the Plan and Profile. As discussed in the Application, Summit will implement comprehensive public awareness and education outreach programs, including damage prevention programs, that meet or exceed industry standards and regulatory requirements concerning public awareness of pipelines and pipeline operations. (4) The public awareness programs are intended to inform members of the public in the vicinity of the pipeline and facilities to protect the public from injury, prevent or mitigate effects on the environment, protect the pipeline and facility assets from damage by the public, and provide ongoing public awareness.</p> <p>(3) DEIS at 8-26, 11-13.</p> <p>(4) Route Permit Application at 26 (Sept. 12, 2022) (eDocket No. 20229-189023-02).</p>	EERA staff has revised Section 8.5.3 and removed the reference to “accidental release plan” and to list information to be filed as compliance filings 60 days prior to the Plan and Profile submittal.	20242-203374-02
Summit Carbon Solutions	Powell, James	2024-02-13	<p>Q. EERA staff recommends including a special permit condition requiring the applicant to provide an “accidental release plan,” developed in coordination with local emergency responders, for Commission review 30 days prior to submittal of the Plan and Profile. (5) What is your response?</p> <p>A. As discussed in the Application and noted above, Summit has prepared a draft Emergency Response Plan and will develop and maintain its Emergency Response Plan in accordance with PHMSA requirements. As noted above, Summit does not object to EERA’s other recommended special permit condition requiring Summit to file with the Commission the Emergency Response Plan that is provided to PHMSA prior to the start of operations. The Emergency Response Plan will include the information required by PHMSA,</p>	EERA staff has revised Section 8.5.3 to remove reference to “accidental release plan” and to list information to be filed as compliance filings 60 days prior to the Plan and Profile submittal.	20242-203374-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>and any additional/other information required by the Commission would be addressed separately. As I discuss further below, Summit does not object to filing additional information, as recommended by EERA, in a compliance filing, but I do not recommend calling it an “accidental release plan,” as naming it as such creates the potential for confusion and/or conflict with PHMSA’s emergency response plan requirements.</p> <p><i>(5) DEIS at 8-26, 11-13.</i></p> <p>Q. EERA staff also lists potential information that could be included in such an “accidental release plan.”⁶ What is your response?</p> <p>A. As noted above, the Emergency Response Plan will include the information required by PHMSA, and any additional/other information required by the Commission would be addressed in a separate document. I do not recommend requiring creation of a separate “accidental release plan,” but Summit does not object to providing a compliance filing addressing the following information recommended by EERA:</p> <ul style="list-style-type: none"> • “include the specific equipment, training, and reimbursement that could be provided to emergency managers.” <i>(7)</i> Summit will file a compliance filing describing its coordination with county emergency managers, including information about equipment, training, and reimbursement provided to emergency managers. • “list the names of the emergency responders and a provision to update contact information as needed.” <i>(8)</i> Summit’s Emergency Response Plan will include contact information for Summit’s qualified and trained response personnel as well as contact information of the county emergency managers. • “discuss the feasibility of a ‘reverse 911’ notice that goes out to landowners’ telephones in the event of an emergency shutdown or rupture.” <i>(9)</i> In accordance with PHMSA regulations, in the event of an emergency condition on the pipeline, Summit’s control center will immediately notify the public safety answering point (PSAP) for each county. Depending on the incident type and severity, additional regulatory notifications, including notifying the public will occur. <p>Summit does not object to filing a compliance filing evaluating the feasibility of also using an electronic notification system, such as Send Word Now.</p> <ul style="list-style-type: none"> • “identify how the applicant would pay for costs of any repair to public infrastructure or private property (including crops and livestock) that might occur during an accidental release.” <i>(10)</i> <p>Summit does not object to filing a compliance filing identifying how the applicant would pay for costs of any repair to public infrastructure or private property (including crops and livestock) that might occur during an accidental release.</p> <p><i>(6) DEIS at 8-26, 11-13.; (7) DEIS at 8-26, 11-13.; (8) DEIS at 8-26, 11-13.; (9) DEIS at 8-26, 11-13.; (10) DEIS at 8-26, 11-13.</i></p>		
Summit Carbon Solutions	Powell, James	2024-03-14	<p>Q. CURE witness Ms. Secchi asserts that the economic benefits of the Project are overstated in the DEIS, and that “job numbers, job characteristics and duration, purchases of materials and other project-specific information” provided by applicants should be independently verified. (Secchi Direct at 4-6.) Was Summit the sole source of the job creation and economic benefits stated in Summit’s Application and your direct testimony?</p> <p>A. No. Summit engaged Ernst & Young LLP (EY) to complete an economic impact analysis of the Project. Summit provided key assumptions to EY to facilitate its analysis, but those assumptions were informed by third party bid proposals. As I stated in my direct testimony, since filing our Application, Summit has contracted with Precision Pipeline LLC to construct the Project. Through this contracting process, Summit has been able to verify its initial assumptions regarding job numbers, duration, materials, and other key components of the economic analysis. Importantly, by hiring a local, union contractor, the economic benefits are anticipated to increase over initial estimates, as the union is expected to source from local union halls for at least 50 percent of the construction workforce. Summit is pleased to partner with this skilled, local workforce to construct the Project.</p>	Thank you for your comment.	20243-204356-02
Summit Carbon Solutions	Powell, James	2024-03-14	<p>Q. CURE witnesses Dr. Emily Grubert and Ms. Silvia Secchi include discussion regarding the potential to use CO₂ transported on the Project for enhanced oil recovery (EOR) (Grubert Direct at 7:8-11 and Secchi Direct at 7-10). Does Summit intend to ship CO₂ on the Project for EOR?</p> <p>A. No. As stated in the Application, the intention is to capture and permanently sequester 100% of the CO₂ captured from the Green Plains Ethanol Plant in Fergus Falls. Green Plains has no plans to use the CO₂ for EOR, and to do so would lessen the Project’s impact on reducing the carbon intensity (CI) score of the ethanol produced at the Green Plains Plant. Accordingly, there are both environmental and economic disincentives to use the CO₂ transported on the Project for EOR. Moreover, the sequestration facilities in North Dakota are geographically distant from any oil producing wells in the state, making use of the CO₂ for EOR physically impossible with the planned facilities.</p>	Information regarding the possibility of using the captured CO ₂ for EOR has been added to Section 5.7.2.3.	20243-204356-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			For clarity, Summit’s pipeline is a common carrier system and, as such, Summit’s shippers ultimately determine the purpose and end use for CO ₂ transported on their behalf. If a shipper chooses to transport CO ₂ for EOR, the shipper must have the means to physically receive the CO ₂ from Summit’s termination area in Oliver and Morton Counties, North Dakota, and transport it independently to an alternative destination. Most of the capacity of the Project is subscribed through a contract with Green Plains, and Summit is unaware of any other shippers with an interest in shipping CO ₂ for EOR via the Project.		
Summit Carbon Solutions	Zoller, Jason	2024-02-13	<p>Q. What environmental surveys have been conducted for the Project?</p> <p>A. Summit has conducted the following environmental surveys for the Applicant’s Preferred Route (RA-South):</p> <ul style="list-style-type: none"> • Wetland and waterbody delineation surveys • Phase I cultural survey (included participation by Tribal Cultural Specialists) • Aerial raptor nest survey • Threatened and endangered species surveys • Groundwater monitoring <p>Q. What percentage of the Applicant’s Preferred Route (RA-South) has been surveyed?</p> <p>A. Summit has completed biological surveys for 98.4% of RA-South and cultural surveys for 99.8% of RA-South.</p> <p>Q. Do you have any additional survey reports summarizing the findings of Summit’s environmental survey efforts?</p> <p>A. Yes, we do have additional survey reports. They are as follows:</p> <ul style="list-style-type: none"> • Draft Minnesota Conventional Archaeological Resources Survey (Phase 1) Volume 4: Fieldwork Report Addendum (MNL-305 and MNL-321) For Work Completed Between July 2, 2022, and November 14, 2022 on MNL-321 in Otter Tail County and MNL-305 in Martin County, and Since December 3, 2021, for the Eliminated Segment of MNL-305 in Faribault County [dated March 31, 2023] • Wetland and Waterbody Delineation Report – Minnesota [dated October 3, 2022] • Wetland and Waterbody Delineation Supplemental Report for MNL-305 and MNL-321 (2022) – Minnesota [dated March 31, 2023] • Results of 2022 Field Surveys for Listed Butterfly and Plant Species in Minnesota [dated February 8, 2023] • Results of 2022-2023 Field Surveys for Listed Butterfly and Plant Species in Minnesota [dated January 18, 2024] <p>Each of these reports has been provided to the appropriate resource agency for review.</p> <p>Q. Will Summit complete environmental survey efforts prior to the start of construction?</p> <p>A. Yes. Summit will complete all identified environmental surveys before beginning construction.</p>	Thank you for your comment.	20242-203374-04
Summit Carbon Solutions	Zoller, Jason	2024-02-13	<p>Q. Has Summit continued to coordinate with tribes on the development of this Project?</p> <p>A. Yes. Summit is committed to building relationships with Tribes, Tribal Communities, and Native American-Owned businesses as the Project is planned, constructed, and operated. Summit has reached out to 62 Tribes with current and historic ties to the Midwest Carbon Express (MCE) Project area, including the eleven federally recognized Minnesota Tribes. Initial outreach occurred at the very start of the MCE Project in August 2021 with Project information and an invitation to participate in field studies. Annual informational webinars hosted by Summit are put on every year to inform the Tribes of MCE Project activities.</p> <p>In December of 2021, each Tribe was invited to conduct Traditional Cultural Property (TCP) studies in the Project area. Summit offered to compensate Tribes for conducting studies that seek to identify possible TCP/historic properties that could be located within the Project corridor.</p> <p>Summit has elected to target 100 percent inventory or cultural survey of the Project route, not just high probability areas and federal jurisdictional areas. Where Summit has been granted permissions to access a property, the Tribes have been afforded the opportunity to accompany archaeological crews along the entire route, or to conduct their own studies if permitted by the landowner. In Minnesota, specifically, the following Tribes have participated in the cultural resource surveys: Rosebud Sioux, Mille Lacs Ojibwe, Sisseton Wahpeton Oyate, and Yankton Sioux. All resources identified by the Tribal Cultural Specialists have been avoided.</p>	Thank you for your comment.	20242-203374-04
Summit Carbon Solutions	Zoller, Jason	2024-02-13	<p>The following are some additional examples how Summit has engaged Tribes, Tribal Communities, and Native American-Owned businesses in the Minnesota and across the larger MCE Project:</p> <ul style="list-style-type: none"> • In February of 2022, Summit Carbon and EXP reached out to Tribally-owned and operated enterprises and Native American-owned businesses to explore job opportunities. This outreach includes working with Tribal Employment Rights Offices (TERO) to maximize potential job opportunities related to the Project. • In May 2022, Summit sponsored a week-long Tribal Cultural Specialist training for the Mille Lacs Band of Ojibwe. • Summit has sponsored and presented at a number of Tribal Coalition meetings including the Coalition of Large Tribes (COLT), the 	Thank you for your comment.	20242-203374-04

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			Midwest Alliance of Sovereign Tribes, the Great Plains Tribal Chairmans Association, the Northern Plains TERO Coalition, the Great Lakes TERO Association, and the National TERO Conference. <ul style="list-style-type: none"> Summit is committed to workforce development in Indian Country and partnered with Five Skies Training and Consulting to host a Career Readiness Enhancement Training for Native Communities in May 2023 in Sioux City, Iowa. In October 2023, Summit sponsored and helped develop a law enforcement training hosted by COLT in Billings, Montana focused on the Missing and Murdered Indigenous Persons (MMIP) crisis. A number of Tribes from across the nation were represented, law enforcement from Tribal nations, and law enforcement from “border towns” or those towns who border reservations. 		
Summit Carbon Solutions	Zoller, Jason	2024-02-13	Summit recognizes that violence against Indigenous peoples is a crisis that has been underfunded in communities throughout Indian Country and that murders and missing persons cases go unsolved and unaddressed. Summit is fully committed to partnering with Tribes and Tribal communities to achieve justice and healing for families around the Project by investing in programs and services that: foster awareness of the issues related to MMIW/MMIWG; address issues of human trafficking; domestic violence; honor Indigenous cultural values; educate on the prevention of sexual violence; support community self-defense training; and invest in the empowerment of Native women and girls. Furthermore, Summit supports the programs and services of agencies responsible for investigating and resolving these cases. Safe communities are Summit’s priority and violence against Native people has no place in the communities in which Summit serves and operates. Summit will require that all of its employees and contractors complete a Human Trafficking Prevention Training prior to construction work.	Section 5.4.8.3 has been updated to note that the applicant would require that all its employees and contractors complete a Human Trafficking Prevention Training prior to construction work.	20242-203374-04
Summit Carbon Solutions	Zoller, Jason	2024-02-13	Q. Have you reviewed the DEIS? A. Yes. Q. Do you have any comments on the DEIS? A. Yes. The DEIS provides a comprehensive evaluation of potential human and environmental impacts associated with construction and operation of the Project. Summit has provided separate DEIS comments recommending several additions, corrections, or clarifications. (O’Konek Direct, Schedule 2.) I assisted with preparation of those comments. In my Direct Testimony, I focus on several issues raised during the DEIS comments and respond to recommendations made by EERA related to environmental impacts and mitigation.	Thank you for your comment.	20242-203374-04
Summit Carbon Solutions	Zoller, Jason	2024-02-13	Q. During the DEIS meetings, several members of the public asked how much water will be used during construction and operation of the Project. How much water will the Project use during construction and operation, and how will water use be regulated? A. During construction, execution of horizontal directional drills (HDDs), hydrostatic testing, and dust control may involve appropriations from surface water or groundwater sources if permitted by the Minnesota Department of Natural Resources (MDNR). The use of water for HDDs and hydrostatic testing would be single-event appropriations, while dust control appropriations would be variable as needed based on conditions. As stated in DEIS on page 5-137, Summit is currently anticipating the need to use approximately 125,000 gallons of water for the execution of HDDs, hydrostatic testing, and dust control for the Project, of which 110,000 gallons would be used for pipeline hydrostatic testing. Summit is currently exploring options for appropriation of water, including duration of use, volume, and appropriation location(s). These could be private, municipal, or surface water sources. Once proposed/preferred and contingency sources and volumes are finalized, these details would be reviewed by the MDNR. Summit would obtain coverage under individual or general MDNR water appropriation permit(s) for any surface or groundwater appropriated for these activities. These permits would contain BMPs for water withdrawals. Water appropriation permits from the MDNR would inform the locations used, any seasonal restrictions to account for low-flow conditions, volume and measurement requirements, and BMPs to be used during appropriation activities.	Thank you for your comment.	20242-203374-04
Summit Carbon Solutions	Zoller, Jason	2024-02-13	Minnesota law sets standards for non-depletion, reasonable use, and non-degradation of water resources in striving to prevent negative impacts. (1) The MDNR, through its water appropriation permitting process, would ensure that water appropriations would not deplete or degrade the water source (e.g., the permit would specify maximum surface water withdrawal rates to protect aquatic life and allow for downstream uses). Summit would include a contingency plan as part of the appropriation permit application because it is challenging to predict how changes in total precipitation, large precipitation events, drought, increased temperatures, variable surface water flows and elevations, and longer growing seasons would impact proposed water resources. The contingency plan would include identification of potential alternate water supply sources and/or a statement that Summit agrees in advance to a suspension of withdrawals following MDNR request, when necessary.	Text has been added to Section 5.7.8.2 to include this commitment by the applicant to provide a contingency plan and apply for water appropriation permits for trench dewatering.	20242-203374-04

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>Trench dewatering is also considered an appropriations activity regulated by MDNR and would be conducted according to permit requirements. Summit is evaluating the need to appropriate water for dewatering, dust control, and hydrostatic testing during construction of the capture facility. A specific water source has not been determined at this time; however, Summit plans to obtain water from either a local surface water source or groundwater well directly, or indirectly, from the Green Plains Ethanol Plant or the City of Fergus Falls.</p> <p>(1) <i>Managing Water Sustainability: Report of the EQB Water Availability Project</i>, available at: https://www.eqb.state.mn.us/sites/eqb/files/documents/Managing_for_Water_Sustainability_12-08.pdf.</p>		
Summit Carbon Solutions	Zoller, Jason	2024-02-13	<p>During operations, the CO₂ capture facility would have estimated water supply needs ranging from 8.2 gallons per minute (gpm) in winter months and 40.9 gpm in summer months, for an average water usage of approximately 13 million gallons per year. The “13 million gallon” total was calculated by using the estimate of 8.2 15 gpm for 182.5 days and the estimate of 40.9 gpm for 182.5 days (for a total of 365 days of use). The water is expected to be obtained from the Green Plains Otter Tail Ethanol Plant’s onsite wells. Water use at the capture facility may also be subject to permitting by the MDNR.</p> <p>The MDNR reported over 23.3 billion gallons of permitted water use in Otter Tail and Wilkin counties in 2022. (2) Due to the volume of current permitted appropriations in the counties crossed by the Project, the relatively small volume likely needed by the Project in comparison, and the measures and conditions outlined above, environmental effects from the Project’s water appropriation activities are expected to be minimal.</p> <p>(2) <i>Minnesota Water Use Data. Permit Index Report: Water Use Data – 1988 to 2022</i>, available at: https://www.dnr.state.mn.us/waters/watermgmt_section/appropriations/wateruse.html.</p>	<p>Section 5.7.8.2 was revised to clarify the applicant's calculation of approximately 13 million gallons per year. Section 5.7.8.2 was also revised to provide context of the project's water use compared to water use in Otter Tail and Wilkin Counties. Section 5.7.8.2 was also revised to include updated permitted groundwater usage.</p>	20242-203374-04
Summit Carbon Solutions	Zoller, Jason	2024-02-13	<p>Q. Do you have any additional information regarding the eligibility status of cultural resources identified with the Project’s environmental survey area during field surveys?</p> <p>A. The DEIS on page 5-78 says, “One of the six resources has not been evaluated (21WL0005)” ; however, the October 2022 MN Cultural Report Volume 2 (Minnesota Conventional Archaeological Resources Survey (Phase 1) Volume 2: Fieldwork Report Addendum (MNL-305 and MNL-321) For work completed between December 3, 2021, and July 2, 2022) recommends site 21WL0005 be deemed not eligible, and the December 5, 2022 Minnesota State Historic Preservation Office (SHPO) letter concurred with that recommendation. Therefore, the characterization of 21WL0005 as “not evaluated” is incorrect, and it should be characterized as “not eligible.” In response to the statement in the DEIS that “Construction of the project would result in negligible impacts on these resources”, (3) under federal regulation (36 CFR 800, the implementing regulations for Section 106), effects can only happen to sites listed or eligible for listing under the National Historic Preservation Act (NHPA), and not to “not eligible” properties. As such, there would be no impact on the resources identified by Summit’s surveys and no further work at the sites are needed.</p> <p>(3) <i>DEIS at 5-78 (Jan. 23, 2024) (eDocket No. 20241-202524-01)</i>.</p>	<p>References to site 21WL0005 within Tables 5-25 and 5-27 and within the text of Section 5.6 of the final EIS has been updated to reflect its NRHP status is Not Eligible instead of Not Evaluated, per the December 5, 2022, SHPO letter. Sites 21OT0229, 21WL0107, and 21WL0108 have also been updated to Not Eligible in all applicable tables, per SHPO's agreement with the surveyor's recommendations.</p>	20242-203374-04
Summit Carbon Solutions	Zoller, Jason	2024-02-13	<p>Q. Do you have any comments on the recommendations EERA staff included in the DEIS?</p> <p>A. Yes.</p> <p>Q. EERA staff recommended that “appropriate surveys for archaeological resources should occur regardless of which route alternative is selected. If archaeological resources are found, treatment plans should be prepared in consultation with Tribes and SHPO, as appropriate.” (4) What is your response?</p> <p>A. Summit will complete archeological surveys regardless of the route selected and is committed to avoiding impacts to any identified eligible cultural resources and Tribal areas of interest through route modifications or construction methodology. If identified resources cannot be avoided, then treatment plans would be developed with Tribes and SHPO, as appropriate. To date, Summit has surveyed 99.8% of RA-South, and the construction of the Project will not impact any cultural resources listed or eligible for listing under the NHPA or Tribal areas of interest.</p> <p>(4) <i>DEIS at 5-80, 11-13</i>.</p>	<p>Summit's commitment to avoid archaeological resources through route modifications or otherwise, or to develop treatment plans if resources cannot be avoided, is already documented in Sections 5.6.1.3 and 5.6.2.3 of the draft EIS.</p>	20242-203374-04
Summit Carbon Solutions	Zoller, Jason	2024-02-13	<p>Q. The DEIS states that “[p]otential impacts to ground-nesting birds during construction would be lessened or avoided by conducting surveys for these species and their nests, per USFWS standards, at appropriate timing ahead of construction.” (5) What is your response?</p> <p>A. Summit intends to follow U.S. Fish and Wildlife Service (USFWS) guidance regarding compliance with the Migratory Bird Treaty Act (MBTA) and will continue to consult with the USFWS regarding MBTA. Additionally, a MBTA plan is under development for company use with the contractors during construction and during operations. Summit has also received the MDNR’s August 23, 2023 Natural</p>	<p>Mitigation proposed in the draft EIS does not conflict with standard USFWS guidance; nevertheless, text in the Mitigation discussion in Section 5.7.5 has been amended to reference adherence to USFWS and DNR guidance.</p>	20242-203374-04

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>Heritage Information review letter for the Project, and the MDNR did not recommend bird surveys. To avoid duplicative, and potentially conflicting requirements, Summit recommends any special condition related to this issue reference adherence to USFWS and MDNR recommendations, if needed, rather than including the specific language suggested on DEIS page 5-114.</p> <p>Q. EERA staff included in the DEIS a recommendation by DNR that “[o]ne additional mitigation for nesting birds in areas of grass/shrub vegetation to be cleared for construction would be to mow/cut these areas during non-nesting season prior to actual construction so suitable nesting habitat is not present prior to final clearing and construction.” (6) What is your response?</p> <p>A. Summit intends to follow USFWS guidance regarding compliance with MBTA and will continue to consult with the USFWS regarding MBTA. Additionally, Summit is developing a MBTA plan for use by the contractors during construction and during operations. As I note above, I recommend that the Commission not establish separate conditions on this issue but rather defer to USFWS and MDNR to identify appropriate measures to minimize potential impacts to nesting birds, if needed.</p> <p>(5) DEIS at 5-114. (6) DEIS at 5-151; see also DEIS at 5-115.</p>		
Summit Carbon Solutions	Zoller, Jason	2024-02-13	<p>Q. EERA staff included in the DEIS a recommendation by CURE that “[p]rior to construction, field surveys should be conducted for state-listed species. Surveys for state-listed plants should follow the MnDNR protocol described in the April 2022 ‘Guidance for Documenting and Collecting Rare Plants.’” (7) What is your response?</p> <p>A. Summit has conducted surveys for state-listed species and has coordinated with the MDNR on survey efforts. Prior to all survey efforts, the MDNR reviews Summit’s survey protocol. Surveys are then conducted under the MDNR-approved protocol. To date, surveys have not identified concerns for impacts to state-listed species. Pages 75-76 of the Scoping EAW contain additional discussion of this issue.</p> <p>(7) DEIS at 5-115.</p>	Thank you for your comment.	20242-203374-04
Summit Carbon Solutions	Zoller, Jason	2024-02-13	<p>Q. EERA staff included in the DEIS a recommendation by CURE that “[p]roper restoration of native vegetation communities would benefit rare and unique species. The proposed performance standard of 70 percent vegetation density relative to background native vegetation cover is too low and should be higher...” (8) What is your response?</p> <p>A. There is no regulatory requirement that mandates a performance standard greater than 70 percent; and therefore, Summit does not agree with this recommendation. The proposed 70 percent revegetation standard is in accordance with the revegetation standards contained within Condition 13.2 of the Minnesota Pollution Control Agency’s (MPCA) Construction Stormwater General Permit. (9) The condition is as follows:</p> <p>Permittees must complete all construction activity and must install permanent cover over all areas prior to submitting the NOT. Vegetative cover must consist of a uniform perennial vegetation with a density of 70 percent of its expected final growth. Vegetation is not required where the function of a specific area dictates no vegetation, such as impervious surfaces or the base of a sand filter. [Minn. R. 7090].</p> <p>(8) DEIS at 5-115. (9)MPCA Construction Storm Water General Permit (issued Aug. 1, 2023), available at: https://www.pca.state.mn.us/sites/default/files/wq-strm2-81a.pdf.</p>	Thank you for your comment.	20242-203374-04
Summit Carbon Solutions	Zoller, Jason	2024-02-13	<p>Q. EERA staff included in the DEIS a recommendation by MDNR that “[i]f the selected route alignment is near the Foxhome Prairie High Biodiversity [Minnesota Biological Survey] MBS site, the alignment should follow the south side of the road in the area and avoid crossing the MBS site.” (11) What is your response?</p> <p>A. The Applicant’s Preferred Route (RA-South) does not cross this MBS site, so there would be no impacts to the site. If the RA-North route was to be selected, Summit would evaluate resources along the route and coordinate with MDNR to avoid impacts to the Foxhome Prairie High Biodiversity MBS site.</p> <p>(11) DEIS at 5-116, 5-151.</p>	Text has been added to section 5.7.5.3 stating that the applicant would evaluate resources and coordinate with DNR if RA-North was selected.	20242-203374-04
Summit Carbon Solutions	Zoller, Jason	2024-02-13	<p>Q. EERA staff recommended that “[t]he applicant should use only ‘bio-netting’ or ‘natural netting’ types and mulch products without synthetic (plastic) fiber additives.” (12) EERA staff also included in the DEIS a recommendation by Minnesota Department of Transportation (MnDOT) that “[t]o reduce potential construction impacts on state-listed species,” applicant should use “erosion control techniques that avoid entrapping or entangling small wildlife.” (13) What is your response?</p> <p>A. Summit has already committed to use wildlife-friendly erosion and sediment control BMPs that contain biodegradable netting</p>	Sections 5.7.5.3 and 5.7.10.3 of the EIS note the applicant's stated intent to use erosion controls with natural fibers and not plastic netting. These sections also reference the applicant's intent to draft and implement a Vegetation Management Plan. Sections 5.7.5.3 and 5.7.10.3 have been revised to remove EERA's recommended mitigation regarding plastic netting and mulch since it is stated in the applicant-proposed mitigation.	20242-203374-04

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>(Category 3N or 4N natural fibers) and to avoid the use of plastic mesh. Both BMPs help to minimize wildlife mortality resulting from the use of erosion and sediment control materials. <i>(14)</i></p> <p>Q. EERA staff included in the DEIS a recommendation by MDNR that the Applicant “[f]ollow MnDOT’s 2020 Standard Specifications for Construction for rolled erosion control materials that specify only natural fibers with no 20 plastic mesh be used.” <i>(15)</i> What is your response?</p> <p>A. During construction, Summit will follow MnDOT’s 2020 Standard Specifications for Construction for rolled erosion control materials that specify only natural fibers with no plastic mesh be used.</p> <p><i>(12) DEIS at 5-116, 5-151.</i></p> <p><i>(13) DEIS at 5-115.</i></p> <p><i>(14) See DEIS App. D at Minnesota Environmental Construction Plan at 7 (Jan. 23, 2024) (eDocket No. 20241-202530-02) (Minnesota ECP).</i></p> <p><i>(15) DEIS at 5-151.</i></p>		
Summit Carbon Solutions	Zoller, Jason	2024-02-13	<p>Q. EERA staff included in the DEIS a recommendation that “[n]o temporary workspace areas shall be placed within or adjacent to wetlands or water resources, as practicable.” <i>(16)</i> What is your response?</p> <p>A. This is not practicable, as the pipeline crosses some wetlands. When this occurs, temporary workspace will be required to install the pipe. Summit is reducing the width of temporary workspace required for the crossing of wetlands from 50 feet to 25 feet to minimize the temporary impacts to the wetland. Additionally, additional temporary workspace (ATWS) will be sited outside of wetlands to the extent practicable. <i>(17)</i></p> <p><i>(16) DEIS at 5-138.</i></p> <p><i>(17) See DEIS App. D at Minnesota ECP.</i></p>	EERA did not make this recommendation. Rather it is a standard condition of the pipeline routing permit issued by the Commission.	20242-203374-04
Summit Carbon Solutions	Zoller, Jason	2024-02-13	<p>Q. EERA staff included in the DEIS recommendations that “[s]oil excavated from the wetlands and riparian areas shall be contained and not placed back into the wetland or riparian area.” <i>(18)</i> What is your response?</p> <p>A. Summit will restore water resource areas disturbed by construction activities to pre-construction conditions in accordance with the requirements of applicable state and federal permits or laws and landowner agreements.</p> <p>The requirement to not replace wetland or riparian soil would be in conflict of Condition F.14 of the USACE’s U.S. Army Corps of Engineer’s (USACE)’s Utility Regional General Permit, <i>(19)</i> which Summit anticipates obtaining for the Project. The condition is as follows [bolded for emphasis]:</p> <p>Restoration of Temporary Impacts: All temporary impacts in waters of the US, including discharges resulting from side casting material excavated from trenching, that occur as a result of the regulated activity must be fully contained with appropriate erosion control or containment methods, be restored to pre-construction contours and elevations, and, as appropriate, revegetated with native, non-invasive vegetation, unless otherwise conditioned in a Corps RGP verification. All temporary access roads constructed in waters of the US must be properly bridged or culverted to maintain surface flows. In temporarily excavated wetlands, the top 6 to 12 inches of the excavation should normally be backfilled with topsoil originating from the wetland. No temporary excavation area, including, but not limited to trenches, may be constructed or backfilled in such a manner as to drain waters of the United States (e.g., backfilling with extensive gravel layers, creating a French drain effect).</p> <p><i>(18) DEIS at 5-138.</i></p> <p><i>(19) https://www.mvp.usace.army.mil/Portals/57/docs/regulatory/RGP/Utility.pdf?ver=9pcj7dVPna3FU6CTYjnCVA%3D%3D</i></p>	"Soil excavated from the wetlands and riparian areas shall be contained and not placed back into the wetland or riparian area" means that, during construction, the contractor may not store trench soils in wetlands—trench soil must be stored in uplands. When necessary in the construction process, these soils are taken from the upland and used to restore the trench. Text in Section 5.7.8.3 and Section 5.7.9.3 has been revised: "Soil excavated from wetlands and riparian areas shall be contained in uplands and not placed back into the wetland or riparian area until necessary to restore the excavated trench."	20242-203374-04
Summit Carbon Solutions	Zoller, Jason	2024-02-13	<p>Q. EERA staff included in the DEIS a recommendation by MDNR that “[i]solated dry trench crossing methods should be used on all stream crossings instead of the proposed open trench method. This method reduces silt and sediment suspension and transport to downstream waterbodies. This would reduce potential impacts from local and downstream transport of disturbed sediments on state-listed mussel species.” <i>(20)</i> What is your response?</p> <p>A. Summit will implement the isolated dry trench crossing method on delineated waterbodies with perceivable water flow during construction. If a delineated waterbody is dry and has no perceivable water flow, then Summit intends to use the proposed open trench method.</p> <p>Q. EERA staff included in the DEIS a recommendation by MDNR that “[u]nintentional release evaluations should be conducted for water crossings proposed to be installed via HDD to ensure the soils are amenable to HDD. This would further reduce potential impacts from local and downstream transport of disturbed sediments on state-listed mussel species. (As described in Section 5.7.3.4,</p>	<p>Sections 5.7.8.2 and 5.7.10.2 have been revised to reflect the applicant's clarification that it would use the isolated dry-trench crossing method on delineated waterbodies with perceivable water flow during construction. The flowing open-cut crossing method would not be used for the project.</p> <p>Text regarding the HDD contingency plan in Section 5.7.8.2 has been revised to include the stipulation that the containment, response, and clean-up equipment would be available "at both sides of an HDD crossing."</p>	20242-203374-04

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>the applicant would develop a contingency plan to address the unintended release of drilling mud to the environment during the execution of each HDD.)” (21) What is your response?</p> <p>A. Unintentional release evaluations will be conducted to ensure soils are amenable for each HDD crossing. Summit’s contractor will develop an HDD contingency plan to address unintended return or release of drilling fluids. Containment, response, and clean-up equipment would be available at both sides of an HDD crossing location and one side of a bore prior to commencement to assure a timely response in the event of an inadvertent release of drilling fluid.</p> <p>(20) DEIS at 5-115.</p> <p>(21) DEIS at 5-115.</p>		
Summit Carbon Solutions	Zoller, Jason	2024-02-13	<p>Q. EERA staff recommends, and the Minnesota Department of Health concurs, requiring Summit to “provide documentation of coordination with residents located within 1,320 feet of HDD entries. The submittal should document locations of sound dampening barrier walls and include a plan for monitoring noise levels at these locations during HDD operations. The information should be provided 30 days prior to submittal of the Plan and Profile.” (22) What is your response?</p> <p>A. The equipment needed to construct the HDD would have a temporary and short-term impact on noise levels in the vicinity of the Project, which would decrease from the levels presented in the response to Summit’s Supplemental Information Inquiry Number 4, Question 8 based on distance, topography, and weather conditions. Summit will coordinate with nearby landowners along the Project prior to execution of HDDs. Summit’s contractor will determine the need for noise mitigation and noise monitoring based on feedback received from landowners during construction.</p> <p>(22) DEIS at 5-37, 11-12.</p>	Thank you for your comment. EERA continues to recommend this mitigation as worded in the draft EIS.	20242-203374-04
Summit Carbon Solutions	Zoller, Jason	2024-03-28	<p>Q. Do you agree with SHPO’s suggestion that section 5.6.1.1 of the DEIS provides a detailed assessment of whether the Permittee’s surveys conducted to date were completed to the guidelines and standards outlined in the SHPO’s “Guidelines for Archaeological Projects in Minnesota” and the Secretary of the Interior’s Standards for the Identification of Historic Properties?</p> <p>A. Yes. Summit would also propose adding the following language to section 5.6.1.1 of the DEIS:</p> <p>“All work was conducted in accordance with Minnesota State Historic Preservation Office (SHPO) and the Office the State Archaeologist (OSA) standards and the SHPO Manual for Archeological Projects in Minnesota (Anfinson 2005) and the State Archaeologist’s Manual for Archaeological Projects in Minnesota (Anfinson 2011) and the Secretary of the Interior’s Standards for the Identification of Historic Properties (48 CFR 44716).”</p> <p>These guidelines are cited and referenced not only in Summit’s protocols, but also in Volume 1, Section 1.4; Volume 2, Section 1.5; Volume 3, Section 1.5; and Volume 4, Section 1.5.</p>	Section 5.6 of the final EIS now indicates that the surveyor's survey method protocol was designed to follow state guidelines as outlined in the Minnesota State Historic Preservation Office Manual for Archaeological Projects in Minnesota (Anfinson 2005) and the State Archaeologist's Manual for Archaeological Projects in Minnesota (Anfinson 2011) and national guidelines as outlined in the Secretary of the Interior's Guidelines for Archaeology and Historic Preservation (48 CFR 44716). It also references that the survey reports follow the SHPO-reviewed and approved survey method protocol.	20243-204748-03
Summit Carbon Solutions	Zoller, Jason	2024-03-14	<p>Q. Has Summit evaluated the potential construction-related impacts to groundwater along the Applicant’s Preferred Route, RA-South?</p> <p>A. Yes. Summit does not expect that ground disturbance or excavation associated with installation of a 4-inch diameter pipeline will significantly affect groundwater resources. Ground disturbance associated with construction will be primarily limited to the upper 5-6 feet, which is above the water table of most regional aquifers. The primary pipeline construction activities that can affect groundwater include the clearing of vegetation (affecting groundwater recharge rates); soil mixing and compaction; trench excavation, the use of sheet piling to create a safe, stable open work area; dewatering of the trench; and hazardous material handling. However, Summit does not anticipate that extensive sheet piling use would be needed to construct the Project because of the small, 4-inch diameter pipe and the resulting narrow trench width. If needed, Summit’s contractor would drive sheets to depths of 10 to 15 feet below the ground surface. This depth is above any confined groundwater aquifers in the area. Additionally, Summit will not use sheet piling in the beach ridge areas and would conduct exploratory borings anywhere sheet piling would be used.</p> <p>Q. Is it likely that similar risks to artesian aquifers are present along RA-North 5 and RA-Hybrid?</p> <p>A. Yes. As noted in the DEIS, “MDH reports that, based on well records in its County Well Index, artesian conditions are present in shallow confined aquifers within 1 mile of each route alternative.”</p> <p>Q. Will Summit continue to coordinate with the Minnesota Department of Natural Resources regarding potential impacts to groundwater resources?</p> <p>A. Yes.</p>	Section 5.7.8.2 describes that geotechnical investigations would be done to identify areas where breaching of a shallow confined aquifer could occur, and sheet piling would not be used. The applicant currently has an ongoing groundwater investigation underway to further inform construction practices and is continuing to consult with DNR. As part of its coordination with DNR, the applicant has agreed to use ground penetrating radar to study the depth of the confining layer through the entire beach ridge system area crossed by the pipeline to further define existing conditions and advise on construction methodology. Furthermore, EERA staff recommends that the applicant develop, in coordination with DNR, a plan for pipeline construction in areas crossing the beach ridge system area. The plan would include, at a minimum, measures to minimize the potential for breaching a shallow confined aquifer during trenching and contingency measures to mitigate the impacts of a breach, should one occur. This information has been added to Section 5.7.8.2.	20243-204356-03
Summit Carbon Solutions	Zoller, Jason	2024-03-14	<p>Q. Has Summit evaluated the potential construction-related impacts to surface water along RA-South?</p> <p>A. Yes.</p>	Thank you for your comment.	20243-204356-03

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>Q. Given the potential risks of inadvertent returns, why is Summit proposing crossing certain waterbodies using the horizontal directional drill (HDD) method?</p> <p>A. First, it is important to understand that HDDs are the best method to reduce overall risks to certain waterbodies, when compared to open cut crossing methods. Advantages of installation by HDD include:</p> <ul style="list-style-type: none"> • Avoids direct impacts to the waterbody, the aquatic flora and fauna within the waterbody, and adjacent habitat located between the entry and exit of the HDD; • Faster installation, with less soil and ground disturbance; • Avoids the introduction of sediment into the waterbody, does not result in impacts to turbidity; • Reduces the potential of contamination of groundwater; • Installation of the pipeline is less influenced by the weather conditions of the site; and • Increased burial depth of the pipeline underneath the waterbody. <p>Second, Summit's HDD contractor will prepare a detailed plan for each HDD crossing. This plan takes into account information about the crossing, such as geotechnical information, and identifies specific risk factors and mitigation methods that can be used to further reduce the risks of inadvertent returns.</p> <p>Third, prior to construction Summit's HDD contractor will develop an HDD Contingency Plan for each HDD crossing that will evaluate the potential for an inadvertent return or release of drilling fluid within wetlands, waterbodies, and areas immediately adjacent to wetlands and waterbodies, such as stream banks or steep slopes, where drilling fluid releases can quickly reach surface waters. The HDD Contingency Plan will contain protocol and best management practices for the containment, response, and clean-up in the event of an inadvertent release of drilling fluid.</p>		
Summit Carbon Solutions	Zoller, Jason	2024-03-14	<p>Q. Would the HDD crossing method be utilized for RA-North and RA-Hybrid?</p> <p>A. Yes, both RA-North and RA-Hybrid have crossings of certain waterbodies and roads that would be accomplished by the HDD crossing method. See DEIS Tables 5-46 and 5-47.</p> <p>Q. Why is Summit proposing to use open cut methods to cross certain waterbodies?</p> <p>A. If a delineated waterbody is dry and has no perceivable water flow, then Summit intends to use open cut methods. Additional detail regarding this method is in the Minnesota Environmental Construction Plan (Minnesota ECP). Open cut methods are employed in areas where no perceivable water flow is present or anticipated to be present from initial disturbance and final stabilization as an industry standard method for installation of pipe across dry waterbodies, and this method will comply with applicable permit regulations and conditions.</p> <p>Q. Would open cut crossings be utilized on RA-North and RA-Hybrid?</p> <p>A. Yes.</p>	Sections 5.7.8.2 and 5.7.10.2 have been revised to indicate that the applicant would use the isolated dry-trench crossing method on delineated waterbodies with perceivable water flow during construction. The flowing open-cut crossing method would not be used for the project.	20243-204356-03
Summit Carbon Solutions	Zoller, Jason	2024-03-14	<p>Q. Has Summit evaluated the potential construction-related impacts to wetlands?</p> <p>A. Yes. Summit will permit all impacts to wetlands as a result of construction with the USACE St. Paul District. Summit is seeking to permit wetland impacts with the St. Paul District under Section 404 of the Clean Water Act (CWA) through the use of the Utility Regional General Permit (RGP). Summit will comply with all permit requirements and conditions associated with the Utility RGP.</p> <p>Q. Would RA-South have significantly higher wetland impacts than the other alternatives?</p> <p>A. No. As stated in Summit's DEIS comments, the data in the DEIS overstates the expected impacts to wetlands crossed by RA-South. Table 5-3 in Section 5.4.4.18 notes that RA-South crosses 81.1 acres of Emergent Herbaceous Wetlands compared to 15.6 and 15.1 acres crossed by RA-North and RA-Hybrid, respectively. This data is based on USGS National Landcover Dataset, which is a very coarse data set for providing spatial reference and descriptive data for characteristics of the land surface such as thematic class (e.g., urban, agriculture, and forest), percent impervious surface, and percent tree canopy cover. This data is known not to be an accurate representative of the occurrence of wetlands within a landscape. Additionally, the acreage provided in Table 5-3 is for the entire route width, not just the project right-of-way. The total 81.1 acres of Emergent Herbaceous Wetlands is highly influenced by the high density of wetland pixels located within the portion of the RA-South corridor that has been increased in width near milepost 6.6 for future routing flexibility intended to avoid potential impacts. The majority of the wetland pixels in this specific area do not overlap the proposed Project right-of-way and would not be impacted by construction. The route widths analyzed by EERA for RA-North and RA-Hybrid do not include similar widened route width areas. When considering the actual width of the right-of-way expected for construction, RA-South would not have demonstrably greater wetland impacts than the other alternatives.</p>	Section 5.4.10.3 has been updated to indicate that Summit proposes to adopt the EERA-recommended mitigation.	20243-204356-03

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
Summit Carbon Solutions	Zoller, Jason	2024-03-14	<p>Q. Dr. Dolph suggests that the No-Build or RA-North present the best alternatives for minimizing impacts to groundwater, surface water, wetlands, and soils (Dolph Direct). Do you agree?</p> <p>A. No. As stated in the DEIS, construction of the Project will have minimal, temporary impacts to these resources, and Summit will implement best management practices to further minimize potential impacts to these resources.</p> <p>As between the No-Build Alternative and RA-South, it will always be true that not building a linear project, like a pipeline, will have fewer construction-related impacts than building a project. However, in order to meet the urgent need to address climate change and reduce greenhouse gas emissions, investment in new infrastructure, with its related impacts, is necessary. As the DEIS notes, the Project will have a positive environmental benefit in reducing greenhouse gas emissions from the Green Plains Ethanol Plant.</p> <p>As between RA-South and RA-North or RA-Hybrid, the DEIS demonstrates that potential impacts are simply shifted to these locations. The potential impacts Dr. Dolph discusses are not unique to RA-South, and they are well-understood impacts that are regularly managed through permits issued by regulatory agencies and application of best management practices in construction activities throughout the state and region.</p>	Thank you for your comment.	20243-204356-03
Summit Carbon Solutions	Zoller, Jason	2024-03-28	<p>Q. Do you agree with Dr. Christy Dolph’s opinion that Summit will cross water bodies with horizontal direction drills (HDD) in places where the soils are not amenable to HDD and rely only a contingency plan inadvertent drilling mud returns?</p> <p>A. No. Based on the geotechnical work completed to date, soils in the area are suitable for HDDs. The geotechnical studies provide necessary information for Summit to design the drills and fine tune the operation of the drills in order to minimize the potential for inadvertent release. Based on the results of the studies, the contractor will be able to fine tune the speed and pressure of the drill and also the depth at which it is designed. Additionally, the installation of a 4-inch diameter pipeline allows for a considerable amount of flexibility in the arc of the drill. Summit will complete a geotechnical evaluation of each HDD along the Project prior to the start of construction.</p>	Thank you for your comment.	20243-204748-03
Summit Carbon Solutions	Zoller, Jason	2024-03-28	<p>Q. Do you agree with Dr. Dolph’s statement that once drilling fluid is spilled to subsurface environments or waterways, it is impossible to remove, and may have negative impacts on surface or subsurface water quality?</p> <p>A. No. Summit does not agree that spilled drilling fluid is impossible to remove. While it is true that temporary impacts could occur as a result of an inadvertent return, cleanup can be successful, and cleanup will minimize impacts to affected resources. The effectiveness of the cleanup really depends on the size of the release, the duration of the release, when the release is detected, and the location of the release (i.e., if the release is in a waterbody, then the flow or size of the waterbody can impact the cleanup). Summit’s inadvertent return plan will help ensure that Summit and its contractors are prepared for a variety of potential scenarios and that they are able to act quickly to clean up the site if an inadvertent return should occur.</p>	Section 5.7.8.2 addresses potential impacts on surface waters in the event of an inadvertent return, factors that can influence the effectiveness of a cleanup, and the applicant's contingency plan for the unintended release of drilling mud.	20243-204748-03
Summit Carbon Solutions	Zoller, Jason	2024-03-28	<p>Q. Do you agree with SHPO’s comment that a full evaluation of either alternative’s potential to impact archaeological resources cannot be determined until the archaeological surveys of RA-North and RA-Hybrid route widths have been completed?</p> <p>A. Yes. However, Summit would like to note it is not typical to complete surveys on all route alternatives other than those proposed by Summit, since landowner permission is necessary to carry out these surveys. Summit plans to complete surveys on all parcels prior to construction on the parcel. Summit would also clarify that that surveys should be completed such that a “good faith effort to carry out appropriate identification efforts” can be agreed upon per 36 CFR 800.4.</p> <p>Q. Do you agree with SHPO’s comment that it would be useful in the final EIS to have complete evaluations for all the archaeological sites within the route width for the three route alternatives evaluated?</p> <p>A. No. Again, it is not typical to complete evaluations of archeological sites on all proposed alternatives at the environmental review stage.</p>	Thank you for your comment.	20243-204748-03
Summit Carbon Solutions		2024-02-13	<p>Summit Carbon Solutions, LLC (Summit) appreciates this opportunity to provide comments on the Draft Environmental Impact Statement: Otter Tail to Wilkin Carbon Dioxide (CO₂) Pipeline Project (DEIS) published by the Minnesota Department of Commerce Energy Environmental Review and Analysis (EERA) staff on January 23, 2024.</p> <p>Overall, the DEIS provides a comprehensive evaluation and discussion of the potential benefits, impacts, and mitigation measures for the Otter Tail to Wilkin CO₂ Pipeline Project (Project) and alternatives being considered by the Minnesota Public Utilities Commission (Commission or MPUC). Importantly, the DEIS confirms the Project “would reduce [greenhouse gas emissions] in the atmosphere and contribute to reducing the effects of climate change”¹ and that the potential impacts of construction and operation of the Project are generally anticipated to be minimal.²</p>	Thank you for your comment.	20242-203374-03

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>These comments are focused on (1) Summit’s assessment of whether the DEIS fully addresses the issues identified in the October 5, 2023 Final Scoping Decision (FSD), as well as the content required under Minn. R. 4410.2300; and (2) corrections, clarifications, and additions that EERA should consider in preparing the final EIS (FEIS) to ensure that the FEIS is complete and accurate and responsive to issues raised during the DEIS comment period. Various sections of the DEIS (e.g., Chapter 5, Section 8.5.3, and Chapter 11) contain recommendations from EERA staff, other agencies, and members of the public regarding mitigation measures the Commission may consider as part of a route permit for the Project. Summit will respond to those recommendations in its pre-filed direct testimony; the recommendations are not addressed in these comments.</p> <p>Summit has organized these DEIS comments first to identify information that should be added to the FEIS based on the FSD and then by chapter and appendix for ease in tracking the comments.</p>		
Summit Carbon Solutions		2024-02-13	<p>I. INFORMATION REQUIRED BY FINAL SCOPING DECISION</p> <p>The FSD states that the EIS should discuss potential impacts to vegetation, including oak trees.³ Summit was unable to locate this discussion in the DEIS. While the DEIS notes that very few trees would be impacted by construction of the Project,⁴ Summit was unable to identify a discussion of impacts to oak trees and recommends this content be added to the FEIS as specified in the FSD.</p>	Section 5.2 and Section 5.7 have been revised to note that the percent cover of oak trees is very low for all route alternatives.	20242-203374-03
Summit Carbon Solutions		2024-02-13	<p>Section 2.1 of the DEIS states that the larger Midwest Carbon Express Project will capture and transport CO₂ from 32 ethanol plants across 5 states to permitted underground sequestration facilities in North Dakota.⁵ Summit recently announced a strategic partnership with POET, LLC that will add 17 of POET’s biorefining facilities in Iowa and South Dakota to Summit’s planned pipeline network.⁶ While the addition of these facilities to the Midwest Carbon Express Project do not impact the analysis in the DEIS, EERA could consider mentioning the updated information in the FEIS.</p>	This information on the expansion of the Midwest Carbon Express project has been added to Section 2.1 of the EIS.	20242-203374-03
Summit Carbon Solutions		2024-02-13	<p>Valve Closure Time: Section 4.5 includes the following statement: “Therefore, in the time it would take for the valves to close in case of an emergency (25 minutes according to the applicant), the throughput volume would be equal to about 5 percent of the volume already in the 13.9-mile-long pipeline segment.”⁷ The stated valve closure time is incorrect. A valve can be closed in as little as 17 seconds. As Summit stated in response to EERA Inquiry No. 5-34, for modeling purposes, the valve closure time for the Project was conservatively modeled as 10 minutes, which is generally the time measured from the beginning of the loss of containment to the time the valve fully closes and typically includes the time it takes to: detect the leak, decide to close the valve (human or logic), travel time to valve (human or signal), and close the valve. The modeled valve closure time is correctly listed as 10 minutes in Table 7 (page 12) of the Aerial and Thermal Dispersion Analysis, included as DEIS Appendix G. Summit requests that EERA correct the valve closure time reference in Section 4.5 in the FEIS.</p>	Text in Section 4.5 on valve closure time has been corrected from 25 minutes to 10 minutes. Elsewhere in the EIS, including the rupture analysis, valve closure time is listed/calculated as 10 minutes. Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that is not outdated but would be revised as required by PHMSA, if the project is approved. Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.	20242-203374-03
Summit Carbon Solutions		2024-02-13	<p>Summit identified several clarifications and minor corrections to the content in DEIS Chapter 5, including:</p> <ul style="list-style-type: none"> Table 5-3 in Section 5.4.4.18 notes that RA-South crosses 81.1 acres of Emergent Herbaceous Wetlands compared to 15.6 and 15.1 acres crossed by RA-North and RA-Hybrid, respectively. The table and surrounding text should clarify that the data is based on USGS National Landcover Dataset, which is a very coarse data set for providing spatial reference and descriptive data for characteristics of the land surface such as thematic class (e.g., urban, agriculture, and forest), percent impervious surface, and percent tree canopy cover. This data is known not to be an accurate representative of the occurrence of wetlands within a landscape. Additionally, the acreage provided in Table 5-3 is for the entire route width, not just the project right- of-way.⁹ The total 81.1 acres of Emergent Herbaceous Wetlands is highly influenced by the high density of wetland pixels located within the portion of the RA-South corridor that has been increased in width near milepost 6.6 for future routing flexibility. The majority of the wetland pixels in this specific area do not overlap the proposed Project right-of-way and would not be impacted by construction. The route widths analyzed by EERA for RA-North and RA-Hybrid do not include similar widened route width areas. 	Discrepancies between Table 5-4 and Table 5-54 result from different datasets and their associated resolutions. Table 5-4 uses NLCD data to analyze land cover and Table 5-54 uses NWI data to analyze wetlands. Table 5-40 has been edited to be consistent with discussions of impacts on wetlands in Section 5.7.9, Table 5-53, and Table 5-54. In addition, footnotes were added to Table 5-3 and Table 5-53 noting that the route width for RA-South is greater than for RA-North and RA-Hybrid.	20242-203374-03

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
Summit Carbon Solutions		2024-02-13	<ul style="list-style-type: none"> Sections 5.4.2.210 and 5.6.1.211 should clarify that tribal cultural resource surveys have been completed on 99.8 percent of RA-South.¹² No sites of tribal significance were identified. Summit has prepared an Unanticipated Discoveries Plan (UDP)¹³ and will provide training on the UDP to all construction personnel.¹⁴ 	Text in Sections 5.4.2.2 and 5.6.1.2 has been revised to indicate that Tribal cultural resource surveys were completed for these portions of each alternative.	20242-203374-03
Summit Carbon Solutions		2024-02-13	<ul style="list-style-type: none"> Section 5.7.1.2 includes several incorrect footnotes in Table 5-36.¹⁵ Footnote (b) should be corrected to read “CO₂e emission rates based on a conversion factor of 6.2901 pounds (lbs) of CO₂ per gallon of ethanol produced and assume a maximum production rate of 65 million gallons of ethanol per year. [CO₂e (lbs/gallon ethanol) = 3,785.41 cubic centimeters/gallon ethanol x 0.789 grams ethanol/cubic centimeter / (46.07 grams ethanol/44.01 grams CO₂) x 0.0022046 lbs CO₂/gram CO₂].” 	Thank you for your comment. The footnote to Table 5-36 has been corrected.	20242-203374-03
Summit Carbon Solutions		2024-02-13	At the DEIS public meetings on February 6-8, 2024, commenters asked several questions regarding the Project’s expected water use. As stated in the DEIS, Summit anticipates using approximately 125,000 gallons of water for the execution of horizontal direction drills (HDDs), hydrostatic testing, and dust control for the Project, of which 110,000 gallons would be used for pipeline hydrostatic testing. ¹⁶ Summit is currently exploring options for appropriation of water, including duration of use, volume, and appropriation location(s). These could be private, municipal, or surface water sources. Once proposed/preferred and contingency sources and volumes are finalized, these details would be reviewed by the Minnesota Department of Natural Resources (MDNR). Summit would obtain coverage under an individual or general MDNR water appropriation permit(s) for any surface or groundwater appropriated for these activities. These permits would contain best management practices (BMPs) for water withdrawals. Water appropriation permits from the MDNR would inform the locations used, any seasonal restrictions to account for low-flow conditions, volume and measurement requirements, and BMPs to be used during appropriation activities.	Thank you for your comment.	20242-203374-03
Summit Carbon Solutions		2024-02-13	<p>Minnesota law sets standards for non-depletion, reasonable use, and non-degradation of water resources in striving to prevent negative impacts.¹⁷ The MDNR, through its water appropriation permitting process, would ensure that water appropriations would not deplete or degrade the water source (e.g., the permit would specify maximum surface water withdrawal rates to protect aquatic life and allow for downstream uses). Summit would include a contingency plan as part of the appropriation permit application because it is challenging to predict how changes in total precipitation, large precipitation events, drought, increased temperatures, variable surface water flows and elevations, and longer growing seasons would impact proposed water resources. The contingency plan would include identification of potential alternate water supply sources and/or a statement that Summit agrees in advance to a suspension of withdrawals following DNR request, when necessary.</p> <p>Trench dewatering is also considered an appropriations activity regulated by MDNR and would be conducted according to permit requirements.</p>	Information on contingency plan and appropriations for trench dewatering has been added to Section 5.7.8.2.	20242-203374-03
Summit Carbon Solutions		2024-02-13	Summit is evaluating the need to appropriate water for dewatering, dust control, and hydrostatic testing during construction of the capture facility. A specific water source has not been determined at this time; however, Summit plans to obtain water from either a local surface water source or groundwater well directly, or indirectly, from the Green Plains Ethanol Plant or the City of Fergus Falls.	This information has been added to Section 5.7.8.2.	20242-203374-03
Summit Carbon Solutions		2024-02-13	During operations, the CO ₂ capture facility would have estimated water supply needs ranging from 8.2 gallons per minute (gpm) in winter months and 40.9 gpm in summer months, for an average water usage of approximately 13 million gallons per year. The “13 million gallon” total was calculated by using the estimate of 8.2 gpm for 182.5 days and the estimate of 40.9 gpm for 182.5 days (for a total of 365 days of use). The water is expected to be obtained from the Green Plains Otter Tail Ethanol Plant’s onsite wells. Summit will coordinate water use permitting at the capture facility with the MDNR.	This information is provided in Section 5.7.8.2.	20242-203374-03
Summit Carbon Solutions		2024-02-13	Any water appropriation permit issued by MDNR would require annual water use reporting. The MDNR reported over 23.3 billion gallons of permitted water use in Otter Tail and Wilkin counties in 2022. ¹⁸ Due to the volume of current permitted appropriations in the counties crossed by the Project, the relatively small volume likely needed by the Project in comparison, and the measures and conditions outlined above, environmental effects from the Project’s water appropriation activities are expected to be minimal. Given the comments regarding water use at the DEIS meetings, Summit suggests including this additional information, which was also discussed in the Scoping Environmental Assessment Worksheet (Scoping EAW), ¹⁹ in the FEIS.	Additional information has been added to Section 5.7.8.2 to address the volume of water that would be used by the project relative to available resources.	20242-203374-03
Summit Carbon Solutions		2024-02-13	Section 5.4.9.3 restates the Minnesota Department of Transportation (MnDOT) recommended mitigation measures at MnDOT right-of-way (ROW) crossings, including depth and casing requirements, restrictions on boring pit locations, avoiding intersecting other roads with MnDOT ROW, and setbacks for existing utilities and structures. ²⁰ Summit is committed to working with MnDOT for all MnDOT road crossings. However, Summit disagrees that casing is an appropriate mitigation measure and requests that the FEIS	The HDD and bore crossing methods are discussed in Section 2.4.8. Additional information has been added describing these two crossing methods. EERA notes that crossing methods at MnDOT ROW would be determined by MnDOT through a road crossing permit.	20242-203374-03

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>include a discussion of potential impacts related to requiring cased crossings. As Summit stated in response to EERA Inquiry No. 5-28, Summit is currently proposing to cross Minnesota TH 210 and US Highway 75 via horizontal directional drill (HDD).</p> <p>Summit does not recommend requiring the use of cased crossings at Minnesota TH 210 and US Highway 75. Requiring cased crossings at these locations will result in greater impacts to privately-owned land during and after construction, increased installation times, increased risk to pipeline integrity, and actually less depth of cover over the pipeline with the road ROWs.</p> <p>For example, in order to install the casing pipe with a minimum depth of cover of 10 feet below the lowest point within the road ROWs as recommended by MnDOT, bell holes approximately 15-20 feet deep by 10-20 feet wide by 20-40 feet long will need to be excavated on both sides of the roadways, on privately owned agricultural land. The bell holes are required to accommodate the equipment and installation of the casing pipe. The large volume of excavated soils will have to be stored onsite during construction. In addition to the bell hole excavations, tail ditches will have to be excavated on both sides to gradually slope the pipeline up from the casing depth to the normal pipeline depth of 4.5 feet. Due to MnDOT’s recommendation to require the casing maintain a minimum of 10 feet of cover under the lowest point within the road ROW, the casings will be 12-16 feet deep at the edges of the road ROW. Larger construction workspace may be needed to accommodate excavation spoils and equipment during installation.</p> <p>In addition to the physical impacts, casing increases installation times. The steps described above will require longer installation time, increasing the impacts to private landowners.</p> <p>Casing pipe also increases risks to pipeline integrity. Casing pipe shields carrier pipe from the induced current cathodic protection system by eliminating contact between the carrier pipe and the electrolyte (soil). This means that the pipeline’s cathodic protection system will not protect the pipe within the casing. Metallic shorts between the casing pipe and the carrier pipe are also common, especially within longer casings. This occurs when the casing pipe comes into contact with the carrier piping and can be caused by earth movement or settlement over time. This situation can lead to additional corrosion and stress on the carrier pipe. Due to railroad ROW abutting the road ROW for both Minnesota TH 210 and US Highway 75, the cased crossings will be approximately 250-270 feet long each.</p> <p>There would also be increased maintenance requirements associated with casings over the life of the pipeline in order to ensure integrity. Vent pipes, end seals, and centralizers may require maintenance (excavation required) to ensure integrity of the casing and carrier pipe throughout the life of the pipeline system.</p>		
Summit Carbon Solutions		2024-02-13	<p>Encasement of pipelines is an outdated technique that was utilized prior to the introduction of trenchless technologies. Modern pipeline design and corrosion guidelines such as ASME B 31.4 – Pipeline Transportation Systems for Liquids and Slurries and NACE RP0200 – Steel- Cased Pipeline Practices recommend avoiding pipeline casings.</p> <p>Finally, casing results in less depth of cover over the pipeline within the road ROWs. MnDOT is recommending requiring 10 feet of cover for the casing, which far exceeds the minimum requirements in the MnDOT Utility Accommodation and Coordination Manual (requires 5 feet of cover below the pavement and 3 feet of cover below the ditch).²¹</p> <p>In summary, Summit’s preliminary HDD designs for these crossings have been designed to provide a minimum depth of cover of 20 feet below the lowest points within the road ROWs, would result in less impact to private landowners, and would allow for the protection afforded by the cathodic protection system. Per the MnDOT Utility Accommodation and Coordination Manual Section VIII(D)(3)(c)(ii), pipelines placed by trenchless technologies may be approved on a case- by-case basis if certain criteria are met.²² Summit’s preliminary HDD designs meet and exceed all the criteria laid out in the MnDOT Utility Accommodation and Coordination Manual. Summit intends to continue to work with MnDOT regarding the crossing methodology at these locations; however, Summit requests that the FEIS consider the increased impacts associated with MnDOT’s requested casing mitigation measure.</p>	The HDD and bore crossing methods are discussed in Section 2.4.8. Additional information has been added describing these two crossing methods. EERA notes that crossing methods at MnDOT ROW would be determined by MnDOT through a road crossing permit.	20242-203374-03
Summit Carbon Solutions		2024-02-13	<p>The discussion of accidental releases found in Chapter 8 and Appendix G of the DEIS provides a conservative and thorough discussion of the potential impacts of an accidental release of CO₂ from the Project and addresses many of the questions that have been raised in public comments. Importantly, the independent evaluation of Summit’s air dispersion model confirmed Summit’s “methodology and results are valid,”²³ and the independent modeling completed by Allied Solutions, while more conservative in some respects than Summit’s analysis, was not materially different than Summit’s modeling for the Project.²⁴</p> <p>Summit offers several suggestions to address what may be perceived as internal inconsistencies in the DEIS and provides additional context related to the potential impacts associated with an accidental CO₂ release.</p>	Thank you for your comment.	20242-203374-03

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
Summit Carbon Solutions		2024-02-13	<p>Short Modeled Release Duration</p> <p>The independent air dispersion and computational fluid dynamics (CFD) modeling completed by Allied Solutions concluded that “regardless of the scenario, the time it takes for the 30,000-ppm concentration CO₂ release to dissipate is very short—less than 4 minutes. In fact, the total time of the entire event would be less than 7 minutes in a worst-case scenario.”²⁵ Summit agrees with the DEIS conclusion that even a reasonable worst-case release event would have a very short duration. However, several other discussions of the potential impacts of a CO₂ release suggest a longer duration and should be revised in the FEIS. For example:</p> <ul style="list-style-type: none"> • DEIS at 8-15 states: “However, CO₂ in gas form dissipates within hours, so [road] closures resulting from nearby ruptures that do not damage infrastructure would be short-term, likely hours rather than days.” (emphasis added). • DEIS at 8-19 states: “As a result, some individuals from amphibian species might eventually be overcome by a large, persistent CO₂ plume and would likely die or experience respiratory trauma and disorientation.” (emphasis added). <p>These statements should be revised to reflect the finding that the total expected duration of a reasonable worst-case release from the Project would be minutes, not hours or days.</p>	Section 8.3.1.4 has been modified to state that dangerous concentrations of CO ₂ would dissipate within minutes. Section 8.3.4 has been revised to remove the word "persistent."	20242-203374-03
Summit Carbon Solutions		2024-02-13	<p>Effects of CO₂ on Humans</p> <p>Given the public interest in obtaining additional information regarding the potential impacts of a CO₂ release on human health, Summit believes the FEIS should provide several corrections and clarifications on the human health discussion currently included in the DEIS.</p> <p>First, the FEIS should correct the bold statement under the Section 8.2 heading on page 8-3 that states “[a] 2020 pipeline rupture in Mississippi caused 45 people to be hospitalized...” This statement is inaccurate. As correctly stated under Section 8.2.1.2, the Pipeline Hazardous Materials Safety Administration’s (PHMSA) 2022 Failure Investigation Report found that “[n]o fatalities occurred, but 200 people were evacuated and 45 people sought medical treatment at local hospitals...”²⁶ This statement accurately reflects PHMSA’s findings, and the earlier statement regarding hospitalization should be revised.</p>	The PHMSA 2022 Failure Investigation Report states numerous times that 45 people were "taken to the hospital," including in its "Key Points" on Page 2 of the report. The text in Section 8.2 and the Executive Summary has been revised to use that phrasing.	20242-203374-03
Summit Carbon Solutions		2024-02-13	<p>Second, the DEIS anchors its discussion on potential human health effects of a CO₂ release on the National Institute for Occupational Safety and Health (NIOSH) Immediately Dangerous to Life and Health (IDLH) limit of 40,000 ppm for healthy people. Specifically, the DEIS utilizes this 40,000 ppm IDLH limit as an identified level of concern in its analysis.²⁷ The DEIS Appendix G also characterizes 15,000, 30,000, or 40,000 ppm CO₂ as a “Toxic Level of Concern.”²⁸ While Summit, too, utilizes 15,000 and 40,000 ppm of CO₂ as levels evaluated in its modeling, the FEIS should include additional discussion regarding the conservative nature of these levels.</p> <p>A NIOSH IDLH limit is an air concentration at or below which healthy workers may be exposed for 30 minutes without risk of permanent harm to health or ability to escape. Accordingly, levels of 40,000 ppm or less are not “Toxic Level[s] of Concern.” The weight of evidence from the available scientific literature on human effects do not show that CO₂ exposure at these levels causes toxic effects. For example, the DEIS cites a 2022 study conducted by van der Schrier, et al. (van der Schrier Study) in Section 8.3.4 where the DEIS discusses the potential impacts of CO₂ exposure on the natural environment.²⁹ The FEIS should also include a discussion of the van der Schrier Study findings related to potential human health impacts. In this detailed and recent study, the study authors reported CO₂ exposures from 60,000 to 120,000 ppm (or 6% to 12% CO₂ atmosphere) to healthy male volunteers. The volunteers were exposed for up to one hour. Exposures to 100,000 and 120,000 ppm were stopped early due to subject irritability, anxiety, or loss of consciousness. However, all subjects completely recovered in all aspects within minutes of exposure cessation.</p> <p>The detailed effects reported for humans in the van der Schrier Study indicate a lack of toxic effect and the presence or continued ability to make escape-related decisions for exposures between 75,000 and 90,000 ppm in typical, healthy individuals. The FEIS should include a discussion of the van der Schrier Study in the human health effects section to provide a more robust discussion of the recent science supporting that inhaled CO₂ exposures of less than 100,000 ppm have been demonstrated to be non-toxic, further demonstrating that use of the NIOSH limit of 40,000 ppm for healthy people is extremely conservative. Based on the best available science, the term “toxic impact distance” used to indicate the distance at which CO₂ concentrations could reach 40,000 or 30,000 ppm should be revisited throughout the DEIS Chapter 8 and Appendix G.</p>	<p>By "toxic levels of concern," the EIS refers to levels of concern (LOC) from the toxic analysis that was performed for this project. The toxic analysis that CANARY provides is the analysis that determines given CO₂ concentrations and their associated impact distances. 30,000 ppm is the concentration that was selected as a LOC for the conservative reasons explained in Appendix G.</p> <p>A review of the science concerning CO₂ toxicity levels is outside the scope of the EIS, and the EIS continues to use CO₂ concentration levels defined by federal agencies in its discussion. The Executive Summary, Chapter 8, and Appendix G have been revised to remove references to "Toxic Level of Concern" or "toxic impact distances."</p>	20242-203374-03
Summit Carbon Solutions		2024-02-13	<p>Other Clarifications or Corrections</p> <p>The FEIS should correct the statement in the DEIS that there is an airport “within the toxic impact distance.”³⁰ The closest edge of the Fergus Falls Airport runway is approximately 1,750 feet from the Project and the primary buildings are nearly 3,200 feet away, well outside the distance identified as the furthest distance that CO₂ concentrations above 40,000 ppm may reach according to Allied Solutions’ modeling. The DEIS later states a potential release would cause “no or minimal damage to the airport”.³¹ Summit suggests</p>	Thank you for your comment. Section 8.3.1.4 of the EIS has been revised to clarify the results of modeling concerning the proposed route near the Fergus Falls Municipal Airport-Einar Mickelson Field.	20242-203374-03

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			that the statement on page 8-14 be revised simply to state that potential impacts on the airport were evaluated, but not suggest that the airport is “within the toxic impact distance.”		
Summit Carbon Solutions		2024-02-13	<p>Assumed Soil and Product Temperature</p> <p>Summit also suggests that the FEIS provide further discussion and clarification regarding Allied Solutions’ assumed product temperature of -20 degrees Fahrenheit.³² Summit assumed 30 degrees for the same factor in its modeling.³³ The DEIS justifies the -20 degrees temperature assumption stating, “[d]ue to a measured soil temperature at burial depth being subzero and the existence of aboveground valve sets, this temperature should be nearly the same as the air temperature.”³⁴ It cites “NOAA. Soil Temperature Maps by Depth: History data in CSV” as the source for this justification.³⁵ Summit was unable to confirm a -20 degrees soil temperature assumption in the cited source. To the contrary, according to the 10-year data from four USDA Natural Resources Conservation Service soil temperature probes in the region (Mandan #1, Glacial Ridge, Crescent Lake, and Eros Data Center), the minimum annual temperature at 40-inch depth ranged between 30-35 degrees Fahrenheit. With Summit’s pipeline proposed depth of cover at 54- inches, it is expected that actual soil temperatures around the pipeline would be slightly above these levels. Once the product enters the pipeline, no additional energy is added and thus the product will begin cooling and ultimately equalizing with surrounding soil temperature. As discussed in the DEIS, colder ambient conditions result in a more conservative dispersion model, which is why both Summit as well as Allied Solutions utilized winter conditions. However, based on the discussion above, Summit believes a soil temperature and, in turn, product temperature of 30 degrees Fahrenheit is a better estimate of a “reasonable worst-case temperature.”</p>	<p>Sections 8.3.1 and 8.3.4 have been revised to discuss the potential impacts of ice covering waters or wetlands at the point of a rupture. In general, if CO₂ released from the pipeline was trapped by ice, then the CO₂ would release more slowly into the atmosphere as it traveled laterally under the ice until it escaped through cracks or gaps in the ice, thereby decreasing the impact distance (the distance the CO₂ would travel through the air). The EIS modeled the worst-case scenario where the CO₂ is not trapped by ice. In the event of a pipeline rupture that caused CO₂ to be trapped by ice covering a waterbody, CO₂ could remain in contact with the water for more time, and the concentration of carbonic acid could increase. In other words, the water and aquatic species could experience a greater impact from the CO₂, but the atmosphere would experience less CO₂, and the risk to humans and other terrestrial species would be lower.</p> <p>As noted in Section 5.7.3.4 and Section 8.1, the applicant has committed to conducting a Phase I Geohazard Assessment to identify areas surrounding the pipeline that may be prone to large earth movement, as recommended by PHMSA in its June 2022 Advisory Bulletin, and EERA staff recommends that the results of the Phase I assessment, and any subsequent assessments, should be provided to the Commission.</p>	20242-203374-03
Summit Carbon Solutions		2024-02-13	<p>Given the stated objective of the independent modeling was to provide a more conservative worst-case representation of potential release impacts,³⁶ Summit does not suggest revising the modeling presented in the FEIS to correct this temperature assumption, but rather the FEIS should discuss the source of this assumption and disclose the overly conservative nature of the assumption given historical soil temperatures in Minnesota, as documented by the USDA. In Summit’s view, revising this assumption would not materially change the outcome of Allied Solutions’ conservative modeling analysis.</p> <p>It is, however, important that the FEIS clarify and further explain use of this assumption so as not to cause confusion for individuals who have asked about the potential risk to the pipeline related to frost heave. Frost heave is not a significant risk to pipeline integrity because the pipe will be buried at a depth of at least 54 inches for this Project,³⁷ well below the frost line.³⁸ Without further clarification of the modeling temperature assumption in the FEIS, individuals concerned about the risk of frost heave may misinterpret this modeling assumption to suggest that, in fact, soil temperatures at the depth of the pipe could be subzero.</p>	<p>Sections 8.3.1 and 8.3.4 have been revised to discuss the potential impacts of ice covering waters or wetlands at the point of a rupture. In general, if CO₂ released from the pipeline was trapped by ice, then the CO₂ would release more slowly into the atmosphere as it traveled laterally under the ice until it escaped through cracks or gaps in the ice, thereby decreasing the impact distance (the distance the CO₂ would travel through the air). The EIS modeled the worst-case scenario where the CO₂ is not trapped by ice. In the event of a pipeline rupture that caused CO₂ to be trapped by ice covering a waterbody, CO₂ could remain in contact with the water for more time, and the concentration of carbonic acid could increase. In other words, the water and aquatic species could experience a greater impact from the CO₂, but the atmosphere would experience less CO₂, and the risk to humans and other terrestrial species would be lower.</p> <p>As noted in Section 5.7.3.4 and Section 8.1, the applicant has committed to conducting a Phase I Geohazard Assessment to identify areas surrounding the pipeline that may be prone to large earth movement, as recommended by PHMSA in its June 2022 Advisory Bulletin, and EERA staff recommends that the results of the Phase I assessment, and any subsequent assessments, should be provided to the Commission.</p>	20242-203374-03
Summit Carbon Solutions		2024-02-13	<p>Response to Public Comment on Modeling</p> <p>At the afternoon DEIS meeting in Fergus Falls, Minnesota, Craig Winters, a member of the public, asked whether the DEIS’ air dispersion modeling evaluated what would occur if a CO₂ release happened while it was raining. Rain is not anticipated to have a major impact on CO₂ dispersion. Precipitation has the potential to strip CO₂ from the air through dissolution, although likely in very small quantities. The rain would only have tens of meters or hundreds of meters of CO₂ to fall through, with only seconds of interaction. Dissolution into raindrops would likely be limited. Puddles that form on the ground may initially have a slightly lower pH,</p>	Thank you for your comment.	20242-203374-03

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			but would offgas to atmosphere, interact with the soils or organic matter on the surface, and dilute with additional rain, returning the pH rather quickly to typical levels. To respond to Mr. Winters’ question, the FEIS could add this additional explanation regarding how CO ₂ would likely disperse if it were raining at the time of a release.		
Summit Carbon Solutions		2024-02-13	Summit requests that EERA consider and incorporate these suggestions in the FEIS to ensure it (1) addresses all issues identified in the FDS; (2) is complete and accurate; and (3) responds to substantive comments raised during the DEIS comment period.	Thank you for your comment.	20242-203374-03
Union of Concerned Scientists	Moura, Maria	2024-02-23	Thank you for the opportunity to comment on the Draft Environmental Impact Statement (DEIS) on Otter Tail to Wilkin Carbon Dioxide Pipeline Project. On behalf of the Union of Concerned Scientists and our more than 5000 members and supporters in Minnesota we request that in order to protect the health and safety of adjacent communities, the approval process for the proposed pipeline and any other carbon dioxide (CO ₂) pipeline should not move forward until the federal Pipeline and Hazardous Materials Safety Administration finalizes new rules governing carbon dioxide pipelines.	Thank you for your comment.	20243-204403-01
Union of Concerned Scientists	Moura, Maria	2024-02-23	Incentivized by the federal 45Q tax credit, pipeline companies have started proposing the rapid buildout of CO ₂ pipelines. The Bipartisan Budget Act passed in 2018 extended and significantly increased the tax credit for CO ₂ use and storage under Section 45Q of the Internal Revenue Code. Our main concern is that according to a 2022 study commissioned by the Pipeline Safety Trust, CO ₂ pipelines pose significant safety and public health hazards which are not adequately addressed by current regulations.	Thank you for your comment. The draft EIS discusses PHMSA rules and regulations, and the pending rulemaking process it is undertaking for CO ₂ pipelines, and acknowledges pending PHMSA changes to such regulations (see draft EIS, Chapter 3, Chapter 8, and Appendix G). PHMSA regulations (that is, their appropriateness) and related standards for CO ₂ pipelines are outside the scope of the EIS (Appendix A).	20243-204403-01
Union of Concerned Scientists	Moura, Maria	2024-02-23	CO ₂ pipelines are susceptible to ductile fractures, which can run along a significant length of the pipe, releasing large amounts of CO ₂ , and projecting segments of pipe and shrapnel. The likelihood of ruptures is aggravated by the fact that water, which is difficult to eliminate from CO ₂ pipelines, contributes to the formation of corrosive carbonic acid.	Ductile fractures are addressed in Section 8.1.2. Measures to prevent fractures are detailed in Section 8.5.1.1.	20243-204403-01
Union of Concerned Scientists	Moura, Maria	2024-02-23	CO ₂ is an asphyxiant that is heavier than air and accumulates close to the ground, where people can be exposed to it. It causes dizziness, severe muscle twitching and unconsciousness within a few minutes and even death at higher concentrations and longer exposure times. Because it is a colorless, odorless, nonreactive and inert gas, victims and first responders have no way of knowing they are exposed until it happens, which is often too late. Impacts happen too quickly so warning detectors are not necessarily effective. As an example, after the rupture in Satartia, Mississippi, on February 22, 2020, first responders were not able to understand why people were lying on the ground, shaking and unable to breathe, and more than 200 people were evacuated and at least 45 people were hospitalized.	Effects of inhaling CO ₂ are described in Section 8.3.1.4. Section 8.2.1.2 discusses the Satartia accident in detail, including a table summarizing significant differences between the proposed project and the pipeline involved in the Satartia incident. As discussed in Section 8.2.1.2, the operator of the Delhi pipeline did not inform local first responders or citizens of the unique safety risks posed by the CO ₂ pipeline. The applicant for this project has committed to educating and training both first responders and the public, as well as paying for equipment needed to safely and effectively respond to CO ₂ ruptures, thereby removing many issues that resulted in hospitalizations during the Satartia rupture (Sections 8.5.1.3, 8.5.1.4, and 8.5.1.5). In addition, EERA staff recommended special permit conditions to avoid impacts of a potential CO ₂ release, as described in Section 8.5.3, including information on the applicant's public information plan.	20243-204403-01
Union of Concerned Scientists	Moura, Maria	2024-02-23	Regulations for CO ₂ pipelines exist at both the federal and state levels in the United States. At the federal level, CO ₂ pipelines are regulated by the Pipeline and Hazardous Materials Safety Administration (PHMSA) under the Department of Transportation (DOT). However, these outdated regulations are unclear and do not sufficiently address the hazards associated with ruptures and other problems associated with CO ₂ pipelines which affect communities and ecosystems, such as dangers to water bodies and aquifers, land degradation, and geologic hazards, to name just a few. In particular, the DEIS accepts Summit’s assurances that it will “comply with federal emergency response requirements”, but given how outdated and inadequate current federal regulations are, the DEIS should not accept these assurances.	Although the Commission cannot set safety standards for pipeline construction or operation, state or local units of government may, to the extent authorized by law, set land use requirements that indirectly contribute to pipeline safety by regulating the activities of third parties located in the pipeline’s vicinity. The Commission’s obligation is to identify a pipeline route consistent with the criteria found in statutes and the applicable administrative rules. Federal law, by contrast, exclusively prescribes pipeline safety requirements.	20243-204403-01
Union of Concerned Scientists	Moura, Maria	2024-02-23	There now about 5,300 miles of CO ₂ pipelines in the U.S., and in the next few decades, that number could grow to more than 65,000 miles, according to an analysis prepared by researchers at Princeton University. Several states are moving forward with carbon sequestration projects. It should be noted that Summit’s project extends well beyond the 28-mile pipeline being considered: Summit	Thank you for your comment. The draft EIS discusses PHMSA rules and regulations, and the pending rulemaking process it is undertaking for CO ₂ pipelines, and acknowledges pending PHMSA changes to such	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			has public plans for a larger buildout in Minnesota and will be applying for permits for additional parts of the network. In addition, Summit should not be allowed to proceed on a segment of the network before a thorough cumulative impact review of the entire network is conducted, and granting a permit for one segment of the network will impede a thorough review of such impacts. It is key to wait for the Pipeline and Hazardous Materials Safety Administration to finalize new rules that are clear and effective and protect communities from the dangers of pipelines before any more CO ₂ pipeline projects are approved.	regulations (see draft EIS, Chapter 3, Chapter 8, and Appendix G). PHMSA regulations (that is, their appropriateness) and related standards for CO ₂ pipelines are outside the scope of the EIS (Appendix A). Section 3.2.2 has been updated to address the comment concerning cumulative impact review of the entire Midwest Carbon Express project.	
Upper Sioux Community	Jensvold, Kevin	2024-02-24	Appendix G provides some information about what the potential impact radius of a rupture might be, but overall the DEIS does not adequately address how the applicant will be able to guarantee the safety of those living along or near the project. The Pipeline and Hazardous Material Safety administration (PHMSA) has issued public statements that their regulations are not adequate to address the safety risks associated with CO ₂ pipelines. CO ₂ pipelines need special considerations because when a pipeline leaks or a rupture occurs it will release an asphyxiant that can suffocate people and prevent combustion-type vehicles from working. The equipment and training needs for Emergency response personnel to response to a pipeline incident needs to be thoroughly addressed and placed into practice prior to pipeline construction. All responders will need additional training and equipment to safely respond. This includes replacing all the gasoline/diesel vehicles with Electric Vehicles. In many rural areas the first responders/emergency response are often volunteers. Communities near the route of the pipeline should not have to bear the expense of specialized equipment needed for response to a new hazard brought to the area by a commercial entity.	Section 3.6 acknowledges that PHMSA is currently conducting rulemaking proceedings on proposed amendments to its pipeline safety rules, and the Commission states it would be prudent for EERA staff and the applicant to take that information into account, even if the updates have not been finalized. Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including that the applicant indicates it will train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes that the applicant indicates it will educate the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that would be revised as required by PHMSA, if the project is approved. Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.	20243-204403-02
Upper Sioux Community	Jensvold, Kevin	2024-02-24	The Summit project aims to significantly impact our state's ethanol production industry. It would be impossible to clearly evaluate those potential impacts without looking at Summit's full Minnesota footprint and all the ethanol facilities contracted to connect to the pipeline. This type of project has the potential to induce further proliferation of carbon capture facilities across the state, as well as impact land use. And, ultimately, this DEIS is precedent-setting. It would be unwise to examine a 28.1-mile segment out of the context of the planned 240-mile Minnesota footprint. We strongly urge that the Commission re-evaluate and research further into the environmental impact of this new type of project by considering the impacts of the entire MN footprint of the Midwest Carbon Express pipeline including impacts to cultural and natural resources along the proposed route. Upper Sioux Community thanks the Commission for the opportunity to comment and for its consideration of our concerns.	Thank you for your comment. The Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-02
Upper Sioux Community	Kevin Jensvold	2024-02-24	The Summit CO ₂ pipeline project's proposed route is within Dakota Homelands. Upper Sioux Community is directly associated to many areas of cultural importance and/or religious significance identified within the project area. The proposed route is located within an archaeologically dense area with a high volume of known cultural resources and/or significant sites. These resources and sites had, and continue to have, a significant cultural and spiritual role in the identity of Dakota practices and lifeways, we request that meaningful and diligent evaluation of project needs be carefully considered. Such sites and resources are irreplaceable.	Thank you for your comment.	20243-204403-02
Upper Sioux Community	Kevin Jensvold	2024-02-24	The Dakota Peoples have a strong spiritual connection to the lands and waters within the ancestral territories of the Dakota. Protection of natural and cultural resources is critically important not only now but for several generations. Therefore, projects that impact the Waters, Air, Lands, wildlife and plant life need a thorough assessment as not to contaminate or destroy the natural environment. Further projects involving relatively new technology are particularly concerning and should be thoroughly researched to avoid issues or consequences.	Thank you for your comment.	20243-204403-02
Upper Sioux Community	Kevin Jensvold	2024-02-24	The purpose of DEIS is to provide an overview of affected resources and discuss potential human and environmental impact and mitigation measures. We have concerns that the proper review hasn't been accomplished and have identified gaps in the impacts and mitigation measures. The following are the concerns regarding the impact to Cultural resources, waters, safety, land, climate change and greenhouse gas emissions, and cumulative impacts.	Thank you for your comment.	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
Upper Sioux Community	Kevin Jensvold	2024-02-24	Tribes are tasked with evaluating impacts to known cultural resources and cultural sites without relevant case studies, scientific analysis, and precedent to guide informed determinations on CO ₂ pipeline impacts. To consider for example subsurface artifacts, human remains or any organic material and how exposure and interaction to CO ₂ would affect them, yet such studies are not available and even more detrimental are not being required in the EIS. The purpose of an EIS is to provide such studies and information. The Summit Carbon Solution pipeline route is a large-scale project, with many complex variables to consider when evaluating cultural resource impact, it is unreasonable for THPO s to review such considerations when key information is absent. The DEIS fails to address cumulative landscape impacts as well as exposure and interaction studies (as cited above).	Thank you for your comment. A study focused on the interaction of CO ₂ and subsurface artifacts, human remains, or any organic material is outside the scope of the EIS (Appendix A). Potential impacts on cultural resources are discussed in Section 5.4.2. Cumulative potential effects are discussed in Chapter 10.	20243-204403-02
Upper Sioux Community	Kevin Jensvold	2024-02-24	<p>The proposed project and the identified right-of-way will impact numerous streams, rivers, wetlands, aquifers and other waterbodies. This includes the Pelican River, the Otter Tail River, and the Bois de Sioux River, and up to 44.6 acres of wetlands.</p> <p>We are concerned that the DEIS did not take an in-depth look at how the proposed project will impact the health and abundance of these water resources. The DEIS describes the potential impact of construction activity within or near these waterbodies as being short-term and minimal. But we know from past experiences with other pipelines, like Line 3, that the pipeline construction can have long-term and widespread impacts on both surface water and groundwater resources. Additional questions that were mentioned in our comments on the scoping (attachment) included the need to identify the amount of water usage that is needed, what will be added to the water, and where will the water be discharged?</p>	<p>Section 5.7.8 and Section 5.7.9 describe the impacts of the project on water resources and wetlands.</p> <p>Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.</p>	20243-204403-02
Upper Sioux Community	Kevin Jensvold	2024-02-24	<p>Additional questions that were mentioned in our comments on the scoping (attachment) included the need to identify the amount of water usage that is needed, what will be added to the water, and where will the water be discharged? Further, how will this project impact the medicinal and cultural plants, fish, macroinvertebrates, mammals, macrophytes, human health, surface water quality, wetlands/connected waterbodies, groundwater, etc.? What is the cumulative impact of the project over the course of the route? These are vital questions about this proposed project that have not been sufficiently investigated. In the past, Upper Sioux staff have reviewed the EIS documents of pipeline and renewal energy projects that addressed these types of questions with specific research and studies. It is not evident in the DEIS that these questions were addressed. Merely stating the project will have minimal impact is not adequate for the NEPA EIS process.</p>	<p>Section 2.4 discusses water discharge locations and processes, Section 3.7 discusses water use and discharge permits that would be acquired, Sections 5.4.4 and 5.7.8 discuss impacts on water and water usage, Section 5.7.7 addresses impacts on vegetation, Section 5.7.10 addresses impacts on wildlife and habitats, Section 5.7.9 addresses impacts on wetlands, Section 5.4 addresses impacts on human settlement, and section 5.4.8 specifically addresses health and safety. Native Minnesota plants and wildlife of significance to Tribes are discussed in Section 5.4.2. The project would temporarily impact the habitats of plants and wildlife of Tribal significance during construction until restoration of disturbed areas is complete. Additional studies on these topics are outside the scope of the EIS. Chapter 8 addresses effects on humans, health, wildlife, and the environment from an accidental release of CO₂. Chapter 10 describes the cumulative impacts of the project.</p>	20243-204403-02
Upper Sioux Community	Kevin Jensvold	2024-02-24	<p>The technology used to capture carbon can also require significant amounts of water. The DEIS states that the average annual water usage for the capture equipment will be 13 million gallons, and that much water will come from on-site wells at the ethanol facility. There is no information in the DEIS about how the additional water use from the ethanol plant will impact surrounding wells or other water resources. Also, the DEIS does not consider the water usage in context of the nearby Communities and the impacts from this new water demand on the current, existing water demands of the aquifers that serve as the source water for these Communities. This is particularly a concern as we have seen recent drought conditions the past few years</p>	<p>Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.</p>	20243-204403-02
Upper Sioux Community	Kevin Jensvold	2024-02-24	<p>Consideration must also be given to the impact on surface and groundwater in the event of a pipeline leak or rupture. It is necessary to state what will be the response to minimize and remediate after such an event.</p>	<p>Potential impacts on water resources and wetlands and mitigation measures associated with a CO₂ release are described in Section 8.3.4.1 of the EIS.</p>	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
Upper Sioux Community	Kevin Jensvold	2024-02-24	We remain concerned about the potential risks to human and environmental health in the event of a leak or a rupture. High concentrations of CO ₂ are hazardous and can sicken and asphyxiate humans and animals. The DEIS has also confirmed that vegetation and soil near a leak or rupture could be significantly impacted, from slowing plant growth to freezing soils and killing off vegetation, soil microbes, mycorrhizae, and soil animals.	Thank you for your comment.	20243-204403-02
Upper Sioux Community	Kevin Jensvold	2024-02-24	The impact of the proposed project to the land is not fully addressed and needs additional research. Studies on the long-term impacts of Line 3 pipeline on the land have shown that the environment does not always recover as promised after construction and other major disturbances, despite assurances from companies that impacts will be short-lived. The degradation and loss of habitats is noted as one of the main reasons native plants are lost. The sensitivity of native and medicinal plants to disruption that will occur during construction is a concern that needs to be studied further before the project occurs. Also the impact of a leak or rupture of the pipeline on sensitive plants needs to be defined and mitigation measures need to be proposed if this type of event happens.	The project's potential impacts on natural resources, including vegetation, wildlife, rare and unique species, surface waters, and groundwater, are discussed in various sections of Chapter 5. Potential impacts on Minnesota plants of significance to Tribes are discussed in Section 5.4.2. In Section 5.7, which discusses mitigation, the EIS states that the applicant will prepare a Vegetation Management Plan for post-construction revegetation and management. Potential impacts due to CO ₂ releases on vegetation, wildlife, rare and unique species, surface waters, and groundwater are discussed in Chapter 8.	20243-204403-02
Upper Sioux Community	Kevin Jensvold	2024-02-24	Climate Change and Greenhouse Gas Emissions In the DEIS, it is assumed that the applicant will be able to capture and permanently sequester 100% of the CO ₂ from the ethanol facility, but there is no evidence to support that assumption. Without the evidence to support 100% sequestration, it is not possible to know what the actual GHG emission reductions (if any) might be.	Text has been added to Section 2.1 describing the suitability of the Broom Creek Formation in North Dakota for CO ₂ sequestration, as well as the monitoring and testing that would be done to verify that the CO ₂ is contained in the storage reservoir.	20243-204403-02
Upper Sioux Community	Kevin Jensvold	2024-02-24	Further, it is not stated length of the life of this project. If a project is for 25 years or perhaps 50 years, does this simply move the issue of greenhouse gases down the road for the future generations to deal with? The purpose is to make ethanol a green fuel to sell more of it and make it a viable energy source.	Section 2.7 describes project decommissioning. If the ethanol plant continues to operate beyond the life of the proposed project, its CO ₂ emissions would not be captured.	20243-204403-02
Upper Sioux Community	Kevin Jensvold	2024-02-24	Summit Carbon Solutions' full proposal is an extensive project with a 239.64-mile footprint in Minnesota, connecting multiple ethanol plants. It aims to impact the State's agricultural and ethanol industry. It is critical that the environmental concerns be addressed now as there may be more permit applications and environmental reviews of this type in the future. The DEIS does not consider the potential environmental and human impacts of the entire Minnesota portion of the applicant's CO ₂ pipeline project. Because of this, we do not know the true cumulative impacts of this entire project on the water, soil, air, health, vegetation, and animals. The DEIS should look at all 240+ miles of pipeline the applicant has publicly proposed. The cumulative impacts of the carbon pipeline are more than listed in the DEIS. For example, the fresh gallons of drinking water currently used for ethanol production is around 3-3.5 billion gallons in the more efficient ethanol plants. In the year 2021 15 billion gallons of ethanol were reportedly produced. Multiply that number by 3 to get a total of 45 billion gallons of fresh drinking water used to produce the ethanol. Additionally, it is necessary to factor in the amount of natural gas used to manufacture ethanol. The current most efficient ethanol plant is using 37 883 btu's of natural gas to manufacture one gallon of ethanol about the equivalent to one cubic meter of natural gas now multiply those times 15 billion. This is an unlikely source of green energy with all the inputs of natural resources and safety concerns with ethanol carbon capture technology. This should also be for the whole "Midwest Carbon Express" pipeline project as the project described in the current DEIS is merely a pipeline to the North Dakota border with no known end connection point.	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-02
Upper Sioux Community	Kevin Jensvold	2024-02-24	Based on the broad-reaching implications of this project, we respectfully request that the Commission appropriately broaden the scope of the DEIS to the Minnesota footprint of the "Midwest Carbon Express" project rather than studying the northern and southern portions of the pipeline in separate reviews. The "Midwest Carbon Express" is Summit's full proposed project- a pipeline across five states, connecting 30 ethanol plants to an underground storage location in North Dakota. In Minnesota, Summit plans to construct approximately 240 miles of pipeline; approximately 212 miles of that pipeline will connect six ethanol plants in southern Minnesota ("Southern Branch"). The project in the DEIS is only the smaller 28.1-mile branch in Otter Tail and Wilkin Counties, that will connect one ethanol plant to the pipeline network ("Northern Branch"). This proposal meets the Minnesota Environmental Policy Act's ("MEPA") definition of a "phased action," and the rules allow the Commission to include the entire Minnesota footprint. By reviewing the entire Midwest carbon express project in one environmental review would allow the Commission to fully understand and evaluate the impact the Carbon pipeline could have on land use conversion, the ethanol industry, environmental impacts, emergency response needs, and climate change.	Thank you for your comment. The Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-02

	Ahlstrand, Heidi	2024-02-22	no pipeline	Thank you for your comment.	20243-204403-01
	Allie, Ginny (Kramer)	2024-02-21	Thank you for hosting three Public Meetings on the Otter Tail – Wilkin CO ₂ Pipeline DEIS. As noted when I spoke at the Thursday Feb. 8, 2024 Online Meeting Webinar, I own land where the Midwest Carbon Express pipeline by Summit Carbon Solutions (SCS) is being proposed. This land is at Redwood County Secs. 27 and 34, Vesta Township. I have concerns that the Draft Environmental Impact Statement (DEIS) for this proposed pipeline does not fully address the magnitude of the impact to Minnesota’s water supplies, electrical resources, farmers land damages, and the safety of Minnesota citizens.	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01
	Allie, Ginny (Kramer)	2024-02-21	The DEIS identified water usage needs per plant using the carbon capture pipeline in Ottertail County. ¹ With six plants currently identified by Summit for this proposed pipeline, the DEIS listing of water usage for one plant is misleading and needs to consider the impact of multiplying this water usage by at least 6 sites that are currently planned for this pipeline proposed through 13 counties in Minnesota. ² The capture facility would require 8.2 gallons per minute in winter months and 40.9 gallons per minute in summer months, for an average water usage of about 13 million gallons per year (DEIS pg. 5-137). Total = 13 million gallons per year X 6 With Minnesota’s continued drought conditions ³ and some farmers/townships already getting water from Non Minnesota resources, the DEIS needs to consider the drainage on Minnesota water resources and impact to water supply when considering Minnesota’s drought conditions. The applicant states that the anticipated lifetime of this project is 25 years. With a 25 year timeline, the DEIS needs to consider the loss of water supply over 25 years. ¹	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS. Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-01
	Allie, Ginny (Kramer)	2024-02-21	CO ₂ is a hazardous material in high concentrations · Although DEIS indicates CO ₂ levels of immediate dangerous to life or health is 617 feet and expands to 910 for lower concentrations, the DEIS does not provide meaningful safety measures for a rupture but suggests “reasonable” measures as supplying residences within 1000 feet with indoor CO ₂ detectors. However, as indicated in Appendix G, a full rupture would happen too quickly for early warning device such as an oxygen detector to be effective. Yet during Feb. 8 webinar discussion, the response to inquiries about warning systems was that it could be seen and heard implying that this would allow individuals time to get to safety with also no warning solution for persona who are deaf or blind. ⁶ · The DEIS does not address the risks to health for both first responders and victims in the event of a rupture. Nor does the DEIS address the impact on small communities who are staffed by volunteers to available personnel and special equipment, including non-internal combustion engines, to respond to a CO ₂ . ⁶	Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that is not outdated but would be revised as required by PHMSA, if the project is approved. Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.	20243-204403-01
	Allie, Ginny (Kramer)	2024-02-21	· Although the DEIS indicates Summit will “comply with federal emergency response requirements”, the Pipeline Hazardous Material Safety Administration (PHMSA) has stated that the current emergency response requirements are dangerously outdated. ⁴ · The DEIS indicates that the PUC cannot set safety standards for the pipeline. Yet PHMSA notes in public letter to CO ₂ pipeline companies including Summit, that local authorities can exercise their powers to regulate land use, including setback distances and that “nothing in the federal pipeline safety law impinges on these traditional prerogatives of local—or state—government.” ⁴	Although the Commission cannot set safety standards for pipeline construction or operation, state or local units of government may, to the extent authorized by law, set land use requirements that indirectly contribute to pipeline safety by regulating the activities of third parties located in the pipeline’s vicinity. The Commission’s obligation is to identify a pipeline route consistent with the criteria found in statutes and the applicable administrative rules. Federal law, by contrast, exclusively prescribes pipeline safety requirements.	20243-204403-01
	Allie, Ginny (Kramer)	2024-02-21	The DEIS sates project would use 38,501,733 kilowatt hours per year that would not require addition of power but fails to state how much electricity the ethanol refinery is currently using. The DEIS needs to provide explanation on how doubling of electrical usage will impact the Lake Region Electric Cooperative and the potential financial impact to the coops member-owners.	Section 5.4.9.1 has been updated with the electricity currently being used by the ethanol plant. Section 5.4.9.2 contains relevant information regarding how LREC would support the project. This section has been updated to indicate that the applicant is solely responsible for necessary	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				infrastructure upgrades (see Appendix I, Supplemental Information Inquiry 13 response and email from LREC).	
	Allie, Ginny (Kramer)	2024-02-21	<p>The DEIS does not fully address the farmers financial impact from indefinite loss of crop yields and landowner liability with pipeline damage while farming land during and after the construction process.</p> <ul style="list-style-type: none"> · Dan Henrikson, a neighbor to land I own in Redwood County, has documentation of continued loss of crop yields after 9 years in area where the soil was compacted during installation of high powerlines with no indication that this will change in the future and this does not factor in the additional crop yield risks that might be caused during removal of top soil needed for the pipeline installation. · During a 1/23/2023 presentation by Dan Henrikson, he also shared farmer liability risks with easements offered by with liability risk on the farmer and not on SCS.9 · “Based on the experience with Dakota Access, the fertility of cropland can be adversely impacted for several (or perhaps many) years.” 2 During a 1/23/2023 presentation by Renville County farmer Bob Reubel (Olivia farmer), he shared how area of his land with pipeline decades later continues to have a decrease in crop yield between 30-35% yet SCS is only proposing to compensate farmers with Midwest Carbon Express pipeline easement for 3 years crop loss.8, 9 <p>Thanks you for considering my concerns and request for additional ipact information as noted above.</p>	<p>As indicated by the definitions found on Page 5-1 of the draft EIS, “long-term impacts extend beyond the end of construction and are generally associated with operation of the project.” Disturbance to soils and crops from construction can result in impacts that extend beyond the construction phase, and the text in the final EIS has been revised to indicate that impacts can be long term.</p> <p>Landowner easements are outside the scope of the EIS.</p>	20243-204403-01
	Anderson, Janet	2024-02-22	<p>In case of a rupture of a CO₂ pipeline, persons within a 617' radius are subject to conditions “immediately dangerous to life or health”. This is euphemistic. Persons nearby lose consciousness within a minute. Persons within 910' will experience dizziness, drowsiness, severe muscle twitching, and unconsciousness within a few minutes. Emergencylive.com tells us Death from suffocation (asphyxia) proceeds in four stages:</p> <p>1) Irritative or ‘respiratory dyspnoea’ stage: lasts from 30 to 60 seconds and is characterized by: tachypnoea (increased respiratory rate); tachycardia; arterial hypotension (‘low blood pressure’); cyanosis (bluish skin); miosis (narrowing of the pupil diameter of the eye).</p> <p>2) Convulsive or ‘expiratory dyspnoea’ stage: lasts about 1 minute and is characterized by: hypercapnia (too much CO₂ in the blood); severe dyspnoea (marked expiratory difficulty); arterial hypertension; high release of adrenaline into the circulation; tachycardia; obnubilation of consciousness; cerebral hypoxia; convulsions; reduced motor reflexes; sensory alteration; sphincter release (faeces and/or urine may be involuntarily released).</p> <p>3) Apnoic or ‘apparent death’ stage: lasts about 1 minute and is characterized by: progressive bradypnoea (progressive reduction in the frequency of respiratory acts); miosis (pupil constriction); muscle relaxation; severe bradycardia (slow and weak heartbeat); deep coma.</p> <p>4) Terminal or ‘gasping’ stage: lasts approximately 1 to 3 minutes and is characterized by: continued loss of consciousness; slow and irregular respiratory movements; severe cardiac arrhythmia; cardiac arrest; cessation of breathing; death. This means that people in the vicinity of a rupture may be dead in 3-1/2 to 6 minutes.</p>	<p>Thank you for your comment. Section 8.3.1.2 describes the risks associated with the inhalation of CO₂.</p>	20243-204403-01
	Anderson, Janet	2024-02-22	<p>Summit indicates that it will take 25 minutes for the system to shut off the relevant valves in the event of “abnormal operation,” the DEIS does not mention any meaningful safety measures for a rupture.</p> <p>Appendix G's rupture report says, “a full rupture results in impact distances too quickly for an early warning device, such as an oxygen detector, to be effective.”</p>	<p>Text in Section 4.5 on valve closure time has been corrected from 25 minutes to 10 minutes. Elsewhere in the EIS, including the rupture analysis, valve closure time is listed/calculated as 10 minutes. Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that is not outdated but would be revised as required by PHMSA, if the project is approved. Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.</p>	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Anderson, Janet	2024-02-22	As CO ₂ is colorless and odorless, both victims and first responders have no way of knowing what is causing the problems. In addition, first responders need special equipment, including vehicles that do not rely on combustion and special breathing equipment, to respond to a CO ₂ disaster. The DEIS does not consider how EMS and health providers should prepare for a pipeline rupture or the burden of acquiring and maintaining the necessary special equipment and training with it.	Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that would be revised as required by PHMSA, if the project is approved. Additionally, EERA staff recommended that a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.	20243-204403-01
	Anderson, Janet	2024-02-22	Though the plan talks of multiple company personnel as playing roles in an emergency response, it ignores the fact that the applicant plans on having only one full-time employee at the capture facility. This pipeline should not be approved without a clear understanding of the risks to human health.	Thank you for your comment.	20243-204403-01
	Anderson, Jon	2024-02-22	My name is Jon Anderson, I am a 3rd generation retired farmer and reside on a 125 year old family farm in Martin Co. Mn. I have seen no proof of any reduction to CO ₂ in the atmosphere which has been occurring for decades.	Thank you for your comment	20243-204403-01
	Anderson, Jon	2024-02-22	Rural residents and their small surrounding communities should not be asked to be subjected to these hazardous CO ₂ pipelines and sequestration sites. CO ₂ from ethanol plant production can be captured at point of production and utilized at the ethanol production facility there is no reason to endanger residents, communities, volunteer responders, livestock and water resources. This proposed pipeline with it's easements offer no beneficial advantage to the land owner, his neighbors, or local community but these rural residents will be left to live with the consequences.	Thank you for your comment.	20243-204403-01
	Anderson, Jon	2024-02-22	It's presence devalues the property and surrounding area value and adds risk to surrounding area. It will consume huge amounts of water from local sources all the while benefiting a fossil fuel industry that will continue to emit.	Impacts on property values are discussed in Section 5.4.7.2, and water use impacts are described in Section 5.7.8.2. Effects on water use in the event of a rupture is described in Section 8.3.4.1. Other impacts in the event of a rupture are described in Section 8.3.	20243-204403-01
	Anderson, Jon	2024-02-22	Carbon credit money would be better spent on new technology. Who will benefit from this proposed boondoggle? Not the rural resident, not the environment, then who? Huge amounts of spending and resources consumed all the while endangering rural communities and nothing to show for it.... very sad ...we can do much better than this. Thank you for listening.	Thank you for your comment. As stated in the final scoping decision, the appropriateness of federal and state policies regarding carbon capture and ethanol, including tax credits and other incentives, is outside the scope of the EIS.	20243-204403-01
	Andresen, Deborah	2024-02-23	We would all like to dream of something that could separate carbon from the air; but that would leave the CO ₂ in high concentrations resulting in hazardous material. A rupture of a CO ₂ pipeline leaves the victims drowsy to the point of unconscious with severe muscle twitching. Being an odorless, colorless gas, first responders are in danger and would need expensive special equipment to be safe.	Section 8.3 describes the effects on humans and the environment from an accidental release of CO ₂ . Section 8.4 describes the actions that would be taken in the event of an accidental release.	20243-204403-01
	Andresen, Deborah	2024-02-23	Pipeline construction can affect water crossings, wetlands, aquifers, and sensitive water bodies that support all kinds of wildlife: fish, reptiles, waterfowl, insects. This is precious.	Potential impacts of pipeline construction on water resources, wetlands, wildlife, and rare and unique resources are described in Sections 5.7.8, 5.7.9, 5.7.10, and 5.7.5.	20243-204403-01
	Andresen, Deborah	2024-02-23	MN has drought problems and the carbon capture process can double the water requirements of a facility and increase toxic wastewater discharge.	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	
	Appel, Dylan	2024-04-23	<p>Hello, my name is Dylan Appel. Resident and homeowner in Wabasso, MN located in the heart of Redwood County. I first learned of the CO₂ pipeline because of yard signs I saw while driving. Through reading, watching videos, talking with community members and being on zoom calls discussing the topic, I learned why the pipeline is being proposed, who's paying for it, how it functions, where it will run and the impacts and risks involved.</p> <p>The proposed pipeline route goes directly through Redwood County. My first and biggest concern is that of public safety. In February of 2020 near Satartia, Mississippi, there was a CO₂ pipeline rupture. The result was vehicles stalled out on highways, people having seizures, and a huge delay in emergency response all due to oxygen deprivation. Fortunately, there were no casualties, but there was over 45 people hospitalized.</p>	Risks of a potential CO ₂ release and potential impacts are described in Chapter 8 of the EIS. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01
	Appel, Dylan	2024-04-23	A well-known problem in our small rural communities is the shortage of EMT's and fire fighters - to the degree that Minnesota launched a task force to help with this problem. We simply do not have the resources, training, or manpower to handle a pipeline rupture. Although Summit Carbon Solutions may have safety failsafe built in, everything manmade fails - and when it does, how many will be hospitalized? Will there be casualties?	Section 8.5.1.5 has been revised to address EMS staffing shortage problems.	20243-204403-01
	Appel, Dylan	2024-04-23	Summit "anticipates" they will consume approximately 13 million gallons of water per year for carbon capture. With years of drought in southwestern Minnesota our aquifers are tapped out and our small towns struggle to keep up with water demand. Recently I was speaking with a Wabasso City Councilman about the water problems we continue to face. He replied, "We're literally sucking sand". We have a very finite supply of fresh water that we need to conserve.	Additional information has been added to Section 5.7.8.2 to address the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-01
	Appel, Dylan	2024-04-23	The DEIS states that during operation the proposed project will require about 38,501,733 kilowatt hours per year, and that this amount is "not anticipated to require the addition of power generation capacity." With the Minnesota legislature mandating electricity production be 100% carbon free by 2040, year after year we see coal power plants being decommissioned. Minnesota would experience a devastating 55-hour blackout in late January if wind and solar output is the same as it was in the year 2020, and electricity demand was the same as 2021 according to an American Experiment study. Once again, we do not have the resources to support this pipeline.	Thank you for your comment.	20243-204403-01
	Appel, Dylan	2024-04-23	<p>In conclusion, I feel this entire project is at the expense of the already marginalized American working class. SCS must provide meaningful solutions to the concerns listed above.</p> <p>Sources: https://files.americanexperiment.org/wp-content/uploads/2022/09/The-High-Cost-of-100-Percent-Carbon-Free-Electricity-by-2040-in-Minnesota.pdf https://www.cbsnews.com/minnesota/news/minnesota-launches-task-force-focused-on-problems-facingrural-ems/ https://www.npr.org/2023/05/21/1172679786/carbon-capture-carbon-dioxide-pipeline</p>	Thank you for your comment.	20243-204403-01
	Appel, Shirley	2024-02-22	My name is Shirley Appel, resident and taxpayer of Redwood County. I learned about Summit's proposal to construct a CO ₂ pipeline through our county from a neighbor. Since then, I have read about the proposal and have listened to presentations regarding concerns with the proposal. One of my many concerns with this project is the dangers associated with our water supply. One of Minnesota's greatest resources is our fresh water, using it for sustenance as well as for recreation. It is my understanding the proposed route for the pipeline includes wetlands, aquifers, and other water bodies. I feel Summit is vague on the impacts to our community's water supplies. This must be assessed in detail. With severe drought the past few years our water supplies have decreased substantially. Summit anticipates millions of gallons of water usage every year. It is crucial we conserve our fresh water for our drinking water supply.	Potential impacts on and mitigations for freshwater (groundwater and surface water) are discussed in Section 5.7.8. Potential impacts on and mitigations for wetlands are discussed in Section 5.7.9. Additionally, potential impacts on and mitigations for recreational resources, including water-based recreation, are discussed in Section 5.4.10.	20243-204403-01
	Appel, Shirley	2024-02-22	In the event of a leak or rupture more research needs to take place on the risks involved for our water supplies and what negative impacts it would present to fish, waterfowl, insects, birds and reptiles, and most importantly to our people. Another concern is	Risks of a potential CO ₂ release and potential impacts are described in Chapter 8 of the EIS. Chapter 8 also describes the steps that would be	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			medical response in case of a rupture or leak. Our small towns do not have the manpower, equipment or financial resources needed for a timely and successful response.	taken in the event of an accidental release and the steps that would be taken to prevent an accidental release.	
	Baka, Ryan	2024-02-23	<p>We all have a duty and responsibility to protect and care for our planet because of what it provides for us.</p> <p>I ask that the Public Utilities Commission and Department of Commerce take these issues into account in order to ensure that the Environmental Impact Statement (EIS) for the Otter Tail to Wilkin CO₂ Pipeline Project in Otter Tail and Wilkin Counties (Docket Number: 22-422) is a factual and thorough account of the project impacts. Minnesotans need a robust environmental review, and we need transparency, accountability, and regulatory oversight to ensure the greater public good and interests of communities impacted by these pipelines and all Minnesotans are respected and protected.</p>	Thank you for your comment.	20243-204403-01
	Batalden, Ryan	2024-02-22	<p>My name is Ryan Batalden. I live in Cottonwood County, MN.</p> <p>Summit wants to build a highly pressurized CO₂ pipeline, as close as they legally can, next to my house and farm site. I live and farm there with my wife and three young children. Summit has NO experience building or maintaining a pipeline of this type.</p>	Thank you for your comment. Detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01
	Batalden, Ryan	2024-02-22	<p>Our local emergency services have NO equipment to deal with a CO₂ leak. Our local emergency services also have NO training to deal with a leak. The safety of my family and my community is FAR MORE important than the subsidized profits of a huge corporation that may well use that same CO₂ to frack for MORE fossil fuels!</p> <p>It is outlandish that this pipeline is even being considered.</p> <p>Thank you for your time,</p>	Sections 8.4 and 8.5 describe the steps that would be taken in the event of an accidental release of CO ₂ , including the training and provisioning of equipment to local emergency responders. Additionally, the applicant's draft Emergency Response Plan is included in Appendix N of the EIS.	20243-204403-01
	Baumann, Roger	2024-02-22	<p>The DEIS consistently fails to properly account for the real CO₂ emission and climate impacts of the project.</p> <p>Lifetime of Project: The applicant states that the anticipated lifetime of this project is 25 years. This means at the end of its life; the project could stop capturing the CO₂ from the ethanol plant. Unless the ethanol plant ceases operations at that point in time, it will continue to emit CO₂ unabated into the future.</p>	<p>See responses to more specific comments regarding CO₂ emissions and climate impacts below.</p> <p>Regarding the lifetime of the project, Section 2.7 describes project decommissioning. If the ethanol plant continues to operate beyond the life of the proposed project, its CO₂ emissions would not be captured.</p>	20243-204403-01
	Baumann, Roger	2024-02-22	<p>100% CO₂ Capture Rate: Summit states that the capture facility "is designed to capture 100% of the CO₂ produced by the ethanol plant." There is no carbon capture facility in the world, ethanol or otherwise, that captures carbon at a rate of 100%. This claim is not supported by any data/information or verified by a third party.</p>	Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios of 100 percent, 70 percent, 40 percent, and 10 percent.	20243-204403-01
	Baumann, Roger	2024-02-22	<p>Additionally, the DEIS should emphasize that any CO₂ capture is solely associated with emissions from the ethanol fermentation process and provides zero reductions on the significant emissions from the facility's electricity use. Added CO₂ from electricity use: Carbon capture technologies are highly energy intensive and will significantly increase the carbon emissions at the facility from electricity use. The DEIS uses the Midwest Reliability Organization West Region average to calculate these emissions, which is unnecessarily inaccurate given the availability of the actual emissions factor from Great River Energy.</p>	<p>Section 2.1 of the EIS has been revised to clarify that the captured CO₂ is produced by the ethanol plant as part of its fermentation process, the amount of CO₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. Section 6.3 describes energy efficiency and energy alternatives that could reduce emissions from the ethanol plant's electricity and process fuel use.</p> <p>Electricity emissions are included in Table 5-39. These numbers have been revised to reflect the electricity emission factor associated with LREC, which would provide electricity to the project. The revised electricity emission factor is 132.2 g CO₂e/MWh. This was calculated from LREC's energy resource mix, in which nearly half comes from clean energy sources. Because LREC has a lower emission factor than the Midwest Reliability West Region emission factor (684.35 g CO₂e/kWh), which was used in the draft EIS, calculated electricity emissions have decreased.</p>	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Baumann, Roger	2024-02-22	CO ₂ Storage: The DEIS assumes 100% of captured CO ₂ is being permanently stored underground. There is no guarantee that this will occur and no explanation of the monitoring and verification protocols that would ensure it.	Text has been added to Section 2.1 describing the suitability of the Broom Creek Formation in North Dakota for CO ₂ sequestration, as well as the monitoring and testing that would be done to verify that the CO ₂ is contained in the storage reservoir.	20243-204403-01
	Baumann, Roger	2024-02-22	Enhanced Oil Recovery: The DEIS fails to explain whether the applicant can sell any of its captured CO ₂ to others for alternative uses instead of permanent sequestration and what the impacts of that would be. The DEIS incorrectly states that “Production of oil through EOR would not be dependent on the availability of CO ₂ produced by the ethanol plant.” This claim is contradicted by countless public statements from public officials in North Dakota and oil industry representatives.	The text questioned by the commenter in Section 5.7.2.3 was prefaced with the following: "if all the CO ₂ produced by the ethanol plant is sequestered as proposed, EOR would likely continue in North Dakota using other sources of CO ₂ , other gases, thermal methods, or chemical methods." Revisions are not necessary. However, Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	20243-204403-01
	Berkholtz, Ric	2024-02-23	I have read about what CO ₂ pipelines entail and I strongly feel that such infrastructure is not the answer to climate change mitigation. On the contrary, they pose serious risks to community health and safety. It does not benefit the residents of Minnesota—only the fossil fuel companies seeking to conduct Enhanced Oil Recovery. Furthermore, they pose a risk to animals and humans alike. CO ₂ is an asphyxiant which is invisible and odorless, but toxic.	Thank you for your comment.	20243-204403-01
	Berkholtz, Ric	2024-02-23	CO ₂ pipelines pose great a risk to land and water as well. Across the country, aquifers have been breached and compromised by pipeline projects. Aquifers are precious and key to maintaining groundwater health and providing clean drinking water for people and animals. The acidic nature of CO ₂ would compromise both groundwater and surface water (lakes, streams, creeks, and rivers).	Section 5.7.8.2 addresses the potential impacts of an aquifer breach. Section 8.3.4.1 addresses the potential impacts of a CO ₂ release on water resources.	20243-204403-01
	Berkholtz, Ric	2024-02-23	What we really need are real solutions to the climate crisis. Namely, the preservation of lowland forests, the planting of new and native trees, and the protection of peatlands; the electrification of buildings and vehicles; and the implementation of sustainable farming on either existing farms or new farms.	Thank you for your comment. Chapter 6 discusses the potential use of sustainable farming practices as an alternative to the project. Only climate smart agricultural practices, energy efficiency measures, and alternative energy sources emerged as viable alternative strategies.	20243-204403-01
	Briese, Allen & Susan	2024-02-23	COMMENTS ON PUC PROCESS This process has been a new one to us. We appreciated how Mr. Levi conducted the public hearings and treated all speakers and attendees with respect, along with the remaining state staffers. At the end of the hearings, both in May of 2023 and February of 2024, he took the time afterwards to walk around inviting questions from the attendees and engaged them to ask their questions. As expected, but still appreciated, Mr. Levi’s familiarization with the EIS and its appendages inspired a confidence level of the intensity and thoroughness of the completed study, in addition to a perusal of the material which revealed additional information was requested, supplied, and reviewed in compiling the EIS.	Thank you for your comment.	20243-204403-01
	Briese, Allen & Susan	2024-02-23	GENERAL COMMENTS Obviously landowners and interested parties are not trained in the areas required to review, regulate, construct and operate a pipeline of this magnitude and while we must rely on those experienced and trained to do so, we must also do our due diligence to insure the safety of those living in the area, impact on our environment, our little slice of Heaven on earth, and how it could affect the potential of our property’s future use, even if never explored, but not to restrict those choices we currently have. There is a projection that ethanol is phasing out and by the time this pipeline is operational, will be a moot issue and then if easements are signed, the pipeline could be subject to another project which would again need to be subject to review for permitting route by the PUC. Some of the comments relating to pipeline matters were summarized in earlier responses by the undersigned and part of the docket and are incorporated herein by reference, as well as responses from other landowners of similar safety matters.	Thank you for your comment.	20243-204403-01
	Briese, Allen & Susan	2024-02-23	PURPOSE We see this proposed pipeline to have little impact on the grand scheme of the world’s carbon emissions and so many outside things would need to change, such as private air travel, factory emissions. The current governmental administration in control supports tax dollars for subsidies and these projects. Another party in control might not. Landowners must rely on themselves to review the effects of this project and not on those that can set the rules and/or profit from the project for other gain. We have attended public meetings, listened to webinars, parts of PHMSA 2023 IA hearings, ND PUC hearings, conducted research, but again, the technical components to the design and structure etc of the pipeline are foreign.	Thank you for your comment.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Briese, Allen & Susan	2024-02-23	<p>RESPONSE TO COMMENTERS</p> <p>This Respondent attended the February 7, 2024, presentation at 6 pm in Fergus Falls. The hearing was fairly well attended, with landowners from the anticipated RA South and RA North line within a three-mile radius of the beginning of the FF to Breckenridge line. Landowners along RA North and RA Hybrid were frustrated on notice of public hearing received just days prior to the hearing. Due to time constraints, this Respondent was unable to listen to any other hearings or podcasts during this short response time. Below are a few comments on the speakers outside of the Respondent.</p> <p>1. Anthony Hicks. CEO of Green Plains Ethanol Plant. From an income-generating standpoint, he shared the economic benefits the entity. I suspect this would include the entity and private investors who do not necessarily live in the area or along the proposed routes. I refute his comments:</p> <p>a. Not considering the negatively on human life, vegetation or animals, but profits.</p> <p>b. How many additional employees who will live in the area will this add? Not enough in the grand scheme of the FF community to be considered a great positive effect.</p> <p>c. Additional noise factor and water ground source usage as a negative to those living nearby.</p> <p>d. Shared what projected and unproven economic benefits might be.</p> <p>e. What other options has the plant explored for CO₂ emissions reduction?</p> <p>f. What about the fuel emissions from the trucks bringing corn to and from the plant?</p> <p>As interesting as these biased comments were, the purpose of the hearing was to review and discuss the EIS, not the projected future P&L of the company and these comments to me did not seem relevant to the nature of the hearing. If Mr. Hicks did not focus his comments on safety.</p>	Thank you for your comment.	20243-204403-01
	Briese, Allen & Susan	2024-02-23	<p>Union Representatives. These comments were biased and not based on the EIS results, but on jobs, salaries and their opinion of economic benefits to communities and personal gain. Union staff will come in and, as represented at the hearing, they will be trained in this type of pipeline. They will most likely not be from the area and are not going to bring their families, buy a house, contribute to the community, send kids to school and pay local taxes. While there will be some influx of revenue, it will be short-lived and in the FF to Breckenridge route, it is 28 miles, so shared temporary housing and only for what, maybe up to five months in the area. Future maintenance of the line will be serviced by out of the area staff who are trained in carbon pipelines passing through and maybe buying some food and gas with occasional hotel room. The financial impact on the Fergus Falls and Breckenridge community is a bogus point. Providing jobs and income for on the road construction staff and to those entity shareholders/owners make profit to us does not fall within the scope of the EIS and comments did not discuss safety concerns.</p>	Thank you for your comment.	20243-204403-01
	Briese, Allen & Susan	2024-02-23	<p>Dale Schmidt. Landowner. Read an article he said he just found as he was attending the meeting. There are so many articles a researcher can find and review with the pros and cons. It is good to do additional due diligence to dig deeper for meaningful pros or cons relating to the project.</p> <p>4. Final Speaker. This gentleman represented that he worked in the industry. He had good points. However, it would be nice to know if his position would be the same if the proposed CO₂ line was asked to be constructed near or over his land.</p>	Thank you for your comment.	20243-204403-01
	Briese, Allen & Susan	2024-02-23	<p>COMMENTS ON EIS</p> <p>As represented previously, much of the logistics of building the pipeline by Summit Carbon (hereinafter SC) and projects and calculations, study within the PUC is foreign to the average layperson. SC's purpose is to build and operate the line for the profit of its private investors and for private gain. The PUC role is to ensure the safety of the pipeline on the 1) population; 2) environment; and 3) animal inhabitants as best can be determined from this projected line. The landowner's role is to protect the landowner's land investment and be adequately compensated if the landowner grants an easement. In some areas, it seems there is prejudice against landowners who happen to live in the path of the proposed pipeline that are not comfortable with it.</p>	Thank you for your comment. The Commission cannot set safety standards (Minnesota Rule 7852.0200, Subp. 2); however, the environmental review process aids "in the selection of a pipeline route and to aid in the understanding of its impacts and how those impacts may be reduced or mitigated" (Minnesota Rule 7852.0200, Subp. 3).	20243-204403-01
	Briese, Allen & Susan	2024-02-23	<p>RESPONDING TO THE EIS EXECUTIVE SUMMARY AND FULL DRAFT EIS</p> <p>January, 2024</p> <p>1. Pipeline Diameter. ES-1. We are comfortable with the previously determined PSI and 4 to 6-inch diameter and note under Supplemental Information Inquiry #3, it has been determined that the effects of a 3-inch pipe to 6-inch pipe reported no significant differences.</p> <p>2. Water Usage. Concerns how this will affect the area surrounding the ethanol plant re water usage. Not sure if annexing the property to the City of Fergus Falls and using city water reduces water tables or not. Maybe not even a point because I have no idea.</p>	Thank you for your comment. Water use is discussed in Section 5.7.8.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			Respondent just hears concerns of use of water to convert is concern. Does SC need to follow the intense permitting process a landowner does when installing and using irrigation. [Note, I noted this later on the DNR will provide permitting.] Dry years, coupled with water usage could be concerning to environment. ES-2		
	Briese, Allen & Susan	2024-02-23	<p>3. Transparency. This has always been a challenge to obtain a clear and concise answer from SC and to see a pictorial of the exact location or more general location project areas, from the beginning after our original meeting with a SC representative. Initially, all SC shared when asked was a vague minute aerial map. Even in the EIS summary, ES-2, there is no map, one has to look to outside sources or try to find it on the PUC flashdrive or printed EIS. It was at the May, 2023, meeting as well. But finally, a copy that can be easily followed. Recorded easements are public data. Please incorporate the route maps into the text when describing the routes or reference where to find the maps. Also, it is a tad confusing in the full report where it refers routes as 1, 2 and 3. Maybe RA- North, AR 1, or something like that.</p> <p>4. Alternatives. ES2. The: 1) no action; 2) three routes; and 3) alternative technologies were discussed. At this time, it could be the no action, pending alternative technologies might be the most attractive to the landowners and adjacent landowners that are impacted by this proposed CO₂ pipeline related to safety measures or a moratorium until the PHMSA has completed its findings [discussed later in this response].</p> <p>This Respondent is wondering why the cost of the three routes is in the report. Why does that have a bearing on the EIS? Is not this project subsidized by the government, its members are entities that are privately owned, and uses taxpayer money, so if the investors do not make as much profit, that is the risk they take and which route is more expensive should not have any impact on any final route, if chosen.</p>	<p>Thank you for your comment. A map has been added to the Executive Summary, and maps are also provided in Chapter 4 and Chapter 5. Appendix B provides an overview map and detailed route maps for the three alternatives.</p> <p>In selecting a route for a pipeline routing permit, the Commission is required to consider the cost of the different routing options pursuant to Minnesota Rule 7852.1900, Subp. 3(E).</p>	20243-204403-01
	Briese, Allen & Susan	2024-02-23	<p>Human Settlement. ES-3 to ES-6.</p> <p>1. Aesthetics. ES-3. EIS states more residents on the RA North line. Mr. Levi informs me that is “building sites”. And how many is “more”. When determining a route, a few households with fewer actual residents is more comparable than just a building site. Generally, closer to a city there are younger families and in the flats, fewer, elderly and may even be vacant. [Not confirmed] This appears to be a summary and not necessarily factual. See response to 6 below and 8.2.3 on page 7.</p>	EERA agrees. Staff does not know how many residents live within a residence. Changes to the final EIS were made to clarify that EERA is referring to the number of residences as opposed to residents.	20243-204403-01
	Briese, Allen & Susan	2024-02-23	<p>2. Cultural Resources. ES-3. Not understanding the reference to “Tribal culture”. Property is unique and the Briese tract contains much wildlife and offers an array of hunting opportunities that would be affected, in addition to recreational use. It would not be similar to a large even 100- acre flat field to the west.</p> <p>3. Environmental Justice. ES-4. No comment.</p>	EERA agrees. Section 5.4.2.2 has been revised to note that wildlife and their habitats could be impacted whether they hold Tribal cultural significance or not.	20243-204403-01
	Briese, Allen & Susan	2024-02-23	<p>4. Land Use and Zoning. ES-4. While the impact of the proposed pipeline would be minimal to much of the land it would cover, which appears to be agricultural land that is farmed, it would be devastating to be near farmsteads and recreational land or potential future land that could be developed due to its safety concerns and usage restrictions. Any saavy landowner would want to keep options and use open for the landowner’s purposes and goals. A CO₂ pipeline would have a negative effect on specific and unique tracts of land. It would be extremely prejudicial to forcibly coerce a landowner to allow an unwanted pipeline and infringe upon that landowner’s constitutionally protected rights.</p> <p>5. Noise. ES-4. Not entirely got the grasp of this section. But no comment. The immediate area by the plant is already subject to city, road, and airport noise factors.</p>	Thank you for your comment.	20243-204403-01
	Briese, Allen & Susan	2024-02-23	<p>6. Populated Areas. ES-4. This area is of concern. This concern was raised by this Respondent at the public hearing. The PUC has redefined populated to fit the scenario. Prejudicial to rural residents and farm residents who produce food. The PUC “Populated areas are defined for this analysis as incorporated areas or legal entities, and census designated places . . .” Further to state “There would be no impacts on populated areas because no populated areas are within 1,600 feet of the route width for any of the three route alternatives.” [emphasis added] So, then is one to understand this to mean residents not residing within a municipality, but are township, county and state residents can be considered to be at risk and collateral damage to a leak or ruptured pipeline?</p> <p>Dictionary definition: In a prior response, there was provided upwards of 100 country residents within a 4-mile radius of the plant, plus the City and developments along the Pelican River. This responder believes all lives are valuable.</p>	Minnesota Rule 7852.1900, Supb. 3(A) requires the Commission to consider the impact of a pipeline to, among other considerations, the "existence and density of populated areas." Minnesota Rule 7852 provides no definition of "populated area." Section 5.4.6 has been revised to clarify the definition used in the EIS for populated areas and to note that the EIS describes potential impacts on the human environment, regardless of whether they would occur within defined populated areas. Section 5.4.5 and the detailed route maps in Appendix B have been updated to reflect the residences identified by the commenters.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			In addition, on this pictorial below, there is omitted the residence site within that 1,600 feet for 2 of the properties – the shohouse and the 2 story house are residences but were identified in yellow instead of red on the routing map for RA South. Please update the map found on page 2 of 19 of the RA-South [Alt 3] map. See also response to 1 above and 8.2.3.		
	Briese, Allen & Susan	2024-02-23	7. Property Values. ES-4. This area is of concern. Respondent disagrees that property values once the pipeline is in place would not be affected by a CO ₂ line nearby. But it really can only be projected and not factual at this point. Or maybe it would not be. Land values could be affected by the line. Not so much if farmland, but for the wooded, recreational, and hunting land. For land close to a town on a river the value could be diminished as any lotting or platting process would need to adhere to the underground line and could inhibit development opportunities, growth for the area and financially to any developer.	Thank you for your comment. Section 5.4.7 has been revised to indicate that impacts on a property's value during operation of the project are not expected to significantly affect a property's value.	20243-204403-01
	Briese, Allen & Susan	2024-02-23	8. Public Health and Safety. ES-5. As previously discussed, and this Respondent didn't have the chance before this submission was due to review, but of training to the plant and local area EMTs, etc. and SC providing the appropriate equipment. How the turn off valve works and SC and FFGP protocol. Somewhere it was asserted that SC could provide appropriate safety mask features, as updated, to area residents close to any line. This would be a necessity, even just for the comfort level of the landowner. 9. Public Services and Infrastructure. ES-5. See comment 8. No other comment. As with health insurance, one never knows the true extent of coverage until something happens.	Thank you for your comment.	20243-204403-01
	Briese, Allen & Susan	2024-02-23	10. Recreation. ES-5. This is discussed elsewhere in the comments herein. 11. Socioeconomics. ES-6. This paragraph represents "local labor will be used, increasing employment in the area". This has been unclear. Calculations from outside sources represent it would increase the current plant's employees by 2.5. SC assures landowners that laborers will be skilled, Unions are in favor of this project (and as presented at the February 7, FF hearing), who will come and go with increased local income similar to a tourism season. Reps checking the lines will be skilled and most likely travel from site to site along the line. Please explain what type of labor force this will create and how does it affect the environment per this study? In addition, what does the cost factor to construct each of the lines matter for the determination of placement of a line for environmental impact studies? If, as stated elsewhere in this EIS, the land values will be the same, how does this create a "generate property tax revenues" . . . "during the first year of operations". What about the following years, how can this be predicted when fossil fuels under the current administration are being phased out?	Thank you for your comment. Section 5.4.11.2 discusses potential impacts associated with the labor force in more detail as well as potential impacts. About half of the anticipated 250 workers are expected to be local. Potential impacts on local economies are expected to be short term and minimal. Cost is a listed factor in Minnesota Rule 7852.1900, Subp. 3. Cost is just one of the many factors PUC must consider when making a decision on a pipeline routing permit. Tax revenues are assessed based on the value of the pipeline and capture facility and other commercial equipment, not the easement. The final EIS has been modified to clarify this point. The EIS does not speculate on future policy decisions related to fossil fuels.	20243-204403-01
	Briese, Allen & Susan	2024-02-23	12. Tribal Treaty Rights. ES-6. No Comment.	Thank you for your comment.	20243-204403-01
	Briese, Allen & Susan	2024-02-23	Economies. ES-6. 1. Agriculture. Loss of farmland and having to farm around the easement area could be problematic. The suggested damages, in addition to easement payment for 2 to 3 to 5 years, should be 10 years. 2. Industrial. No comment.	Thank you for your comment. Landowner agreements are outside the scope of the EIS.	20243-204403-01
	Briese, Allen & Susan	2024-02-23	3. Tourism. Other than as stated previously in these comments the loss of use by the landowner, no comment. Archaeological and Historic Resources. ES-7. 1. Archaeological Resources. No comment. 2. Historic Architectural Resources. No comment.	Thank you for your comment.	20243-204403-01
	Briese, Allen & Susan	2024-02-23	Natural Environment. ES-7. 1. Air Quality and Greenhouse Gas Emissions. No comment except that the number of semis to and from the plant current emitted into the air during transport. It does appear the EIS addresses. 2. Climate Change. ES-8. While considerable, this project is just a small footprint in the world's global warming and carbon emissions reduction. Foreign countries are building plants. The phrase "Drought conditions might require contingency water sources." That is	Thank you for your comment. Water use is discussed in Section 5.7.8.2. Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			discerning. For example, in winters such as 2023-24, the water usage from the plant and lack of moisture in the ground be absorbed to compensate for no snow coverages, how do the experts answer how that affects landowners’ water source and levels? 3. Geology and Topography. ES-8. No comment. Proper restoration per the easement agreement would need to be fulfilled by SC.	include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	
	Briese, Allen & Susan	2024-02-23	4. Public and Designated Lands. ES-8. No comment. 5. Rare and Unique Resources. ES-8. No Comment.	Thank you for your comment.	20243-204403-01
	Briese, Allen & Susan	2024-02-23	6. Soils. ES-8. Landowner would need to satisfy Landowner with restoration in any easement agreement. 7. Vegetation. ES-9. The farmland can be restored by proper coverage, but some studies indicate could take up to 10 years until disrupted soil reaches its before construction base. Woody vegetation would be of particular concern to landowners who reside near or in wooded areas, water, ground shrubs and grass and use the area for hunting and recreational purposes. What “disturbing less than 1 acre” to a proponent of the proposed pipeline is subjective and can be minimal; but in the eyes of a landowner in conflict with landowner’s intent for the land use could be significant.	Thank you for your comment.	20243-204403-01
	Briese, Allen & Susan	2024-02-23	8. Water Resources. ES-9. This was good to read that permits will be granted in alignment with DNR regulations (per comments noted previously). But this is an area of concern to area landowners that there may not be enough water for all. What if the footprint of the converter is increased and it uses more water than expected or expands? Does water usage again need to be permitted? 9. Wetlands. ES-9. No comment. This is public land. 10. Wildlife and Their Habitats. ES-9. Natural habitat wildlife could be affected greatly in the event of a leak or rupture. It could take time for the wildlife to return and thus inhibit a hunting paradise to be tainted. Could construction during mating season for birds and mammals affect that? Would the additional noise and disruption during construction cause the deer to move to other, quieter areas? Would waterfowl not land in a construction zone? Probably. That would affect the landowners’ hunting and nature watching enjoyment, although temporary until wildlife returns to the disrupted area.	8. Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has also been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2. 9. Thank you for your comment. 10. Section 5.7.10.2 discusses potential impacts on wildlife. This section acknowledges the concern that wildlife will be displaced during construction. Section 5.4.10.2 discusses potential impacts on hunting and fishing.	20243-204403-01
	Briese, Allen & Susan	2024-02-23	Chapter 8 Accidental Release of CO ₂ . Mr. Levi suggested Respondent review this in detail. While there is some new data to the Respondents, most of the information in this section has been previously hashed over, noted, and brought before SC and the PUC. Certainly, it is not Respondent’s intention to discredit or minimize the groundwork SC staff, PUC, or others have put into this project, investigating, answering questions, designing the plans and speculations. Some of the sections in Appendix G are just too complicated for laypeople to understand, i.e. 5 and 6, appendix reports to disbursement and line sensitivity, etc., although 8 on page 7 of 9 relating to pipeline pressure was as previously represented and reassuring since the PSI on this line will be relatively low this Respondent is information than other lines. Respondent will take additional time to review this section. Some comments. “A large rupture of the pipeline is unlikely to occur”. “Leakage is the main form . . .” Pg 8-1. 8.1.1.1 Leaks are lower hazard. 8.2.3 Public Safety, etc. reads: RA-North has 33 residences [emphasis added] . . . RA-Hybrid has 39 . . . RA-South has 34 residences . . . [Note in _____ that there are 2 additional residences to add in RA-South to make it 36] Under Human Settlement, Aesthetics in the summary it reads: “RA-North would have several more residents [emphasis added] . . . RA-South would have fewer residents . . . compared to RA-Hybrid.” After the February 7 hearing, I did question Mr. Levi on this and he informed me the PUC could not count “residents” only “residences”. I do not believe the two words are interchangeable and each has its own meaning. Just in the pictorial under 6 herein there are 24 residents in 6 residences. With the projected four-mile radius of the plant and line, there are as	Staff agrees that "resident" and "residence" are not interchangeable words. The final EIS has been revised for clarity.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>mentioned previously the appx 100 residents, in addition to those living to the East and in the Fergus Falls city, with developments north and south along the Pelican River and Otter Tail River in what this summary defined as “populated” areas. It maybe has been found that the preferred route is more jagged than other routes and the premature pursuit of the easements along the RA-South has flaws. See 1 and 6 on page 4 and the map on page 5 herein.</p> <p>8.3 Effects in event of rupture. The disclosure here is threatening, but this Respondent also compared it to a medical drug disclaimer we do often see in ads, where this entire list of everything and anything possible is disclosed. The question is then, “is one overthinking this risk?” I think the answer is maybe, but not having any potentially dangerous pipeline close to residences v. allowing one with the risk, albeit minimal, but still unknown, is a question to ponder for the landowner.</p>		
	Briese, Allen & Susan	2024-02-23	<p>APPENDIX REVIEW. Very brief and quick and lots of technical data provided by experts with knowledge.</p> <p>Appendix A. Final Scoping Decision. Respondent would like more time to review this.</p> <p>Appendix B. Detailed Route Maps. Great to have these available as printed.</p> <p>Appendix C. Aboveground Facility Drawings.</p> <p>Appendix D. Minnesota Environmental Construction Plan. Would like more time to review; but expect that any landowner entering into an easement agreement could negotiate some of these practices.</p> <p>Appendix E. Winter Construction Plan. Would like more review; but expect that any landowner entering into an easement agreement could negotiate some of these practices. Originally thought winter construction was not requested.</p> <p>Appendix G. Accidental Release Dispersion Reports and Summary of PHMSA Regulations. Mr. Levi suggested concerned landowners review this Appendix in detail. Comments follow.</p> <p>Appendix G provides detailed information on regulations and pipelines. It may be the MN PUC would issue a moratorium until the PHMSA rules and follow the stricter guidelines between the state and federal regulations? If the ND PUC or other state allow a line, shouldn't the lines have the same regulations since the line is all connected?</p> <p>Again, this section, in addition to other sections, is very comprehensive and contains material and information foreign to the Respondent, as a lay person. Expressing concerns may be areas already addressed and proven either way as safe or unsafe. At the FF February 7 evening session, Mr. Levi took the time to show landowners these important areas and the illustrations of a rupture and projected analytical effects. Pg. 6 and 7. However, page 9 the data under Figure 2 description seems discerning in that there is no early warning of a rupture and dissipation time is fast. Our yards are not inner city types, we can have acres which could take longer than 3 minutes to get out of any leak or rupture dissipation area.</p> <p>See attached handout from PHMSA, dated May, 2023. Additional Data. Exhibit A.</p> <p>Appendix H. Sample Routing Permit.</p>	<p>Thank you for your comment. Should the project be constructed, safety and operation of the pipeline as it continues in North Dakota would be regulated in the same way by PHMSA, since regulations for operation are the same in all states. Siting this pipeline, however, is state-specific.</p>	20243-204403-01
	Briese, Allen & Susan	2024-02-23	<p>Appendix I. Supplemental Inquiries and Responses.</p> <p>Inquiry 1. Just noting thinking was odd public data noted as could be redacted.</p> <p>Inquiry 2. The comments throughout the EIS related to noise and that effect on the area was noted and something Respondent had not previously focused on and noted the hours of operation for construction. Inquiry 2.5. Vegetation preservation, permanent tree removal or planting remains concerning; but SC outside comments it works with landowners to minimize is good.</p> <p>Inquiry 2.6-12. Noted communication re waterbody matters and the project.</p> <p>Inquiry 3. Stated previously, good to know that a 3 or 6 inch pipeline makes little difference.</p> <p>Inquiry 3.4. Energy usage. Hopefully extra use will not affect landowners' lines.</p> <p>Inquiry 4. 6&7. Does electricity and installation of a fan for LRCEA require placement on any landowner's land or just within the area substation?</p> <p>Inquiry 4. 12. Assuming SC would make every effort for full cleanup.</p> <p>Inquiry 4. 18. Assuming if farm animals are affected, SC would compensate landowner? Or if vegetation is use for crop income?</p> <p>Inquiry 4. 35. When do the landowners get a chance for input and to know about the SC meeting with the OTC commissioners in Sept of 2023?</p> <p>Inquiry 4. 36. Why would odorant create concerns with pipeline? Respondent has not seen that it would be effective? SC is representing it would not be?</p>	<p>Thank you for your comment.</p>	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>Inquiry 4. 40. It would seem transportation to and from the ethanol plants creates carbon emissions.</p> <p>Inquiry 5. Shows the Frost Heave Study and construction plan. Would assume experts prepared.</p> <p>Seems odd that the data is reacted w/o knowing the reasons.</p> <p>Inquiry 6. Contains a lot of technical information and pictorials.</p> <p>Inquiry 7. 5f. Addressing water usage and land use</p> <p>Inquiry 7. 6. Shouldn't the plant have an estimate on this?</p>		
	Briese, Allen & Susan	2024-02-23	<p>Inquiry 8.3. Reviewed this and appears SC working with the PHMSA regulations and exceeds 49 CFR 195.260(c): “(c) On each pipeline at locations along the pipeline system that will minimize or prevent safety risks, property damage, or environmental harm from accidental hazardous liquid or carbon dioxide discharges, . . . those compliance deadline requirements would be economically, technically, or operationally infeasible.”</p> <p>Inquiry 9. 4. The response to this inquiry appears to be complete and on the side of overcautious, perhaps a response due to the landowners’ safety and state and federal agencies’ safety concerns?</p> <p>Inquiry 10. Mr. Levi’s January 19, 2024, EM to staff and SC was noted and addressed earlier in this response as to why construction cost matters for the EIS.</p> <p>Appendix J. Agency Correspondence.</p> <p>Appendix K. Environmental Justice Screen Report. Respondent not sure what this means, but looks like a lot of the technical data]</p> <p>Appendix L. Minnesota Unanticipated Discoveries Plan.</p> <p>Appendix M. Alternative Technologies Supplemental Information.</p> <p>Appendix N. Applicant’s Draft Emergency Plan. This appears to be similar in nature to a previous draft response plan and is dated September 12, 2022. The outline contains the chain of command to make the assessment to send an ERT to the area which, unfortunately, in most cases, would be after the 3 to 7-minute immediate release. It is also noted that SC met with the OTC commissioners on September 15, 2023, to discuss the implementation of the plan. It is assumed the City of Fergus Falls and area rural town fire departments would have the means and education to address but a thought is that if vehicles stall and the emergency is down a mile driveway, how is that to be handled?</p> <p>Also, Respondent would anticipate this plan might be updated from time to time if the pipeline is construction and new information on operations and similar matters evolve. Again, safety masks provided and periodically updated by SC in the event of a leak or rupture would bring some comfort.</p> <p>A final notation and unable to pinpoint the location, but as of October 5, 2023, now the projected project date construction date is from March to July of 2025 with no winter construction. Imagine that is subject to change.</p>	Thank you for your comment.	20243-204403-01
	Briese, Allen & Susan	2024-02-23	<p>SUMMARY</p> <p>Landowners and adjacent landowners along the three proposed pipeline routes have safety concerns for any CO₂ pipeline close to residences or over landowners’ property. There are also individuals and entities of the position there are no or minimal safety concerns. See Exhibit B. This process of the EIS has been about this in Minnesota for Wilkin and Otter Tail Counties, but also keeping a close eye on this process are landowners residing in eight additional southwestern Minnesota counties who could be affected by CO₂ pipeline construction and abutting states as well. While the MN PUC looks at Minnesota law, it must also recognize the fact there are concerns from landowners and entities in the additional states the Midwest Carbon Project is anticipated to run through.</p> <p>Thank you to the time and talents of those conducting and reporting on this study.</p> <p>Respectfully submitted: Allen and Susan Briese (COMMENTOR INCLUDED 10 ADDITIONAL PAGES OF ATTACHMENTS)</p>	Thank you for your comment.	20243-204403-01
	Brodt, Kelsey	2024-02-22	The applicant states that the anticipated lifetime of this project is 25 years. This means at the end of its life, the project could stop capturing the CO ₂ from the ethanol plant. Unless the ethanol plant will also cease operations at that point in time, it will continue to emit CO ₂ unabated into the future.	Section 2.7 describes project decommissioning. If the ethanol plant continues to operate beyond the life of the proposed project, its CO ₂ emissions would not be captured.	20243-204403-01
	Brodt, Kelsey	2024-02-22	The DEIS fails to explain whether the applicant can sell any of its captured CO ₂ to others for alternative uses instead of permanent sequestration and what the impacts of that would be. The DEIS incorrectly states that “Production of oil through EOR would not be dependent on the availability of CO ₂ produced by the ethanol plant.” This claim is contradicted by countless public statements from	The text questioned by the commenter in Section 5.7.2.3 was prefaced with the following: "if all the CO ₂ produced by the ethanol plant is sequestered as proposed, EOR would likely continue in North Dakota	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			public officials in North Dakota and oil industry representatives. This is not a true solution. An ounce of prevention is worth a pound of cure. Have them spend their money in better ways to help stop climate change.	using other sources of CO ₂ , other gases, thermal methods, or chemical methods." Revisions are not necessary. However, Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	
	Buresch, Michael	2024-04-23	I am a farmer, landowner, land renter and resident of Jackson County, MN. I am part of a larger operation that with a footprint across the middle of the county. We have declined allowing participating in Summit Carbon Solutions CO ₂ pipeline project on land that we own. We have rented land that some of our landlords have granted rights to be included in the project depending upon the route. Whatever happens I and my family will be affected by this pipeline. Although Summit is only asking for a permit for 28 miles of pipeline, they publicly have announced plans connecting the majority of ethanol plants in West Central and Southern Minnesota, shouldn't this EIS be addressing the entire project?	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01
	Buresch, Michael	2024-04-23	Public Health and Safety Risks CO ₂ pipelines operate at very high pressure (much higher than a natural gas pipeline). CO ₂ is also an asphyxiant that is colorless, odorless, and heavier than air. Those exposed to high concentrations of CO ₂ may experience fainting, incapacitation, asphyxiation, respiratory and cognitive damage, cryogenic burns, and even death. The rupture at Satartia, MS proved these dangers are real not conjecture.	Thank you for your comment.	20243-204403-01
	Buresch, Michael	2024-04-23	Pipeline ruptures: If a rupture occurs, the result could be a rapid, uncontrolled release of CO ₂ over a large swath of land. There is little to no independent expert modeling examining the consequences and area of impact of a CO ₂ pipeline rupture. What are safe setback distances from homes, businesses, farms and livestock facilities? What will happen in the case of a pipeline leak – above ground, underground, or underwater? How far will the CO ₂ disperse, and what will its effects be? How will the impacts of a rupture be modeled and proven so that public safety will not be compromised? Can we as citizens depend on the validity of dispersion models paid for by Summit? How will Summit monitor pipeline performance to determine if a leak is occurring. How quickly can the line be shut down in the case of a failure? How far apart will shut offs be placed to contain the amount of CO ₂ leaked? Will these valves be controlled remotely, or must an operator manually close them?	Chapter 8 describes the impacts of a potential rupture. Section 8.3.1.3 describes the independent dispersion modeling performed by an independent contractor, and results of that modeling are presented in Appendix G. Section 2.3.2.1 describes the mainline valves. Section 8.5 provides additional mitigation measures to protect against an accidental release and to limit impacts if one should occur.	20243-204403-01
	Buresch, Michael	2024-04-23	First responders and health professionals: CO ₂ pipelines pose unique problems for first responders and health care providers. Because CO ₂ is colorless and odorless, both victims and first responders have no way of knowing what is causing the health problems. In addition, first responders require special equipment, including non-internal combustion engines, to respond to a CO ₂ disaster. What kind of burden will this put on local EMS and health providers in the case of an accident, large leak or rupture? How will they be prepared to respond, given their unique needs?	Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.	20243-204403-01
	Buresch, Michael	2024-04-23	Air pollution: Industrial sources like ethanol plants with carbon capture can still emit toxic, healthdamaging air pollution (e.g., volatile organic compounds, particulate matter, etc.). The air pollutants emitted by these facilities can affect lung and heart function, imply a higher risk of respiratory disease and cancer, and increase smog, which can affect air visibility, damage plant life, and be deadly to humans.	Thank you for your comment. Emissions from the capture facility are shown in Table 5-38 and are further discussed in the text following that table. Emissions from the ethanol plant are covered in the Title V Permit for the plant.	20243-204403-01
	Buresch, Michael	2024-04-23	In addition to CO ₂ from Ethanol Plants what other CO ₂ producers with their own unique pollutant compounds could be added into this network and what would these compounds have on pipe corrosion, valves and other physical components of this pipeline system that will impact public safety?	The project pipeline would carry CO ₂ captured from the ethanol plant. Corrosion monitoring and protection are addressed in Chapter 2.	20243-204403-01
	Buresch, Michael	2024-04-23	Regulatory gaps: Federal regulations governing this new and risky technology are limited and under review. For example, the federal rules don't currently require CO ₂ pipelines, which can rupture, to be a safe distance from sensitive sites. PHMSA is now in the process of creating specific CO ₂ pipeline rules.	Although the Commission cannot set safety standards for pipeline construction or operation, state or local units of government may, to the extent authorized by law, set land use requirements that indirectly contribute to pipeline safety by regulating the activities of third parties located in the pipeline's vicinity. The Commission's obligation is to identify a pipeline route consistent with the criteria found in statutes	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			How can the PUC ensure the safe routing and construction of this pipeline in the absence of credible guidance on critical issues like this? Do the citizens of Minnesota want a CO ₂ pipeline that does not conform to the new rules once they are finalized? Permitting and allowing this pipeline under the existing rules will only endanger the public.	<p>and the applicable administrative rules. Federal law, by contrast, exclusively prescribes pipeline safety requirements. Section 3.4 of the EIS has been revised with this information.</p> <p>PHMSA regulations (that is, their appropriateness) and related standards for CO₂ pipelines are outside the scope of the EIS. Section 3.6 acknowledges that PHMSA is currently conducting rulemaking proceedings on proposed amendments to its pipeline safety rules, and that the Commission states that it would be prudent for EERA staff and the applicant to take that information into account, even if the updates have not been finalized. Appendix G of the EIS further summarizes the extensive and detailed PHMSA CO₂ pipeline regulations applicable to the construction, operation, and maintenance of such pipelines, and the status of pending PHMSA changes to such.</p> <p>EERA staff has been following PHMSA CO₂ pipeline rulemaking proceedings before and since issuance of the draft EIS. As of July 5, 2024, PHMSA has not published the Notice of Proposed Rulemaking that will describe the scope of new and amended regulations, and changes to existing rules and regulations are not known. Therefore, as ordered by the Commission, it is not possible for the EIS to include “a discussion of mitigation strategies and measures to ensure public safety including, but not limited to, measures consistent with the proposed and final federal rules to the extent available” (Commission. September 26, 2023. Order Approving Scope of Environmental Review and Denying Stay. eDockets No. 20239-199149-01). To the extent applicable, Section 3.6 and Appendix G of the EIS have been updated with the above information.</p> <p>Thank you for your comment. To EERA staff’s understanding, the Commission must make a decision on a route permit for the project that is consistent with Minnesota statutes and rules. The applicant has stated its proposed CO₂ pipeline would be designed, constructed, and operated to meet PHMSA regulations, including any operational changes to PHMSA regulations that may occur in the future.</p>	
	Buresch, Michael	2024-04-23	<p>Pipeline risks to land, water, and natural resources</p> <p>One of the things that Minnesota takes immense pride in is our natural heritage. Beyond the damage done during the construction phase of the project, what happens to the land, water, air, and all living creatures that depend on a vibrant ecosystem for survival?</p>	Thank you for your comment.	20243-204403-01
	Buresch, Michael	2024-04-23	Dangers to water and waterbodies: The proposed route for Summit’s pipeline network includes many water crossings, wetlands, aquifers, and other sensitive water bodies. More research and analysis are needed to understand how CO ₂ disperses in water and what risks a CO ₂ pipeline leak or rupture poses to Minnesota’s precious waters and the fish, amphibians, reptiles, waterfowl, birds, and insects that rely on it to survive.	Potential impacts of a pipeline rupture on water resources and wildlife are addressed in Section 8.3.4. Stand-alone studies concerning impacts on water resources, wildlife, and wildlife habitat are outside the scope of the EIS.	20243-204403-01
	Buresch, Michael	2024-04-23	<p>Water use: Carbon Capture and Sequestration (CCS) can also double water requirements and increase toxic wastewater discharge. There must be a careful and case-specific assessment of how the installation and operation of carbon capture equipment will impact and exacerbate existing water use and pollution sources.</p>	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Buresch, Michael	2024-04-23	Land degradation: This project is going to cut through roads, ditches, tile lines, and prime farmland—are we supposed to take it on faith that this will be “back to normal” in two or three years? Other pipeline projects in the Midwest are still suffering yield reduction and damage to land years after project completion and “restoration”. My conclusion from farming areas where heavy construction has occurred is that damage to the land is permanent and that the affected areas will not return to profitable production. Pipeline operators should be held liable for crop damage for as long as the damage occurs via damage clauses in their easements. The current language in this draft is more of a promise beyond initial construction.	Thank you for your comment. As indicated by the definitions found on Page 5-1 of the draft EIS, “long-term impacts extend beyond the end of construction and are generally associated with operation of the project.” Disturbance to soils and crops from construction can result in impacts that extend beyond the construction phase, and the text in the final EIS has been revised to indicate that impacts can be long term. Landowner agreements with the applicant are outside the scope of the EIS.	20243-204403-01
	Buresch, Michael	2024-04-23	Geohazards: The geotechnical assessment in the Environmental Assessment Worksheet (EAW) is cursory and inadequate. A CO ₂ pipeline in Satartia, MS, experienced a dangerous rupture because the ground it was in collapsed after some heavy rain. This could and should have been anticipated by the company if they had properly studied the region for geohazards and other geological risks. Minnesota shouldn’t make the same mistake.	Section 8.3.1.3 discusses the Satartia accident, including a table summarizing significant differences between the proposed project and the pipeline involved in the Satartia incident.	20243-204403-01
	Buresch, Michael	2024-04-23	Economic Benefits? Summit and its supporters are making big promises about the benefits to Minnesota’s rural communities—in employment, tax income, and economic growth—but provide very little credible evidence to back up these promises. Independent academics from the University of Iowa have pointed out that these claims overestimate the benefits and ignore the costs to rural communities, local governments, and the surrounding environment. <ul style="list-style-type: none"> • How many and what kind of jobs will this project really bring to local communities? Large projects like this usually bring skilled workers from outside the area and from out of state leaving mostly crumbs for the local economy beyond the restaurants, lodging and trailer parks. • What are the hidden costs—like the burdens on local government or community resources? Local governments are spending hours gathering information for Summit’s design efforts. Outside workers bring outside social problems as well. • Summit makes vague claims that local farmers will see huge revenue gains by getting access to lowcarbon fuel markets. Can those claims be backed up with real numbers? As a corn producer I will believe these claims when I see better market prices. • How will this project really impact the local tax base? Hard numbers are hard to guarantee, for example the Wind Energy Revenues for Jackson County are less than projected as the transmission capacity available to Jackson County Producers is less than in the past. Will Summit reduce or cut off some plants because others, closer to the destination increase their production or cut better deals reducing the value of a line or lines? 	Thank you for your comment.	20243-204403-01
	Buresch, Michael	2024-04-23	Who will be liable if there’s an accident with the pipeline or construction causes damage to the natural environment, farmland, or built structures?	Summit has stated that it would be responsible for 100 percent of costs in case of an accident. Sections 2.6 and 8.4 have been updated to clarify.	20243-204403-01
	Buresch, Michael	2024-04-23	CO ₂ Pipeline easements are granted in perpetuity in Minnesota, shouldn’t these easements have a finite life, like the life of the line, perhaps 50 years, at which time the pipeline operator will have to renegotiate or decommission the line? Is there a published plan describing how the line will be decommissioned at the end of its life? Abandoning it without filling the pipe with a medium like bentonite clay eventually allows potentially harmful ground water movement.	Section 2.7 describes project decommissioning. This section was revised to describe the financial assurances to be provided by the applicant for costs associated with decommissioning. Landowner agreements are outside the scope of the EIS.	20243-204403-01
	Bute, Marnie	2024-02-22	As a land owners in Wilkins county, my husband and I I oppose the construction of the carbon dioxide pipeline in northern Minnesota. This project raises significant environmental concerns, including the risk of leaks and potential harm to local ecosystems.	Thank you for your comment.	20243-204403-01
	Bute, Marnie	2024-02-22	We must prioritize sustainable solutions that protect our environment and communities for future generations. Have they thought about stop producing ethanol? This whole nightmare would go away. Government subsidies ethanol and now they subsidize carbon dioxide capture. Once that funding goes away this will also go away. We have so many other challenges, seems this one has not been thought through. Can’t even get a good answer about the storage of the gas and what Cannon will happen to it. Once the funding is no longer there and who would be responsible. There’s just way too much to unpack here and not enough answers . #NoToCO ₂ Pipeline #ProtectOurEnvironment	As stated in the final scoping decision, the appropriateness of federal and state policies regarding carbon capture and ethanol, including tax credits and other incentives, is outside the scope of the EIS.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Butler, Misty	2024-02-22	My name is Misty Butler. I live in rural Lac qui Parle county in Minnesota. I own some land and a pond out here, that we use recreationally. We invite friends and family to camp and swim in the pond from late spring to early fall and get great enjoyment from it. I care deeply about preserving the health of that pond and spend many hours a year maintaining it. As a result issues concerning water and water health are close to my heart and continually pique my interest. The proposed route for Summit's pipeline network includes many water crossings, wetlands, aquifers, and other sensitive water bodies. More research and analysis are needed to understand how CO ₂ disperses in water and what risks a CO ₂ pipeline leak or rupture poses to Minnesota's precious waters and the fish, amphibians, reptiles, waterfowl, birds, and insects that rely on it to survive.	Potential impacts of a pipeline rupture on water resources and wildlife are addressed in Section 8.3.4. Stand-alone studies concerning impacts on water resources, wildlife, and wildlife habitat are outside the scope of the EIS.	20243-204403-01
	Butler, Misty	2024-02-22	As I have watched our pond throughout recent years, I have noticed and been concerned about water levels and what the results of climate change and droughts. It has been very concerning to me to watch the water table drop throughout the year and it continues to be of concern. Much of southern Minnesota is suffering from the consequences of drought and overcommitment of our fresh drinking water supplies. The DEIS fails to discuss the impacts of an increase in water use on local water supply. The carbon capture process can double water requirements at a facility and increase toxic wastewater discharge. The DEIS states that Summit "anticipates" an average water use for the operation of the carbon capture equipment of 13 million gallons per year, which is concerningly ambiguous. There must be a careful and casespecific assessment done of how the installation and operation of carbon capture will impact current drought conditions and exacerbate existing pollution sources. Moreover, Summit has not finalized its water appropriation sources or volumes needed for construction, so it is impossible to know the full impacts of those appropriations on water resources. Why should Minnesota risk our fresh drinking water supply and commit to an infrastructure when the proposing company has not been transparent with its true demands for water resources?	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-01
	Carter, Kathy	2024-02-23	I am a landowner in northern Iowa (Floyd County), directly affected by the proposed Summit pipeline. A lot of us were taken very much by surprise in late 2021 when we received mailings that stated "we're going to put a pipeline through your property". Since then, we've learned a LOT. Way too much to go into detail here, but one of the main things is that, as a company, Summit excels at evading and spinning and being dishonest and non-transparent. We have a long list of instances that support that. Now, the company is failing to pay counties for inspection services that have been contracted.	Thank you for your comment.	20242-203795-01
	Carter, Kathy	2024-02-23	As for the environmental impact itself, let me tell you this: I have a narrow piece of ground they want to cross, and the ground contains both flood plain and a steep rise covered with mature oak , walnut, and pine trees. Summit claims they can bore under it all "without any surface disruption" and no damage to my 80+ year old oak trees. Yet, another landowner with a property very similar to mine, with just a narrow stream running through it, has been told that they will clear cut the band of trees bordering that stream. I have seen other instances where they have told landowners they will cut a strip; indeed, all the easement contract language indicates that, like natural gas lines, etc, all brush & trees would be cut and the easement must remain clear. This is in direct contradiction to Summit's claim that they will not damage my timber. Do I believe a thing Summit claims? Not after listening to them, reading hundreds of articles, and being a part of the Iowa Utilities Board permit hearing -- not on your life. Do NOT ALLOW SUMMIT TO PROCEED.	Thank you for your comment.	20242-203795-01
	Childers, Amy	2024-02-23	My name is Amy Childers. I am a resident of the Fergus Falls area. I have lived and worked here 17 years. I am an environmental scientist. I am concerned about the amount and quality of research done on the impact of this proposed pipeline to the Otter Tail River ecosystem and landscape. More analysis is needed on the impacts to the rivers and landscape. Also more research is needed into the effects on the groundwater resources of the area from construction to operation.	Thank you for your comment. Stand-alone studies concerning water resources are outside the scope of the EIS.	20243-204403-01
	Childers, Amy	2024-02-23	More information needs to be provided about the capture rate and actual efficiency of the process versus the ecological impacts to the area's natural resources. Much more research is needed into the efficiencies of the CO ₂ capture process and environmental impacts.	Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. A stand-alone study concerning carbon capture technology is outside the scope of the EIS.	20243-204403-01
	Christensen, Linda	2024-02-14	We moved to OTTER Tail COUNTY after retiring because of all the lakes and wetlands. We are very concerned about this Co2 pipeline. One possible line could be under Otter Tail river!!! According to DEIS a rupture would not impact our fish and wildlife. HOW DO THEY KNOW THIS????? Have they proved it elsewhere?	The Otter Tail River would be crossed via HDD. Potential impacts of a pipeline rupture on water resources and aquatic resources are addressed in Section 8.3.4.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Christensen, Linda	2024-02-14	From what I have read they also have said if this project is decommissioned they will not take responsibility for care of the pipes. Who will? Also what about the extra electricity. I have been told that it will double what the ethanol plant is now using. Who will pay for that??	Section 2.7 describes the decommissioning process. This section was revised to describe the financial assurances to be provided by the applicant for costs associated with decommissioning. Section 5.4.9 describes electricity use for the existing ethanol plant and the proposed project.	20243-204403-01
	Christensen, Ronald	2024-02-14	I am a retired truck driver spending my time fishing in summer and winter. It sounds to me that this pipeline could possibly ruin my retirement along with the lakes and wetlands that I enjoy. I am very concerned that rivers are in several of the pipelines. What happens if there is a rupture? What happens to the wild life?	The project's impacts on water resources are addressed in Section 5.7.8, and impacts on wildlife are addressed in Section 5.7.10. Chapter 8 addresses the potential for a pipeline rupture and associated impacts.	20243-204403-01
	Christensen, Ronald	2024-02-14	Their claim of 100% capture?? This is not supported by any data or information or third party. CO ₂ is a hazardous material in high concentrations. The DEIS consistently underplays the known and unknown risks of transporting CO ₂ in pipes with high pressure. I really believe that this is a very dangerous plan to all of us just to make Summit wealthy.	Thank you for your comment. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios of 100 percent, 70 percent, 40 percent, and 10 percent.	20243-204403-01
	Christenson, Brooke	2024-02-23	Hi my name is Brooke and I believe CO ₂ pipelines are still destructive and not a good solution to carbon emissions.	Thank you for your comment.	20243-204403-01
	Christenson, Jaci	2024-02-22	I am a full-time volunteer working for clean water, sustainable climate and upholding treaty rights. With 60% of Minnesota's iconic water impaired to the point that it is no longer safe to consume fish from and/or drink water from and/or swim in, it is past time that we address the current impacts and permit no more harm to our waters/wetlands.	Thank you for your comment.	20243-204403-01
	Christenson, Jaci	2024-02-22	Minnesota's recent experience with Line 3/93 tar sands pipeline construction demonstrates the serious harms that it causes on water resources, as well as a tendency by state agencies to underaccount for those impacts. I volunteer with Waadookaawad Amikwag, the multi-cultural community group of volunteers that is monitoring construction damages from Line 3/93 and have seen the damage firsthand in 60 field visits. Through thermal imaging and on the ground, field work we discovered aquifer breaches, frac outs, wetland destruction, threats to wild rice, remediation damages and dewatering and aquifer drawdown--all from construction. The Line 3 Environmental Impact Statement (EIS) and Enbridge were misleading/incorrect as to the impacts. Equally disturbing is the fact that all of these impacts were predicted/forewarned by scientists and Indigenous people but abhorrently ignored by Enbridge, Public Utilities Commission, the state agencies, Governor Walz and legislators. We would be remiss to ignore what we learned from L3/93 in evaluating CO ₂ pipelines. If we take these seriously into account, the conclusion is clear--no more pipelines through Minnesota's wetlands.	Thank you for your comment.	20243-204403-01
	Christenson, Jaci	2024-02-22	Dangers to water and water bodies: The proposed route for Summit's pipeline network includes many water crossings, wetlands, aquifers, and other sensitive water bodies. More research and analysis are needed to understand how CO ₂ disperses in water and what risks a CO ₂ pipeline leak or rupture poses to Minnesota's precious waters and the fish, amphibians, reptiles, waterfowl, birds, and insects that rely on it to survive.	Potential impacts of a pipeline rupture on water resources and wildlife are addressed in Section 8.3.4. Stand-alone studies concerning impacts on water resources, wildlife, and wildlife habitat are outside the scope of the EIS.	20243-204403-01
	Christenson, Jaci	2024-02-22	Water use: Much of southern Minnesota is suffering from the consequences of drought and overcommitment of our fresh drinking water supplies. The DEIS fails to discuss the impacts of an increase in water use on local water supply. The carbon capture process can double water requirements at a facility and increase toxic wastewater discharge. The DEIS states that Summit "anticipates" an average water use for the operation of the carbon capture equipment of 13 million gallons per year, which is concerningly ambiguous. There must be a careful and casespecific assessment done of how the installation and operation of carbon capture will impact current drought conditions and exacerbate existing pollution sources. Moreover, Summit has not finalized its water appropriation sources or volumes needed for construction, so it is impossible to know the full impact of those appropriations on water resources. Looking at Line 3/93 we saw that after construction began Enbridge asked for (and received) a 10-fold increase in their dewatering permit. Why should Minnesota risk our fresh drinking water supply and commit to an infrastructure when the proposing company (Enbridge, Summit or any other applicant) is not transparent with its true demands for water resources?	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has also been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-01
	Christenson, Jaci	2024-02-22	Aquifer Damage: Summit's preferred route, RA-South, crosses a surficial beach ridge aquifer in Otter Tail County. The DNR has said that the area is "prone to significant groundwater discharge," and the applicant's initial groundwater investigation confirmed that "artesian groundwater conditions are present" along that beach ridge system. In early feedback on the DEIS, the DNR noted that "Project construction has the potential to intersect shallow confined groundwater potentially causing a breach in a confined aquifer	Section 5.7.8.2 acknowledges that damage to aquifers is a serious problem and indicates that an uncontrolled flow of water from a shallow confined aquifer could have a significant, long-term impact on groundwater. Section 5.7.8.2 also describes geotechnical investigations	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			and that “breaching shallow confined aquifers could have significant long-term impacts to groundwater resources.” This, along with our state’s first-hand knowledge of how damaging pipelines can be, requires that the DEIS take potential damage to aquifers more seriously. Waadookawaad Amikwag has documented the impacts to wetland ecosystems from aquifer breaches. Water samples collected upstream and downstream of the breached aquifer (and analyzed at an accredited lab) verify the hydrological changes and altered natural composition of the wetland. Enbridge was excused from meaningful geological/hydrological investigation and as a result we have 4 verified aquifer breaches and Waadookawaad Amikwag is investigating more.	that would be done to identify areas where breaching of a shallow confined aquifer could occur, and sheet piling would not be used. The applicant currently has an ongoing groundwater investigation underway to further inform construction practices and is continuing to consult with DNR. As part of its coordination with DNR, the applicant has agreed to use ground penetrating radar to study the depth of the confining layer through the entire beach ridge system area crossed by the pipeline to further define existing conditions and advise on construction methodology. Furthermore, EERA staff recommends that the applicant develop, in coordination with DNR, a plan for pipeline construction in areas crossing the beach ridge system area. The plan would include, at a minimum, measures to minimize the potential for breaching a shallow confined aquifer during trenching and contingency measures to mitigate the impacts of a breach, should one occur. This information has been added to Section 5.7.8.2.	
	Christenson, Jaci	2024-02-22	HDD Drilling: The DEIS also states that “drilling mud mixed with additives that are not on the MDH-approved additive list and/or do not meet [drinking water quality certification standards] would be disposed of as solid waste at an approved facility, or the applicant would obtain a land application permit from MPCA.” The DEIS does not discuss the risks of applying drilling mud, especially with additives not approved by MDH, to the land. The DEIS says that “drilling fluids and additives for the HDD would be non-toxic to the aquatic environment and humans,” however, even supposedly “non-toxic” drilling fluid is chemical waste that has been found to be harmful to plant and animal species. Summit’s preferred route and alternative route, RA-Hybrid, would both cross three rivers (Pelican River, Otter Tail River, and Bois de Sioux River) via the HDD mention. Enbridge and the L3/93 EIS minimized the rate of Horizontal Directional Drilling (HDD) failure and frac out of drilling mud, when in actuality frac outs occurred in 67% of the water crossings. In the Line 3/93 HDD crossing of East Savanna River, there were 6 frac outs--clearly a terrible place to put a pipeline.	As described in Section 5.7.8.2, an additive approved by MDH or meeting NSF International/ANSI Standard 60, Drinking Water Treatment Chemicals – Health Effects, might need to be mixed with the drilling mud for viscosity or lubricating reasons and to reduce the potential for an inadvertent release or failed HDD. The specific additive used would depend on the conditions at the crossing location and would be determined by the HDD contractor. The EIS discloses the potential for an inadvertent release of drilling mud and describes potential impacts in Chapter 5. Land application of drilling mud and potential impacts are addressed in Section 5.7.6.2.	20243-204403-01
	Christenson, Jaci	2024-02-22	Wetlands: In Table 5-40 on p. 5-98 of the DEIS it states that “the loss of wetlands would be less than 0.01 acre.” However, Table 5-4 on p. 5-24 says that for Summit’s preferred route, operation impacts are expected to be 3.3 acres, and construction impacts are expected to be 4.7 acres. And Table 5-52 on p. 5-143 suggests that the total construction impact on wetlands for RA-South is 2.7 acres. Which is it?? And let’s start treating wetlands and water as the incredible resource that it is.	Discrepancies between Table 5-4 and Table 5-54 result from different datasets and their associated resolutions. Table 5-4 uses NLCD data to analyze land cover and Table 5-54 uses NWI data to analyze wetlands. Table 5-40 has been edited to be consistent with discussions of impacts on wetlands in Section 5.7.9 and Table 5-53 and Table 5-54.	20243-204403-01
	Collins, Kathryn Flaig	2024-02-19	I am writing in opposition to construction of the proposed Summit Carbon Recapture Pipeline in Redwood County. As a citizen with land in the area near the pipeline, I am concerned about the safety of this project. The pipeline is projected to go across or near land with multiple waterways, including the Redwood River, Coalmine Creek (which crosses my land), and the Cottonwood River. The pipeline would use technology that has not been proven to be effective and safe. A pipeline leak would not only create hazards through the air but could pollute waterways and make the water acidic. An accidental release of carbon dioxide under high pressure into the air or water would be detrimental to human, animal and plant life in the area.	Thank you for your comment. The commenter references an area in Redwood County. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS. Risks of a potential CO ₂ release and potential impacts on humans and aquatic environments are described in Chapter 8 of the EIS.	20243-204403-01
	Collins, Kathryn Flaig	2024-02-19	Although the building of the pipeline would create a short term boost to the economy, its main benefit would be to ethanol producers and oil companies. According to ethanol promotional literature, companies plan to use the carbon credits gained to make additional ethanol, thus creating more carbon pollution. There are safer ways to remove CO ₂ from the atmosphere. Planting trees and/or planting carbon removing plants between row crop plants would be much safer ways to remove excess carbon dioxide.	The EIS analyzes the proposed project, including alternatives that lower the CI score of the ethanol produced at the ethanol plant. An alternative that does not include ethanol production was not studied in the EIS because it would not meet the purpose of the project.	20243-204403-01
	Collins, Kathryn Flaig	2024-02-19	Please do not risk environmental devastation in Redwood County for the benefit of short term economic gains of a few companies and their shareholders. Those most likely to gain from the pipeline are those who wish to continue polluting the atmosphere of our planet through the production of additional ethanol and/or promotion of continued use of petroleum products. The citizens of Minnesota and Redwood County, in particular, deserve better. Vote no to the construction of Summit’s Carbon Recapture Pipeline. Thank you for your attention to this matter.	Thank you for your comment. The commenter references an area in Redwood County. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Coppin, Loni	2024-02-23	With so much air and water pollution today, and the climate crisis that is having more major impacts than ever, I am concerned that this Draft Environmental Impact Statement does not go far enough.	Thank you for your comment.	20243-204403-01
	Coppin, Loni	2024-02-23	My first concern about possible hazardous impacts has to do with the construction of the pipeline itself. Not enough attention is being given to pipeline construction, and this has resulted in recent aquifer breaches. Also, any breach of oil in a pipeline is going to be very harmful to agricultural land, to other ecosystems and its non-human inhabitants, and to the water. We cannot afford to have more land and water compromised because of pipeline breaches.	Section 5.7.8.2 acknowledges that damage to aquifers is a serious problem and indicates that an uncontrolled flow of water from a shallow confined aquifer could have a significant long-term impact on groundwater. Section 5.7.8.2 also describes geotechnical investigations that would be done to identify areas where breaching of a shallow confined aquifer could occur, and sheet piling would not be used. The applicant currently has an ongoing groundwater investigation underway to further inform construction practices and is continuing to consult with DNR. As part of its coordination with DNR, the applicant has agreed to use ground penetrating radar to study the depth of the confining layer through the entire beach ridge system area crossed by the pipeline to further define existing conditions and advise on construction methodology. Furthermore, EERA staff recommends that the applicant develop, in coordination with DNR, a plan for pipeline construction in areas crossing the beach ridge system area. The plan would include, at a minimum, measures to minimize the potential for breaching a shallow confined aquifer during trenching and contingency measures to mitigate the impacts of a breach, should one occur. This information has been added to Section 5.7.8.2.	20243-204403-01
	Coppin, Loni	2024-02-23	Another concern has to do with CO ₂ emissions. It seems to me that not enough analysis has been done to fully understand the level of harmful CO ₂ emissions to both victims and rescue workers should there be a breach in a pipeline.	Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that would be revised as required by PHMSA, if the project is approved. Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.	20243-204403-01
	Coppin, Loni	2024-02-23	At this time on Earth, we must do everything we possibly can to safeguard the air, water, and land. That means we must stop building those projects that can cause more harm than good. Attempting to find carbon capture solutions that have not been proven so far to be as viable as they claim does not give us the right to continue with "business as usual."	Thank you for your comment.	20243-204403-01
	Daly, Mike	2024-02-23	I, Mike Daly, am a retired engineer who lives in the Wolf Carbon Capture pipeline corridor that is proposed for Eastern Iowa. What Summit pipeline accomplishes in the Midwest will set precedence for what Wolf and subsequent pipelines encounter. That is why I am concerned about the DEIS for the Otter tail to Wilkin County statement. I have been studying the Carbon capture technology and pipeline build out for the last 3 years. It seems that many government officials rely on what they think is the expertise of the pipeline companies like Summit. This is a new technology, and the pipeline companies exhibit a bold and rash persona of expertise concerning the Carbon Capture technology. One way to verify what they boast of as factual is to demand extensive testing and unbiased research. As I read through Summits documentation and the DEIS, I notice statements that seem factual but may be only half-truth and misleading.	Thank you for your comment.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Daly, Mike	2024-02-23	<p>This pipeline should not be approved without a clear understanding of the risks to human health and meaningful measures to ensure the safety of people and animals in the area. The DEIS does not mention any meaningful safety measures for a rupture and instead suggests that it is “reasonable” for Summit to simply supply indoor CO₂ detectors for residences within 1,000 feet of the project.</p> <p>The DEIS does not consider the burdens this will put on local EMS and health providers in the case of a pipeline rupture or accident or an assessment of how they should be prepared to respond given the unique needs. The DEIS includes Summit’s September 2022 Emergency Response Plan (Appendix N). This plan is not only outdated but also unclear as to how local EMS and first responders will interact with the applicant in the event of a leak or rupture.</p>	Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that is not outdated but would be revised as required by PHMSA, if the project is approved. Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.	20243-204403-01
	Daly, Mike	2024-02-23	The DEIS states that the PUC “cannot set safety standards” for Summit’s proposed pipeline. PHMSA has expressly said in public that state and local authorities can exercise their powers to regulate land use—including setback distances. The PUC must consider where the pipeline is placed and what is the safest option for Minnesotans, which means the PUC can and should determine what routing, setback, and depth requirements are necessary to adequately protect Minnesotans.	Although the Commission cannot set safety standards for pipeline construction or operation, state or local units of government may, to the extent authorized by law, set land use requirements that indirectly contribute to pipeline safety by regulating the activities of third parties located in the pipeline’s vicinity. The Commission’s obligation is to identify a pipeline route consistent with the criteria found in statutes and the applicable administrative rules. Federal law, by contrast, exclusively prescribes pipeline safety requirements. Section 3.4 of the EIS has been revised with this information.	20243-204403-01
	Daly, Mike	2024-02-23	This project is going to cut through roads, ditches, tile lines, and prime farmland. The pipeline projects in the Midwest have caused yield reduction and damage to land years after project completion and “restoration”.	Thank you for your comment. As indicated by the definitions found on Page 5-1 of the draft EIS, “long-term impacts extend beyond the end of construction and are generally associated with operation of the project.” Disturbance to soils and crops from construction can result in impacts that extend beyond the construction phase, and the text in the final EIS has been revised to indicate that impacts can be long term.	20243-204403-01
	Daly, Mike	2024-02-23	The DEIS concludes a leak of CO ₂ “would slow plant growth” and that the rupture of the pipeline would instantly freeze the surrounding soil and “instantly kill all herbaceous ground vegetation” but provides no measures to avoid these impacts, nor does it discuss the long-term impacts of such damage on the soils and vegetation.	Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. EERA staff recommended special permit conditions to avoid impacts of a potential CO ₂ release, as described in Section 8.5.3. Section 8.3.4.3 has been revised to include language regarding potential long-term effects of freezing on soils and vegetation.	20243-204403-01
	Daly, Mike	2024-02-23	The DEIS acknowledges that “soil compaction would be unavoidable. that even if soils were decompacted, “some compacted soils could remain.” Soil compaction can have serious consequences in terms of water infiltration and drainage and should not be dismissed as an insignificant impact.	Section 5.7.8.2 indicates that groundwater recharge could be impacted by soil compaction. Section 5.7.6 explains that the applicant would comply with required permits and implement its Minnesota ECP and Minnesota APP, which would minimize impacts on soils. The text in Section 5.7.6 has been revised to indicate that while most impacts on soils during construction would be minimal and temporary, some impacts could be long term..	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Daly, Mike	2024-02-23	The DEIS fails to discuss the impacts of an increase in water use on local water supply. The carbon capture process can double water requirements at a facility and increase toxic wastewater discharge. The DEIS states that Summit “anticipates” an average water use for the operation of the carbon capture equipment of 13 million gallons per year, which is disconcertingly ambiguous. Why should Minnesota risk fresh drinking water supply and commit to an infrastructure when the proposing company has not been transparent with its true demands for water resources?	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-01
	Daly, Mike	2024-02-23	In early feedback on the DEIS, the DNR noted that “Project construction has the potential to intersect shallow confined groundwater potentially causing a breach in a confined aquifer and that “breaching shallow confined aquifers could have significant long-term impacts to groundwater resources.” This, along with our state’s first-hand knowledge of how damaging pipelines can be, requires that the DEIS take potential damage to aquifers more seriously.	Section 5.7.8.2 acknowledges that damage to aquifers is a serious problem and indicates that an uncontrolled flow of water from a shallow confined aquifer could have a significant long-term impact on groundwater. Section 5.7.8.2 also describes geotechnical investigations that would be done to identify areas where breaching of a shallow confined aquifer could occur, and sheet piling would not be used. The applicant currently has an ongoing groundwater investigation underway to further inform construction practices and is continuing to consult with DNR. As part of its coordination with DNR, the applicant has agreed to use ground penetrating radar to study the depth of the confining layer through the entire beach ridge system area crossed by the pipeline to further define existing conditions and advise on construction methodology. Furthermore, EERA staff recommends that the applicant develop, in coordination with DNR, a plan for pipeline construction in areas crossing the beach ridge system area. The plan would include, at a minimum, measures to minimize the potential for breaching a shallow confined aquifer during trenching and contingency measures to mitigate the impacts of a breach, should one occur. This information has been added to Section 5.7.8.2.	20243-204403-01
	Daly, Mike	2024-02-23	According to the DEIS, CO ₂ leaks would not affect mammals, birds, reptiles, amphibians, and insects and would be unlikely to impact fish and freshwater mussels. The DEIS reaches this conclusion without providing any reasoning or supporting evidence. Though the DEIS does note some harm may come to animals in the event of a rupture, it relies heavily on the assumption that animals will simply move out of the rupture area to avoid the release. The reason for this assumption is not provided and is contradicted by information in the rupture report in Appendix G which suggests the impacts of a rupture would be nearly immediate.	CO ₂ is a widespread, naturally occurring gas and is the primary byproduct of respiration—the conversion of sugars to usable energy. Minor leaks of CO ₂ from operation of the proposed pipeline would not elevate ambient CO ₂ to a level that is detrimental to local vegetation or wildlife. Potential impacts on wildlife from a CO ₂ rupture could result first from the physical force of a rupture and secondarily from localized short-term high levels of CO ₂ prior to dispersal and extreme cold temperatures associated with the depressurization of the CO ₂ from a supercritical state to a gas. Chapter 8 of the EIS acknowledges that wildlife in the immediate vicinity of a rupture might be killed or injured by this force; however, it is expected that most mobile wildlife species would follow their natural instincts and would attempt to escape the direct effect of a rupture. Chapter 8 of the EIS also acknowledges that less-mobile species in the immediate vicinity of the point of a rupture would be less likely to escape the impacts and might be killed or injured. The data presented in Appendix G describes models of dispersal patterns in the immediate vicinity of a rupture. These models support the statements in Chapter 8 that wildlife in the immediate vicinity of a	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				rupture might be exposed to high levels of CO ₂ , which could be toxic for species unable to leave the area of the release.	
	Daly, Mike	2024-02-23	Summit states that the capture facility “is designed to capture 100% of the CO ₂ produced by the ethanol plant.” There is no carbon capture facility in the world, ethanol or otherwise, that captures carbon at a rate of 100%. This claim is not supported by any data/information or verified by a third party.	Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities.	20243-204403-01
	Daly, Mike	2024-02-23	Additionally, the DEIS should emphasize that any CO ₂ capture is solely associated with emissions from the ethanol fermentation process and provides zero reductions on the significant emissions from the facility’s electricity use. Carbon capture technologies are highly energy intensive and will significantly increase the carbon emissions at the facility from electricity use. The DEIS uses the Midwest Reliability Organization West Region average to calculate these emissions, which is unnecessarily inaccurate given the availability of the actual emissions factor from Great River Energy.	Section 2.1 of the EIS has been revised to clarify that the captured CO ₂ is produced by the ethanol plant as part of its fermentation process, the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. Section 6.3 describes energy efficiency and energy alternatives that could reduce emissions from the ethanol plant's electricity and process fuel use. Electricity emissions are included in Table 5-39. These numbers have been revised to reflect the electricity emission factor associated with LREC, which would provide electricity to the project. The revised electricity emission factor is 132.2 g CO ₂ e/MWh. Because LREC has a lower emission factor than the Midwest Reliability West Region emission factor (684.35 g CO ₂ e/kWh), which was used in the draft EIS, calculated electricity emissions have decreased.	20243-204403-01
	Daly, Mike	2024-02-23	<p>The DEIS assumes 100% of captured CO₂ is being permanently stored underground. There is no guarantee that this will occur and no explanation of the monitoring and verification protocols that would ensure it.</p> <p>The DEIS fails to explain whether the applicant can sell any of its captured CO₂ to others for alternative uses instead of permanent sequestration and what the impacts of that would be. The DEIS incorrectly states that “Production of oil through EOR would not be dependent on the availability of CO₂ produced by the ethanol plant.” This claim is contradicted by countless public statements from public officials in North Dakota and oil industry representatives.</p>	The text questioned by the commenter in Section 5.7.2.3 was prefaced with the following: "if all the CO ₂ produced by the ethanol plant is sequestered as proposed, EOR would likely continue in North Dakota using other sources of CO ₂ , other gases, thermal methods, or chemical methods." Revisions are not necessary. However, Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR. Text has been added to Section 2.1 describing the suitability of the Broom Creek Formation in North Dakota for CO ₂ sequestration, as well as the monitoring and testing that would be done to verify that the CO ₂ is contained in the storage reservoir.	20243-204403-01
	Daly, Mike	2024-02-23	The DEIS states that during operation the proposed project will require about 38,501,733 kilowatt hours per year, and that this amount is “not anticipated to require the addition of power generation capacity.” However, the DEIS fails to clearly state how much electricity the ethanol refinery is currently using. For that information, the public must look in Appendix I. The DEIS does not explain how this doubling of the electricity use at the ethanol refinery will impact overall electricity for Lake Region Electric Cooperative. Who is paying for that electricity? Summit or the ethanol facility? And if the latter, will those cost increases be passed on to producers or other member-owners?	Section 5.4.9.2 contains relevant information regarding how LREC would support the project. This section has been updated to indicate that the applicant is solely responsible for necessary infrastructure upgrades (see Appendix I, Supplemental Information Inquiry 13 response and email from LREC).	20243-204403-01
	Daly, Mike	2024-02-23	In addition to the direct impacts of the 28 miles of pipeline included in Summit’s application, the DEIS does not account for the indirect and cumulative impacts of Summit’s entire project in Minnesota. This is despite Summit’s clear and public plans for a much larger buildout in Minnesota and recent statements that they will be applying for permits for additional parts of the network imminently. Allowing Summit to artificially segment permitting requests for multiple concurrent projects on one pipeline will prevent a thorough review of the cumulative impacts and potential environmental and climate damages of the project.	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01
	Daly, Mike	2024-02-23	Neither Minnesota’s state agencies nor Summit has any experience building, operating, or overseeing CO ₂ pipelines or carbon capture projects. The claims in the DEIS that this pipeline will have “minimal impact” across the board are unsupported by the existing evidence about carbon pipelines and pipeline construction generally. We need a careful analysis and credible assessment of how this project could affect our homes, lands, waters, and communities.	Thank you for your comment.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Darst, Wendy	2024-02-23	Hello- Carbon capture is an unproven process- and we know this process will enhance fossil fuel use through "Enhanced Oil Recovery" rather than moving us away from deadly technologies, while endangering land and communities across the Midwest.	Thank you for your comment.	20243-204403-01
	DeGier, Kenneth	2024-02-22	Before we start digging, we need to ask the question, do we really need to take out CO ₂ from the air? The answer is no. We are at some of the lowest concentrations of CO ₂ in the earth's atmosphere ever recorded. Why do we need to dig up and put pipes in God's earth that are not necessary? Putting in the pipeline will add more CO ₂ in the atmosphere not justifying the putting in the pipeline. The squeeze is not worth the juice.	Thank you for your comment.	20243-204403-01
	DeGross, Lydia	2024-02-23	My name is Lydia DeGross. I'm 18 years old and I live in South Minneapolis. I am worried about the impact climate change will have on my future, animals, and those who are most vulnerable to its effects. I know pipelines have a history of leaks that cause significant damage to the surrounding environment, so I expect a robust environmental impact assessment.	Thank you for your comment.	20243-204403-01
	DeGross, Lydia	2024-02-23	I believe the DEIS for this pipeline is insufficient. Neither Minnesota's state agencies nor Summit has any experience building, operating, or overseeing CO ₂ pipelines or carbon capture projects. The DEIS does not account for the indirect and cumulative impacts of Summit's entire project in Minnesota.	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01
	DeGross, Lydia	2024-02-23	The claims in the DEIS that this pipeline will have "minimal impact" and that CO ₂ leaks would be unlikely to impact mammals, birds, reptiles, amphibians, insects, fish, and freshwater mussels, are unsupported by evidence. The DEIS fails to mention any negative impacts from construction on the ecosystem.	Chapter 5 discusses general project impacts on fish and wildlife. Chapter 8 provides a detailed, referenced discussion of the potential impacts on fish and wildlife posed by CO ₂ leaks and a CO ₂ pipeline rupture.	20243-204403-01
	DeGross, Lydia	2024-02-23	There is inconsistency in the reported impact on wetlands. In Table 5-40 on p. 5-98 of the DEIS, it states that "the loss of wetlands would be less than 0.01 acre." However, Table 5-4 on p. 5-24 says that for Summit's preferred route, operation impacts are expected to be 3.3 acres, and construction impacts are expected to be 4.7 acres. Table 5-52 on p. 5-143 suggests that the total construction impact on wetlands for RA-South is 2.7 acres.	Discrepancies between Table 5-4 and Table 5-54 result from different datasets and their associated resolutions. Table 5-4 uses NLCD data to analyze land cover and Table 5-54 uses NWI data to analyze wetlands. Table 5-40 has been edited to be consistent with discussions of impacts on wetlands in Section 5.7.9 and Table 5-53 and Table 5-54.	20243-204403-01
	DeGross, Lydia	2024-02-23	Summit states that the capture facility "is designed to capture 100% of the CO ₂ produced by the ethanol plant." There is no carbon capture facility in the world, ethanol or otherwise, that captures carbon at a rate of 100%. This claim is not supported by any data/information or verified by a third party.	Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. Section 2.1 has been revised to clarify that the captured CO ₂ is produced by the ethanol plant as part of its fermentation process, the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. Section 6.3 describes energy efficiency and energy alternatives that could reduce emissions from the ethanol plant's electricity and process fuel use.	20243-204403-01
	DeGross, Lydia	2024-02-23	This project poses a threat to public safety and health, agriculture, ecosystems, and water. CO ₂ is dangerous at high concentrations and those in the rupture impact zone are at risk. The DEIS does not mention any meaningful safety measures for a rupture and instead suggests that it is "reasonable" for Summit to simply supply indoor CO ₂ detectors for residences within 1,000 feet of the project. According to the PHMSA, the current emergency response requirements for this project are dangerously outdated. The PUC must determine what routing, setback, and depth requirements are necessary to adequately protect Minnesotans.	The draft EIS discusses PHMSA rules, regulations, and the pending rulemaking process PHMSA is undertaking for CO ₂ pipelines and acknowledges pending PHMSA changes to such regulations (see draft EIS, Chapter 3, Chapter 8, and Appendix G). PHMSA regulations (that is, their appropriateness) and related standards for CO ₂ pipelines are outside the scope of the EIS (Appendix A). Although the Commission cannot set safety standards for pipeline construction or operation, state or local units of government may, to the extent authorized by law, set land use requirements that indirectly contribute to pipeline safety by regulating the activities of third parties located in the pipeline's vicinity. The Commission's obligation is to	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				identify a pipeline route consistent with the criteria found in statutes and the applicable administrative rules. Federal law, by contrast, exclusively prescribes pipeline safety requirements. Section 3.4 of the EIS has been revised with this information.	
	DeGross, Lydia	2024-02-23	This pipeline will cause yield reduction and damage to prime farmland, yet the DEIS fails to identify any measures the applicant should take to avoid these damages or repair them. Summit’s preferred route for this pipeline would impact significantly more acres of prime farmland across both the construction footprint and the operation footprint of the proposed project than the proposed alternatives.	While the applicant's preferred route, RA-South, was calculated to have the highest percent of prime farmland within the footprint (0.3 percent and 0.6 percent higher than RA-North for operation and construction footprint, respectively), the total acres of prime farmland in both construction and operation footprint for RA-South is greater than the total acres for RA-North and less than the total acres for RA-Hybrid. Additionally, impacts and mitigation to prime farmland and soils are discussed in sections 5.5.1.3 and 5.7.6.3.	20243-204403-01
	DeGross, Lydia	2024-02-23	A leak would kill plants, yet the DEIS provides no measures to avoid these impacts, nor does it discuss the long-term impacts of such damage on the soils and vegetation.	Impacts on vegetation are discussed in Section 8.3.4.3. Section 8.5 describes the steps that would be taken to help prevent an accidental release.	20243-204403-01
	DeGross, Lydia	2024-02-23	More research and analysis are needed to understand how CO ₂ disperses in water and what risks a CO ₂ pipeline leak or rupture poses to Minnesota’s precious waters and the fish, amphibians, reptiles, waterfowl, birds, and insects that rely on it to survive. Project construction has the potential to cause a breach in a confined aquifer which could have significant long-term impacts on aquifers.	Potential impacts of a pipeline rupture on water resources and wildlife are addressed in Section 8.3.4. Stand-alone studies concerning impacts on water resources, wildlife, and wildlife habitat are outside the scope of the EIS.	20243-204403-01
	DeGross, Lydia	2024-02-23	The proposed route for Summit’s pipeline network includes many water crossings, wetlands, aquifers, and other sensitive water bodies while going through prime farmland and ecosystems. Given pipelines’ high potential to leak or rupture this project puts animals, the environment, and people’s health in danger.	Impacts on water resources are discussed in Section 8.3.4.1. Section 8.5 describes the steps that would be taken to help prevent an accidental release.	20243-204403-01
	DeGross, Lydia	2024-02-23	Additionally, carbon capture technologies are highly energy intensive and will significantly increase the carbon emissions at the facility from electricity use. Given our current climate and biodiversity crisis, we need a careful analysis and credible assessment of how this project could affect our homes, lands, waters, and communities. This will require more research and evidence to back up all claims.	Electricity use is described in Section 5.4.9.	20243-204403-01
	Dircks, Lisa	2024-04-23	NO to CO ₂ Pipelines!!! Private Companies taking land for personal gain is Wrong !! All these Companies want is the money grab in the Inflation Reduction Act. They don't care about the danger these Pipelines have or land they will ruin. I am in Iowa trying to stop these and we need to STOP them everywhere!!!	Thank you for your comment.	20243-204403-01
	Dornfeld, Tess	2024-02-23	As a fourth generation Minnesotan, I'm very concerned about the impacts and risks that this proposal, and the larger project it is clearly part and parcel of, pose to our water resources in particular, as well as important farmland, rural communities, and emergency responders. The DEIS needs to thoroughly account both for the recent and ongoing drought conditions in the state, and future projections. We know these conditions are only going to get more extreme and unpredictable. A guess at 20 million gallons of water every year is a huge commitment and needs to be analyzed carefully for the lifetime of the project. The risks to water resources in the construction process are also not addressed sufficiently, especially given our recent experience in the state of aquifer breaches from pipeline construction. Obviously past permitting processes have not been robust enough and groundwater and aquifer damage needs to be treated seriously from the start.	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-01
	Dyce, Darwin	2024-02-22	What follows are just a few of my concerns regarding Draft Environmental Impact Statement (DEIS) for the Otter Tail to Wilkin CO ₂ Pipeline Project. Summit’s application misleads and skirts around vital information pertaining to environmental and human impact of the CO ₂ Pipeline, because such considerations interfere with their profit margin. I urge the PUC to look seriously at the human and environmental concerns that arise with the CO ₂ Pipeline. We all know that such a pipeline can and will break. I have many friends who are First Responders and would arrive on the scene to protect the public when such breaks occur. Adequate information to provide basic protections to First Responders does not exist in this plan. A pipeline rupture releases CO ₂ that is both colorless and odorless. First Responders do not have the necessary equipment to deal with a pipeline break, nor is there a plan for communities to obtain additional funding to acquire such equipment. Although	Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			the plan speaks to multiple company personnel as playing roles in an emergency response, it ignores the fact that it has only one full-time employee at the capture facility. First responders deserve more information and equipment to respond to such an event. Their lives and the lives of others are at stake.	Emergency Response Plan included as Appendix N is a draft plan that would be revised as required by PHMSA, if the project is approved. Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.	
	Dyce, Darwin	2024-02-22	The application speaks to 28 miles of pipeline, yet the DEIS conveniently ignores the indirect and cumulative impacts of the entire project, a project that clearly is intended to expand. Segment permitting for multiple projects prevents a thorough review of the cumulative impacts and potential environmental and climate damages of the project.	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01
	Dyce, Darwin	2024-02-22	It is also apparent that Summit will likely have no responsibility to monitor or maintain once the pipeline is decommissioned.	Section 2.7 describes project decommissioning. This section was revised to describe the financial assurances to be provided by the applicant for costs associated with decommissioning.	20243-204403-01
	Dyce, Darwin	2024-02-22	We are increasingly dependent upon ever decreasing sources of clean water. Native Americans are correct in pointing out Mni Wiconi (Water is life). The DEIS fails to discuss the impacts of an increase of water use on an already dwindling supply. The carbon capture process can double water requirements at a facility, in addition it will increase toxic wastewater discharge. Summit has not been transparent about water related issues. It has not finalized its water appropriation sources or volumes needed for construction. It is not in the best interests of Minnesotans to allow fresh drinking water to be put at risk.	Impacts on water resources are discussed in section 5.7.8. Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-01
	Dyce, Darwin	2024-02-22	Our state has first-hand knowledge of how damaging fractured pipelines can be. The DEIS must consider more seriously the damage that can occur to aquifers. Breaching shallow aquifers has long term groundwater impacts. In addition, it is unwise to ignore the impact of harmful drilling fluid on plants and animals. Summit’s preferred route crosses 3 rivers magnifying risk. The DEIS ignores far too many risks to critical habitats and wetlands. As I said these are just a few of my concerns. Looking out for present and future generations is your charge, I urge you not to give a green light to this project.	Groundwater impacts and mitigation are addressed in Section 5.7.8.2. Land application of drilling mud and potential impacts are addressed in Section 5.7.6.2.	20243-204403-01
	Erickson, Stephen	2024-02-23	We do not need more pipelines!	Thank you for your comment.	20243-204403-01
	Fischer, Simona	2024-02-12	I am an architect and sustainability expert with projects around the state of Minnesota, and I know how difficult it is to track the impact of buildings and infrastructure projects. I am concerned that the DEIS has issued an oversimplified statement that falsely minimizes the potential impact of a CO ₂ pipeline in two areas The application inaccurately claims that the capture facility “is designed to capture 100% of the CO ₂ produced by the ethanol plant.” There is no carbon capture facility in the world, ethanol or otherwise, that captures carbon at a rate of 100%. This claim is not supported by data or verified by a third party.	Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios for 100 percent, 70 percent, 40 percent, and 10 percent.	20243-204403-01
	Fischer, Simona	2024-02-12	Also, carbon capture technologies are energy intensive due to electricity use. The DEIS calculation is oversimplified and omits actual emissions factors that are from Great River Energy.	Electricity emissions are included in Table 5-39. These numbers have been revised to reflect the electricity emission factor associated with LREC, which would provide electricity to the project. The revised electricity emission factor is 132.2 g CO ₂ e/MWh. This was calculated from LREC’s energy resource mix in which nearly half comes from clean energy sources. Because LREC has a lower emission factor than the Midwest Reliability West Region emission factor (684.35 g CO ₂ e/kWh),	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				which was used in the draft EIS, calculated electricity emissions have decreased.	
	Fischer, Simona	2024-02-12	The DEIS also fails to discuss the impacts of an increase in water use on local water supply to surrounding communities. The carbon capture process can double water requirements at a facility and increase toxic wastewater discharge.	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-01
	Fischer, Simona	2024-02-12	The proposed route for Summit’s pipeline network also includes water crossings, wetlands, aquifers, and other sensitive water bodies. More research and analysis are needed to understand how CO ₂ disperses in water and what risks a CO ₂ pipeline leak or rupture poses to Minnesota’s waters and the wildlife ecosystems that will be affected.	Potential impacts of a pipeline rupture on water resources and wildlife are addressed in Section 8.3.4. Stand-alone studies concerning impacts on water resources, wildlife, and wildlife habitat are outside the scope of the EIS.	20243-204403-01
	Fischer, Simona	2024-02-12	Minnesotans deserve a comprehensive, science-based review of impacts of any proposed pipeline, and frankly, there are dozens of better climate solutions out there that are better than fast-tracking a poorly conceived pipeline project without proper vetting.	Thank you for your comment.	20243-204403-01
	Flaig, Patricia & Jean	2024-02-19	As part owners of farmland in Redwood County, we are writing to voice our opposition to the pressurized pipeline proposal put forth by Summit Carbon Solutions. The reasons for opposition center around its impact on the environment as well as climate. 1) While capturing carbon dioxide might seem like a positive step, using it to help or promote other businesses to produce more carbon dioxide such as the fracking in North Dakota results in a net zero gain in the struggle to improve air quality and in the fight to reduce negative effects on climate. It does not appear to address the issue of simply reducing the amount of carbon dioxide released into the air.	Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	20243-204403-01
	Flaig, Patricia & Jean	2024-02-19	2) Approval of this proposal would promote more ethanol production and subsequently more carbon dioxide. It takes a great deal of energy to produce ethanol, so this “green solution” is not really a solution.	Thank you for your comment.	20243-204403-01
	Flaig, Patricia & Jean	2024-02-19	3) Transporting captured carbon dioxide in a pressurized pipeline through prime farmland and essential rivers, streams and aquifers creates a huge potential for an ecological disaster. a. Even a small leak into the ground could destroy vegetation. This begs the question of how long would it take to restore this production land, and what do farmers and those who rely on farmers do while waiting for safe restoration to occur. b. It is our understanding that when carbon dioxide is dissolved in water, it creates an acidic liquid which when leaked into waterways would deplete the oxygen and subsequently kill all plant and animal life. These waterways are a part of a larger watershed so the potential harm would not necessarily be localized. c. An explosion of a pressurized pipeline could endanger all those living in the area. d. An ecological or environmental disaster usually takes specialized teams and equipment to contend and contain the situation. Rural areas and surrounding small farming communities do not have those resources nor the financial wherewithal to acquire them on short notice.	Chapter 8 describes the risk of a CO ₂ release and potential impacts.	20243-204403-01
	Flaig, Patricia & Jean	2024-02-19	4) The use of taxpayers money via tax credits needs to be refocused. Tax credits should be given to companies who reduce their emissions and not those who simply shift them around. Also, farmers should be included. Tax monies could be used to educate farmers about carbon farming and incentives given to those who incorporate it into their overall operation. Farmers and communities could be given financial help to create and maintain more green spaces in and around their farms and communities. As the saying goes, “it takes a whole village,” or in this case, it takes a whole county or state to make sure life on this planet is sustainable. We can not ignore the Common Good, that which is good for all. The people of Redwood County and the state of Minnesota deserve that. This proposal needs to be rejected.	As stated in the final scoping decision, the appropriateness of federal and state policies, including tax credits and other incentives, regarding carbon capture and ethanol is outside the scope of the EIS.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			Respectfully submitted, Patricia Flaig Riley Jean Flaig Crummett		
	Fossen, Heath	2024-02-22	I am a current landowner and will soon be a resident of Wilkin County, just a few hundred feet from this pipeline. I have concerns about the water usage needed for this project, not just the Ottertail/Wilkin leg, but the entire line slated for southern MN as well. Much of southern Minnesota is suffering from the consequences of drought and over-commitment of our fresh drinking water supplies. The DEIS fails to discuss the impacts of an increase in water use on local water supply. The carbon capture process can double water requirements at a facility and increase toxic wastewater discharge. The DEIS states that Summit “anticipates” an average water use for the operation of the carbon capture equipment of 13 million gallons per year, which is concerningly ambiguous. There must be a careful and case-specific assessment done of how the installation and operation of carbon capture will impact current drought conditions and exacerbate existing pollution sources. My family's rural homestead relies on a private well for drinking water, I am concerned that the water needed for this project will deplete/contaminate the drinking water in my area. Will I be forced to drill a deeper well (who pays for that?) or worse yet- have to purchase bottled water for my family to survive?	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has also been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01
	Fossen, Heath	2024-02-22	It also seems there hasn't been much research done on the excessive amount of electricity needed to run the carbon capture operation. Electrical grids across the US are notorious taxed on a daily basis. The DEIS states that during operation the proposed project will require about 38,501,733 kilowatt hours per year, and that this amount is “not anticipated to require the addition of power generation capacity.” However, the DEIS fails to clearly state how much electricity the ethanol refinery is currently using. For that information, the public must look in Appendix I. The DEIS does not explain how this doubling of the electricity use at the ethanol refinery will impact overall electricity for Lake Region Electric Cooperative. Who is paying for that electricity? Summit or the ethanol facility? And if the latter, will those cost increases be passed on to producers or other member-owners? If twice as much carbon is emitted during the capture process, perhaps this isn't the most efficient method to pursue.	Section 5.4.9.1 has been updated with the electricity currently being used by the ethanol plant. Section 5.4.9.2 contains relevant information regarding how LREC would support the project. This section has been updated to indicate that the applicant is solely responsible for necessary infrastructure upgrades (see Appendix I, Supplemental Information Inquiry 13 response and email from LREC).	20243-204403-01
	Fossen, Heath	2024-02-22	In addition to the direct impacts of the 28 miles of pipeline included in Summit’s application, the DEIS does not account for the indirect and cumulative impacts of Summit’s entire project in Minnesota. This is despite Summit’s clear and public plans for a much larger buildout in Minnesota and recent statements that they will be applying for permits for additional parts of the network imminently. Allowing Summit to artificially segment permitting requests for multiple concurrent projects on one pipeline will prevent a thorough review of the cumulative impacts and potential environmental and climate damages of the project.	Thank you for your comment. The full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01
	Fossen, Heath	2024-02-22	Please do not allow Minnesota to be the guinea pig for a project of this magnitude. There are other, more sustainable methods of carbon capture that require far less degradation of land and depletion of fresh water.	Thank you for your comment.	20243-204403-01
	Fossen, Heidi	2024-02-22	Hello - I am a landowner, past and (soon to be) future resident of Wilkin County, my farmland has been cited by Summit as a possible route for the carbon pipeline project and over the past couple of years Summit has approached my family several times trying to get us to sign their easements in a rude and almost forcible manner. The proposed route is also a few hundred feet from my elderly mother's farmstead where she has lived for the past 50 years, this land and farmstead has been in my family for almost 100 years now. I grew up here and will take over this farm and land when my mother becomes too old. Hopefully my children will take it over for me when I become too old.	Thank you for your comment.	20243-204403-01
	Fossen, Heidi	2024-02-22	I appreciate the research the Dept of Commerce did for this project and am very concerned about climate change and do think we should be taking measures now to fight climate change. However, I don't believe this pipeline project exhibits a responsible solution to the climate change crisis. To be clear, I am a proponent of carbon capture and think that it will be needed in order to fight this crisis but there are other methods of carbon capture that do not involve degrading precious farmland and using billions of gallons of freshwater [that we do not have]. Many new studies at research schools all over the world (like the University of Wisconsin and University of Minnesota) have come up with safer, cheaper and more ecofriendly carbon capture solutions involving plants such as switchgrass and other native plants. It is possible to capture carbon without degrading hundreds of miles of farmland and wasting billions of gallons of precious, non-renewable, fresh water.	Thank you for your comment. An alternative that does not include ethanol production was not studied in the EIS because it would not meet the purpose of the project.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Fossen, Heidi	2024-02-22	Throughout this process, we have been getting conflicting figures (from Summit and the PUC) on how much fresh water is going to be needed to build this pipeline and operate it for the next 20+ years. As you know, this area (and most of the Midwest) has been in various levels of drought for the past several years with no sign of a turnaround. Is it really in the best interest of the state to allow an outside company to drain our aquifers, leaving our rural communities without adequate drinking water and water for irrigational needs related to livestock and crop production? Please go back and take another look at the short- and long-term water calculations needed for this pipeline and reassess if Summit's consumption of this valuable, community resource is going to be worth it for Minnesotans in the long run. Please consider the entire buildout of this project- not just the 28 miles in Ottertail and Wilkin counties. Regardless of how much carbon is in the air, we all die without adequate drinking water and food to eat.	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has also been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01
	Fossen, Heidi	2024-02-22	I am also concerned about a potential rupture/leak. It is unclear if/when the pipeline will be tested for leaks, and if leaks can even be detected. If there is a large-scale rupture, the EMS team in tiny Breckenridge MN is not equipped to respond to such a disaster; people, plants and animals can die. This tiny community is not prepared or equipped to mitigate a leak or accident of any kind regarding carbon gas. Also, we've recently been notified from our insurance company that there are "a lot of red flags that could lead to a gap in coverage as it relates to liability for damages and/or bodily injury related to this pipeline". I think we also need solid clarification on who is responsible for all the scenarios surrounding a rupture/accident that happens on privately held land. I know safety is the utmost concern for this project by all involved, but let's be real-with a project of this magnitude (the first ever of its kind worldwide), there WILL be mistakes/leaks/accidents/injuries- there ALWAYS are. And in the end, it is always the rural communities that are left scarred and picking up the pieces, not the corporation that was responsible for the mess in the first place. All I ask is that we take a hard look at environmental disasters that have happened in the past and learn from the way those were handled between corporate America and local residents.	As detailed in Section 2.3.2.2, the applicant would install a pipeline internal inspection tool to monitor pipeline integrity. The applicant would monitor the system from a control center and assess conditions to ensure the pipeline is operating within established parameters (see Section 2.6.1). The applicant would also run a real-time model of the pipeline system, and if conditions of the model do not match the conditions of the pipeline, alerts would notify controllers to potential leaks. Section 8.4 describes the steps that would be taken in case of a rupture, and Section 8.5 describes the steps that would be taken to prevent an accident and reduce impacts if a leak or rupture occurred. Section 5.4.7.2 has been revised to address the availability and cost of property insurance, and to note that the applicant has agreed to indemnify landowners for any losses resulting from the applicant's use of the easements.	20243-204403-01
	Fossen, Heidi	2024-02-22	For the past several generations, my family and the families of these small communities have been responsible stewards of farmland and water resources in the Red River Valley, please do not sell out to an out of state company that is looking to make a quick buck on current tax incentives, rape our land and deplete our fresh water supply. This project does not benefit Minnesotans or the environment and there is other, more ecofriendly options for carbon capture available that should be considered.	Thank you for your comment. An alternative that does not include ethanol production was not studied in the EIS because it would not meet the purpose of the project.	20243-204403-01
	Furshong, Peg	2024-02-22	My name is Peg Furshong, and I am a landowner in the proposed 242-mile footprint of this proposed CO ₂ project for the state of Minnesota. As a mother, farmer and Minnesota taxpayer, I am opposed to being a 'pilot' project for this this extraction industry to make millions of dollars while putting rural Minnesotans at risk. After reading the EIS – it seems to be a template for other projects not relevant to this specific project in Minnesota. Much of the DEIS cites "best practices" in general without detailing them and their application in Minnesota. There are significant promises made by Summit Carbon Solutions without substance and details on how these promises will be addressed or implemented. Below I have indicated concerns and would like the PUC to further investigate concerns shared by many before proceeding with this routing application.	See the responses to specific comment topics below.	20243-204403-01
	Furshong, Peg	2024-02-22	With reference to: CO ₂ Rupture Impact Zone: According to the analysis in the DEIS, the potential impact radius for levels of CO ₂ that would be "immediately dangerous to life or health" is 617 feet. This expands to 910 feet for lower concentrations that cause dizziness, drowsiness, severe muscle twitching, and unconsciousness within a few minutes. Although Summit indicates that it will take 25 minutes for the system to shut off the relevant valves in the event of "abnormal operation," the DEIS does not mention any meaningful safety measures for a rupture and instead suggests that it is "reasonable" for Summit to simply supply indoor CO ₂ detectors for residences within 1,000 feet of the project. But the rupture report in Appendix G states that "a full rupture results in impact distances too quickly for an early warning device, such as an oxygen detector, to be effective." This pipeline should not be approved without a clear understanding of the risks to human health and meaningful measures to ensure the safety of people and animals in the area. This proposed pipeline is planned to be at the foot of our farm driveway which would be 100 yards from our house and less than 16 feet from our pasture where we graze our cattle. Are we expendable? According to the Iowa Utility Board	Text in Section 4.5 on valve closure time has been corrected from 25 minutes to 10 minutes. Elsewhere in the EIS, including the rupture analysis, valve closure time is listed/calculated as 10 minutes. Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that is not	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			hearings – it would cost rural communities approximately \$9,600 per EMS responder for the equipment necessary to respond to a CO ₂ incident. MN Rural EMS departments budgets already struggle – the other key element is that responders need to be in electric vehicles and as far as I know, not one rural EMS department in MN has electric vehicles. The other solution that Summit has mentioned at public meetings was to have regional response teams – well, by the time we wait for a ‘crew’ to be dispatched to a rural incident, the damage would be done. Back in February of 2020, a rupture in rural Mississippi resulted in 45 people being transported to area hospitals. Think about this footprint – what area hospitals would have ER rooms for 45 people? You would be taking people to St. Cloud, Fargo, and Sioux Falls. Those 45 people may not have died from the rupture but years later, they are still suffering from the side effects of exposure to the CO ₂ .	outdated but would be revised as required by PHMSA, if the project is approved. Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.	
	Furshong, Peg	2024-02-22	Compliance with PHMSA Rules: The DEIS accepts Summit’s assurances that it will “comply with federal emergency response requirements,” but as noted in a Pipeline Safety Trust report and by the Pipeline Hazardous Material Safety Administration (PHMSA) itself, the current emergency response requirements are dangerously outdated. As a state entity, the MN Public Utilities Commission should be putting Minnesotan’s wellbeing and safety over out-of-state, for-profit businesses interests. We should be your priority, not Summit Carbon Solutions and their investors. This is a “first of its kind” project that has NEVER been proven at this scale. Currently, there is no such pipeline in the upper Midwest – by approving this proposed project you will be creating a new pipeline corridor that will impact Minnesota’s Natural Heritage for generations. You need to error on the side of caution and public interest. Setbacks: The DEIS states that the PUC “cannot set safety standards” for Summit’s proposed pipeline. PHMSA has expressly said in public letters to CO ₂ pipeline companies like Summit that state and local authorities can exercise their powers to regulate land use—including setback distances—and that “nothing in the federal pipeline safety law impinges on these traditional prerogatives of local—or state—government.” The PUC must consider where the pipeline is placed and what is the safest option for Minnesotans, which means the PUC can and should determine what routing, setback, and depth requirements are necessary to adequately protect Minnesotans. We are asking you to protect rural communities – this segment of the proposed project will begin in the Fergus Falls community – a densely populated community that will risk and endanger lives.	Although the Commission cannot set safety standards for pipeline construction or operation, state or local units of government may, to the extent authorized by law, set land use requirements that indirectly contribute to pipeline safety by regulating the activities of third parties located in the pipeline’s vicinity. The Commission’s obligation is to identify a pipeline route consistent with the criteria found in statutes and the applicable administrative rules. Federal law, by contrast, exclusively prescribes pipeline safety requirements.	20243-204403-01
	Furshong, Peg	2024-02-22	Geologic Hazards: The DEIS does not address whether the applicant has conducted geologic hazard surveys pursuant to the PHMSA Bulletin here: https://www.phmsa.dot.gov/sites/phmsa.dot.gov/files/2022-06/2022-11791.pdf	Geologic hazards are addressed in Sections 5.7.3 and 5.7.6. Text regarding geohazard assessments that would comply with the recommendations in PHMSA Advisory Bulletin 2022-01 has been added to both sections.	20243-204403-01
	Furshong, Peg	2024-02-22	Dangers to water and waterbodies: The proposed route for Summit’s pipeline network includes many water crossings, wetlands, aquifers, and other sensitive water bodies. More research and analysis are needed to understand how CO ₂ disperses in water and what risks a CO ₂ pipeline leak or rupture poses to Minnesota’s precious waters and the fish, amphibians, reptiles, waterfowl, birds, and insects that rely on it to survive.	Potential impacts of a pipeline rupture on water resources and wildlife are addressed in Section 8.3.4. Stand-alone studies concerning impacts on water resources, wildlife, and wildlife habitat are outside the scope of the EIS.	20243-204403-01
	Furshong, Peg	2024-02-22	There has been no modeling of a rupture in a moving waterway. Being that the company who did the EIS is from Texas – do we trust their judgement when it comes to concerns and conditions we face in the northern climates. What happens when there is a leak or rupture under an icecap? How is a rupture handled during the winter months? While I have limited capacity and am not a scientist or engineer – I can deduct that the impacts would likely be much different during the winter than the summer. Look at this winter for example – we have water pipes in a variety of communities rupturing when we have a warm/cold cycle that happens with the erratic temperatures from January through April. How will that freeze/thaw cycle impact this infrastructure? If we have a rupture during the colder weather – with that impact the time people will be exposed to dangerous levels of CO ₂ ?	Sections 8.3.1 and 8.3.4 have been revised to discuss the potential impacts of ice covering waters or wetlands at the point of a rupture. In general, if CO ₂ released from the pipeline was trapped by ice, then the CO ₂ would release more slowly into the atmosphere as it traveled laterally under the ice until it escaped through cracks or gaps in the ice, thereby decreasing the impact distance (the distance the CO ₂ would travel through the air). The EIS modeled the worst-case scenario where the CO ₂ is not trapped by ice. In the event of a pipeline rupture that caused CO ₂ to be trapped by ice covering a waterbody, CO ₂ could remain in contact with the water for more time and the concentration of carbonic acid could increase. In other words, the water and aquatic species could experience a greater impact from the CO ₂ , but the atmosphere would experience less CO ₂ , and the risk to humans and other terrestrial species would be lower. As noted in Section 5.7.3.4 and Section 8.1, the applicant has committed to conducting a Phase I Geohazard Assessment to identify areas surrounding the pipeline that may be prone to large earth movement, as	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				recommended by PHMSA in its June 2022 Advisory Bulletin, and EERA staff recommends that the results of the Phase I assessment, and any subsequent assessments, should be provided to the Commission.	
	Furshong, Peg	2024-02-22	Water use: Much of southern Minnesota is suffering from the consequences of drought and over-commitment of our fresh drinking water supplies. The DEIS fails to discuss the impacts of an increase in water use on local water supply. The carbon capture process can double water requirements at a facility and increase toxic wastewater discharge. The DEIS states that Summit “anticipates” an average water use for the operation of the carbon capture equipment of 13 million gallons per year, which is concerningly ambiguous. There must be a careful and casespecific assessment done of how the installation and operation of carbon capture will impact current drought conditions and exacerbate existing pollution sources. Moreover, Summit has not finalized its water appropriation sources or volumes needed for construction, so it is impossible to know the full impact of those appropriations on water resources. Why should Minnesota risk our fresh drinking water supply and commit to an infrastructure when the proposing company has not been transparent with its true demands for water resources? I have attended several in person meetings where Summit Carbon Solutions has given various answers to questions around how much water is going to be needed to run the carbon capture equipment. They have not been transparent in their application or the proceedings leading up to this process. They have also been approaching local utilities asking for water – it is my understanding based on volume needed, they are required to go through the MN DNR water appropriations process. If so, it seems like they are already trying to circumvent regulatory processes. The best answer we have been given is that the carbon capture process with double the water demands that an ethanol plant already uses. Currently it takes 3 to 3.5 gallons of water to produce 1 gallon of ethanol. Add carbon capture to the mix and it now becomes 6 to 7 gallons of water per one gallon of ethanol. That now becomes 12 to 13 million gallons of water per year per proposed plant in Minnesota (currently at 6 plants in 10 counties) Does Minnesota really have that much fresh drinking water to give to a private – for profit – company over the next twenty years. It seems highly unlikely that we will have that kind of water with climate and drought conditions. This is not sustainable – what research has been done to ensure that our aquifers will not be depleted by this extractionist industry?	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has also been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-01
	Furshong, Peg	2024-02-22	Aquifer Damage: Summit’s preferred route, RA-South, crosses a surficial beach ridge aquifer in Otter Tail County. The DNR has said that the area is “prone to significant groundwater discharge,” and the applicant’s initial groundwater investigation confirmed that “artesian groundwater conditions are present” along that beach ridge system. In early feedback on the DEIS, the DNR noted that “Project construction has the potential to intersect shallow confined groundwater potentially causing a breach in a confined aquifer and that “breaching shallow confined aquifers could have significant long-term impacts to groundwater resources.” This, along with our state’s first-hand knowledge of how damaging pipelines can be, requires that the DEIS take potential damage to aquifers more seriously. What baseline studies are being done to ensure that extractionist companies are not putting our natural heritage (water) at risk?!	Section 5.7.8.2 acknowledges that damage to aquifers is a serious problem and indicates that an uncontrolled flow of water from a shallow confined aquifer could have a significant long-term impact on groundwater. Section 5.7.8.2 also describes geotechnical investigations that would be done to identify areas where breaching of a shallow confined aquifer could occur, and sheet piling would not be used. The applicant currently has an ongoing groundwater investigation underway to further inform construction practices and is continuing to consult with DNR. As part of its coordination with DNR, the applicant has agreed to use ground penetrating radar to study the depth of the confining layer through the entire beach ridge system area crossed by the pipeline to further define existing conditions and advise on construction methodology. Furthermore, EERA staff recommends that the applicant develop, in coordination with DNR, a plan for pipeline construction in areas crossing the beach ridge system area. The plan would include, at a minimum, measures to minimize the potential for breaching a shallow confined aquifer during trenching and contingency measures to mitigate the impacts of a breach, should one occur. This information has been added to Section 5.7.8.2.	20243-204403-01
	Furshong, Peg	2024-02-22	HDD Drilling: The DEIS also states that “drilling mud mixed with additives that are not on the MDH-approved additive list and/or do not meet [drinking water quality certification standards] would be disposed of as solid waste at an approved facility, or the applicant would obtain a land application permit from MPCA.” The DEIS does not discuss the risks of applying drilling mud, especially with additives not approved by MDH, to the land. The DEIS says that “drilling fluids and additives for the HDD would be non-toxic to the aquatic environment and humans,” however, even supposedly “non-toxic” drilling fluid is chemical waste that has been found to be harmful to plant and animal species. Summit’s	As described in Section 5.7.8.2, an additive approved by MDH or meeting NSF International/ANSI Standard 60, Drinking Water Treatment Chemicals – Health Effects, might need to be mixed with the drilling mud for viscosity or lubricating reasons and to reduce the potential for an inadvertent release or failed HDD. The specific additive used would depend on the conditions at the crossing location and would be determined by the HDD contractor. The EIS discloses the potential for an	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			preferred route and alternative route, RA-Hybrid, would both cross three rivers (Pelican River, Otter Tail River, and Bois de Sioux River) via the HDD mention.	inadvertent release of drilling mud and describes potential impacts in Chapter 5. Land application of drilling mud and potential impacts are addressed in Section 5.7.6.2.	
	Furshong, Peg	2024-02-22	Wetlands: In Table 5-40 on p. 5-98 of the DEIS it states that “the loss of wetlands would be less than 0.01 acre.” However, Table 5-4 on p. 5-24 says that for Summit’s preferred route, operation impacts are expected to be 3.3 acres, and construction impacts are expected to be 4.7 acres. And Table 5-52 on p. 5-143 suggests that the total construction impact on wetlands for RA-South is 2.7 acres. Which is it??	Discrepancies between Table 5-4 and Table 5-54 result from different datasets and their associated resolutions. Table 5-4 uses NLCD data to analyze land cover, and Table 5-54 uses NWI data to analyze wetlands. Table 5-40 has been edited to be consistent with discussions of impacts on wetlands in Section 5.7.9 and Table 5-53 and Table 5-54.	20243-204403-01
	Furshong, Peg	2024-02-22	<p>Impacts of a Leak or Rupture on Animals: According to the DEIS, CO₂ leaks would not affect mammals, birds, reptiles, amphibians, and insects and would be unlikely to impact fish and freshwater mussels. The DEIS reaches this conclusion without providing any reasoning or supporting evidence. Though the DEIS does note some harm may come to animals in the event of a rupture, it relies heavily on the assumption that animals will simply move out of the rupture area to avoid the release. The reason for this assumption is not provided and is contradicted by information in the rupture report in Appendix G which suggests the impacts of a rupture would be nearly immediate.</p> <p>The Otter Tail is home to a river ecology that supports freshwater mussels – they often spend their entire lifetime (decades) within a 15’ area - they will not simply ‘get out of the way’.</p> <p>Critical Habitats: Summit’s preferred route would cross over or near several waterfowl protection areas, including the Orwell 9 Unit and Ridgeway WPA in Otter Tail County. The DEIS notes that some of these areas will be avoided during construction but fails to consider the impacts to these features in the event of a leak or rupture.</p>	CO ₂ is a widespread, naturally occurring gas and is the primary byproduct of respiration—the conversion of sugars to usable energy. Minor leaks of CO ₂ from operation of the proposed pipeline would not elevate ambient CO ₂ to a level that is detrimental to local vegetation or wildlife. Potential impacts on wildlife from a CO ₂ rupture could result first from the physical force of a rupture and secondarily from localized, short-term high levels of CO ₂ prior to dispersal and extreme cold temperatures associated with the depressurization of the CO ₂ from a supercritical state to a gas. Chapter 8 of the EIS acknowledges that wildlife in the immediate vicinity of a rupture might be killed or injured by this force; however, it is expected that most mobile wildlife species would follow their natural instincts and would attempt to escape the direct effect of a rupture. Chapter 8 of the EIS also acknowledges that less-mobile species in the immediate vicinity of the point of a rupture would be less likely to escape the impacts and might be killed or injured. The data presented in Appendix G describes models of dispersal patterns in the immediate vicinity of a rupture. These models support the statements in Chapter 8 that wildlife in the immediate vicinity of a rupture might be exposed to high levels of CO ₂ , which could be toxic for species unable to leave the area of the release.	20243-204403-01
	Furshong, Peg	2024-02-22	<p>Enhanced Oil Recovery: The DEIS fails to explain whether the applicant can sell any of its captured CO₂ to others for alternative uses instead of permanent sequestration and what the impacts of that would be. The DEIS incorrectly states that “Production of oil through EOR would not be dependent on the availability of CO₂ produced by the ethanol plant.” This claim is contradicted by countless public statements from public officials in North Dakota and oil industry representatives.</p> <p>Early on during the public meetings Summit officials publicly said that their CO₂ would not be used for EOR and now they no longer make those statements. In fact, they have gone out of their way to say that once they deliver the CO₂ to ND, they have no control over what happens. (They will just collect their money from the 45Q and be on their way.) The fact is, once the 45Q program sunsets – there are no protections in place that keep the CO₂ in the ground.</p>	The text questioned by the commenter in Section 5.7.2.3 was prefaced with the following: "if all the CO ₂ produced by the ethanol plant is sequestered as proposed, EOR would likely continue in North Dakota using other sources of CO ₂ , other gases, thermal methods, or chemical methods." Revisions are not necessary. However, Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	20243-204403-01
	Furshong, Peg	2024-02-22	Environmental Justice Communities: The DEIS acknowledges that the project will directly intersect a defined environmental justice community but does not account for the burden of the potential health and safety impacts of a leak or a rupture, not to mention any negative impacts from construction on the ecosystem. The DEIS also fails to assess the cumulative impacts of this project in relation to existing pollution or health disparities in the area.	Chapter 8 has been revised to include a new section (8.3.1.2) describing effects on environmental justice populations in the event of an accidental release of CO ₂ .	20243-204403-01
	Furshong, Peg	2024-02-22	<p>Complete Network Impacts: In addition to the direct impacts of the 28 miles of pipeline included in Summit’s application, the DEIS does not account for the indirect and cumulative impacts of Summit’s entire project in Minnesota. This is despite Summit’s clear and public plans for a much larger buildout in Minnesota and recent statements that they will be applying for permits for additional parts of the network imminently. Allowing Summit to artificially segment permitting requests for multiple concurrent projects on one pipeline will prevent a thorough review of the cumulative impacts and potential environmental and climate damages of the project.</p> <p>It doesn’t take much to figure out the only reason that Summit Carbon Solutions (SCS) only applied for the 28.5 segment in MN was because currently SCS has been unsuccessful in getting their infrastructure and sequestering permits in Iowa, South Dakota and North</p>	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			Dakota. It is disappointing that we are wasting taxpayer dollars (not only at the state level but on the local level – countless hours of time on the backs of taxpayers) on this project when it is a pipeline to nowhere. It is also telling that states who have several pipelines and have been in the pipeline permitting business for many years are concerned about this project and the risks involved.		
	Gardner, Annah	2024-02-22	<p>The DEIS fails to provide a thorough assessment of this project’s impacts.</p> <p>A lot of information and analysis is missing, including:</p> <ul style="list-style-type: none"> - The DEIS does not discuss the risks of applying drilling mud, especially with additives not approved by MDH, to the land. - The DEIS fails to discuss the impacts of an increase in water use on local water supply. 	Land application of drilling mud and potential impacts are addressed in Section 5.7.6.2. Water use and impacts are addressed in Section 5.7.8.2. Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. 	Gardner, Annah	2024-02-22	According to the DEIS, CO ₂ leaks would not affect mammals, birds, reptiles, amphibians, and insects and would be unlikely to impact fish and freshwater mussels. The DEIS reaches this conclusion without providing any reasoning or supporting evidence.	CO ₂ is a widespread, naturally occurring gas and is the primary byproduct of respiration—the conversion of sugars to usable energy. Minor leaks of CO ₂ from operation of the proposed pipeline would not elevate ambient CO ₂ to a level that is detrimental to local wildlife. This is discussed in Section 8.3.4.2 of the final EIS.	20243-204403-01
	Gardner, Annah	2024-02-22	Summit states that the capture facility “is designed to capture 100% of the CO ₂ produced by the ethanol plant.” There is no carbon capture facility in the world, ethanol or otherwise, that captures carbon at a rate of 100%. This claim is not supported by any data/information or verified by a third party.	Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios for 100 percent, 70 percent, 40 percent, and 10 percent.	20243-204403-01
	Gardner, Annah	2024-02-22	<p>The DEIS assumes 100% of captured CO₂ is being permanently stored underground. There is no guarantee that this will occur and no explanation of the monitoring and verification protocols that would ensure it.</p> <ul style="list-style-type: none"> - The DEIS fails to explain whether the applicant can sell any of its captured CO₂ to others for alternative uses instead of permanent sequestration and what the impacts of that would be. 	Text has been added to Section 2.1 describing the suitability of the Broom Creek Formation in North Dakota for CO ₂ sequestration, as well as the monitoring and testing that would be done to verify that the CO ₂ is contained in the storage reservoir.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	
	Gardner, Annah	2024-02-22	The DEIS also fails to assess the cumulative impacts of this project in relation to existing pollution or health disparities in the area. - In addition to the direct impacts of the 28 miles of pipeline included in Summit's application, the DEIS does not account for the indirect and cumulative impacts of Summit's entire project in Minnesota.	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01
	Gardner, Annah	2024-02-22	There is not a detailed discussion of decommissioning, so the public and state agencies cannot know what human and environmental impacts the plan will have into the future.	Section 2.7 describes project decommissioning. This section was revised to describe the financial assurances to be provided by the applicant for costs associated with decommissioning.	20243-204403-01
	Gooch, Van	2024-02-22	I am Dr. Van Gooch, Professor emeritus of the University of Minnesota -Morris. I am also a member of the Citizens for a Sustainable Future-Alexandria. We are very concerned about the environment and the reduction of carbon dioxide emission. On the surface the CO ₂ Pipeline Project has a good sound to it. In reality, as we have looked at it in detail, the plan is a disaster. The company proposing this pipeline has no background that qualifies them for this project. It seems that they see a "money tree" and they are going for it.	Thank you for your comment.	20243-204403-01
	Gooch, Van	2024-02-22	The high pressure of the pipeline is a danger. Carbon dioxide is in the air all of the time. But a CO ₂ pipeline burst is very dangerous for humans as it reacts with water to form carbonic acid. People have died from areas where high CO ₂ has been released. The pipeline burst in water again forms into carbonic acid and again is a disaster for our valued aquatic environments.	Risks of a potential CO ₂ release and potential impacts on humans and aquatic environments are described in Chapter 8 of the EIS.	20243-204403-01
	Gooch, Van	2024-02-22	Most importantly it is a huge amount of money that has very little effect on the problem. There are so many other ways this money could be used to mitigate the climate change problem, I ask that the Public Utilities Commission and Department of Commerce seriously consider not approving this proposal. It is mostly useless and high in potential for danger to the public and to the environment. Environmental groups, such as ours, highly oppose this project as a potential administrative failure.	Thank you for your comment. As stated in the final scoping decision, the appropriateness of federal and state policies regarding carbon capture and ethanol, including tax credits and other incentives, is outside the scope of the EIS.	20243-204403-01
	Goose, Leanna	2024-02-09	Hello my name is Leanna Goose. I live in northern Minnesota. I would advise the Public Utilities commission to not allow CO ₂ pipelines to be put anywhere in Minnesota. These are not solutions to climate change they only prolong the current overuse of fossil fuels and allow companies to continue to pollute. They are dangerous and not needed. What is needed is pressure on polluters to stop the carbon emissions. We are beginning to see the disastrous effects of climate change today and we need true solutions. CO ₂ pipelines are a false solution.	Thank you for your comment.	20243-204403-01
	Goyette, Chuck	2024-02-23	Andrew I live in Red Lake Falls Mn. Area. I am very much opposed to a CO ₂ pipeline. Mother Nature does not need further threats, damage to waterways, lakes, rivers, wetlands. No!!!	Thank you for your comment.	20243-204403-01
	Graney, Edith	2024-02-22	My name is Edith Graney. I was born and raised in Minnesota and care about the land and the people who live here. The Summit Carbon Capture pipeline is not a good idea for Minnesota. Rural areas don't have extensive emergency response capabilities. The rupture of a high-pressure pipeline would overwhelm the local services.	Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that would be revised as required by PHMSA, if the project is approved. Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.	20243-204403-01
	Graney, Edith	2024-02-22	The water usage for this project is unclear regarding initial need and ongoing water needs for the carbon capture and compression operation. The present DEIS is for only part of the planned extensive pipeline network that Summit has planned. We need an accurate assessment of the entire project, not a piece-by-piece approval process.	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	
	Gurian-Sherman, Doug	2024-04-18	<p>My name is Doug Gurian-Sherman, and the following comments concern the proposed CO₂ pipeline routing permit in Otter Tail and Wilkins Counties in Minnesota. I am a resident of Minneapolis, MN. I attest that these comments are true and accurate to the best of my knowledge. Where I mention the DEIS, it is only to provide specific examples to illustrate broader points regarding the routing permit application.</p> <p>I submit this testimony as provided by Judge Moseng’s first and second pre-hearing orders from June and September 2023 respectively. These include section 6 of the June 2023 order, which allows for non-party testimony according to MN rule 1405.0800.</p> <p>I am an agricultural scientist, with a doctorate degree in plant pathology from the University of California, Berkeley. I conducted post-doctoral research for the U.S. Department of Agriculture, acted as a risk assessment scientist for the U.S. Environmental Protection Agency on pesticides and biotechnology, was an advisor for the U.S. Food and Drug Administration on food biotechnology, and was a senior scientist for several science-based environmental non-profit organizations. I have also authored scientific publications on agriculture and climate change. I therefore have expertise on agricultural sciences and practices relevant to the potential environmental risks and benefits of the pipeline, including climate change. My CV is attached at the end of my comments.</p>	Thank you for your comment.	20244-205651-01
	Gurian-Sherman, Doug	2024-04-18	My testimony evaluates the potential for the proposed pipeline to cause harm directly and indirectly to the environment of the area and to nearby communities. In this context it is important to consider the proposed pipeline and the ethanol plant it would serve as part of the larger industrial agriculture industry of the region and the state. The production of corn for the plant is part of the row crop industry of the state and region, and the influence of the pipeline on that local, regional and international industry and its impacts on the environment and communities is therefore directly relevant to the permit process. My testimony evaluates agricultural aspects of the proposed pipeline. I do not consider the operation of the ethanol plant, such as possibly supplying energy to the plant by renewable sources such as solar or wind.	Thank you for your comment.	20244-205651-01
	Gurian-Sherman, Doug	2024-04-18	Although the proposal for the permit claims that its approval would result in a net benefit for the climate and environment, a broader perspective of the relevant science leads to conclusion that significant net harm is the more likely outcome. Therefore, I conclude that the best course for the environment and the local communities would be to reject the permit, or a no action alternative.	Thank you for your comment.	20244-205651-01
	Gurian-Sherman, Doug	2024-04-18	<p>My conclusion that net harm is a more likely outcome relies on analysis of actual changes in corn and related crop cultivation in the area caused in part by the success of the corn ethanol industry over the past 15 years, which is fostered by renewable fuel standards (RFS) that provide incentives and subsidies. These subsidies are scheduled to continue for many years. Additionally, the low carbon fuel standards (LCFS) that the pipeline is intended to access would provide further incentives for the cultivation of additional corn for ethanol.</p> <p>The incentives of the RFS and other related trends have resulted in the past 15 years in substantial expansion of corn into previously uncultivated areas in MN near the proposed pipeline. This results in large release of CO₂ and increases in the CI of ethanol corn, as well as other large environmental impacts. The intention of the RFS and LCRS incentives is to support and expand the corn ethanol industry. Therefore, although predictions always have associated uncertainty, the most likely outcome if the pipeline is approved, based on the actual recent history in the region as well as an intended purpose of the RFS and LCFS, is the continuing expansion of corn for ethanol production.</p> <p>Corn cultivation for ethanol or other purposes such as livestock feed causes great environmental harm. Broadly speaking, it is important for the context of this pipeline proposal to recognize the immensity of harms from industrial agriculture such as the production of corn for ethanol. Agriculture is the largest human use of land and fresh water, it is the largest source of the major water pollutants nitrogen and phosphorus, is responsible for up to a third of climate change and is one of the top causes of the global biodiversity crisis^{1,2,3} We cannot reach climate goals, even with the elimination of fossil fuels, without substantially reducing the climate impacts of agriculture.</p>	Thank you for your comment.	20244-205651-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>4 Agriculture is responsible for about 25% of Minnesota’s climate emissions, which is close to that of transportation and power generation. Known harms that may be exacerbated from the pipeline project in the region from corn grown for ethanol include contamination of drinking water wells and other supplies, lowering of water tables through irrigation affecting multiple ecosystem functions and recreation (and hence economies like tourism). They also include harm to biodiversity from land use change, fertilizer and sediment in surface water, and pesticide pollution, in addition to negative climate impacts. Industrial corn production is among the largest contributors to these harms.</p> <p>A related concern is whether in conjunction with the pipeline, the LCFS would provide enough incentives to meaningfully reduce the environmental impacts of ethanol corn cultivation. If so, would those improvements offset expansion of corn or related row crops into currently uncultivated areas? I argue that while some improvements may occur, they are at best equivocal, minor, and would not offset the greater harm from expanded production of corn into currently uncultivated areas. There are also trends in corn production that are making it more harmful to the environment by measures other than climate change, calling into question claims that it will become more sustainable overall under the LCFS, which does not incentivize reduction of non-climate risks.</p> <p>1 Roesch-McNally, G.E. et al. 2017. Barriers to implementing climate resilient agricultural strategies: The case of crop diversification in the U.S. Corn Belt. Glob. Environ. Change. 48: 206-215. https://doi.org/10.1016/j.gloenvcha.2017.12.002</p> <p>2 Rockström, J. et al. 2020. Planet-proofing the global food system. 	Gurian-Sherman, Doug	2024-04-18	<p>Additionally, for any hope of the expressed climate goals of the project to be accomplished, the carbon from the plant must be permanently sequestered in the ground and not increase other sources of fossil CO₂. However, there is no assurance that carbon dioxide from this ethanol plant could not be diverted for extraction of additional fossil fuels. This must be fully evaluated under MN Rule 7852.1900, subpart 3, section I. as a cumulative potential effect related to anticipated future pipeline construction. If used for fossil fuel extraction, the pipeline CO₂ would produce the exact opposite effect of one of the main purposes and social justifications of the project. This is especially troubling in the context of this project because most captured CO₂ is currently used for fossil fuel extraction, and fossil fuel production areas that might use carbon dioxide for this purpose occur in the general region of the pipeline.</p>	Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	20244-205651-01
	Gurian-Sherman, Doug	2024-04-18	<p>Another important consideration is whether the project would be good for the local economy. There would be temporary pipeline jobs and some possible small stimulation of the local economy as well as local taxes. However, sociological literature has documented over several decades that industrial agriculture’s net effects on local socioeconomic wellbeing are more likely to be negative. In addition, temporary labor from elsewhere is often associated with local exploitation, for example trafficking of disappearance of native women.^{5,6} This is a consistent problem with pipeline projects and must not be ignored. For all these reasons the pipeline permit should be rejected.</p> <p>5 Minnesota Public Radio and Associated Press. 2021. Six men, including two Line 3 workers, arrested in human trafficking sting. At: https://www.mprnews.org/story/2021/07/03/six-men-including-two-line-3-workers-arrested-in-human-trafficking-sting</p> <p>6 Cohen, L. 2023. The role pf environmental law in addressing the violent effects of resource extraction on native women. Harvard Law J. at: https://journals.law.harvard.edu/elr/wpcontent/uploads/sites/79/2023/04/HELR-Vol.-47.1-Cohen.pdf</p>	Section 5.4.8.2 has been revised to note the potential for violence associated with the presence of temporary workers. The applicant's commitment to educating all employees and contractors about prevention of human trafficking has been added to Section 5.4.8.3. In addition, Section 5.4.8.3 has been revised to add an EERA staff recommendation for a special permit condition requiring the applicant to provide its Human Trafficking Prevention Training for Commission review 30 days prior to submittal of the Plan and Profile.	20244-205651-01
	Gurian-Sherman, Doug	2024-04-18	<p>Carbon Intensity Land Use</p> <p>The carbon intensity (CI) of corn ethanol according to Scully et al 2021 is 52.1-78.3g CO₂eq/MJ.⁷ By comparison, gasoline’s CI is 93-101g CO₂eq/MJ. However, land use changes can alter the CI of ethanol corn and elevate it to above that of gasoline. The National Wildlife Foundation and U.S. Department of Energy note that this can raise corn ethanol levels to 24% above that of gasoline. In fact, it is likely that the CI of corn ethanol used for this project would be as great or greater than that of gasoline if the project succeeds as</p>	Section 6.1.3 has been revised to discuss the debate between Lark et al. and GREET model authors.	20244-205651-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>intended. Likely changes in land use, especially expansion of corn for ethanol into currently uncultivated (“natural”) areas in the region are important in the context of both direct and indirect environmental impacts.</p> <p>Specifically, conversion of previously uncultivated land, for example grasslands-prairie, forest, or wetlands, to row crops such as corn, results in release into the atmosphere of huge amounts of stored carbon from soil or standing tree biomass. These are major reservoirs of carbon which have very large climate impacts. The release of this CO₂ occurs over a period of decades from soil or wetlands once converted to annual row crops like corn. Therefore, possible land use changes related to corn ethanol production have large implications for the CI of the corn ethanol plant for a long time.</p> <p>These considerations are relevant under MN Rule 7852.1900, subpart 3, sections B. and I. concerning environmental and cumulative effects respectively. If the intended purpose of the pipeline to make the plant more profitable or economically successful are achieved, that will provide incentive to expand ethanol production within the existing plant or others if markets support it. Although expanding electric car markets may eventually work against this, use of ethanol in the medium term and possible use in other classes of vehicles or aircraft and continuing renewable fuel standards (RFS) nationally and in Minnesota would support increasing ethanol use for years to come.</p> <p>Conversion of large amounts of uncultivated land in the region to corn and other row crops over the past 15 years has been demonstrated by research by Lark et al. (2015).⁸ One of the major national hotspots for this conversion has been in northwestern and northcentral Minnesota as well as eastern and central North and South Dakota, that is, in the vicinity of the proposed pipeline.⁹ My rough estimation based on Lark et al. (2015) is that this amounts to up to several hundred thousand acres in MN over this time. Much of this conversion has been for corn, and over half does not involve conversion of Conservation Reserve Program land back into crop production. This research was consistent with several other research papers concerning the upper Midwest and covered the period between 2008-2012 and 2008-2016 respectively, that is, after renewable fuel standard policy changes in 2007 that were intended to discourage such conversion of uncultivated land to biofuel crops.</p> <p>These authors also note that in 2014 new provisions in the Farm Bill included insurance penalties for converting uncultivated grasslands to crops. However, conversion of forested lands was not covered by this policy. And importantly much of the converted land in the area near the proposed pipeline in Minnesota was forested rather than grassland (as is more common farther west). Research covering 2008-2016 further implicated corn ethanol subsidies under the 2007 revisions of the RFS for raising the price of corn and indirectly other field crops such as soybeans and wheat.¹⁰ Soybeans, along with corn are two of the main crops being grown in newly cultivated soil in the MN regions of the proposed pipeline.</p> <p>These scientists found that when newly cultivated domestic land was included in the determination of CI for corn, it was no less than gasoline but more likely at least 24% greater. It is important to note that this large impact on CI from newly cultivated areas would occur even if additional measures for growing crops sustainably were used due to incentives from LCFS (which is mostly unlikely, as discussed below). Due to the relative magnitudes of the effects, even if widely enacted such measures would not entirely offset the emissions of CO₂ from conversion of uncultivated lands to corn or related crops. Additionally, as discussed below, the agricultural measures to further reduce CI have not been shown to reliably sequester more carbon in soil in the most thorough and recent science research. Soil carbon sequestration is the primary means of reducing CI for several of these conservation practices. It is important to note that some other previous studies have included the potential for land use change to increase CI, but those focused mostly on international regions and underestimated domestic sources. So, the findings of Lark et al. (2022) supplant that earlier research.¹¹</p> <p>Additionally, these trends in newly cultivated corn acres increased fertilizer use by 3-8% and increased measures of water quality degradation by 3-5%. Increases in fertilizer use are contrary to claims that greatly reduced fertilizer use is likely under LCFS incentives and would reduce CI. Such actual increases in nitrogen fertilizer use would, to the contrary, increase the CI of corn grown for ethanol production by increasing production of the potent greenhouse gas (GHG) nitrous oxide.¹²</p> <p>One way that increased corn production may occur without expanded acreage is by higher productivity (yield) per unit of land, and this has been important for several decades over the mid to late twentieth century and is still a factor. But clearly the actual expansion of cultivated land in the past several decades shows that yield gains alone are not sufficient to prevent expansion of cropland. Importantly, there is no good research evidence that new technologies such as GMOs or gene editing will change this trend significantly.^{13,14} Furthermore, one of the primary ways to increase yield has been to increase nitrogen fertilizer use.</p> <p>Even where the RFS result in expansion of corn on currently cultivated land rather than uncultivated land for expanded ethanol production, that would still likely result in a corresponding increase of previously uncultivated land used for corn or related row crops. This would occur by displacement of corn or other crops grown for other purposes onto currently uncultivated land, especially</p>		

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>livestock feed, since demand trends for those other purposes is generally increasing. In other words, the total corn and other field crops acreage for all purposes needs to be considered, because they collectively determine land use and are linked economically. Therefore, both direct and indirect drivers of conversion of uncultivated land to corn production (and other row crops), with its very high negative climate and other environmental impacts, should be expected if the pipeline succeeds as intended. Expanded demand for corn for ethanol, which is most likely to be supplied from the local region, when possible, would therefore directly and indirectly put pressure on expanding corn acreage into uncultivated nearby land.</p> <p>Although increasing corn production is only one possibility, it is a reasonable one and therefore must be evaluated as part of any reasonable EIS.</p> <p>Given that expansion of corn into previously uncultivated lands has been the case over the past 15 years, the burden for showing that this trend would not be exacerbated by the pipeline must be convincingly demonstrated. However, based on my analysis, this has not been done and the pipeline permit should be rejected.</p> <p>7 Scully, M.J. et al. 2021. 	Gurian-Sherman, Doug	2024-04-18	<p>Improved Agricultural Practices for Climate and the Environment</p> <p>Several sustainable agricultural practices are touted as likely to be adopted or much more widely adopted by farmers growing corn for ethanol. Some of the more widely touted and discussed practices are no-till, growing cover crops, and reducing nitrogen (N) fertilizer use. As discussed below, to the contrary there is reliable data that shows that very few corn acres in MN use these either no-till or cover crops. And there are reasons why this is not likely to change much in the foreseeable future. Importantly, for both cover crops and no-till, the recent and best data contradict claims that they increase the sequestration of CO₂ in the soil, which if it occurred would benefit climate and reduce the CI of ethanol corn. A substantial reduction in N fertilizer use is also questionable and may also not have the intended effect of reducing GHGs or at least not to the extent claimed.</p>	Thank you for your comment.	20244-205651-01
	Gurian-Sherman, Doug	2024-04-18	<p>This is important because, as shown above, the pipeline and carbon sequestration proposed by the applicants is not assured if the CO₂ is used for recovery of petroleum that would not otherwise be produced, as is often the case. And if the project succeeds and thereby provides economic incentive for expansion, it is likely to occur in significant part through conversion of currently uncultivated land, with its great environmental and climate impacts. These impacts mean that the project is more likely to cause substantial negative climate and other environmental impacts than positive ones.</p>	<p>Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO₂ transported by the project could be used for EOR. To analyze impacts of the proposed project (Chapter 5), the EIS assumes the current level of ethanol production is maintained. Chapter 6 analyzes two alternative technologies—a suite of agricultural practices and a suite of energy use and efficiency changes—and assumes the current level of ethanol production is maintained with no land use change associated with expanded crop conversion from forestland, wetlands, or grazing lands. All cropland analyses assume historical persistence of conventional management pre-1980s for the region supplying feedstock to the ethanol plant. Emissions associated with introducing another variable (increase or decrease in ethanol production) would needlessly complicate the analysis of these alternative technologies. The final EIS has been revised to discuss the land use change debate between Lark et al. and GREET model authors.</p>	20244-205651-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Gurian-Sherman, Doug	2024-04-18	<p>Therefore, it is important to ask whether additional environmentally desirable farming practices may occur in conjunction with corn ethanol production associated with the pipeline, and whether if adopted they would reduce CI. As discussed below, these outcomes are unlikely except to a limited extent, which will therefore more likely result in increased net environmental and climate harm when cultivation of currently uncultivated land is accounted for.</p> <p>It is unlikely that favored sustainable agriculture practices will be adopted to a substantial degree, or that they will improve the climate and environmental footprint of corn ethanol significantly.</p> <p>Nitrogen fertilizer use may be reduced somewhat. Nitrogen (N) fertilizer use is important for GHG (greenhouse gas) production in agriculture because some of it is converted in the soil by microbes to the very potent GHG nitrous oxide. In general, the less N fertilizer used the less nitrous oxide produced. But several factors in addition to the availability of precision farming resources determine how much N fertilizer is used.</p> <p>As noted above, expansion of corn acres for ethanol production in recent years led to increases in nitrogen fertilizer use, not reductions.¹⁵ Furthermore, implementation of several practices to reduce nitrogen contamination to water supplies by reducing use in sandy soils in Wisconsin, similar to many soils in the MN region that includes the pipeline, still resulted in contamination of groundwater with dangerous levels of nitrates.¹⁶ With pressure to maximize corn yields which requires adequate fertilizer levels, and greater likelihood of losses of nitrogen below corn root zones in sandy soil, it is even more difficult to substantially reduce nitrogen use in practice.¹⁷</p> <p>Profit margins per unit of corn production are usually small, and even negative in many years. This pushes the industry to focus heavily on increasing production, farm size, and production efficiency rather than activities that reduce environmental harm.¹⁸ Precision farming in the form of reduced nitrogen fertilizer use may have some positive effects but this has not been substantial so far, possibly because of the related costs of the technology, such as field mapping and the cost of GPS services and specialized equipment. In addition, time and resource allocations often work against separating fertilizer applications over the growing season and especially at times of greatest crop growth and uptake. Another contrary factor can be that even though higher amounts of fertilizer application is less efficient in terms of crop growth response and yield, when fertilizer prices are low relative to crop prices, there may still be incentive to apply more. This may be doubly problematic because the lower corn uptake efficiencies at higher application rates usually result in exponentially greater release of the potent GHG nitrous oxide from the soil.</p> <p>Large reductions in N, even where possible in some fields in some years, is not generalizable. As discussed above, this is difficult to accomplish and even when some reductions are achieved, they may have limited impact. It is also contradicted, as noted above, by recent data for such corn which showed increases rather than decreases in N fertilizer use.¹⁹ Small or moderate reductions in N would also be advantageous, but proportionally less than larger ones.</p> <p><i>15 Lark, T.J. et al. 2022. ibid</i></p> <p><i>16 Kraft, G.J and W. 	Gurian-Sherman, Doug	2024-04-18	<p>Additionally, large reductions in fertilizer use, such as proposed in the DEIS to reduce CI, could have negative consequences for soil carbon storage, touted as a means of reducing CI in corn grown for ethanol. Research has shown that increases in soil carbon sequestration, or conversely loss of soil carbon into the atmosphere as CO₂, is related to both carbon sources such as crop residues or composts and amounts of other vital nutrients and especially nitrogen as a limiting resource.^{20,21,22} The soil microbes that convert soil carbon to CO₂ or to more stable soil carbon, require sufficient amounts of all of these nutrients. The research has found that when too little nitrogen is available, soil microbes do not build soil carbon reserves even when otherwise sufficient carbon is available. Also, the recommended amounts of nitrogen fertilizer from agronomists that are typically used in determining N fertilizer application rates including possible reductions, take only the crop needs into account, but not the amounts needed by soil microbes responsible for soil carbon levels. So, if nitrogen fertilizer amounts are substantially reduced to just meet crop requirements, such as for LCFS, it may work against the stated goals of increasing soil carbon sequestration by supplying too little for soil microbes. As noted in the cited</p>	<p>The EIS analyzes the two alternative technologies ordered by the Commission. 			<p>references, more research is needed to understand these issues more fully, but certainly they show that claims about substantial reductions in N fertilizer in ethanol corn are at best premature.</p> <p>Much of the land for corn cultivation in north central and northwestern MN contains sandy soils that originated as glacial outwash. These soils hold less moisture and often require higher levels of fertilization because more fertilizer may be carried below the root zone by precipitation or irrigation compared to other soils.²³ This makes it more difficult to reduce the amount of fertilizer applied and means that more of it and more applied pesticides are likely to leach into groundwater, increasing harm. These conditions must be addressed in any adequate EIS.</p> <p><i>20 Chaplot, V. and P. Smith. 2023a. 	Gurian-Sherman, Doug	2024-04-18	<p>Additionally, these soils are also more susceptible to drought and irrigation of them in MN typically relies on surficial (shallow) aquifers that are susceptible to being depleted and thereby harming area water supplies for both residents and biodiversity and reducing resupply of deeper aquifers. The increasing irrigation in Minnesota from multiple crops including corn has already harmed water access by residents and others in the region of the proposed pipeline, including indigenous communities.^{24,25} In addition to increased irrigation on sandy soils, climate change is also leading to increased irrigation across the upper Midwest generally. This also occurs on existing corn ethanol cropland, causing harm to residential water supplies and harming the environment. Recent research suggests that corn for ethanol may be a driver of trends since the late 1990s of increasing irrigation of corn in central Minnesota that could contribute to supplying the ethanol plant.²⁶</p> <p><i>24 Xie, Y. and T.J. 	Gurian-Sherman, Doug	2024-04-18	<p>In other corn growing areas in Minnesota which are also susceptible to infiltration of agricultural chemicals into aquifers, toxic insecticides sulfoxaflor and neonicotinoids have been found in groundwater originating from corn and soybean fields.²⁷ They are also widely and commonly found in surface waters from the agricultural origins.²⁸ These insecticides are applied to close to 100% of seed corn, with approximately 95% of it never entering the plant but rather ending up in soil and water.²⁹ They are also very water soluble and persistent, which facilitates them entering groundwater and surface water compared to many other pesticides. Their extreme toxicity to beneficial organisms including pollinating bees, makes them especially harmful at very low concentrations. They are also a substantial threat to many other organisms from aquatic invertebrates to birds, including threatened and endangered species, especially because they have become nearly ubiquitous in recent years, more so than previous insecticides used on corn. ^{30,31,32} Expansion of corn for ethanol due to success of the proposed pipeline is likely to exacerbate these harms.</p> <p><i>27 Thompson, D.A. et al. 2021. 	Gurian-Sherman, Doug	2024-04-18	<p>Other agricultural conservation practices have been suggested as possibly being used with ethanol corn. One such practice is no-till or reduced tillage (or conservation tillage). Reduced tillage is among the most accepted conservation practices for industrial agriculture. This is in part because it fits relatively well with the overall trend toward reduced labor requirements for industrial corn production because it relies heavily on herbicide use rather than more labor-intensive tillage to control weeds. This is especially true for genetically engineered herbicide-resistant corn of the past three decades because the herbicides can be applied directly to the crop without harming it (although this use is threatened by herbicide resistant weeds).</p> <p>Soils remain cooler without tillage which can delay germination and seedling emergence and this can be a disincentive in northern climates with already short growing seasons. But in part to address the perceived greater vulnerability to pests due to delayed seedling emergence, virtually all corn seed is now pre-treated by pesticide/seed companies with fungicides and neonicotinoid insecticides.³³</p> <p>Both patented genetically engineered seed and pesticide seed treatments, which have occurred over the past 20-30 years, are part of the trends toward biologically and ecologically simplified and environmentally harmful agriculture which is increasingly more capital and less labor intensive. Corn seed today is several times more expensive to farmers than it was a generation ago.</p> <p>All of these trends lock-in today's huge corn farms into these practices through loans and the sunk costs of machinery, farm structures, costly chemical and seed technologies, and corporate research agendas which lock-out more diversified and environmentally sound practices.</p> <p>34,35,36 This makes it increasingly difficult to employ most ecologically sound farming practices, which by definition rely on increased biological complexity and diversity like rotating three or four different crops and growing cover crops rather than the common corn monoculture or simple corn-soybean rotation that is overwhelming common for corn in the Midwest. Greater crop diversity and other ecological practices are somewhat more labor intensive and require more adaptable, rather than increasingly highly specialized, machinery.</p> <p>This biological complexity that is antithetical to today's industrial corn ethanol farms is necessary to achieve the best environmental and climate outcomes. For example, long crop rotations, and including cover crops, can reduce the need for pesticides and N fertilizers by over 90% and have multiple benefits for the climate.^{37,38}</p> <p>33 Gurian-Sherman, D. 2017. The Commission cannot select either of these alternative technologies as an action alternative; however, the information provided will inform the Commission's decision to issue a pipeline routing permit. Minnesota Rule 4410.2300(H) indicates that an EIS shall include "a thorough but succinct discussion of potentially significant adverse or beneficial effects generated" by the proposed project and each major alternative with "[l]ess important material ... summarized, consolidated, or simply referenced." Factors to be considered include "the impact and the relevance of the information to a reasoned choice among alternatives" and "the relationship between the cost of data and analyses and the relevance and importance of the information." As a result, the draft EIS provided a range of agricultural practices and a range of implementation rates from zero percent to 75 percent.</p> <p>The commenter suggests that the EIS include a feasibility study concerning these agricultural practices. Such an analysis is not commensurate with the importance of the impact and the relevance of the information to a reasoned choice among pipeline routing alternatives. As such, the EIS provides a range of implementation rates from zero percent to 75 percent to account for the uncertainty associated with implementation. Section 6.2.3. has been revised to include endnotes referencing the suggested studies discussing the challenges and opportunities associated with implementing alternative agricultural practices. Further, the EIS summarizes challenges farmers might face implementing these practices in Section 6.2.3.4.</p>	20244-205651-01
	Gurian-Sherman, Doug	2024-04-18	<p>Instead, the only farming practices that are likely to be adopted widely by corn ethanol farmers without substantial subsidies and other policies as incentives are those that will fit well with the current efficiency and production paradigms. Cover crops, which are important for the environment and soil quality generally fit much less well into this paradigm than conservation tillage, which can include no-till. This is because of the cost of the seed and the additional labor for sowing it, as well as timing issues in northern regions and the lower cover crop biomass that often results, and perceptions concerning reduced yield of corn. This is supported by the fact that despite the USDA advocating for cover crop use over the past 15 years or so they were grown on only about 5% of row crop acres in the U.S. in 2012.³⁹ And while there have been some small increases in cover crop acreage in the Midwest, there has been less in MN compared to more southerly states.⁴⁰ There was no substantial change in cover crop acreage between 2012 and 2017, with most parts of the state using cover crops on less than 3% of acres, and few areas with more than 6% coverage. Research has shown some yield losses in corn associated with cover crop cultivation (other research has refuted such yield loss). And although this may vary</p>	<p>As stated in the EIS, an "accessible and reproducible evaluation of alternative agricultural practices applicable to west central Minnesota was necessary." The COMET-Farm tool was chosen because it was produced by a government agency (USDA) and is publicly available at no cost, allowing for duplication of results by interested persons. Section 6.2.3. has been revised to include endnotes referencing the suggested studies discussing the challenges and opportunities associated with implementing alternative agricultural practices. Section 6.2.3.1 discusses the challenges associated with the different modelling software tools.</p>	20244-205651-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>considerably with the types of cover crop and management practices, it has been difficult to persuade farmers to adopt them. In Minnesota, the short growing season makes it more difficult to establish cover crops. If the pipeline alone would reduce the accepted CI below what is needed to receive credits from LCFS programs such as California’s, it is unclear that there would be sufficient additional incentive for many corn ethanol farmers to adopt cover crops. Certainly, this cannot be accepted without much more substantial evidentiary support.</p> <p>The single practice that is relatively amenable to corn ethanol growers, conservation tillage or to a much lesser extent no-till, is not likely to increase soil carbon sequestration, which would otherwise reduce the CI of corn ethanol. This is contrary to the claims of many supporters of corn ethanol. The outputs from agriculture climate models such as the COMET model provided in the DEIS Appendix M show substantial removal of CO₂ and reduction of the CI associated with management practices of no-till and cover crops (clover), presumably through soil carbon sequestration (Appendix M is not explicit about this). But as explained below, recent science contradicts such soil carbon sequestration.</p> <p>39 Dunn et al. 2016. <i>Perceptions and use of cover crops among early adopters: Findings from a national survey. J. Soil Water Conserv.</i> 79(1): 29-40.</p> <p>40 Deines, J.M. et al. 2022. <i>Recent cover crop adoption is associated with small maize and soybean yield losses in the United States. 	Gurian-Sherman, Doug	2024-04-18	<p>Many research papers, beginning with Baker (U of MN) in 2007, challenged the then prevalent idea that no-till increased carbon sequestration in row crops.⁴¹ Baker found, in a review of many previous research papers, that the apparent increases in soil carbon attributed to no-till was likely an artifact of the measurement methods used in conducting most research. Due to cost and time constraints and standardization, most research sampled soil only to depths between about 5 and 30 centimeters (cm). However, for annual row crops most of the crop residues, roots and root exudates that contribute to soil carbon storage occur close to the soil surface, specifically in the top 30 cm or so. Therefore, most carbon was concentrated in these upper levels in no-till, while deeper soil horizons where no-till contributed little were typically not measured.</p> <p>High measured carbon amounts from nearer the surface for no-till were improperly assumed to apply to the entire depth of the soil profile. When Baker analyzed the minority of research papers that included deeper soils levels, he found that there was no statistically supportable evidence of higher soil carbon sequestration for no-till. Subsequently, many research papers, even by respected soil scientists who previously supported the hypothesis of increasing soil carbon sequestration for no-till, confirmed Baker’s findings by around the mid-2010s that no-till cannot be relied upon to increase soil carbon sequestration. ^{42,43,44}</p> <p>It may be that government entities anxious to find climate solutions, especially those that are most readily acceptable to large industrial agricultural interests that dominate Midwestern farming, were overly eager to accept no-till as a climate solution, and less inclined to reconsider it.</p> <p>A second problem with no-till is that some weeds, especially aggressive annuals like several amaranth species, have been developing resistance to the most effective herbicides due to their overuse on GMO corn and soybeans which are the large majority of these crops in the U.S. Therefore, it is harder to forego tillage indefinitely and many farmers that practice no-till or conservation tillage revert to heavier tillage periodically, which can significantly reverse many of the benefits of no-till (such as reducing soil erosion).</p> <p>41 Baker, J.M. et al. 2007. <i>Tillage and soil carbon sequestration—What do we really know? Agricul. Eco. Environ.</i> 118:1–5</p> <p>42 Blanco-Canqui, H and R. Lal. 2008. <i>No-Tillage and Soil-Profile Carbon Sequestration: An On-Farm Assessment. Soil Sci. Soc. Am. 	Gurian-Sherman, Doug	2024-04-18	<p>Other practices cited as increasing soil carbon sequestration are unlikely to be widely adopted by industrial corn farmers. Cover crops are one such practice that is widely agreed to have multiple environmental benefits. But as with no-till, recent analysis has called into question the ability of cover crops to reliably increase soil carbon sequestration.⁴⁵ This analysis notes several of the same problems as were found previously with no-till research including shallow soil assays and not accounting for differences in soil density, as well poor experimental design in many cases. Of the few studies reviewed that were adequate, there was no trend toward increased soil carbon sequestration. It should be noted that there are many different cover crop species and how they are grown and managed may also</p>	Section 6.2.3. has been revised to include endnotes referencing the suggested studies discussing the challenges and opportunities associated with implementing alternative agricultural practices.	20244-205651-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>affect sequestration. But as of the present, the claim's that adoption of cover crops will increase soil carbon sequestration is not scientifically supportable.</p> <p>It should also be noted that soil carbon sequestration aside, cover crops provide several other important benefits such as reducing soil erosion, improving soil quality, increasing water infiltration, providing habitat for beneficial organisms and so on.</p> <p>But as noted above, cover crop seed is an additional expense, and typically cover crops are not harvested and sold in industrial cropping systems. They may be grazed in more diverse farming systems and the value of grazing livestock thereby increased, while the livestock supply manure to the soil. But this kind of diversity is not generally compatible with industrial agriculture specialization such as corn for ethanol. Some cover crops may be harvested, but this may compromise their possible contribution to soil carbon. All these considerations discourage the use of cover crops by industrial corn producers. And in fact, as noted above, the percentage of corn acres using cover crops in MN is tiny. It certainly should not be accepted that they will be more widely adopted given the history of their use unless and until it can be shown in actual reliable and appropriate research.</p> <p><i>45 Chaplot, V. and P. Smith. 2023a. Cover crops do not increase soil organic carbon stocks as much as has been claimed: What is the way forward? Glob. Change Biol. DOI: 10.1111/gcb.16917</i></p>		
	Gurian-Sherman, Doug	2024-04-18	<p>Finally, estimations of the CI for corn grown for the ethanol plant must be evaluated carefully. For example, where the permit application suggests that the CI for this corn may be lower than national averages, the details of how this is determined must be carefully addressed because as noted above, some of these methods use older research and highly contested or refuted conclusions. In addition to examples discussed above, another way that models may underestimate CI involves indirect nitrous oxide emissions. Indirect emissions are those that occur from nitrogen originating from farms but that has moved beyond them, such as from streams that acquire nitrogen from field runoff or leaching. Research in Minnesota determined that values commonly used in agricultural climate models may underestimate nitrous oxide emissions by 40% overall in the corn belt, and indirect emission from stream receiving nitrogen from crop fields by 3 – 9-fold.⁴⁶ These concerns suggest that the current CI value of the corn supplied to the ethanol plant may be considerably higher than claimed.</p> <p><i>46 Turner, P.A. et al. 2015. Indirect nitrous oxide emissions from streams within the U.S. corn belt scale with stream order. PNAS. 112(32):9839-9843 www.pnas.org/cgi/doi/10.1073/pnas.1503598112</i></p>	<p>The CI Score metric used in the draft EIS reflects the net emissions of the full life cycle analysis according to the United States Department of Energy Argonne National Laboratory's GREET model, and results are current as of the release date of the draft EIS. Argonne has developed this full fuel-cycle model to estimate energy use and emissions from transportation fuel/vehicle technology systems. The model includes detailed information on corn farming and chemical manufacturing. The model and its documents are posted at http://greet.anl.gov. Argonne's annual releases of the latest R&D GREET are comprehensive in order to inform the life cycle analysis technical community and elicit stakeholder feedback. Not all pathways and data in R&D GREET are appropriate for use in circumstances where a high level of quantitative certainty or precision is required. Inclusion of a pathway or module in R&D GREET does not necessarily represent U.S. Government concurrence for any specific use, but instead is intended to gather technical feedback and advance the science of life-cycle analysis. The current (2023) estimated Argonne GREET CI scores of the Otter Tail facilities align with the most up-to-date studies analyzing the CI of corn ethanol. Section 6.2.3. has been revised to include endnotes referencing the suggested studies discussing the challenges and opportunities associated with implementing alternative agricultural practices. Section 6.2.3.1 discusses some modeling platforms available to estimate various GHG emissions associated with agricultural systems. One of the alternative agricultural practices discussed in the EIS included reducing synthetic nitrogen-based fertilizers. Such an analysis is not commensurate with the importance of the impact and the relevance of the information to a reasoned choice among pipeline routing alternatives, as the discussion in Chapter 6 includes nitrogen emissions.</p>	20244-205651-01
	Gurian-Sherman, Doug	2024-04-18	<p>To summarize, the general trends involved with growing corn for ethanol production favors large farms with simplified agroecosystems that generally are antithetical to practices that increase soil carbon sequestration or that are better for the environment. There is some opportunity to use precision agricultural methods to reduce N fertilizer inputs, which could reduce nitrous oxide emissions to some extent, but large reductions are unlikely and not credible without adequate research support. And as noted, large reductions may result in lower soil carbon sequestration or even further reduction of soil carbon stores. I.e. increased release of CO₂ from soil may occur which would increase CI unless counterbalanced by reduced nitrous oxide. This balance is currently not known. The most likely practice to be adopted by ethanol corn farmers is no-till or conservation tillage, but those practices do not reliably increase soil</p>	<p>Thank you for your comment.</p>	20244-205651-01

			<p>carbon sequestration and rely on heavy use of harmful herbicides in industrial agriculture. Additionally, reversion to tillage reverses several of the benefits, which is widely recognized as the permanence problem for soil carbon sequestration.</p> <p>Furthermore, recent changes in industrially farmed corn in the region show that by several measures, corn farming is becoming more harmful to the environment. These include the almost ubiquitous uses of neonicotinoid insecticide seed treatments where previously only about 30% of corn acres were treated with insecticides.⁴⁷ Similarly, harmful irrigation has been increasing in the region in recent years. This suggests that in some ways, and perhaps overall, the impact on the environment of ethanol corn, even on already cultivated acres, may become more harmful rather than less.</p> <p><i>47 Gurian-Sherman, D. 2017. Ibid. The volume of neonicotinoids used to treat seeds is lower than the previously sprayed or soil applied insecticides. However, in terms of the extent of harm to the environment, area treated and intrinsic toxicity are more important, and neonicotinoids are likely more harmful overall than previous corn insecticide use for those reasons.</i></p>		
	Gurian-Sherman, Doug	2024-04-18	<p>Socioeconomic Impact</p> <p>The trend in the production of corn and similar industrial crops is for larger and larger farms, where technology has been increasingly substituted for labor. To the extent that this supplants dangerous or debilitating work it is beneficial provided these benefits are equitably distributed. However, technology has mostly gone well beyond what is needed to reduce undesirable forms of labor in row crops. These benefits can be achieved without the massive concentration and industrialization of corn farming that has continued for many decades, especially since the mid-20th century.</p> <p>Mostly, the increasing dependence on external purchased and expensive inputs like fertilizers, pesticides, patented seed, and larger and more specialized machinery has supplanted much of the previous local income for labor that would be circulated to provide a local economic multiplier effect. Instead, much of the profit from farming now goes to distant parts of the supply chain of those inputs. This technological substitution, driven by small margins in corn profits due to frequent overproduction and extreme concentration in grain aggregator corporations and a technology treadmill that pushes farmers to adopt new expensive technologies, has contributed to the hollowing out of local economies. Now most of the local economic value in many rural areas no longer comes from agriculture. The combined effects of these trends have been found repeatedly through rural sociological research to result in socioeconomic harm for rural areas dominated by industrial agriculture such as corn ethanol.⁴⁸ To the extent that this pipeline is successful and contributes to this trend, the greater the likely harm. Without evaluating these well documented effects, the claim of probable socioeconomic benefit is superficial and not adequately supported.</p> <p><i>48 Lobao, L. and C.W. Stofferahn. 2007. The community effects of industrialized farming: Social science research and challenges to corporate farming laws. Ag. Human Values. DOI 10.1007/s10460-007-9107-8</i></p>	Thank you for your comment. Text has been added to Section 5.5.1.2 acknowledging that if the project were to contribute to the current trend of larger, more technologically advanced farms, the local farm workforce could be adversely impacted.	20244-205651-01
	Gurian-Sherman, Doug	2024-04-18	<p>Summary and Conclusions</p> <p>The DEIS fails for several reasons to accurately evaluate the environmental impacts of the proposed carbon pipeline, and especially its climate and broader environmental impacts related to the cultivation of corn.</p> <p>It likely substantially underestimates the reasonable possibility that land use for corn, or indirectly other row crops like soybeans influenced by ethanol corn, will continue to expand further into nearby uncultivated land, releasing substantial amounts of CO₂ into the atmosphere for many years due to success of the pipeline. It would thereby result in much higher CI of the corn ethanol plant (or other plants).</p>	Section 6.1.3 has been revised to discuss the scientific debate about emissions associated with land use change between Lark et. al. and GREET model authors.	20244-205651-01
	Gurian-Sherman, Doug	2024-04-18	There is also no assurance that CO ₂ from the pipeline would not be used for the extraction of fossil fuels that would not otherwise be produced, as is a large percentage of currently captured CO ₂ emissions. This would be in direct contradiction to the climate goals of the project and the state of Minnesota.	Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	20244-205651-01
	Gurian-Sherman, Doug	2024-04-18	It is also unlikely that significantly more sustainable practices will be adopted by corn ethanol farmers and that those practices would reduce CI. As an aside, it would make much more sense for the State of Minnesota to shift such subsidies from corn ethanol to renewable electricity production (mainly wind, solar, and storage) and distribution which have much greater positive climate impacts even under the most favorable scenarios for corn ethanol. It would also make much more sense to substantially increase subsidies for moving farming toward more agroecologically diverse systems that have great environmental benefits, and to legislate policies that prevent cultivation on previously uncultivated land. All of these would have actual and substantial benefits for the environment and climate. To the extent that subsidies and policies for corn ethanol detract from those better investments, they can be rightfully labeled as detrimental.	An alternative that does not include ethanol production was not studied in the EIS because it would not meet the purpose of the project.	20244-205651-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>The permit application appears to rely on outdated values for the climate benefits of practices like no-till and cover crops. This is not necessarily surprising because, as noted by Chaplot and Smith (2023a), there has been premature acceptance of these practices as beneficial for soil carbon sequestration when subsequent more careful analysis has shown that they are likely in error. This premature acceptance has shown up in government policy already, perhaps for political reasons, as noted by these authors, in the U.S. Build Back Better (infrastructure) legislation and in national legislation in France.</p> <p>Large reductions of N fertilizer use to further reduce CI are also highly questionable as described above.</p> <p>Similarly, in terms of improving the environment more generally, the adoption of practices that are most likely to occur with corn for ethanol, such as some reduction in fertilizer use or adoption of conservation tillage, will have only minimal environmental benefit overall for issues of climate, water quality, and especially biodiversity. They would be overwhelmed by the negative consequences of conversion of currently uncultivated land to corn ethanol or related production. There are also recent trends such as increasing irrigation of corn in the region, including on existing corn acres, that have negative environmental and social consequences that have not been properly considered so far.</p> <p>In terms of the socioeconomic impact, temporary jobs and a small number of permanent jobs that may be gained building the pipeline and small increases in the tax base do not consider broader socioeconomic impacts. Well-documented historic records of negative socioeconomic impacts of increasing agricultural industrialization on rural economies and communities, including harm to native women, must be evaluated and part of the EIS.</p> <p>In summary, the permit must be rejected as such and remanded to the agency with instructions to do a proper EIS. In addition, the best course for the climate, the environment and the community would be a “no action” option.</p> <p>Chaplot, V. and P. Smith. 2023a. Cover crops do not increase soil organic carbon stocks as much as has been claimed: What is the way forward? Glob. Change. Biol. DOI: 10.1111/gcb.16917</p>		
	Gustafson, Marcia	2024-02-23	<p>My name is Marcia Gustafson, and I live in Mankato. I am deeply concerned about the DEIS for the Otter Tail Wilkin CO₂ Pipeline Project because it does not adequately take into account that water is essential to life. The proposed route for Summit’s pipeline network includes many water crossings, wetlands, aquifers, and other sensitive water bodies. Such a route has different potential impacts for each kind of water body involved. The DEIS does not fully address these various impacts, or in the case of wetlands has contradictory information on how many acres could be affected (see Tables 5-40 on p. 5-58; 5-4 on p. 5-24; and 5-52 on p. 143). We cannot be cavalier about our aquifers, wetlands, and rivers that can be damaged during construction or by breaches in the pipeline itself and can cause irreparable harm. Unfortunately, Minnesota has an example of this kind of damage with the Enbridge Line 3/93 where breaches have and are occurring, and Enbridge is not able to properly undo the damage, which is putting drinking water at risk in some communities. Today, February 23, 2024, I heard Cathy Wurzer on MPR interviewing former Governor Arne Carlson, who is 89 years old and sounds sharp as a tack. Near the end of the interview, Cathy asked him what a current concern of his was, and he responded with Minnesota waters. He thought that our waters are in danger. We have already polluted or damaged too many of our water resources and are not taking appropriate steps to safeguard those remaining into the future. So, I will end where I began by repeating "water is essential to life." This DEIS does not provide an adequate account of project impacts on water resources.</p>	<p>Thank you for your comment. Discrepancies between Table 5-4 and Table 5-54 result from different datasets and their associated resolutions. Table 5-4 uses NLCD data to analyze land cover, and Table 5-54 uses NWI data to analyze wetlands. Table 5-40 has been edited to be consistent with discussions of impacts on wetlands in Section 5.7.9 and Table 5-53 and Table 5-54.</p>	20243-204403-01
	Henriksen, Dan	2024-02-14	<p>To whom it may concern, I, Dan Henriksen own and farm in Redwood County, Mn and I have great concerns about the Ottertail to Wilkin branch of SCS CO₂ pipeline that in the future is proposed to cross our farms in Redwood County. The water needed for carbon capture is a huge concern for me as all living organisms need water to survive! Wells are drying up and rivers and streams are low. We cannot afford to give up the water needed for this private, for-profit company, to sequester such a minuscule amount of CO₂, that if all activities and processes needed to sequester are factored in, that more CO₂ will be emitted than stored!</p>	<p>Additional detail has been added to Section 5.7.8.2 to address the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following DNR request, when necessary. This information has also been added to Section 5.7.8.2.</p>	20243-204403-01
	Henriksen, Dan	2024-02-14	<p>If SCS is allowed to proceed with this project, thousands of drainage tile lines and tile systems will be crossed. Appendix E, 6.23 title states tile repair after pipeline installation. Nowhere in the paragraphs do I see anything about tile repair, only future tile installations. It also requires a "qualified tile technician" to submit a plan for future tile. Many tile systems are installed by farmers with their own equipment. Who would be a qualified tile technician in that case, and who would pay the extra costs incurred to get Summit the plans needed by this clause? In appendix E, paragraph 1, it states that any mitigation plans spelled out in the easement would take</p>	<p>Section 2.4.6 states that any drain tiles damaged during pipeline construction would be repaired before backfilling the trench. Section 6.7 of the applicant's APP (Appendix E) specifies the procedures and timelines for repair of drain tiles disturbed during construction. The APP notes that tile disturbed or damaged by pipeline construction would be</p>	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			precedence over the EIS. The easement given to me to consider for signing states many times states that Summit will repair to a REASONABLE condition, be it tile repair or bringing the land back to farmable condition. What does reasonable mean?? In appendix E,6.3 it states that in frozen conditions a ripper can be used to scarify the topsoil to aid in removal. How would the operator in this case be able to determine topsoil depth? If he goes too deep, mixing top and subsoil will occur and cause even more permanent damage to the land!	<p>repaired to its original or better condition, and that permanent repairs would be completed within 21 days after the pipeline is installed in accordance with the applicant's Minnesota ECP (Appendix D). Section 5.5.1.3 has been revised to include a reference to this mitigation measure. Agreements negotiated between the applicant and the landowner are outside the scope of this EIS.</p> <p>Regarding topsoil segregation under frozen conditions, as stated in Section 2 of the APP, agricultural inspectors would provide construction personnel with field training on specific topics (e.g., protocols for topsoil stripping), observe construction activities on agricultural land on a continual basis, and be responsible for verifying compliance with the APP.</p>	
	Henriksen, Dan	2024-02-14	Appendix F 2.8.2 states that in frost conditions that Summit has the right to modify the plans. What does this mean? Also, several parts of the DEIS it states that a County Inspector will oversee the project. It appears that in the DEIS the Ct will be an employee of Summit. It seems that fair and impartial judgement could become skewed easily with this arrangement. I have many other concerns, but too numerous to mention in this writing.	<p>Section 2.8.2 of the Winter Construction Plan states, “Trench topsoil will be segregated as practicable but modified dependent on depth of frost, thickness of topsoil, and the trenching method used.” Prior to this statement, the Winter Construction Plan states that “Where frozen blocks have been cut, excavation equipment (e.g., a backhoe or excavator) will be used to remove the large frozen blocks and to place them adjacent to the trench.” The sentence in question indicates that, depending on conditions, the ability to segregate topsoil would require flexibility in methodology. Segregation of topsoil in winter with a shallow frost depth would occur differently than with a deep freeze in more saturated soil conditions where soil may need to be cut in blocks. Workers may still be able to segregate soils with little to no frost layer in separate piles by topsoil and subsoil, but segregation may not occur in the same manner when soil must be stored in blocks.</p> <p>Per the sample routing permit, the Agricultural Monitor and County Inspector would be designated by the County, if appointed.</p>	20243-204403-01
	Henriksen, Dan	2024-02-14	I ask that the Public Utilities Commission and Dept of Commerce take these issues seriously and that the Ottertail to Wilkin CO ₂ Pipeline Project in Ottertail to Wilkin counties (Docket Number: 22-242) is a factual and thorough account of the project impacts. Minnesotans need a robust review, and neither Minnesota's state agencies or Summit has any experience building, overseeing or operating CO ₂ pipelines or carbon capture projects. We need a careful analysis and credible assessment of how this project could affect our homes, lands, waters and communities.	Thank you for your comment.	20243-204403-01
	Henriksen, Jolene	2024-02-15	To whom it may concern, I am Jolene Henriksen and my family owns land and farms in Redwood County Mn. We are greatly concerned about the Ottertail to Wilkin DEIS as our farms are in the pathway of the southern portion of the Summit pipeline. Dangers to water and waterbodies: The proposed route for Summit’s pipeline network includes many water crossings, wetlands, aquifers, and other sensitive water bodies. More research and analysis are needed to understand how CO ₂ disperses in water and what risks a CO ₂ pipeline leak or rupture poses to Minnesota’s precious waters and the fish, amphibians, reptiles, waterfowl, birds, and insects that rely on it to survive.	Potential impacts of a pipeline rupture on water resources and wildlife are addressed in Section 8.3.4.	20243-204403-01
	Henriksen, Jolene	2024-02-15	Water use: Much of southern Minnesota is suffering from the consequences of drought and over-commitment of our fresh drinking water supplies. The DEIS fails to discuss the impacts of an increase in water use on local water supply. The carbon capture process can double water requirements at a facility and increase toxic wastewater discharge. The DEIS states that Summit “anticipates” an average water use for the operation of the carbon capture equipment of 13 million gallons per year, which is concerningly ambiguous. There must be a careful and case-specific assessment done of how the installation and operation of carbon capture will impact current drought conditions and exacerbate existing pollution sources. Moreover, Summit has not finalized its water appropriation sources or volumes needed for construction, so it is impossible to know the full impacts of those appropriations on water resources. Why should	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			Minnesota risk our fresh drinking water supply and commit to an infrastructure when the proposing company has not been transparent with its true demands for water resources?	following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	
	Henriksen, Jolene	2024-02-15	Aquifer Damage: Summit’s preferred route, RA-South, crosses a surficial beach ridge aquifer in Otter Tail County. The DNR has said that the area is “prone to significant groundwater discharge,” and the applicant’s initial groundwater investigation confirmed that “artesian groundwater conditions are present” along that beach ridge system. In early feedback on the DEIS, the DNR noted that “Project construction has the potential to intersect shallow confined groundwater potentially causing a breach in a confined aquifer and that “breaching shallow confined aquifers could have significant long-term impacts to groundwater resources.” This, along with our state’s first-hand knowledge of how damaging pipelines can be, requires that the DEIS take potential damage to aquifers more seriously.	Section 5.7.8.2 acknowledges that damage to aquifers is a serious problem and indicates that an uncontrolled flow of water from a shallow confined aquifer could have a significant long-term impact on groundwater. Section 5.7.8.2 also describes geotechnical investigations that would be done to identify areas where breaching of a shallow confined aquifer could occur, and sheet piling would not be used. The applicant currently has an ongoing groundwater investigation underway to further inform construction practices and is continuing to consult with DNR. As part of its coordination with DNR, the applicant has agreed to use ground penetrating radar to study the depth of the confining layer through the entire beach ridge system area crossed by the pipeline to further define existing conditions and advise on construction methodology. Furthermore, EERA staff recommends that the applicant develop, in coordination with DNR, a plan for pipeline construction in areas crossing the beach ridge system area. The plan would include, at a minimum, measures to minimize the potential for breaching a shallow confined aquifer during trenching and contingency measures to mitigate the impacts of a breach, should one occur. This information has been added to Section 5.7.8.2.	20243-204403-01
	Henriksen, Jolene	2024-02-15	HDD Drilling the DEIS also states that “drilling mud mixed with additives that are not on the MDH-approved additive list and/or do not meet [drinking water quality certification standards] would be disposed of as solid waste at an approved facility, or the applicant would obtain a land application permit from MPCA.” The DEIS does not discuss the risks of applying drilling mud, especially with additives not approved by MDH, to the land. The DEIS says that “drilling fluids and additives for the HDD would be non-toxic to the aquatic environment and humans,” however, even supposedly “non-toxic” drilling fluid is chemical waste that has been found to be harmful to plant and animal species. Summit’s preferred route and alternative route, RA-Hybrid, would both cross three rivers (Pelican River, Otter Tail River, and Bois de Sioux River) via the HDD mention.	As described in Section 5.7.8.2, an additive approved by MDH or meeting NSF International/ANSI Standard 60, Drinking Water Treatment Chemicals – Health Effects, might need to be mixed with the drilling mud for viscosity or lubricating reasons and to reduce the potential for an inadvertent release or failed HDD. The specific additive used would depend on the conditions at the crossing location and would be determined by the HDD contractor. The EIS discloses the potential for an inadvertent release of drilling mud and describes potential impacts in Chapter 5. Land application of drilling mud and potential impacts are addressed in Section 5.7.6.2.	20243-204403-01
	Henriksen, Jolene	2024-02-15	Wetlands: In Table 5-40 on p. 5-98 of the DEIS it states that “the loss of wetlands would be less than 0.01 acre.” However, Table 5-4 on p. 5-24 says that for Summit’s preferred route, operation impacts are expected to be 3.3 acres, and construction impacts are expected to be 4.7 acres. And Table 5-52 on p. 5-143 suggests that the total construction impact on wetlands for RA-South is 2.7 acres. Which is it??	Discrepancies between Table 5-4 and Table 5-54 result from different datasets and their associated resolutions. Table 5-4 uses NLCD data to analyze land cover, and Table 5-54 uses NWI data to analyze wetlands. Table 5-40 has been edited to be consistent with discussions of impacts on wetlands in Section 5.7.9 and Table 5-53 and Table 5-54.	20243-204403-01
	Henriksen, Jolene	2024-02-15	Impacts of a Leak or Rupture on Animals: According to the DEIS, CO ₂ leaks would not affect mammals, birds, reptiles, amphibians, and insects and would be unlikely to impact fish and freshwater mussels. The DEIS reaches this conclusion without providing any reasoning or supporting evidence. Though the DEIS does note some harm may come to animals in the event of a rupture, it relies heavily on the assumption that animals will simply move out of the rupture area to avoid the release. The reason for this assumption is not provided and is contradicted by information in the rupture report in Appendix G which suggests the impacts of a rupture would be nearly immediate. Critical Habitats: Summit’s preferred route would cross over or near several waterfowl protection areas, including the Orwell 9 Unit and Ridgeway WPA in Otter Tail County. The DEIS notes that some of these areas will be avoided during construction but fails to consider the impacts to these features in the event of a leak or rupture. The DEIS discounts the direct and long-term impacts of pipeline construction on land and soil integrity in spite of the significant evidence of likely harm.	CO ₂ is a widespread, naturally occurring gas and is the primary byproduct of respiration—the conversion of sugars to usable energy. Minor leaks of CO ₂ from operation of the proposed pipeline would not elevate ambient CO ₂ to a level that is detrimental to local vegetation or wildlife. Potential impacts on wildlife from a CO ₂ rupture could result first from the physical force of a rupture and secondarily from localized short-term high levels of CO ₂ prior to dispersal and extreme cold temperatures associated with the depressurization of the CO ₂ from a supercritical state to a gas. Chapter 8 of the EIS acknowledges that wildlife in the immediate vicinity of a rupture might be killed or injured by this force; however, it is expected that most mobile wildlife species	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				would follow their natural instincts and attempt to escape the direct effect of a rupture. Chapter 8 of the EIS also acknowledges that less-mobile species in the immediate vicinity of the point of a rupture would be less likely to escape the impacts and might be killed or injured. The data presented in Appendix G describes models of dispersal patterns in the immediate vicinity of a rupture. These models support the statements in Chapter 8 that wildlife in the immediate vicinity of a rupture might be exposed to high levels of CO ₂ , which could be toxic for species unable to leave the area of the release.	
	Henriksen, Jolene	2024-02-15	Land degradation: This project is going to cut through roads, ditches, tile lines, and prime farmland. There is a growing body of anecdotal evidence and peer-reviewed research that shows that pipeline projects in the Midwest have caused yield reduction and damage to land years after project completion and “restoration”. The DEIS does acknowledge that the reduced productivity from construction “typically would extend for 2 to 3 years, but could take up to 5 years, depending on impacts on soils from the construction disturbance,” but fails to identify any measures the applicant should take to avoid these damages or repair them. Prime Farmland and Farmland of Statewide Importance: All three routes would impact both Prime Farmland and Farmland of Statewide Importance, but Summit’s preferred route would impact significantly more acres of both across both the construction footprint and the operation footprint of the proposed project than the proposed alternatives.	Measures that the applicant would take to minimize impacts on soils and agricultural land are described in the Minnesota ECP in Appendix D and Minnesota APP in Appendix E. Text in Chapter 5 has been revised to indicate that impacts on crop production would be long term due to changes in soils from construction disturbance.	20243-204403-01
	Henriksen, Jolene	2024-02-15	Impact of Leaks or Ruptures on Vegetation: The DEIS concludes a leak of CO ₂ “would slow plant growth” and that the rupture of the pipeline would instantly freeze the surrounding soil and “instantly kill all herbaceous ground vegetation” but provides no measures to avoid these impacts, nor does it discuss the long-term impacts of such damage on the soils and vegetation. Instead, the DEIS states without proof that “local soil microbes, mycorrhizae, and soil animals such as worms, arachnids, and insects...would re-colonize after the area is restored.”	Chapter 2 discusses engineering and design elements incorporated into the project to reduce the likelihood of pipeline leaks or failure. Chapter 8 discusses potential impacts on vegetation and wildlife from slow leaks of CO ₂ and from a larger rupture. In the event of a pipeline rupture and large release, impacts on vegetation and soils would be highly localized to the area above the rupture. Re-colonization of the impact area would result from ecological succession processes that are well documented in areas that have experienced disturbance events of a similar source, duration, and effect on other projects of a similar scale.	20243-204403-01
	Henriksen, Jolene	2024-02-15	Soil Compaction: The DEIS acknowledges that “soil compaction would be unavoidable in unpaved areas of equipment and vehicle operation” and that even if soils were DE compacted, “some compacted soils could remain.” Soil compaction can have serious consequences in terms of water infiltration and drainage and should not be dismissed as an insignificant impact.	The commenter is referring to Section 9.1.1, which discuss unavoidable impacts during construction. Section 5.7 discusses soil compaction in greater detail. Section 5.7.6 has been revised to indicate that, while most impacts on soils during construction would be minimal and temporary, some impacts could be longer term.	20243-204403-01
	Henriksen, Jolene	2024-02-15	Geologic Hazards: The DEIS does not address whether the applicant has conducted geologic hazard surveys pursuant to the PHMSA Bulletin here: https://www.phmsa.dot.gov/sites/phmsa.dot.gov/files/2022-06/2022-11791.pdf Risks to water and natural resources	Geologic hazards are addressed in Sections 5.7.3 and 5.7.6. Text regarding geohazard assessments that would comply with the recommendations in PHMSA Advisory Bulletin 2022-01 has been added to both sections.	20243-204403-01
	Henriksen, Samuel	2024-02-15	To whom it may concern, I am Samuel Henriksen and am a landowner and farm with my family in Redwood County MN. I am concerned with the Summit pipeline as the southern route passes through our land. The DEIS consistently fails to properly account for the real CO ₂ emission and climate impacts of the project. Lifetime of Project: The applicant states that the anticipated lifetime of this project is 25 years. This means at the end of its life, the project could stop capturing the CO ₂ from the ethanol plant. Unless the ethanol plant will also cease operations at that point in time, it will continue to emit CO ₂ unabated into the future.	Section 2.7 describes project decommissioning. If the ethanol plant continues to operate beyond the life of the proposed project, its CO ₂ emissions would not be captured.	20243-204403-01
	Henriksen, Samuel	2024-02-15	100% CO ₂ Capture Rate?: Summit states that the capture facility “is designed to capture 100% of the CO ₂ produced by the ethanol plant.” There is no carbon capture facility in the world, ethanol or otherwise, that captures carbon at a rate of 100%. This claim is not supported by any data/information or verified by a third party.	Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. The analyses in Section 5.7.1.3 and Chapter 6 have been	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				revised to include capture rate scenarios of 100 percent, 70 percent, 40 percent, and 10 percent.	
	Henriksen, Samuel	2024-02-15	Additionally, the DEIS should emphasize that any CO ₂ capture is solely associated with emissions from the ethanol fermentation process and provides zero reductions on the significant emissions from the facility's electricity use	Section 2.1 has been revised to clarify that the captured CO ₂ is produced by the ethanol plant as part of its fermentation process, the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. Section 6.3 describes energy efficiency and energy alternatives that could reduce emissions from the ethanol plant's electricity and process fuel use.	20243-204403-01
	Henriksen, Samuel	2024-02-15	Added CO ₂ from electricity use: Carbon capture technologies are highly energy intensive and will significantly increase the carbon emissions at the facility from electricity use. The DEIS uses the Midwest Reliability Organization West Region average to calculate these emissions, which is unnecessarily inaccurate given the availability of the actual emissions factor from Great River Energy. CO ₂ Storage: The DEIS assumes 100% of captured CO ₂ is being permanently stored underground. There is no guarantee that this will occur and no explanation of the monitoring and verification protocols that would ensure it.	Electricity emissions are included in Table 5-39. These numbers have been revised to reflect the electricity emission factor associated with LREC, which would provide electricity to the project. The revised electricity emission factor is 132.2 g CO ₂ e/MWh. This was calculated from LREC's energy resource mix in which nearly half comes from clean energy sources. Because LREC has a lower emission factor than the Midwest Reliability West Region emission factor (684.35 g CO ₂ e/kWh), which was used in the draft EIS, calculated electricity emissions have decreased. Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios of 100 percent, 70 percent, 40 percent, and 10 percent.	20243-204403-01
	Henriksen, Samuel	2024-02-15	Enhanced Oil Recovery: The DEIS fails to explain whether the applicant can sell any of its captured CO ₂ to others for alternative uses instead of permanent sequestration and what the impacts of that would be. The DEIS incorrectly states that "Production of oil through EOR would not be dependent on the availability of CO ₂ produced by the ethanol plant." This claim is contradicted by countless public statements from public officials in North Dakota and oil industry representatives.	The text questioned by the commenter in Section 5.7.2.3 was prefaced with the following: "if all the CO ₂ produced by the ethanol plant is sequestered as proposed, EOR would likely continue in North Dakota using other sources of CO ₂ , other gases, thermal methods, or chemical methods." Revisions are not necessary. However, Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	20243-204403-01
	Henriksen, Samuel	2024-02-15	The DEIS discounts the direct and long-term impacts of pipeline construction on land and soil integrity in spite of the significant evidence of likely harm.	Impacts on soils are addressed in Section 5.7.6, as are measures that would be implemented to minimize impacts. Most impacts would occur during construction. The text in Section 5.7.6 has been revised to indicate that some impacts on soils could be long term. Impacts on soils related to operation of the pipeline would be negligible.	20243-204403-01
	Henriksen, Samuel	2024-02-15	Land degradation: This project is going to cut through roads, ditches, tile lines, and prime farmland. There is a growing body of anecdotal evidence and peer-reviewed research that shows that pipeline projects in the Midwest have caused yield reduction and damage to land years after project completion and "restoration". The DEIS does acknowledge that the reduced productivity from construction "typically would extend for 2 to 3 years, but could take up to 5 years, depending on impacts on soils from the construction disturbance," but fails to identify any measures the applicant should take to avoid these damages or repair them. Prime Farmland and Farmland of Statewide Importance: All three routes would impact both Prime Farmland and Farmland of Statewide Importance, but Summit's preferred route would impact significantly more acres of both across both the construction footprint and the operation footprint of the proposed project than the proposed alternatives.	Measures that the applicant would take to minimize impacts on soils and agricultural land are described in the Minnesota ECP in Appendix D and Minnesota APP in Appendix E. Text in Chapter 5 has been revised to indicate that impacts on crop production would be long term due to changes in soils from construction disturbance.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Henriksen, Samuel	2024-02-15	Impact of Leaks or Ruptures on Vegetation: The DEIS concludes a leak of CO ₂ “would slow plant growth” and that the rupture of the pipeline would instantly freeze the surrounding soil and “instantly kill all herbaceous ground vegetation” but provides no measures to avoid these impacts, nor does it discuss the long-term impacts of such damage on the soils and vegetation. Instead, the DEIS states without proof that “local soil microbes, mycorrhizae, and soil animals such as worms, arachnids, and insects...would re-colonize after the area is restored.”	Chapter 2 of the draft EIS discusses engineering and design elements incorporated into the project to reduce the likelihood of pipeline leaks or failure. Chapter 8 discusses potential impacts on vegetation and wildlife from slow leaks of CO ₂ and from a larger rupture. In the event of a pipeline rupture and large release, impacts on vegetation and soils would be highly localized to the area above the rupture. Re-colonization of the impact area would result from ecological succession processes that are well documented in areas that have experienced disturbance events of a similar source, duration, and effect on other projects of a similar scale.	20243-204403-01
	Henriksen, Samuel	2024-02-15	Soil Compaction: The DEIS acknowledges that “soil compaction would be unavoidable in unpaved areas of equipment and vehicle operation” and that even if soils were decompacted, “some compacted soils could remain.” Soil compaction can have serious consequences in terms of water infiltration and drainage and should not be dismissed as an insignificant impact.	Section 5.7.8.2 indicates that groundwater recharge could be impacted by soil compaction. Section 5.7.6 explains that the applicant would comply with required permits and implement its Minnesota ECP and Minnesota APP, which would minimize impacts on soils. The text in Section 5.7.6 has been revised to indicate that, while most impacts on soils during construction would be minimal and temporary, some impacts could be long term.	20243-204403-01
	Henriksen, Samuel	2024-02-15	Geologic Hazards: The DEIS does not address whether the applicant has conducted geologic hazard surveys pursuant to the PHMSA Bulletin here: https://www.phmsa.dot.gov/sites/phmsa.dot.gov/files/2022-06/2022-11791.pdf	Geologic hazards are addressed in Sections 5.7.3 and 5.7.6. Text regarding geohazard assessments that would comply with the recommendations in PHMSA Advisory Bulletin 2022-01 has been added to both sections.	20243-204403-01
	Henriksen, Samuel	2024-02-15	Minnesota’s recent experience with pipeline construction demonstrates the serious harms that it causes on water resources as well as a tendency by state agencies to under-account for those impacts. Dangers to water and waterbodies: The proposed route for Summit’s pipeline network includes many water crossings, wetlands, aquifers, and other sensitive water bodies. More research and analysis are needed to understand how CO ₂ disperses in water and what risks a CO ₂ pipeline leak or rupture poses to Minnesota’s precious waters and the fish, amphibians, reptiles, waterfowl, birds, and insects that rely on it to survive.	Potential impacts of a pipeline rupture on water resources and wildlife are addressed in Section 8.3.4. Stand-alone studies concerning impacts on water resources, wildlife, and wildlife habitat are outside the scope of the EIS.	20243-204403-01
	Henriksen, Samuel	2024-02-15	Water use: Much of southern Minnesota is suffering from the consequences of drought and over-commitment of our fresh drinking water supplies. The DEIS fails to discuss the impacts of an increase in water use on local water supply. The carbon capture process can double water requirements at a facility and increase toxic wastewater discharge. The DEIS states that Summit “anticipates” an average water use for the operation of the carbon capture equipment of 13 million gallons per year, which is concerningly ambiguous. There must be a careful and case-specific assessment done of how the installation and operation of carbon capture will impact current drought conditions and exacerbate existing pollution sources. Moreover, Summit has not finalized its water appropriation sources or volumes needed for construction, so it is impossible to know the full impacts of those appropriations on water resources. Why should Minnesota risk our fresh drinking water supply and commit to an infrastructure when the proposing company has not been transparent with its true demands for water resources?	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-01
	Henriksen, Samuel	2024-02-15	Aquifer Damage: Summit’s preferred route, RA-South, crosses a surficial beach ridge aquifer in Otter Tail County. The DNR has said that the area is “prone to significant groundwater discharge,” and the applicant’s initial groundwater investigation confirmed that “artesian groundwater conditions are present” along that beach ridge system. In early feedback on the DEIS, the DNR noted that “Project construction has the potential to intersect shallow confined groundwater potentially causing a breach in a confined aquifer and that “breaching shallow confined aquifers could have significant long-term impacts to groundwater resources.” This, along with our state’s first-hand knowledge of how damaging pipelines can be, requires that the DEIS take potential damage to aquifers more seriously.	Section 5.7.8.2 acknowledges that damage to aquifers is a serious problem and indicates that an uncontrolled flow of water from a shallow confined aquifer could have a significant long-term impact on groundwater. Section 5.7.8.2 also describes geotechnical investigations that would be done to identify areas where breaching of a shallow confined aquifer could occur, and sheet piling would not be used. The applicant currently has an ongoing groundwater investigation underway to further inform construction practices and is continuing to consult with DNR. As part of its coordination with DNR, the applicant has agreed to use ground penetrating radar to study the depth of the	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				confining layer through the entire beach ridge system area crossed by the pipeline to further define existing conditions and advise on construction methodology. Furthermore, EERA staff recommends that the applicant develop, in coordination with DNR, a plan for pipeline construction in areas crossing the beach ridge system area. The plan would include, at a minimum, measures to minimize the potential for breaching a shallow confined aquifer during trenching and contingency measures to mitigate the impacts of a breach, should one occur. This information has been added to Section 5.7.8.2.	
	Henriksen, Samuel	2024-02-15	<p>HDD Drilling The DEIS also states that “drilling mud mixed with additives that are not on the MDH-approved additive list and/or do not meet [drinking water quality certification standards] would be disposed of as solid waste at an approved facility, or the applicant would obtain a land application permit from MPCA.” The DEIS does not discuss the risks of applying drilling mud, especially with additives not approved by MDH, to the land.</p> <p>The DEIS says that “drilling fluids and additives for the HDD would be non-toxic to the aquatic environment and humans,” however, even supposedly “non-toxic” drilling fluid is chemical waste that has been found to be harmful to plant and animal species. Summit’s preferred route and alternative route, RA-Hybrid, would both cross three rivers (Pelican River, Otter Tail River, and Bois de Sioux River) via the HDD mention.</p>	As described in Section 5.7.8.2, an additive approved by MDH or meeting NSF International/ANSI Standard 60, Drinking Water Treatment Chemicals – Health Effects, might need to be mixed with the drilling mud for viscosity or lubricating reasons and to reduce the potential for an inadvertent release or failed HDD. The specific additive used would depend on the conditions at the crossing location and would be determined by the HDD contractor. The EIS discloses the potential for an inadvertent release of drilling mud and describes potential impacts in Chapter 5. Land application of drilling mud and potential impacts are addressed in Section 5.7.6.2.	20243-204403-01
	Henriksen, Samuel	2024-02-15	<p>Impacts of a Leak or Rupture on Animals: According to the DEIS, CO₂ leaks would not affect mammals, birds, reptiles, amphibians, and insects and would be unlikely to impact fish and freshwater mussels. The DEIS reaches this conclusion without providing any reasoning or supporting evidence. Though the DEIS does note some harm may come to animals in the event of a rupture, it relies heavily on the assumption that animals will simply move out of the rupture area to avoid the release. The reason for this assumption is not provided and is contradicted by information in the rupture report in Appendix G which suggests the impacts of a rupture would be nearly immediate.</p> <p>Critical Habitats: Summit’s preferred route would cross over or near several waterfowl protection areas, including the Orwell 9 Unit and Ridgeway WPA in Otter Tail County. The DEIS notes that some of these areas will be avoided during construction but fails to consider the impacts to these features in the event of a leak or rupture.</p>	<p>CO₂ is a widespread, naturally occurring gas and is the primary byproduct of respiration—the conversion of sugars to usable energy. Minor leaks of CO₂ from operation of the proposed pipeline would not elevate ambient CO₂ to a level that is detrimental to local vegetation or wildlife. Potential impacts on wildlife from a CO₂ rupture could result first from the physical force of a rupture and secondarily from localized, short-term high levels of CO₂ prior to dispersal and extreme cold temperatures associated with the depressurization of the CO₂ from a supercritical state to a gas. Chapter 8 of the EIS acknowledges that wildlife in the immediate vicinity of a rupture might be killed or injured by this force; however, it is expected that most mobile wildlife species would follow their natural instincts and attempt to escape the direct effect of a rupture. Chapter 8 of the EIS also acknowledges that less-mobile species in the immediate vicinity of the point of a rupture would be less likely to escape the impacts and might be killed or injured. The data presented in Appendix G describes models of dispersal patterns in the immediate vicinity of a rupture. These models support the statements in Chapter 8 that wildlife in the immediate vicinity of a rupture might be exposed to high levels of CO₂, which could be toxic for species unable to leave the area of the release.</p> <p>Operation of the proposed pipeline would include integrated systems for detecting leakages, as well as protocols for addressing leaks promptly. Minor leaks of CO₂ from operation of the proposed pipeline would not elevate ambient CO₂ to a level that is detrimental to waterfowl and other wildlife within the Orwell 9 Unit or Ridgeway WPAs. As the comment notes, the pipeline route would avoid these areas. As a result, there would be negligible risk of impacts on these areas due to a pipeline rupture. This is because the potential impacts of a pipeline rupture would be highly localized and outside of the WPA boundaries.</p>	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Henriksen, Samuel	2024-02-15	Wetlands: In Table 5-40 on p. 5-98 of the DEIS it states that “the loss of wetlands would be less than 0.01 acre.” However, Table 5-4 on p. 5-24 says that for Summit’s preferred route, operation impacts are expected to be 3.3 acres, and construction impacts are expected to be 4.7 acres. And Table 5-52 on p. 5-143 suggests that the total construction impact on wetlands for RA-South is 2.7 acres. Which is it??	Discrepancies between Table 5-4 and Table 5-54 result from different datasets and their associated resolutions. Table 5-4 uses NLCD data to analyze land cover, and Table 5-54 uses NWI data to analyze wetlands. Table 5-40 has been edited to be consistent with discussions of impacts on wetlands in Section 5.7.9 and Table 5-53 and Table 5-54.	20243-204403-01
	Honnold, Rikki	2024-02-23	Hey, I don't think we need another pipeline. I know this is old hat but somehow you all keep digging more pipelines for no good reason. I hope you consider this as you look to your legacy and for your children. I hope you can honestly sleep at night when you tell your kids that you thought this was necessary, despite all of the environmental reasons why people have already told you this isn't needed. Really, please, think about it.	Thank you for your comment.	20243-204403-01
	Huemann, Emily	2024-02-23	Hi, I’m Emily, a born and raised Minnesotan who cares about our natural resources and communities. I’m deeply concerned about the local and global impacts of this project. I’m particularly concerned about land degradation, and the impact report needs to fully represent these risks. Healthy land and healthy soil is a lifeline for farmers and for our whole world. I’m also concerned about the risks this project poses to clean water and healthy wetlands.	Chapter 5 addresses impacts of the project, including impacts on land use, soils, agriculture, water resources, and wetlands.	20243-204403-01
	Irlbeck, Brandon	2024-02-13	Please stop this project. This whole thing is complete nonsense. I farm and would be directly affected with this project crossing my farm.	Thank you for your comment.	20243-204403-01
	Irlbeck, Joel	2024-02-14	We are land owners that would be impacted by the pipeline and are very concerned about all of effects that would result in its wake. All of the damage done to our land and danger to our communities from leaks and water quality. We are against it and do not want it on our property!	Risks of a potential CO ₂ release and potential impacts are described in Chapter 8. Section 5.7.8 addresses water resources.	20243-204403-01
	Iverson, Ed	2024-02-22	Dear members of the Minnesota Public Utilities Commission, I am writing this as a very concerned citizen of Cottonwood County, Minnesota. I have farmed full time for 28 years in Cottonwood, Redwood, and Murray Counties. I have several concerns and thought I'd share some of them. 1. Setbacks: With a four-inch pipeline under 2,200 psi I would imagine that there would be a huge volume of CO ₂ released into the atmosphere. I asked a Summit Representative if he knew how much CO ₂ would be released, his answer was "I don't know." To be fair I'm sure somebody knows, they maybe just don't want us to know. I don't know how far the pipeline would need to be away from a residence to make it safe, but I would hope to see the word "miles" after the number rather than feet! In my opinion we need to look at the absolute worst-case scenario and plan for it to be worse. On January 9th, 2024, there was an earthquake reported near Crandon Wisconsin. Can a pipeline under 2,200 psi handle that? How will frost heaves affect the pipeline? From what I've heard, this pipeline will run through farmland at about a 3' depth, under normal circumstances, that is above the frostline. I have a lot of drainage tiles that are about 3' deep, who is going to want to work on tile repairs where this CO ₂ pipeline runs?	Chapter 8 and Appendix G detail the potential outcomes of a CO ₂ rupture, including impact distances and release volume. As described in Section 2.4.5, the pipeline would have a minimum cover depth of 54 inches, or 4.5 feet. Frost heave is addressed in Sections 5.7.6.2 and 8.1.	20243-204403-01
	Iverson, Ed	2024-02-22	2. Water Usage. The amount of water that this process will take is a staggering number. I think I can safely say "We don't have enough!" Weather cycles change all the time, but these last few years have been very dry. Do we really want to put another huge drain in our aquifer? At some point, we are going to lose the ability to recharge our water supply. We can't allow a company to come in, drop an 1,100' well, and tell everyone else "Sorry, we didn't see this coming."	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-01
	Iverson, Ed	2024-02-22	3. Easements. From what I have read in the EIS report, this looks to be a long-term mess, for a short-term solution. The design life is only 25 years?? Do I dare ask why the easements are forever? What could be pumped across our state in the future.... next to our homes....next to whatever is most precious to us? This might be a good place to use our "worst case scenario" ideas. I don't want to stand in the way of	Thank you for your comment. Landowner agreements are outside the scope of the EIS. Section 2.7 describes project decommissioning. This section was revised to describe the financial assurances to be provided by the applicant for costs associated with decommissioning.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			progress, but I sure don't want progress to run me over...or in this case asphyxiate me. I was reading about the decommissioning plan. This plan looks like a direct path to water and or air pollution to me.		
	Iverson, Kathryn	2024-02-22	I do not support the Otter Tail to Wilkin CO ₂ pipeline project. I am a lifetime resident of Minnesota and am a grandmother. I have had the opportunity to live my life in Minnesota without concerns about horrendous water pollution, and this project would totally destroy our surface and aquifer water systems.	Thank you for your comment.	20243-204403-01
	Iverson, Kathryn	2024-02-22	Dangers to water and waterbodies: The proposed route for Summit’s pipeline network includes many water crossings, wetlands, aquifers, and other sensitive water bodies. More research and analysis are needed to understand how CO ₂ disperses in water and what risks a CO ₂ pipeline leak or rupture poses to Minnesota’s precious waters and the fish, amphibians, reptiles, waterfowl, birds, and insects that rely on it to survive.	Potential impacts of a pipeline rupture on water resources and wildlife are addressed in Section 8.3.4. 				Chapter 5. Land application of drilling mud and potential impacts are addressed in Section 5.7.6.2.	
	Iverson, Kathryn	2024-02-22	Wetlands: In Table 5-40 on p. 5-98 of the DEIS it states that “the loss of wetlands would be less than 0.01 acre.” However, Table 5-4 on p. 5-24 says that for Summit’s preferred route, operation impacts are expected to be 3.3 acres, and construction impacts are expected to be 4.7 acres. And Table 5-52 on p. 5-143 suggests that the total construction impact on wetlands for RA-South is 2.7 acres. Which is it??	CO ₂ is a widespread, naturally occurring gas and is the primary byproduct of respiration—the conversion of sugars to usable energy. Minor leaks of CO ₂ from operation of the proposed pipeline would not elevate ambient CO ₂ to a level that is detrimental to local vegetation or wildlife. Potential impacts on wildlife from a CO ₂ rupture could result first from the physical force of a rupture and secondarily from localized short-term high levels of CO ₂ prior to dispersal and extreme cold temperatures associated with the depressurization of the CO ₂ from a supercritical state to a gas. Chapter 8 of the EIS acknowledges that wildlife in the immediate vicinity of a rupture might be killed or injured by this force; however, it is expected that most, but not all, individuals of mobile wildlife species would follow their natural instincts and attempt to escape the direct effect of a rupture. Chapter 8 of the EIS also acknowledges that less-mobile species in the immediate vicinity of the point of a rupture would be less likely to escape the impacts and might be killed or injured. The data presented in Appendix G describes models of dispersal patterns in the immediate vicinity of a rupture. These models support the statements in Chapter 8 that wildlife in the immediate vicinity of a rupture might be exposed to high levels of CO ₂ , which could be toxic for species unable to leave the area of the release. Operation of the proposed pipeline would include integrated systems for detecting leakages, as well as protocols for addressing leaks promptly. Minor leaks of CO ₂ from operation of the proposed pipeline would not elevate ambient CO ₂ to a level that is detrimental to waterfowl and other wildlife within the Orwell 9 Unit or Ridgeway WPAs. These WPAs are not crossed by any of the RAs. As a result, the potential effects of a rupture on those WPAs would be diminished by the distance between any potential point of release and the WPA boundary. The potential impacts of a pipeline rupture would be highly localized and outside of these WPA boundaries.	20243-204403-01
	Iverson, Kathryn	2024-02-22	Impacts of a Leak or Rupture on Animals: According to the DEIS, CO ₂ leaks would not affect mammals, birds, reptiles, amphibians, and insects and would be unlikely to impact fish and freshwater mussels. The DEIS reaches this conclusion without providing any reasoning or supporting evidence. Though the DEIS does note some harm may come to animals in the event of a rupture, it relies heavily on the assumption that animals will simply move out of the rupture area to avoid the release. The reason for this assumption is not provided and is contradicted by information in the rupture report in Appendix G which suggests the impacts of a rupture would be nearly immediate. Critical Habitats: Summit’s preferred route would cross over or near several waterfowl protection areas, including the Orwell 9 Unit and Ridgeway WPA in Otter Tail County. The DEIS notes that some of these areas will be avoided during construction but fails to consider the impacts to these features in the event of a leak or rupture.	CO ₂ is a widespread, naturally occurring gas and is the primary byproduct of respiration—the conversion of sugars to usable energy. Minor leaks of CO ₂ from operation of the proposed pipeline would not elevate ambient CO ₂ to a level that is detrimental to local vegetation or wildlife. Potential impacts on wildlife from a CO ₂ rupture could result first from the physical force of a rupture and secondarily from localized short-term high levels of CO ₂ prior to dispersal and extreme cold temperatures associated with the depressurization of the CO ₂ from a supercritical state to a gas. Chapter 8 of the EIS acknowledges that wildlife in the immediate vicinity of a rupture might be killed or injured by this force; however, it is expected that most, but not all, individuals of mobile wildlife species would follow their natural instincts and attempt to escape the direct effect of a rupture. Chapter 8 of the EIS also acknowledges that less-mobile species in the immediate vicinity of the point of a rupture would be less likely to escape the impacts and might be killed or injured. The data presented in Appendix G describes models	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				of dispersal patterns in the immediate vicinity of a rupture. These models support the statements in Chapter 8 that wildlife in the immediate vicinity of a rupture might be exposed to high levels of CO ₂ , which could be toxic for species unable to leave the area of the release. Operation of the proposed pipeline would include integrated systems for detecting leakages, as well as protocols for addressing leaks promptly. The route width of the proposed pipeline abuts, but does not cross, the Orwell 9 Unit or Ridgeway WPAs. Minor leaks of CO ₂ from operation of the proposed pipeline would not elevate ambient CO ₂ to a level that is detrimental to waterfowl and other wildlife within the Orwell 9 Unit or Ridgeway WPAs. As a result, the potential effects of a rupture on those WPAs would be diminished by the distance between any potential point of release and the WPA boundary. The potential impacts of a pipeline rupture would be highly localized and outside of these WPA boundaries.	
	Jennen, Gary	2024-02-26	This pipeline has a proposed route that runs close to where I live. In fact is runs next to where several of my neighbors live. If you are interested in how I feel about that, I refer you to the published articles about the pipeline rupture in Sataria, Mississippi. This rupture was supposedly caused by saturated soil. In my area we have very dry cycles and extremely wet cycles. In addition, we have extreme fluctuations of temperature. We also have had several dirt work operations that could compromise the pipeline.	Saturated soils alone do not pose a risk to pipelines. Under the right conditions, saturated soils combined with steep slopes can lead to slope failure (landslide), which can damage pipelines. The project would cross relatively flat topography with low landslide risk. The pipeline would be underground and would not be exposed to extreme fluctuations of temperature. The pipeline location would be marked, and anyone planning to excavate is required by state law to clear the location for underground utilities prior to beginning work.	20243-204403-02
	Jennen, Gary	2024-02-26	The safeguards that are mandated to stop a release of gas in a populated area seem totally inadequate in the event of a rupture. How many thousands of feet of pipeline would be emptied upon us in the event of a rupture? How often are valves required?	Federal code requires that valves be installed on each side of one or more adjacent water crossings that are more than 100 feet wide from high water mark to high water mark. Valves are also required at intervals no more than 15 miles apart if protecting a high consequence area (HCA) as defined in CFR § 195.450, and no more than 20 miles apart if not protecting an HCA. There is one potential HCA on the proposed southern route by the Fergus Falls Airport. The valves that protect the potential HCA are spaced at 4.8 miles. The longest distance of pipeline between valves is 13.9 miles and the shortest distance of pipeline between valves is 1.6 miles. Appendix G includes assumptions regarding potential release scenarios.	20243-204403-02
	Jennen, Gary	2024-02-26	As you can see, I am very opposed to this pipeline especially in my back yard. Don't expect any easements from me. CO ₂ has been referred to as the gas of life. Many scientists have discounted the ability of CO ₂ to cause climate change. There are many other forces that influence global temperatures more than CO ₂ . How many millions of tax dollars are being wasted trying to promote the construction of pipelines across the country?	Thank you for your comment.	20243-204403-02
	Jennen, Gary	2024-02-26	Traveling from the twin cities to where I live in West Otter Tail County, I see a sign that states "Carbon Capture is Safe". I have no problem with the safety of the carbon capture process. What I do have a problem with is the transport of CO ₂ in critical fluid phase which is very dangerous. Also when this project is sequestered underground, it creases a very dangerous hazard depending on future events.	Thank you for your comment.	20243-204403-02
	Jennen, Gary	2024-02-26	Why are we doing this? Why is the government heavily subsidizing this scheme? Just look at the entities promoting this. There are people hoping to glean millions of tax dollars from the promotion of this enterprise. There are entities promoting this looking for a cheap (government subsidized) source of CO ₂ for industrial purposes. This is a whole pipeline building industry put into operation at enormous tax payer expense to basically chase a ghost. Where I live mainly corn and soybeans are raised which would thrive on much higher CO ₂ levels than we have now.	Thank you for your comment.	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Jennen, Kay	2024-02-21	I am writing because I live less than two miles downwind from the proposed pipeline. I am very concerned about possible environmental hazards to humans and animals that live near or could come into close proximity to the pipeline.	Thank you for your comment.	20243-204403-01
	Jennen, Kay	2024-02-21	This pipeline would be part of the world's largest of its kind and so warrants closer scrutiny before being built Intensive study is critical concerning even the validity of the need for a carbon-dioxide transfer pipeline.	Thank you for your comment.	20243-204403-01
	Jennen, Kay	2024-02-21	The scientific community has differing opinions on the effects of carbondioxide on the climate. A recent study titled " how much has the Sun influenced Northern Hemisphere temperature trends? An ongoing debate," published in the international scientific journal Research in Astronomy and Astrophysics by exports over a dozen international experts show conclusively that depending on the data sets used, it is entirely possible that most or all of the warming has nothing to do with man. Thank you for your consideration.	Thank you for your comment.	20243-204403-01
	Jensen, Pan	2024-02-14	My name is Pam Jensen and I live near Lamberton in Redwood County, MN. My husband and I own 19 acres adjacent to Summit's proposed CO ₂ pipeline route. Even though we live in Southern MN we care what happens to the land, water and residents all across MN. I'd like to point out several parts of the DEIS that you should consider revising. Pg. 9 – The project would provide a Net Benefit to GHG emissions because the CO ₂ sequestered from ongoing annual operations would outweigh construction and operation emissions. I don't think this considers the immense fuel cost of manufacturing the pipeline/materials, transporting the pipeline to the construction sites and the monitoring costs (every 2 wks. by vehicle, or as we were told by a Summit rep at an informational mtg–aerial fly-overs every 2 wks.!) Sequestering CO ₂ hasn't been proven as a successful method for reducing CO ₂ emissions. The small amount of CO ₂ emissions that ethanol plants actually emit is a drop in the bucket compared to emissions from other sources. Is it worth damaging land, using up water and creating a safety risk to residents? Pg. 10 –Climate Change - The project would have a net beneficial effect on climate change as it would capture and store CO ₂ emissions from the ethanol plant. This should not be included as a reason to grant a permit because it hasn't been proven that it will have any real effect on climate change. Previous/current CO ₂ pipeline projects haven't met expectations.	Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios of 100 percent, 70 percent, 40 percent, and 10 percent. Section 6.3 describes energy efficiency and energy alternatives that could reduce emissions from the ethanol plant's electricity and process fuel use. Section 5.7.2 has been revised to note that the project would contribute to a net beneficial effect on climate change as it would capture and store CO ₂ emissions from the ethanol plant.	20243-204403-01
	Jensen, Pan	2024-02-14	Drought conditions might require a contingency water source. Minnesota and surrounding states are currently in drought conditions. The construction and operational phases will require twice as much water as the ethanol plants currently use. Farmers in our area are having to drill new wells already and they're having difficulty finding water.	Additional information has been added to Section 5.7.8.2 to address the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-01
	Jensen, Pan	2024-02-14	Pg. 42 – 2.6 – The applicant indicates that the project would meet or exceed State and Federal Safety Regulations and, at a minimum would be operated and maintained in accordance with PHMSA's regulations in 49 CFR Part 195. How can this be included since the updated PHMSA regulations haven't even been implemented yet? The current pipeline safety regulations are outdated and don't apply to Hazardous CO ₂ Pipelines. Summit is trying to get their permits quickly before the updated regulations are in place so that the rules won't apply to them. Who/How will Summit Carbon Solutions be held accountable to follow regulations? I read an article about the damage left behind from a gas pipeline. The company (SPIRE) disputes any damage claims. Government regulators failed to hold the company accountable. An affected farmer said, "The rules and regulations are there, but that's just for looks." I'm concerned that the same type of thing will happen with Summit Carbon Solutions.	Thank you for your comment. PHMSA regulations (that is, their appropriateness) and related standards for CO ₂ pipelines are outside the scope of the EIS (Appendix A). The EIS discusses current PHMSA regulations that apply to the project (Chapter 3 and Appendix G). The applicant has stated its proposed CO ₂ pipeline would be designed, constructed, and operated to meet PHMSA regulations, including any operational changes to PHMSA regulations that may occur in the future.	20243-204403-01
	Jensen, Pan	2024-02-14	Pg. 43 - 2.6.2 - Abnormal Operations - First responders require special equipment, including non-internal combustion engines, to respond to a CO ₂ disaster. The DEIS does not consider the burdens this will put on local EMS and health providers in the case of a pipeline rupture or accident or an assessment of how they should be prepared to respond given the unique needs. *A warning system needs to be included to inform residents in the surrounding area (up to 4 miles?) of any leak or rupture.	Section 8.3 describes the effect on humans and the environment of an accidental release of CO ₂ . As noted in Section 8.5, the applicant has committed to provide CO ₂ air monitoring equipment to first responders and to pay all costs associated with CO ₂ response training and air monitoring equipment.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			The PUC should take into consideration the negative impacts that the CO ₂ pipeline would have on people’s safety and well-being, land, wildlife and water resources. It's very important to protect our state's resources and the health and safety of the residents that live here.		
	Jeppesen, Kim	2024-02-23	<p>I am a lifelong Minnesotan who grew up in southwestern Minnesota. After graduating from college, I lived and worked in the metro for eighteen years before taking a position in SW Minnesota. I have enjoyed living in rural Cottonwood County on the family farm, which I now own with my husband. We love our farm property’s natural beauty and environment, including the lands along Dutch Charley Creek that bisects the farm.</p> <p>I spent the last part of my career with the Minnesota Department of Health and was involved with Emergency preparedness for man-made or natural biological events. I understand that living in rural Cottonwood County, unlike in the urban core, emergency response will be local volunteers until professionally trained teams can be deployed. Since CO₂ pipelines operate at very high pressure (much higher than a natural gas pipeline), any type of breach can be catastrophic since, without warning, this colorless, odorless, heavier-than-air cloud of asphyxiant gas can bring death to all mammalian life downwind of the leak. Humans exposed to high concentrations of CO₂ may die before they are even aware of the danger. As a rural Minnesota resident, I find the potential risk to my health and safety of the rural residents of the proposed CO₂ pipeline that Summit Carbon Solutions is presenting for construction across our rural community.</p>	Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that would be revised as required by PHMSA, if the project is approved. Additionally, EERA staff recommended special permit conditions as described in Section 8.5.3.	20243-204403-01
	Jeppesen, Kim	2024-02-23	<p>I am also concerned about the enormous quantities of groundwater that will be needed to test and capture the CO₂. I rely on a private well for drinking water, so I am very concerned about impacts on the water supply, whether from private wells or rural water systems’ wells. Another concern is the potential damage to vital cropland, which is of finite supply. In the past, pipelines have been demonstrated to cause long-lasting damage to cropland, with crop yield reductions lasting decades.</p>	<p>Additional information has been added to Section 5.7.8.2 to address the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.</p> <p>As indicated by the definitions found on Page 5-1 of the draft EIS, “long-term impacts extend beyond the end of construction and are generally associated with operation of the project.” Disturbance to soils and crops from construction can result in impacts that extend beyond the construction phase, and the text in the final EIS has been revised to indicate that impacts can be long term.</p>	20243-204403-01
	Jeppesen, Kim	2024-02-23	<p>As a rural Minnesota farm property resident, I am VERY concerned about the health, life, and safety risks this unnecessary pipeline poses to residents, first responders, farm animals, and wildlife. CO₂ is a hazardous material in high concentrations. The DEIS consistently underplays the known and unknown risks of transporting large amounts of CO₂ at high pressures through a pipeline. • CO₂ Rupture Impact Zone: According to the analysis in the DEIS, the potential impact radius for levels of CO₂ that would be “immediately dangerous to life or health” is 617 feet. This expands to 910 feet for lower concentrations that cause dizziness, drowsiness, severe muscle twitching, and unconsciousness within a few minutes. Although Summit indicates that it will take 25 minutes for the system to shut off the relevant valves in the event of “abnormal operation,” the DEIS does not mention any meaningful safety measures for a rupture and instead suggests that it is “reasonable” for Summit to simply supply indoor CO₂ detectors for residences within 1,000 feet of the project. But the rupture report in Appendix G states that “a full rupture results in impact distances too quickly for an early warning device, such as an oxygen detector, to be effective.” This pipeline should not be approved without a clear understanding of the risks to human health and meaningful measures to ensure the safety of people and animals in the area.</p>	Section 8.3 describes the effect on humans and the environment of an accidental release of CO ₂ . As noted in Section 8.5, the applicant has committed to provide CO ₂ air monitoring equipment to first responders and to pay all costs associated with CO ₂ response training and air monitoring equipment. Section 8.5.3 describes steps that would be taken to reduce the risk and impacts of a potential rupture.	20243-204403-01
	Jeppesen, Kim	2024-02-23	<p>• First responders and health professionals: CO₂ pipelines pose unique problems for first responders and health care providers. Because CO₂ is colorless and odorless, both victims and first responders have no way of knowing what is causing the health problems. In addition, first responders require special equipment, including non-internal combustion engines, to respond to a CO₂ disaster. The DEIS does not consider the burdens this will put on local EMS and health providers in the case of a pipeline rupture or accident or an assessment of how they should be prepared to respond given the unique needs. The DEIS includes Summit’s September 2022</p>	Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			Emergency Response Plan (Appendix N). This plan is not only outdated but also unclear as to how local EMS and first responders will interact with the applicant in the event of a leak or rupture. Though the plan talks of multiple company personnel as playing roles in an emergency response, it ignores the fact that the applicant only plans on having one full-time employee at the capture facility. Local first responders deserve more clarity about how they will be expected to respond to an emergency situation and what the applicant will do to ensure they are adequately equipped and informed for such an event.	on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that is not outdated but would be revised as required by PHMSA, if the project is approved. Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.	
	Jeppesen, Kim	2024-02-23	<ul style="list-style-type: none">• Compliance with PHMSA Rules: The DEIS accepts Summit’s assurances that it will “comply with federal emergency response requirements,” but as noted in a Pipeline Safety Trust report and by the Pipeline Hazardous Material Safety Administration (PHMSA) itself, the current emergency response requirements are dangerously outdated.	Thank you for your comment. PHMSA regulations (that is, their appropriateness) and related standards for CO ₂ pipelines are outside the scope of the EIS (Appendix A). Additionally, the applicant has stated its proposed CO ₂ pipeline would be designed, constructed, and operated to meet PHMSA regulations, including any operational changes to PHMSA regulations that may occur in the future. To the extent applicable and in response to this and similar comments, Section 3.6 and Appendix G of the EIS have been updated to include this information.	20243-204403-01
	Jeppesen, Kim	2024-02-23	<ul style="list-style-type: none">• Setbacks: The DEIS states that the PUC “cannot set safety standards” for Summit’s proposed pipeline. PHMSA has expressly said in public letters to CO₂ pipeline companies like Summit that state and local authorities can exercise their powers to regulate land use—including setback distances—and that “nothing in the federal pipeline safety law impinges on these traditional prerogatives of local—or state—government.” The PUC must consider where the pipeline is placed and what is the safest option for Minnesotans, which means the PUC can and should determine what routing, setback, and depth requirements are necessary to adequately protect Minnesotans. <p>Minnesota’s recent experience with pipeline construction demonstrates the serious harms that it causes on water resources as well as a tendency by state agencies to under-account for those impacts.</p>	Although the Commission cannot set safety standards for pipeline construction or operation, state or local units of government may, to the extent authorized by law, set land use requirements that indirectly contribute to pipeline safety by regulating the activities of third parties located in the pipeline’s vicinity. The Commission’s obligation is to identify a pipeline route consistent with the criteria found in statutes and the applicable administrative rules. Federal law, by contrast, exclusively prescribes pipeline safety requirements.	20243-204403-01
	Jeppesen, Kim	2024-02-23	<ul style="list-style-type: none">• Dangers to water and waterbodies: The proposed route for Summit’s pipeline network includes many water crossings, wetlands, aquifers, and other sensitive water bodies. More research and analysis are needed to understand how CO₂ disperses in water and what risks a CO₂ pipeline leak or rupture poses to Minnesota’s precious waters and the fish, amphibians, reptiles, waterfowl, birds, and insects that rely on it to survive.	Potential impacts of a pipeline rupture on water resources and wildlife are addressed in Section 8.3.4. Stand-alone studies concerning impacts on water resources, wildlife, and wildlife habitat are outside the scope of the EIS.	20243-204403-01
	Jeppesen, Kim	2024-02-23	<ul style="list-style-type: none">• Water use: Much of southern Minnesota is suffering from the consequences of drought and overcommitment of our fresh drinking water supplies. The DEIS fails to discuss the impacts of an increase in water use on local water supply. The carbon capture process can double water requirements at a facility and increase toxic wastewater discharge. The DEIS states that Summit “anticipates” an average water use for the operation of the carbon capture equipment of 13 million gallons per year, which is concerningly ambiguous. There must be a careful and case-specific assessment done of how the installation and operation of carbon capture will impact current drought conditions and exacerbate existing pollution sources. Moreover, Summit has not finalized its water appropriation sources or volumes needed for construction, so it is impossible to know the full impacts of those appropriations on water resources. Why should Minnesota risk our fresh drinking water supply and commit to an infrastructure when the proposing company has not been transparent about its actual water resource demands?	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-01
	Jeppesen, Kim	2024-02-23	<ul style="list-style-type: none">• Aquifer Damage: Summit’s preferred route, RA-South, crosses a surficial beach ridge aquifer in Otter Tail County. The DNR has said that the area is “prone to significant groundwater discharge,” the applicant’s initial groundwater investigation confirmed that “artesian groundwater conditions are present” along that beach ridge system. In early feedback on the DEIS, the DNR noted that “Project construction has the potential to intersect shallow confined groundwater potentially causing a breach in a confined aquifer and that “breaching shallow confined aquifers could have significant long-term impacts to groundwater resources.” This, along with our state’s first-hand knowledge of how damaging pipelines can be, requires that the DEIS take potential damage to aquifers more seriously.	Section 5.7.8.2 acknowledges that damage to aquifers is a serious problem and indicates that an uncontrolled flow of water from a shallow confined aquifer could have a significant long-term impact on groundwater. Section 5.7.8.2 also describes geotechnical investigations that would be done to identify areas where breaching of a shallow confined aquifer could occur, and sheet piling would not be used. The applicant currently has an ongoing groundwater investigation underway to further inform construction practices and is continuing to consult with DNR. As part of its coordination with DNR, the applicant has	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				agreed to use ground penetrating radar to study the depth of the confining layer through the entire beach ridge system area crossed by the pipeline to further define existing conditions and advise on construction methodology. Furthermore, EERA staff recommends that the applicant develop, in coordination with DNR, a plan for pipeline construction in areas crossing the beach ridge system area. The plan would include, at a minimum, measures to minimize the potential for breaching a shallow confined aquifer during trenching and contingency measures to mitigate the impacts of a breach, should one occur. This information has been added to Section 5.7.8.2.	
	Jeppesen, Kim	2024-02-23	<ul style="list-style-type: none"> • HDD Drilling: The DEIS also states that “drilling mud mixed with additives that are not on the MDH approved additive list and/or do not meet [drinking water quality certification standards] would be disposed of as solid waste at an approved facility, or the applicant would obtain a land application permit from MPCA.” The DEIS does not discuss the risks of applying drilling mud to the land, especially with additives not approved by MDH. <p>The DEIS says that “drilling fluids and additives for the HDD would be non-toxic to the aquatic environment and humans;” however, even supposedly “non-toxic” drilling fluid is chemical waste that is harmful to plant and animal species. Summit’s preferred and alternative routes, RA-Hybrid, would cross three rivers (Pelican River, Otter Tail River, and Bois de Sioux River) via the HDD mention.</p>	As described in Section 5.7.8.2, an additive approved by MDH or meeting NSF International/ANSI Standard 60, Drinking Water Treatment Chemicals – Health Effects, might need to be mixed with the drilling mud for viscosity or lubricating reasons and to reduce the potential for an inadvertent release or failed HDD. The specific additive used would depend on the conditions at the crossing location and would be determined by the HDD contractor. The EIS discloses the potential for an inadvertent release of drilling mud and describes potential impacts in Chapter 5. Land application of drilling mud and potential impacts are addressed in Section 5.7.6.2.	20243-204403-01
	Jeppesen, Kim	2024-02-23	<ul style="list-style-type: none"> • Wetlands: Table 5-40 on p. 5-98 of the DEIS states that “the loss of wetlands would be less than 0.01 acre.” However, Table 5-4 on p. 5-24 says that for Summit’s preferred route, operation impacts are expected to be 3.3 acres, and construction impacts are expected to be 4.7 acres. Table 5-52 on p. 5-143 suggests that the total construction impact on wetlands for RA-South is 2.7 acres. Which is it?? 	Discrepancies between Table 5-4 and Table 5-54 result from different datasets and their associated resolutions. Table 5-4 uses NLCD data to analyze land cover, and Table 5-54 uses NWI data to analyze wetlands. Table 5-40 has been edited to be consistent with discussions of impacts on wetlands in Section 5.7.9 and Table 5-53 and Table 5-54.	20243-204403-01
	Jeppesen, Kim	2024-02-23	<ul style="list-style-type: none"> • Impacts of a Leak or Rupture on Animals: According to the DEIS, CO₂ leaks would not affect mammals, birds, reptiles, amphibians, and insects and would unlikely impact fish and freshwater mussels. The DEIS reaches this conclusion without providing any reasoning or supporting evidence. <p>Though the DEIS does note some harm may come to animals in the event of a rupture, it relies heavily on the assumption that animals will move out of the rupture area to avoid the release. The reason for this assumption is not provided. This is contradicted by information in the rupture report in Appendix G, which suggests the impacts of a rupture would be nearly immediate.</p>	CO ₂ is a widespread, naturally occurring gas and is the primary byproduct of respiration—the conversion of sugars to usable energy. Minor leaks of CO ₂ from operation of the proposed pipeline would not elevate ambient CO ₂ to a level that is detrimental to local vegetation or wildlife. Potential impacts on wildlife from a CO ₂ rupture could result first from the physical force of a rupture and secondarily from localized short-term high levels of CO ₂ prior to dispersal and extreme cold temperatures associated with the depressurization of the CO ₂ from a supercritical state to a gas. Chapter 8 of the EIS acknowledges that wildlife in the immediate vicinity of a rupture might be killed or injured by this force; however, it is expected that most mobile wildlife species would follow their natural instincts and attempt to escape the direct effect of a rupture. Chapter 8 of the EIS also acknowledges that less-mobile species in the immediate vicinity of the point of a rupture would be less likely to escape the impacts and might be killed or injured. The data presented in Appendix G describes models of dispersal patterns in the immediate vicinity of a rupture. These models support the statements in Chapter 8 that wildlife in the immediate vicinity of a rupture might be exposed to high levels of CO ₂ , which could be toxic for species unable to leave the area of the release.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Jeppesen, Kim	2024-02-23	<ul style="list-style-type: none"> • Critical Habitats: Summit’s preferred route would cross over or near several waterfowl protection areas, including the Orwell 9 Unit and Ridgeway WPA in Otter Tail County. The DEIS notes that some of these areas will be avoided during construction but fails to consider the impacts of these features in the event of a leak or rupture. The DEIS consistently fails to properly account for the project’s actual CO₂ emission and climate impacts. 	Operation of the proposed pipeline would include integrated systems for detecting leaks, as well as protocols for addressing leaks promptly. Minor leaks of CO ₂ from operation of the proposed pipeline would not elevate ambient CO ₂ to a level that is detrimental to waterfowl and other wildlife within the Orwell 9 Unit or Ridgeway WPAs. As the comment notes, the pipeline route would avoid these areas. As a result, there would be negligible risk of impacts on these areas due to a pipeline rupture. The potential impacts of a pipeline rupture would be highly localized and outside of the WPA boundaries.	20243-204403-01
	Jeppesen, Kim	2024-02-23	<ul style="list-style-type: none"> • Lifetime of Project: The applicant states that the anticipated lifetime of this project is 25 years. This means at the end of its life; the project could stop capturing the CO₂ from the ethanol plant. Unless the ethanol plant will also cease operations at that point in time, it will continue to emit CO₂ unabated into the future. 	Section 2.7 describes project decommissioning. If the ethanol plant continues to operate beyond the life of the proposed project, its CO ₂ emissions would not be captured.	20243-204403-01
	Jeppesen, Kim	2024-02-23	<ul style="list-style-type: none"> • 100% CO₂ Capture Rate: Summit states that the capture facility “is designed to capture 100% of the CO₂ produced by the ethanol plant.” No carbon capture facility in the world, ethanol or otherwise, captures carbon at a rate of 100%. This claim is not supported by any data/information or verified by a third party. Additionally, the DEIS should emphasize that any CO₂ capture is solely associated with emissions from the ethanol fermentation process and provides zero reductions on the significant emissions from the facility’s electricity use 	Section 2.1 has been revised to clarify that the captured CO ₂ is produced by the ethanol plant as part of its fermentation process, the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. Section 6.3 describes energy efficiency and energy alternatives that could reduce emissions from the ethanol plant's electricity and process fuel use.	20243-204403-01
	Jeppesen, Kim	2024-02-23	<ul style="list-style-type: none"> • Added CO₂ from electricity use: Carbon capture technologies are highly energy intensive and will significantly increase the carbon emissions at the facility from electricity use. The DEIS uses the Midwest Reliability Organization West Region average to calculate these emissions, which is unnecessarily inaccurate given the availability of the actual emissions factor from Great River Energy. 	Electricity emissions are included in Table 5-39. These numbers have been revised to reflect the electricity emission factor associated with LREC, which would provide electricity to the project. The revised electricity emission factor is 132.2 gCO ₂ e/MWh. Because LREC has a lower emission factor than the Midwest Reliability West Region emission factor (684.35 g CO ₂ e/kWh), which was used in the draft EIS, calculated electricity emissions have decreased.	20243-204403-01
	Jeppesen, Kim	2024-02-23	<ul style="list-style-type: none"> • CO₂ Storage: The DEIS assumes that 100% of captured CO₂ is permanently underground. There is no guarantee that this will occur and no explanation of the monitoring and verification protocols to ensure it. 	Text has been added to Section 2.1 describing the suitability of the Broom Creek Formation in North Dakota for CO ₂ sequestration, as well as the monitoring and testing that would be done to verify that the CO ₂ is contained in the storage reservoir.	20243-204403-01
	Jeppesen, Kim	2024-02-23	<ul style="list-style-type: none"> • Enhanced Oil Recovery: The DEIS fails to explain whether the applicant can sell any of its captured CO₂ to others for alternative uses instead of permanent sequestration and what the impacts of that would be. The DEIS incorrectly states, “Oil production through EOR would not depend on the availability of CO₂ produced by the ethanol plant.” Countless public statements from public officials in North Dakota and oil industry representatives contradict this claim. 	The text questioned by the commenter in Section 5.7.2.3 was prefaced with the following: "if all the CO ₂ produced by the ethanol plant is sequestered as proposed, EOR would likely continue in North Dakota using other sources of CO ₂ , other gases, thermal methods, or chemical methods." Revisions are not necessary. However, Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	20243-204403-01
	Jeppesen, Kim	2024-02-23	Thank you for taking my concerns and comments into thoughtful consideration.	Thank you for your comment.	20243-204403-01
	Jones, Barbara	2024-02-22	<p>I am a resident of Ely MN concerned about our climate.</p> <p>In principle capturing CO₂ and sequestering it sounds like a smart thing to do, but in practice it is misleading and dangerous. Almost all the captured CO₂ goes to enhanced oil recovery from failing oil and gas wells. Capturing CO₂ from coal or gas power plants is expensive and unproven technology. Transport of CO₂ through pipelines is DANGEROUS.</p>	Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR. The proposed project would not capture CO ₂ from a coal or gas power plant. Chapter 8 describes the potential for an unanticipated release of CO ₂ from the capture facility or pipeline, the	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				potential for adverse human and environmental impacts of an unanticipated release of CO ₂ , and describes prevention, preparedness, and response measures that could prevent or reduce the impacts of a release.	
	Jones, Barbara	2024-02-22	A break in an oil pipeline makes a bad mess and can be a local environmental disaster, but a break in a CO ₂ pipeline KILLS people, animals, and birds. CO ₂ is an asphyxiant which displaces the air we breathe. You cannot escape in your car or truck because an internal combustion engine also needs oxygen. First responders cannot help those impacted if they have no transportation.	Risks of a potential CO ₂ release and potential impacts are described in Chapter 8 of the EIS. Chapter 8 also describes the steps that would be taken in the event of an accidental release and the steps that would be taken to prevent an accidental release.	20243-204403-01
	Jones, Barbara	2024-02-22	It is much preferable to leave the fossil fuels in the ground than to dig them up just to use their energy to put them back again. It is better to use the acreage now used to grow corn to make ethanol for agri-solar projects. The space between solar panels can be used to grow food. The panels generate many times more energy than can ever be retrieved from corn ethanol since solar panels are up to 100 times more efficient than photosynthesis.	The EIS analyzes the proposed project, including alternatives that lower the CI score of the ethanol produced at the ethanol plant. An alternative that does not include ethanol production was not studied in the EIS because it would not meet the purpose of the project.	20243-204403-01
	Knaeble, Barnadette	2024-02-23	I am writing in reference to Docket No 22-42, Otter Tail to Wilkin Carbon Dioxide Pipeline Project. I am a medical professional residing in Minnesota. I oppose this pipeline project in its entirety for many reasons. I will speak to two of them. 1. Land and water degrading pipelines always damage ecosystems far more than any DEIS addresses. Where in the document is there any data on projected cost to the environment and therefore cultural communities from other pipelines? Once again Industry writes the DEIS and feels free to forecast minimal degradation. It is full of industry spin. Example: Take a look at the results of HDD drilling Enbridge used to lay Line 3/39? Frack outs of drilling mud, invasive species spread, clear cutting shrubs and trees, soil erosion and water body disruption are all visible along the Line 3/93 corridor. Please go take a look. What agencies are monitoring that damage and reporting it to the public? Did that destruction inform this DEIS?	Thank you for your comment. Chapter 5 discusses the potential environmental impacts of construction and operation of the project. Multiple sections in Chapter 5 describe potential environmental impacts associated with HDD.	20243-204403-01
	Knaeble, Barnadette	2024-02-23	Instead of acknowledging the potential ecological damage, Summit Carbon Solutions Construction "would use horizontal direction drill (HDD) and boring techniques at road crossings to limit impacts on local traffic" This quote is from the Environmental Justice section of the DEIS. What type of environmental justice does this address? None.	Thank you for your comment.	20243-204403-01
	Knaeble, Barnadette	2024-02-23	2. Moving compressed CO ₂ is extremely dangerous. The DEIS does not mention any meaningful safety measures for a rupture and instead suggests that it is ? reasonable? for Summit to simply supply indoor CO ₂ detectors for residences within 1,000 feet of the project. But the rupture report in Appendix G states that ?a full rupture results in impact distances too quickly for an early warning device, such as an oxygen detector, to be effective.?	Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that would be revised as required by PHMSA, if the project is approved. Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.	20243-204403-01
	Knaeble, Barnadette	2024-02-23	This pipeline should not be approved without a clear understanding of the risks to human health and meaningful measures to ensure the safety of people and animals in the area. I urge denial of permits to the Otter Tail to Wilkin Carbon Dioxide Pipeline Project.	Thank you for your comment.	20243-204403-01
	Kopel, Carol	2024-02-23	My name is Carol Kopel. I live in Tyler, MN in SW Minnesota. My husband and I are landowners near Lamberton, MN in Redwood County. We have been following the proposed Summit pipeline news, because we have been contacted about signing an easement for the proposed southern route of the pipeline. Our farmland is directly north of the ethanol plant in Lamberton. I am commenting on the EIS for the Otter Tail to Wilkin because I feel the decisions made for that proposed project will ultimately determine decisions for the proposed southern route that Summit has planned. I am concerned about the potential impacts this pipeline would have on people along the proposed pipeline routes, but also to people adjacent to the routes.	See responses to specific comment topics below.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Kopel, Carol	2024-02-23	Safety is of the utmost importance. CO ₂ is a hazardous material in high concentrations. The DEIS consistently underplays the known and unknown risks of transporting large amounts of CO ₂ at high pressures through a pipeline. The proposed pipeline will run close to many small communities and farms. In the event of a rupture. Summit indicates that it will take 25 minutes for the system to shut off the relevant valves in the event of “abnormal operation,” the DEIS does not mention any meaningful safety measures for a rupture and instead suggests that it is “reasonable” for Summit to simply supply indoor CO ₂ detectors for residences within 1,000 feet of the project. But the rupture report in Appendix G states that “a full rupture results in impact distances too quickly for an early warning device, such as an oxygen detector, to be effective.” This pipeline should not be approved without a clear understanding of the risks to human health and meaningful measures to ensure the safety of people and animals in the area.	Text in Section 4.5 on valve closure time has been corrected from 25 minutes to 10 minutes. Elsewhere in the EIS, including the rupture analysis, valve closure time is listed/calculated as 10 minutes. Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that is not outdated but would be revised as required by PHMSA, if the project is approved. Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.	20243-204403-01
	Kopel, Carol	2024-02-23	Impact to the farmland this proposed pipeline would affect is also of concern to me. The DEIS discounts the direct and long-term impacts of pipeline construction on land and soil integrity in spite of the significant evidence of likely harm. Land degradation: This project is going to cut through roads, ditches, tile lines, and prime farmland. There is a growing body of anecdotal evidence and peer-reviewed research that shows that pipeline projects in the Midwest have caused yield reduction and damage to land years after project completion and “restoration”. The DEIS does acknowledge that the reduced productivity from construction “typically would extend for 2 to 3 years, but could take up to 5 years, depending on impacts on soils from the construction disturbance,” but fails to identify any measures the applicant should take to avoid these damages or repair them.	As indicated by the definitions found on Page 5-1 of the draft EIS, “long-term impacts extend beyond the end of construction and are generally associated with operation of the project.” Disturbance to soils and crops from construction can result in impacts that extend beyond the construction phase, and the text in the final EIS has been revised to indicate that impacts can be long term.	20243-204403-01
	Kopel, Carol	2024-02-23	Another concern is the impact on our water sources. Water use: Much of southern Minnesota is suffering from the consequences of drought and over-commitment of our fresh drinking water supplies. The DEIS fails to discuss the impacts of an increase in water use on local water supply. The carbon capture process can double water requirements at a facility and increase toxic wastewater discharge. The DEIS states that Summit “anticipates” an average water use for the operation of the carbon capture equipment of 13 million gallons per year, which is concerningly ambiguous. There must be a careful and case-specific assessment done of how the installation and operation of carbon capture will impact current drought conditions and exacerbate existing pollution sources. Moreover, Summit has not finalized its water appropriation sources or volumes needed for construction, so it is impossible to know the full impact of those appropriations on water resources. Why should Minnesota risk our fresh drinking water supply and commit to an infrastructure when the proposing company has not been transparent with its true demands for water resources?	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-01
	Kopel, Carol	2024-02-23	Wetlands: In Table 5-40 on p. 5-98 of the DEIS it states that “the loss of wetlands would be less than 0.01 acre.” However, Table 5-4 on p. 5-24 says that for Summit’s preferred route, operation impacts are expected to be 3.3 acres, and construction impacts are expected to be 4.7 acres. And Table 5-52 on p. 5-143 suggests that the total construction impact on wetlands for RA-South is 2.7 acres. Which is it?? Wetlands: In Table 5-40 on p. 5-98 of the DEIS it states that “the loss of wetlands would be less than 0.01 acre.” However, Table 5-4 on p. 5-24 says that for Summit’s preferred route, operation impacts are expected to be 3.3 acres, and construction impacts are expected to be 4.7 acres. And Table 5-52 on p. 5-143 suggests that the total construction impact on wetlands for RA-South is 2.7 acres. Which is it??	Discrepancies between Table 5-4 and Table 5-54 result from different datasets and their associated resolutions. Table 5-4 uses NLCD data to analyze land cover, and Table 5-54 uses NWI data to analyze wetlands. Table 5-40 has been edited to be consistent with discussions of impacts on wetlands in Section 5.7.9 and Table 5-53 and Table 5-54.	20243-204403-01
	Kopel, Carol	2024-02-23	Complete Network Impacts: Summit has applied for permits for the 28 miles of pipeline for the OtterTail to Wilkin project. As a landowner in Redwood County, we have been contacted to sign easements as well as many individuals along the proposed southern route, so we assume this project will eventually affect our area. In Summit’s application, the DEIS does not account for the indirect and cumulative impacts of Summit’s entire project in Minnesota. This is despite Summit’s clear and public plans for a much larger buildout in Minnesota. This allows Summit to artificially segment permitting requests for multiple concurrent projects on one pipeline and will prevent a thorough review of the cumulative impacts and potential environmental and climate damages of the project.	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Kopel, Carol	2024-02-23	Decommissioning: Summit appears to indicate that once the pipeline is decommissioned, it will no longer monitor or maintain the pipeline. This is despite the DEIS acknowledging that pipeline segments left in place “would degrade over time and could serve as potential conduits for groundwater or cause minor subsidence when they collapse.” There is no information about who would be responsible for any damage caused by the deteriorating pipeline [see pg. 2-15 of the DEIS]. The DEIS references the Decommissioning Plan, but it is not included as an Appendix to the DEIS, nor was it included as an Appendix to the EAW. Without a detailed discussion of decommissioning, the public and state agencies cannot know what human and environmental impacts the plan will have into the future.	Section 2.7 describes project decommissioning. This section was revised to describe the financial assurances to be provided by the applicant for costs associated with decommissioning.	20243-204403-01
	Kramer, Anthony	2024-02-22	My name is Anthony Kramer. My wife Julie and I live, own and operate farmland in Redwood County, Mn where the proposed CO ₂ pipeline would cross very close to our home. I have several concerns regarding this proposed pipeline, not the least of which are health in safety concerns. While I very much appreciate our small volunteer fire departments, they not only lack the adequate equipment and training to respond to a leak or rupture but with many unmanned volunteer departments in rural Minnesota would be unable to respond quick enough to ensure the health and safety of those close to the pipeline.	Sections 8.4 and 8.5 describe the steps that would be taken in the event of an accidental release of CO ₂ , including the training and provisioning of equipment to local emergency responders. Additionally, the applicant’s draft Emergency Response Plan is included in Appendix N of the EIS.	20243-204403-01
	Kramer, Anthony	2024-02-22	also am concerned how a leak could potentially contaminate our ground water and or get into the aquifers contaminating our wells. Carbonic acid is formed when carbon dioxide reacts with water.	Section 8.3.4.1 describes the effects of a CO ₂ leak on water resources. Any CO ₂ leakage from the pipeline would be insufficient to measurably alter water quality in either shallow or deep aquifers. Any formation of carbonic acid from reaction between CO ₂ and water would be insufficient to contaminate groundwater and would be buffered and neutralized by the local soils/geology.	20243-204403-01
	Kramer, Anthony	2024-02-22	Summit also has said they plan on installing the pipeline at a depth of 6 feet which they believe would be below the frost line and therefore would not be damaged from frost heaves. I do not believe a depth of 6 feet without snow cover would be deep enough on extremely cold winters. "How much does a frost heave move?" "The expansion of soil from the formation of ice lenses varies over a wide range, but vertical movements of 4 to 8 in. are not unusual and as much as 24 in. has been reported. Heaving pressures also vary over quite wide limits and depend mainly on the type of soil and its moisture content."	Information regarding frost depth has been added to Section 5.7.6.1. EERA staff have been unable to find published data to support comments that the pipeline would be shallower than the frost depth, and no commenter has provided such data. Additional text regarding the potential for frost heave has been added to Section 5.7.6.2.	20243-204403-01
	Kramer, Anthony	2024-02-22	I do not feel we have adequate water supply that will be used by the ethanol plants during the process to turn the CO ₂ into a liquid that would be pumped up to North Dakota. Water already comes via a pipeline to Southwest Minnesota from the Missouri River watershed. I would suspect the same can be said in Iowa. Even some of the small ethanol plants have admitted they will use around 50,000 gallons of water a day. Do we want to be using our valuable groundwater supplies for this project? Will it jeopardize our water supply? What effect could that have on our waterways we use to transport grain and fertilizer on dry years? We have already experienced years where the depth of the Mississippi River is not adequate to transport goods.	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-01
	Kramer, Anthony	2024-02-22	I am concerned of the potential damage done to thousands of drainage tile lines which will be crossed installing this pipeline. Not only do I believe they will not know when they cross every drainage tile line I feel it is very unlikely every repaired tile line will be properly repaired. Some of the damage may not be realized until several years later. How quickly will Summit come to repair the damage? Will any drainage tile contractors and installers want to work anywhere near the pipeline after it is installed? Will they be allowed to?	Section 2.4.6 states that any drain tiles damaged during pipeline construction would be repaired before backfilling the trench. Section 6.7 of the applicant's APP (Appendix E) specifies the procedures and timelines for repair of drain tiles disturbed during construction. The APP notes that tile disturbed or damaged by pipeline construction would be repaired to its original or better condition, and that permanent repairs would be completed within 21 days after the pipeline is installed in accordance with the applicant's Minnesota ECP (Appendix D). Section 5.5.1.3 has been revised to include a reference to this mitigation measure.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Kramer, Anthony	2024-02-22	Another question I ask is how much CO ₂ will be released as Summit constructs the pipeline, processes CO ₂ into a liquid form, and monitors the pipeline daily with CO ₂ emitting vehicles and airplanes. I believe further studies are needed to see what if any net gain we will actually see of CO ₂ captured in this venture.	Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios of 100 percent, 70 percent, 40 percent, and 10 percent.	20243-204403-01
	Kramer, Terese	2024-02-22	Dear Mr. Levi, As a fourth-generation landowner in Redwood County, my seven siblings and I hold a deep connection to the land, considering ourselves stewards entrusted with its care. However, our 130+ year old family farm faces an imminent threat: a planned CO ₂ pipeline intends to cut across 240 acres of the family farm. My objections to the pipeline are rooted in environmental concerns and health and safety matters. The pipeline’s impact remains shrouded in uncertainty, including unknown water requirements, the loss of tillable land, the potential for ruptures and the life-threatening consequences such ruptures may pose. As a guardian of this land, I stand resolute in my opposition. This Draft Environmental Impact Study (DEIS) is a crucial step in raising these fundamental issues regarding CO ₂ pipelines and Minnesota land. My major concerns with the DEIS are focused on the risks to water & land resources as well as public health and safety.	Thank you for your comment.	20243-204403-01
	Kramer, Terese	2024-02-22	Water and natural resource risk Minnesota’s recent experience with non-CO ₂ pipeline construction demonstrates the serious harms that it causes on water resources as well as a tendency by state agencies to underestimate those impacts. Dangers to water and water bodies: The proposed route for Summit Carbon Solutions (“Summit”)’s pipeline network includes many water crossings, wetlands, aquifers, and other sensitive water bodies. More research and analysis are needed to understand how CO ₂ disperses in water and what risks a CO ₂ pipeline leak or rupture poses to Minnesota’s waters and the fish, amphibians, reptiles, waterfowl, birds, and insects as well as Minnesota’s residents, that rely on it to survive.	An independent study that analyzes how CO ₂ disperses in water is outside the scope of the EIS and would not aid the Commission's decision on a route permit as all alternatives cross waterbodies. Potential impacts of a pipeline rupture on water resources and wildlife are addressed in Section 8.3.4.	20243-204403-01
	Kramer, Terese	2024-02-22	Water use: Much of southern Minnesota is suffering from the consequences of drought and over-commitment of our fresh drinking water supplies. The DEIS fails to discuss the impacts of an increase in water use on local water supply. The carbon capture process can double water requirements at a facility and increase toxic wastewater discharge. The DEIS states that Summit “anticipates” an average water use for the operation of the carbon capture equipment of 13 million gallons per year, which is disturbingly ambiguous. There must be a careful and case-specific assessment done of how the installation and operation of carbon capture will impact current drought conditions and exacerbate existing pollution sources. Moreover, Summit has not finalized its water appropriation sources or the volume of water needed for construction, so it is impossible to know the full impacts of those appropriations on water resources. Why should Minnesota risk our fresh drinking water supply and commit to an infrastructure when Summit has not been transparent with its true demands for water resources?	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-01
	Kramer, Terese	2024-02-22	Aquifer Damage: Summit’s preferred route, RA-South, crosses a surficial beach ridge aquifer in Otter Tail County. The DNR has said that the area is “prone to significant groundwater discharge,” and the applicant’s initial groundwater investigation confirmed that “artesian groundwater conditions are present” along that beach ridge system. In early feedback on the DEIS, the DNR noted that “Project construction has the potential to intersect shallow confined groundwater potentially causing a breach in a confined aquifer and that “breaching shallow confined aquifers could have significant long-term impacts to groundwater resources.” This, along with our state’s first-hand knowledge of how damaging pipelines can be, requires that the DEIS take potential damage to aquifers more seriously.	Section 5.7.8.2 acknowledges that damage to aquifers is a serious problem and indicates that an uncontrolled flow of water from a shallow confined aquifer could have a significant long-term impact on groundwater. Section 5.7.8.2 also describes geotechnical investigations that would be done to identify areas where breaching of a shallow confined aquifer could occur, and sheet piling would not be used. The applicant currently has an ongoing groundwater investigation underway to further inform construction practices and is continuing to consult with DNR. As part of its coordination with DNR, the applicant has agreed to use ground penetrating radar to study the depth of the confining layer through the entire beach ridge system area crossed by the pipeline to further define existing conditions and advise on construction methodology. Furthermore, EERA staff recommends that the applicant develop, in coordination with DNR, a plan for pipeline	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				construction in areas crossing the beach ridge system area. The plan would include, at a minimum, measures to minimize the potential for breaching a shallow confined aquifer during trenching and contingency measures to mitigate the impacts of a breach, should one occur. This information has been added to Section 5.7.8.2.	
	Kramer, Terese	2024-02-22	<p>HDD Drilling: The DEIS also states that “drilling mud mixed with additives that are not on the MDH-approved additive list and/or do not meet [drinking water quality certification standards] would be disposed of as solid waste at an approved facility, or the applicant would obtain a land application permit from MPCA.” The DEIS does not discuss the risks of applying drilling mud, especially with additives not approved by MDH, to the land.</p> <p>The DEIS says that “drilling fluids and additives for the HDD would be non-toxic to the aquatic environment and humans,” however, even supposedly “non-toxic” drilling fluid is chemical waste that has been found to be harmful to plant and animal species. Summit’s preferred route and alternative route, RA-Hybrid, would cross three rivers (Pelican River, Otter Tail River, and Bois de Sioux River) via the HDD mention.</p>	As described in Section 5.7.8.2, an additive approved by MDH or meeting NSF International/ANSI Standard 60, Drinking Water Treatment Chemicals – Health Effects, might need to be mixed with the drilling mud for viscosity or lubricating reasons and to reduce the potential for an inadvertent release or failed HDD. The specific additive used would depend on the conditions at the crossing location and would be determined by the HDD contractor. The EIS discloses the potential for an inadvertent release of drilling mud and describes potential impacts in Chapter 5. Land application of drilling mud and potential impacts are addressed in Section 5.7.6.2.	20243-204403-01
	Kramer, Terese	2024-02-22	Wetlands: Table 5-40 on p. 5-98 of the DEIS states that “the loss of wetlands would be less than 0.01 acre.” However, Table 5-4 on p. 5-24 says that for Summit’s preferred route, operation impacts are expected to be 3.3 acres, and construction impacts are expected to be 4.7 acres. And Table 5-52 on p. 5-143 suggests that the total construction impact on wetlands for RA-South is 2.7 acres. Clarification is required.	Discrepancies between Table 5-4 and Table 5-54 result from different datasets and their associated resolutions. Table 5-4 uses NLCD data to analyze land cover and Table 5-54 uses NWI data to analyze wetlands. Table 5-40 has been edited to be consistent with discussions of impacts on wetlands in Section 5.7.9 and Table 5-53 and Table 5-54.	20243-204403-01
	Kramer, Terese	2024-02-22	Critical Habitats: Summit’s preferred route would cross over or near several waterfowl protection areas, including the Orwell 9 Unit and Ridgeway WPA in Otter Tail County. The DEIS notes that some of these areas will be avoided during construction but fails to consider the impacts to these features in the event of a pipeline leak or rupture.	Operation of the proposed pipeline would include integrated systems for detecting leakages, as well as protocols for addressing leaks promptly. Minor leaks of CO ₂ from operation of the proposed pipeline would not elevate ambient CO ₂ to a level that is detrimental to waterfowl and other wildlife within the Orwell 9 Unit or Ridgeway WPAs. As the comment notes, the pipeline route would avoid these areas. As a result, there would be negligible risk of impacts on these areas due to a pipeline rupture.	20243-204403-01
	Kramer, Terese	2024-02-22	<p>Agriculture and Land Impact</p> <p>The DEIS discounts the direct and long-term impacts of pipeline construction on land and soil integrity in spite of the significant evidence of likely harm.</p> <p>Land degradation: Summit plans to cut through roads, ditches, tile lines, and prime farmland including my family’s farmland. Under cumulative effects or impact theory – it is suggested that multiple activities on the environment may have an additive, synergistic or antagonistic effect on one another and with natural processes. It is my understanding that the emergence of cumulative effects in environmental regulations began in the 1970s and has since been increasingly seen as a consideration in environmental impact assessments and land management. Because of this cumulative effects consideration and Summit’s stated plans to expand in southern Minnesota (Highwater Ethanol plant in Lamberton, MN is already a committed plant), I believe all of this DEIS will be used to govern environmental issues throughout Minnesota. There is a growing body of anecdotal evidence and peer-reviewed research that shows that pipeline projects in the Midwest have caused yield reduction and damage to land years after project completion and “restoration”. The DEIS does acknowledge that the reduced productivity from construction “typically would extend for 2 to 3 years, but could take up to 5 years, depending on impacts on soils from the construction disturbance,” but fails to identify any measures the applicant should take to avoid these damages or repair them.</p> <p>Prime Farmland and Farmland of Statewide Importance: All three of the proposed routes would impact both Prime Farmland and Farmland of Statewide Importance, but Summit’s preferred route would impact significantly more acres of both across both the construction footprint and the operation footprint of the proposed project than the proposed alternatives.</p>	Measures that the applicant would take to minimize impacts on soils and agricultural land are described in the Minnesota ECP in Appendix D and Minnesota APP in Appendix E. Text in Chapter 5 has been revised to indicate that impacts on crop production would be long term due to impacts on soils from construction disturbance. Impacts on prime farmland and farmland of statewide importance are shown in Table 5-21 for each alternative. RA-Hybrid would impact the most acres of prime farmland. The amount of farmland of statewide importance that would be impacted by construction is relatively small for all three routes, ranging from 17.8 acres for RA-South to 15.7 acres for RA-Hybrid.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Kramer, Terese	2024-02-22	Impact of Leaks or Ruptures on Vegetation: The DEIS concludes a leak of CO ₂ “would slow plant growth” and that the rupture of the pipeline would instantly freeze the surrounding soil and “instantly kill all herbaceous ground vegetation” but provides no measures to avoid these impacts, nor does it discuss the long-term impacts of such damage on the soils and vegetation. Instead, the DEIS states, without proof, that “local soil microbes, mycorrhizae, and soil animals such as worms, arachnids, and insects...would re-colonize after the area is restored.”	Chapter 2 of the draft EIS discusses engineering and design elements incorporated into the project to reduce the likelihood of pipeline leaks or failure. Chapter 8 discusses potential impacts on vegetation and wildlife from slow leaks of CO ₂ and from a larger rupture. In the event of a pipeline rupture and large release, impacts on vegetation and soils would be highly localized to the area above the rupture. Re-colonization of the impact area would result from ecological succession processes that are well documented in areas that have experienced disturbance events of similar source, duration, and effect on other projects of a similar scale.	20243-204403-01
	Kramer, Terese	2024-02-22	Soil Compaction: The DEIS acknowledges that “soil compaction would be unavoidable in unpaved areas of equipment and vehicle operation” and that even if soils were decompacted, “some compacted soils could remain.” Soil compaction can have serious consequences in terms of water infiltration and drainage and should not be dismissed as an insignificant impact.	Section 5.7.8.2 indicates that groundwater recharge could be impacted by soil compaction. Section 5.7.6 explains that the applicant would comply with required permits and implement its Minnesota ECP and Minnesota APP, which would minimize impacts on soils. The text in Section 5.7.6 has been revised to indicate that, while most impacts on soils during construction would be minimal and temporary, some impacts could be long term.	20243-204403-01
	Kramer, Terese	2024-02-22	Geologic Hazards: The DEIS does not address whether the applicant has conducted geologic hazard surveys pursuant to the PHMSA Bulletin: https://www.phmsa.dot.gov/sites/phmsa.dot.gov/files/2022-06/2022-11791.pdf	Geologic hazards are addressed in Sections 5.7.3 and 5.7.6. Text regarding geohazard assessments that would comply with the recommendations in PHMSA Advisory Bulletin 2022-01 has been added to both sections.	20243-204403-01
	Kramer, Terese	2024-02-22	In my view, the DEIS consistently underplays the known and unknown risks of transporting large amounts of CO ₂ at high pressures through a pipeline. CO ₂ Rupture Impact Zone: · According to the analysis in the DEIS, the potential impact radius for levels of CO ₂ that would be “immediately dangerous to life or health” is 617 feet. This expands to 910 feet for lower concentrations that cause dizziness, drowsiness, severe muscle twitching, and unconsciousness within a few minutes. Although Summit indicates that it will take 25 minutes for the system to shut off the relevant valves in the event of “abnormal operation,”the DEIS does not mention any meaningful safety measures for a rupture and instead suggests that it is “reasonable” for Summit to simply supply indoor CO ₂ detectors for residences within 1,000 feet of the project. · But the rupture report in Appendix G states that “a full rupture results in impact distances too quickly for an early warning device, such as an oxygen detector, to be effective.” Impacts of a Leak or Rupture on Animals: According to the DEIS, CO ₂ leaks would not affect mammals, birds, reptiles, amphibians, and insects and would be unlikely to impact fish and freshwater mussels. The DEIS reaches this conclusion without providing any reasoning or supporting evidence. Though the DEIS does note some harm may come to animals in the event of a rupture, it relies heavily on the assumption that animals will simply move out of the rupture area to avoid the release. The reason for this assumption is not provided and is contradicted by information in the rupture report in Appendix G which suggests the impacts of a rupture would be nearly immediate. · Bottom line: This pipeline should not be approved without a clear understanding of the risks to human health and meaningful measures to ensure the safety of people and animals in pipeline area.	Text in Section 4.5 on valve closure time has been corrected from 25 minutes to 10 minutes. Elsewhere in the EIS, including the rupture analysis, valve closure time is listed/calculated as 10 minutes. Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that is not outdated but would be revised as required by PHMSA, if the project is approved. Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3. CO ₂ is a widespread, naturally occurring gas and is the primary byproduct of respiration (the conversion of sugars to usable energy). Minor leaks of CO ₂ from operation of the proposed pipeline would not elevate ambient CO ₂ to a level that is detrimental to these organisms. Potential impacts on wildlife from a CO ₂ rupture could result first from the physical force of a rupture and secondarily from localized short-term high levels of CO ₂ prior to dispersal and extreme cold temperatures associated with the depressurization of the CO ₂ from a supercritical state to a gas. Chapter 8 of the EIS acknowledges that wildlife in the immediate vicinity of a rupture might be killed or injured by this force; however, it is expected that most mobile wildlife species would follow	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				their natural instincts and attempt to escape the direct effect of a rupture. Chapter 8 of the EIS also acknowledges that less-mobile species in the immediate vicinity of the point of a rupture would be less likely to escape the impacts and might be killed or injured. The data presented in Appendix G describes models of dispersal patterns in the immediate vicinity of a rupture. These models support the statements in Chapter 8 that wildlife in the immediate vicinity of a rupture might be exposed to high levels of CO ₂ , which could be toxic for species unable to leave the area of the release.	
	Kramer, Terese	2024-02-22	<p>First responders and health professionals:</p> <ul style="list-style-type: none"> · CO₂ pipelines pose unique problems for first responders and health care providers. Because CO₂ is colorless and odorless, both victims and first responders have no way of knowing what is causing the health problems. · In addition, first responders require special equipment, including non-internal combustion engines, to respond to a CO₂ disaster. · The DEIS does not consider the burdens this will put on local EMS and health providers in the case of a pipeline rupture or accident or an assessment of how they should be prepared to respond given the unique needs. The DEIS includes Summit’s September 2022 Emergency Response Plan (Appendix N). This plan is not only outdated but also unclear as to how local EMS and first responder will interact with the applicant in the event of a leak or rupture. Though the plan talks of multiple company personnel as playing roles in an emergency response, it ignores the fact that the applicant only plans on having one full-time employee at the capture facility. Local first responders deserve more clarity about how they will be expected to respond to an emergency situation and what the applicant will do to ensure they are adequately equipped and informed for such an event. 	<p>Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that is not outdated but would be revised as required by PHMSA, if the project is approved.</p> <p>Additionally, EERA staff recommended that a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.</p>	20243-204403-01
	Kramer, Terese	2024-02-22	<p>Compliance with PHMSA Rules: The DEIS accepts Summit’s assurances that it will “comply with federal emergency response requirements,” but as noted in a Pipeline Safety Trust report and by the Pipeline Hazardous Material Safety Administration (PHMSA) itself, the current emergency response requirements are dangerously outdated.</p> <p>According to the DEIS, the Minnesota Public Utilities Commission (PUC) faces a critical decision regarding Summit’s proposed CO₂ pipeline.</p> <p>Safety Standards and Local Authority:</p> <ul style="list-style-type: none"> · The DEIS acknowledges that the PUC cannot directly set safety standards for the pipeline. · However, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has clarified that state and local authorities retain the power to regulate land use, including setback distances. · PHMSA emphasizes that federal pipeline safety law does not infringe on local or state prerogatives in this regard. <p>PUC’s Responsibility: The DEIS should clarify the role and authority of the PUC to carefully consider the pipeline’s placement and safety implications, and make clear that it has the authority to determine:</p> <ul style="list-style-type: none"> · Routing: The optimal path for the pipeline. · Setback Requirements: How far the pipeline should be from sensitive areas (e.g., homes, schools). · Depth specifications: the optimal depth to ensure adequate protection for humans, animals and the environment. 	<p>Although the Commission cannot set safety standards for pipeline construction or operation, state or local units of government may, to the extent authorized by law, set land use requirements that indirectly contribute to pipeline safety by regulating the activities of third parties located in the pipeline’s vicinity. The Commission’s obligation is to identify a pipeline route consistent with the criteria found in statutes and the applicable administrative rules. Federal law, by contrast, exclusively prescribes pipeline safety requirements. Section 3 .4 of the EIS has been revised with this information.</p>	20243-204403-01
	Kramer, Terese	2024-02-22	<p>In addition to the concerns and issues stated above, I am alarmed that the DEIS falls short in accurately assessing its true CO₂ emissions and climate impact over its lifetime.</p> <p>Key concerns:</p> <ul style="list-style-type: none"> · Project longevity: The DEIS assumes a 25-year lifespan, but fails to address the continued CO₂ emissions from the ethanol plant after capture stops. This presents a significant unaccounted-for impact. 	<p>Section 2.7 describes project decommissioning. If the ethanol plant continues to operate beyond the life of the proposed project, its CO₂ emissions would not be captured.</p>	20243-204403-01
	Kramer, Terese	2024-02-22	<ul style="list-style-type: none"> · Unrealistic capture claims: The claim of 100% CO₂ capture from the ethanol plant lacks supporting data, independent verification, and transparency. No existing carbon capture facility achieves this rate. 	<p>Section 2.1 has been revised to clarify that the amount of CO₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture</p>	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				facilities. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios of 100 percent, 70 percent, 40 percent, and 10 percent.	
	Kramer, Terese	2024-02-22	· Electricity usage ignored: The DEIS overlooks the increased emissions from electricity needed for carbon capture. Using regional averages instead of the specific, higher emission factor from the local utility (Great River Energy) underestimates the true impact.	Electricity emissions are included in Table 5-39. These numbers have been revised to reflect the electricity emission factor associated with LREC, which would provide electricity to the project. The revised electricity emission factor is 132.2 gCO ₂ e/MWh. This was calculated from LREC’s energy resource mix in which nearly half comes from clean energy sources. Because LREC has a lower emission factor than the Midwest Reliability West Region emission factor (684.35 g CO ₂ e/kWh), which was used in the draft EIS, calculated electricity emissions have decreased.	20243-204403-01
	Kramer, Terese	2024-02-22	· Uncertain storage: The assumption of 100% permanent underground storage for captured CO ₂ lacks guarantees and details on monitoring and verification protocols.	Text has been added to Section 2.1 describing the suitability of the Broom Creek Formation in North Dakota for CO ₂ sequestration, as well as the monitoring and testing that would be done to verify that the CO ₂ is contained in the storage reservoir.	20243-204403-01
	Kramer, Terese	2024-02-22	· EOR ambiguity: The DEIS offers no clarity on whether captured CO ₂ could be sold for alternative uses (besides permanent storage) and the associated consequences. Additionally, the claim that oil production isn't dependent on the project's CO ₂ contradicts public statements from North Dakota officials and industry representatives. In conclusion, the DEIS must be amended and improved to comprehensively and accurately reflect the project's actual and long-term CO ₂ emissions and climate impact.	Section 5.7.2.3 stated: "if all the CO ₂ produced by the ethanol plant is sequestered as proposed, EOR would likely continue in North Dakota using other sources of CO ₂ , other gases, thermal methods, or chemical methods." Revisions are not necessary. However, Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	20243-204403-01
	Kramer, Terese	2024-02-22	Summary of concerns regarding the proposed CO ₂ pipeline project and need to be adequately addressed in the DEIS: Environmental impacts: · Water: Potential for contamination through leaks, disruption of aquifers, and increased water usage. · Land: Loss of productive farmland, soil compaction, and disruption of critical habitats. · Vegetation: Damage to plants from leaks and ruptures, limited understanding of long-term impacts. Health and safety risks: · Leak and rupture: Large impact zone with potential for serious harm to humans and animals. Unclear response plan and inadequate safety measures. · First responders: Lack of training and equipment for CO ₂ emergencies. · Outdated regulations: Concerns about the adequacy of current safety standards. Additional concerns: · Limited scope of DEIS: Failure to properly assess long-term emissions, uncertainties surrounding CO ₂ storage, and lack of transparency on capture efficiency. · Route selection: PUC should have the authority to determine the optimal path, setbacks, and depth of the pipeline. Conclusion: The DEIS requires significant improvement to address these critical concerns before the project can be considered safe and responsible.	See responses to the detailed comments above.	20243-204403-01
	Lagaard, Scott	2024-02-22	The CO ₂ pipeline is a great concern of mine, for several reasons: 1) The rules for CO ₂ pipelines are not yet finalized. This must happen first, BEFORE construction begins. 2) This project will extend the life of fossil fuels - used as justification for more ETOH production, which use a food to make fuel, and fracking to get more oil from the ground.	Thank you for your comments. PHMSA regulations (that is, their appropriateness) and related standards for CO ₂ pipelines are outside the scope of the EIS (Appendix A). Section 3.6 acknowledges that PHMSA is currently conducting rulemaking proceedings on proposed amendments to its pipeline safety rules. Section 3.6 also notes that the Commission has indicated that it would be prudent for EERA staff and the applicant to take any updated mitigation strategies or safety guidelines into account, even if the updates have not been finalized. Appendix G of the EIS further summarizes the extensive and detailed PHMSA CO ₂ pipeline	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				regulations applicable to the construction, operation, and maintenance of such pipelines, and the status of pending PHMSA changes to such. EERA staff has been following PHMSA CO ₂ pipeline rulemaking proceedings before and since issuance of the draft EIS. As of July 5, 2024, PHMSA has not published the Notice of Proposed Rulemaking that will describe the scope of new and amended regulations; thus, there are currently no changes to existing PHMSA rules and regulations. Accordingly, discussion in the EIS of “mitigation strategies and measures to ensure public safety including, but not limited to, measures consistent with the proposed and final federal rules to the extent available” is based on existing PHMSA rules and regulations (Commission. September 26, 2023. Order Approving Scope of Environmental Review and Denying Stay. eDockets No. 20239-199149-01). To the extent applicable, Section 3.6 and Appendix G of the EIS have been updated with the above information.	
	Lagaard, Scott	2024-02-22	3) The pipeline is not safe. The CO ₂ makes acid with even the most tiny moisture, which is unavoidable, and can weaken the metal. 4) When the pipe ruptures (as has already happened in the U.S.), pressurized CO ₂ jets out, making a cloud of asphyxiating gas, heavier than air, that kills people and animals. Vehicles cannot start or run in this cloud, inhibiting escape or rescue. At the very least, O ₂ masks and cylinders should be mandated, to be delivered and deployed in each home or building for every person - and extras for visitors - for each possible habitable structure within one mile on either side of the entire pipeline.	Thank you for your comment.	20243-204403-01
	Lagaard, Scott	2024-02-22	5) There is no proof that CO ₂ can be retained perpetually in storage, and projects of this type so far have a very poor success rate. Hold construction AT LEAST until all questions are researched and proven by university scientists.	Text has been added to Section 2.1 describing the suitability of the Broom Creek Formation in North Dakota for CO ₂ sequestration, as well as the monitoring and testing that would be done to verify that the CO ₂ is contained in the storage reservoir.	20243-204403-01
	Leussler, Marcy	2024-02-23	The DEIS consistently fails to properly account for the real CO ₂ emission and climate impacts of the project. Lifetime of Project: The applicant states that the anticipated lifetime of this project is 25 years. This means at the end of its life, the project could stop capturing the CO ₂ from the ethanol plant.	Thank you for your comment. If the ethanol plant continues to operate beyond the life of the proposed project, its CO ₂ emissions would not be captured.	20243-204403-01
	Leussler, Marcy	2024-02-23	Unless the ethanol plant will also cease operations at that point in time, it will continue to emit CO ₂ unabated into the future. 100% CO ₂ Capture Rate: Summit states that the capture facility “is designed to capture 100% of the CO ₂ produced by the ethanol plant.” There is no carbon capture facility in the world, ethanol or otherwise, that captures carbon at a rate of 100%. This claim is not supported by any data/information or verified by a third party. Additionally, the DEIS should emphasize that any CO ₂ capture is solely associated with emissions from the ethanol fermentation process and provides zero reductions on the significant emissions from the facility’s electricity use.	Section 2.1 has been revised to clarify that the captured CO ₂ is produced by the ethanol plant as part of its fermentation process, the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. Section 6.3 describes energy efficiency and energy alternatives that could reduce emissions from the ethanol plant's electricity and process fuel use.	20243-204403-01
	Lind, Kat	2024-02-18	re: Docket no 22-422 draft EIS comment period: Dear State, Public Utilities Commissioner & Dept. of Commerce, Based on Minnesota Rules and the formal practice and execution of the State's Environmental Review / Protection Act, this draft EIS appears inadequate. It may be fair to involve the EQB and EQB Board due to the project involving complex issues with multijurisdictional effects [Minn.R.4410.2800]. More needs to be disclosed and considered with this "project" in relation to connected actions of the project. What is currently disclosed fails to present the project as a whole. It is in the best interest of the State to be a leader in establishing safe, sound, and practicable decisions that influence Minnesotan environment, resources, and its people. The draft EIS shall be prepared consistent with parts 4410.0200 thru 4410.6500. For the Final EIS, please consider and add additional required information:	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Lind, Kat	2024-02-18	4410.0200, subp. 65 - it appears that this EIS was 'scoped' limitedly and more so in line with permitting which goes against Minn. Rules as, "Project" means a governmental action, the results of which would cause physical manipulation of the environment, directly or indirectly. The determination of whether a project requires environmental documents shall be made by reference to the physical activity to be undertaken and not to the governmental process of approving the project.	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01
	Lind, Kat	2024-02-18	4410.0200, subp. 9c - this segment of pipeline presented in this draft EIS is not operational in and of itself, the carbon sequestration location/s is part of this pipeline project as its intent and destination. Greater amounts of detail and solid-science information about the carbon sequestration location/activities should be publicly disclosed and discussed in a wholistic and meaningful way as, Connected actions. Two projects are "connected actions" if a responsible governmental unit determines they are related in any of the following ways: A. one project would directly induce the other; B. one project is a prerequisite for the other and the prerequisite project is not justified by itself; or C. neither project is justified by itself.	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS. Text has been added to Section 2.1 describing the suitability of the Broom Creek Formation in North Dakota for CO ₂ sequestration, as well as the monitoring and testing that would be done to verify that the CO ₂ is contained in the storage reservoir.	20243-204403-01
	Lind, Kat	2024-02-18	4410.0200, subp 11 and 11a - because of the connected actions associated with this pipeline route [e.g., long-term carbon sequestration in geologic substrate] the cumulative effects contexts of the project as currently disclosed are substantially inadequate. "Cumulative impact" means the impact on the environment that results from incremental effects of the project in addition to other past, present, and reasonably foreseeable future projects regardless of what person undertakes the other projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time. "Cumulative potential effects" means the effect on the environment that results from the incremental effects of a project in addition to other projects in the environmentally relevant area that might reasonably be expected to affect the same environmental resources, including future projects actually planned or for which a basis of expectation has been laid, regardless of what person undertakes the other projects or what jurisdictions have authority over the projects. Significant cumulative potential effects can result from individually minor projects taking place over a period of time. In analyzing the contributions of past projects to cumulative potential effects, it is sufficient to consider the current aggregate effects of past actions. It is not required to list or analyze the impacts of individual past actions, unless such information is necessary to describe the cumulative potential effects. In determining if a basis of expectation has been laid for a project, an RGU must determine whether a project is reasonably likely to occur and, if so, whether sufficiently detailed information is available about the project to contribute to the understanding of cumulative potential effects. In making these determinations, the RGU must consider: whether any applications for permits have been filed with any units of government; whether detailed plans and specifications have been prepared for the project; whether future development is indicated by adopted comprehensive plans or zoning or other ordinances; whether future development is indicated by historic or forecasted trends; and any other factors determined to be relevant by the RGU.	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01
	Lind, Kat	2024-02-18	Controversy - the project is controversial in North Dakota, which is the destination location with sequestration storage; North Dakota denied this project approvals. This project also has pipeline in neighboring states where the project is controversial. The State / the Dept. needs to be a leader in environmental protection by considering the objective, wholistic view of projects, its impacts, including what could be controversial, esp. when involving decisions associated with connected actions of our permitting/project across state boundaries. MN, its resources and people need to feel secure and safe into our future; making blind narrow-focused 'decisions' is not in the best interest of the state when these actions are controversial elsewhere. Why would the State permit a pipeline with destination and connected actions across state borders, when the destination of this pipeline that requires a pipeline permit, has been denied? What about the portion of the project that is anticipated in southern/south-central MN (Section 2.1 / Figure 2.1)? What is that connected action? Status? Timeline? Details?	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS. The applicant has indicated that, should a permit for the North Dakota portion of the Midwest Carbon Express project not be issued, it will not construct the Otter Tail to Wilkin portion of the project.	20243-204403-01
	Lind, Kat	2024-02-18	Due to the potential for significant environmental effects associated with the connected actions (e.g., pipeline, carbon sequestration in geological substrate across state borders, others?), it is reasonable to include that the project [including the carbon sequestration and other pipeline routes outside of MN] are controversial. The project on whole is controversial and it is not discussed in this EIS those controversial sticking points have not been disclosed. This is concerning in that there is not full public disclosure and the scope of the State Dept. is narrow on that for what is being permitted in one portion of the state. Is there another portion of pipeline potentially in the southern portion of the state? Minding, some public news feeds has this "project" spanning a larger distance and impact in southern/south-central MN. The "project" also has pipeline and destinations in Iowa, Nebraska, South Dakota, and North Dakota with the carbon sequestration storage site north of Bismark, North Dakota. Here is an example of where the public can find a full map of "the project"	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS. The Midwest Carbon Express project is discussed in Section 2.1 of the EIS. A map showing the proposed Midwest Carbon Express project in North Dakota, South Dakota, Nebraska, Minnesota, and Iowa is shown on Page 2-2. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			https://www.desmoinesregister.com/story/money/business/2023/08/31/iowa-basedsummit-wins-bid-for-carbon-pipeline-environmental-review-inminnesota/70731887007/ https://iowacapitaldispatch.com/2023/08/04/north-dakota-denies-summit-carbon-apipeline-permit/ It appears that this project is 'getting political' and as a concerned citizen in MN, it is suggested that this EIS document reflects objectively, the project as a whole, and its full span of effects of all components of "the project". The whole picture is not presented in this EIS. This is concerning for the overall health and well-being of our State (its citizens and environment); Minnesota should be showing we're a leader especially when dealing with contentious/controversial environmental activities, esp. when we're building out connected actions to controversial activities across state lines. These connections are not made or disclosed in this draft EIS with its narrow scope of pipeline in MN.		
	Lind, Kat	2024-02-18	It feels wild to note, but the State, the PUC/Dept., and its project EIS should consider things associated with the proposed carbon sequestration storage site including things like long-term effects, potential for migration, effects of migration, or other time oriented effects or geological-oriented effects of storing the carbon in the geologic substrate. Is there potential for earthquakes, land shifts/sinkholes, implications with the Yellowstone Caldera, etc./others? What are the unforeseen consequences or carbon storage in this manner? What are the alternatives? What is the payoff of doing this environmental activity that has long-term effects [of connected actions, not addressed in this EIS] in relation to invisible/intangible carbon credits? Is it worth it?	Text has been added to Section 2.1 describing the suitability of the Broom Creek Formation in North Dakota for CO ₂ sequestration, as well as the monitoring and testing that would be done to verify that the CO ₂ is contained in the storage reservoir.	20243-204403-01
	Lind, Kat	2024-02-18	It is overly sweeping [arbitrary and capricious] to state, "The project would have a net beneficial effect on climate change as it would capture and store CO ₂ emissions from the ethanol plant." (Exec Summary, pg. 8) Where is the proof of this? What in the global climate change systems and cycles will be transitioned off of its current course? It's highly unlikely this project actually has a "net beneficial effect on [global] climate change". The statement is said without addressing the storage of CO ₂ in the draft EIS and how the effects of that weigh in the balance of storing the carbon in this infrastructure-heavy project. What if the geologic storage in North Dakota fails? What kind of effect would this have? Furthermore the roll of food, starvation, increasing population, agriculture, soil health, water usage and pollution from conventional ag practices, human health, poverty, and food for fuel are not being disclosed and considered in balanced proportions. Corn is a very nutrient and water intensive crop. It strips topsoil of nutrients, there's often plowing involved resulting in water quality issues. There's a whole universe of impacts related to growing corn then using that as fuel which is not being considered here. Are there other potential plant based fuel sources? All these thing directly effect Minnesota, our resiliency and wellbeing now and into the future. Furthermore, the draft EIS does not cover the carbon sequestration storage, its location, actions, and short and long-term impacts of that. This is concerning the State of MN would make a limited view pipeline approval on a controversial and multijurisdictional project and not cover the pipeline destination to a newer technology of geologic carbon sequestration. Please validate that this statement is true with factual evidence and provide vetted proof in the final EIS or make decision-based action moving forward.... like taking a pause or moratorium on geologic carbon sequestration related projects including any of the pipelines that would be leading to it until more is known for certain. It is concerning this environmental review has been handled with such narrow (seemingly, permitting oriented view) scope of what the project, its controversy, and long-term connected actions are involved.	Section 5.7.2 has been revised to note that the project would contribute to a net beneficial effect on climate change as it would capture and store CO ₂ emissions from the ethanol plant. Text has been added to Section 2.1 describing the suitability of the Broom Creek Formation in North Dakota for CO ₂ sequestration, as well as the monitoring and testing that would be done to verify that the CO ₂ is contained in the storage reservoir.	20243-204403-01
	Lind, Kat	2024-02-18	I do apologize for missing the comment period for the Scoping EAW. It is concerning this environmental review has proceeded with such narrow and seemingly permitting oriented view when there is controversy over the project across state boundaries and associated with the long-term connected actions of long-term geologic storage of CO ₂ . Kind request for the State, the PUC/Dept. to consider the comments provided in this letter and the potential for significant environmental effects of the full project, including the sequestration site that serves this MN pipeline alignment, the larger connection of pipelines associated with the project [cross-state infrastructure under the same project] and that these connected actions and wholistic breadth of "the project" be explored and publicly disclosed in the Final EIS and future decisions associated with this project. Regards, Concerned MN citizen.	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01
	Ludington, Mary	2024-02-23	The DEIS consistently fails to properly account for the real CO ₂ emission and climate impacts of the project. Lifetime of Project: The applicant states that the anticipated lifetime of this project is 25 years. This means at the end of its life; the project could stop capturing the CO ₂ from the ethanol plant. Unless the ethanol plant ceases operations at that point in time, it will continue to emit CO ₂ unabated into the future.	Thank you for your comment. Section 2.7 describes project decommissioning. If the ethanol plant continues to operate beyond the life of the proposed project, its CO ₂ emissions would not be captured.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Ludington, Mary	2024-02-23	100% CO ₂ Capture Rate: Summit states that the capture facility “is designed to capture 100% of the CO ₂ produced by the ethanol plant.” There is no carbon capture facility in the world, ethanol or otherwise, that captures carbon at a rate of 100%. This claim is not supported by any data/information or verified by a third party. Additionally, the DEIS should emphasize that any CO ₂ capture is solely associated with emissions from the ethanol fermentation process and provides zero reductions on the significant emissions from the facility’s electricity use	Section 2.1 has been revised to clarify that the captured CO ₂ is produced by the ethanol plant as part of its fermentation process, the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. Section 6.3 describes energy efficiency and energy alternatives that could reduce emissions from the ethanol plant's electricity and process fuel use.	20243-204403-01
	Ludington, Mary	2024-02-23	Added CO ₂ from electricity use: Carbon capture technologies are highly energy intensive and will significantly increase the carbon emissions at the facility from electricity use. The DEIS uses the Midwest Reliability Organization West Region average to calculate these emissions, which is unnecessarily inaccurate given the availability of the actual emissions factor from Great River Energy.	Electricity emissions are included in Table 5-39. These numbers have been revised to reflect the electricity emission factor associated with LREC, which would provide electricity to the project. The revised electricity emission factor is 132.2 gCO ₂ e/MWh. Because LREC has a lower emission factor than the Midwest Reliability West Region emission factor (684.35 g CO ₂ e/kWh), which was used in the draft EIS, calculated electricity emissions have decreased.	20243-204403-01
	Ludington, Mary	2024-02-23	CO ₂ Storage: The DEIS assumes 100% of captured CO ₂ is being permanently stored underground. There is no guarantee that this will occur and no explanation of the monitoring and verification protocols that would ensure it. Enhanced Oil Recovery: The DEIS fails to explain whether the applicant can sell any of its captured CO ₂ to others for alternative uses instead of permanent sequestration and what the impacts of that would be. The DEIS incorrectly states that “Production of oil through EOR would not be dependent on the availability of CO ₂ produced by the ethanol plant.” This claim is contradicted by countless public statements from public officials in North Dakota and oil industry representatives.	The text questioned by the commenter in Section 5.7.2.3 was prefaced with the following: "if all the CO ₂ produced by the ethanol plant is sequestered as proposed, EOR would likely continue in North Dakota using other sources of CO ₂ , other gases, thermal methods, or chemical methods." Revisions are not necessary. However, Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	20243-204403-01
	Lutz, Dale R.	2024-02-13	This key goal, as stated on page 1-1 of the Draft EIS, is to: “reduce the carbon-intensity score of ethanol produced at the Green Plains ethanol plant and enhance its marketability in low-carbon fuel standard markets.” The Minnesota legislature is currently setting state fuel carbon-intensity targets with the input of the February 1, 2024, report from their Clean Transportation Standard (CTS) Work Group. The ignored alternative technology is described on page 179 of the Addendum to this 2023-2024 Clean Transportation Standard Work Group Report, which is copied below. ... There are several existing technological approaches for converting CO ₂ and hydrogen (H ₂) to ethanol (or other alcohols). An industrial reverse water-gas shift reactor can convert most of the (CO ₂ + H ₂) to (CO + H ₂ O), yielding a mixture called synthesis gas or syngas. The syngas can then be converted to ethanol, as demonstrated by LanzaTech, for example. The company Twelve uses a CO ₂ electrolyze to split the CO ₂ into CO (for syngas) and O ₂ . When the CO is combined with “green hydrogen”, the resulting syngas will then be further processed into jet fuel, in their recently announced E-Jet® plant at Moses Lake, Washington.	Thank you for your comment. Ethanol gasification would fundamentally alter the ethanol plant—its construction and operation, staff, business continuity, supply chain, and co-products. This would yield far reaching economic and social impacts. Therefore, conversion of the ethanol plant from a dry milling corn grain feedstock process to gasification does not meet the project's purpose. As such, this alternative technology is considered outside the scope of the EIS.	20243-204403-01
	Lutz, Dale R.	2024-02-13	concerns about potential pipeline ruptures or aquifer breaches, make me very concerned that resistance to pipeline construction will delay CO ₂ emission reduction efforts longer than we can afford. The construction funds would be better spent to build the localized CO ₂ capture and conversion infrastructure described above, rather than pipelines. The proposed Summit Carbon Solutions pipeline ends near the Bakken oil field in North Dakota. While the project may claim to sequester the CO ₂ in saline aquifers, I strongly suspect that at some point, perhaps after the tax credits expire, the pipeline CO ₂ will be used for enhanced oil recovery to produce more fossil fuel, making our climate crisis worse.	Thank you for your comment. Section 5.7.2.3 addresses the potential for the captured CO ₂ to be used for EOR.	20243-204403-01
	Mackenzie, Colin	2024-02-21	The ethanol industry contributes billions of dollars to Minnesota’s GDP and ensures that farmers have a consistent market for their corn. Ensuring that our state and our farmers continue to benefit from the ethanol industry is paramount, and Summit’s carbon capture project will do just that. Not only will it protect an already existing industry, but it will create both short-term and permanent local jobs. Furthermore, when the pipeline is operational, Summit will pay additional property taxes to support local priorities in communities across the state. This project promises to bring economic benefits to our state, and for that reason, I am happy to support Summit Carbon Solutions and hope the Minnesota PUC will issue the company a permit.	Thank you for your comment.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Manning Christie	2024-04-23	<p>To MN Department of Commerce,</p> <p>I'm writing to state my deep concern about the Draft EIS for the Otter Tail to Wilkin CO₂ pipeline project. I am a resident of Minnesota, and a social scientist who studies the impacts of environmental degradation on mental health.</p> <p>This pipeline project is worrying for many reasons:</p> <p>The DEIS was not adequate.</p> <p>It's climate numbers that don't add up, it did not give enough attention to pipeline construction risks such as aquifer breaches and it does not seriously enough consider the health or safety impacts a pipeline rupture would have on the community.</p>	Thank you for your comment.	20243-204403-01
	Mathiowetz, Wade	2024-02-09	<p>I am seriously concerned about the proposed Summit Carbon Solutions CO₂ pipeline set to traverse through 13 Minnesota Counties. The DEIS does not acknowledge meaningful safety measures for a rupture, instead suggests Summit supply CO₂ detectors for residents within 1000 feet. I feel there needs to be a healthier safety protocol. A rupture that occurs, and 25 minutes goes by, before valves are closed, an extreme amount of CO₂ has released is very frightening, as emergency personal will have extra burden, immobilized vehicles from loss of oxygen. Mostly all of local EMS in rural Minnesota is under equipped and inexperienced with CO₂. More cost to the EMS for CO₂ related incidences, as the local EMS are ill supplied with funds.</p>	<p>Text in Section 4.5 on valve closure time has been corrected from 25 minutes to 10 minutes. Elsewhere in the EIS, including the rupture analysis, valve closure time is listed/calculated as 10 minutes. Potential impacts associated with a CO₂ release are described in Chapter 8 of the EIS. Emergency response is also discussed in Chapter 8. Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that is not outdated but would be revised as required by PHMSA, if the project is approved. Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.</p>	20243-204403-01
	Mathiowetz, Wade	2024-02-09	<p>CO₂ capture at ethanal plants require double the amount of water from what is required already to operate. This will impose grim consequences on aquifers, as southern Minnesota has gone through 3 years of drought. This will deplete already constrained aquifers. The residents will lose their drinking water supply.</p>	<p>Additional information has been added to Section 5.7.8.2 to address the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.</p>	20243-204403-01
	Mathiowetz, Wade	2024-02-09	<p>Summit states the capture facility is designed to capture 100% CO₂ produced from ethanal plants. There is no carbon capture facility in the world that would capture 100% CO₂. This claim does not have any info or verified by a third party. Furthermore, this entire project will not capture enough CO₂ to offset what it will produce. This is not going to benefit the public people at all, it will just create economic hardship and safety hazards. If you drink water, you are involved. This statement involves all Minnesotans. I cannot express the need to let all Minnesotans know all the facts about this proposed Summits Carbon pipeline.</p>	<p>Section 2.1 has been revised to clarify that the amount of CO₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios for 100 percent, 70 percent, 40 percent, and 10 percent.</p>	20243-204403-01
	Mehmel, Gretchen	2024-02-23	<p>I am commenting on the Ottertail to Wilken Co2 pipeline project's draft EIS. My primary concern is the section on rare, threatened, and endangered species. That entire section is so general it becomes meaningless. More specifics regarding species actually present along the corridor of disturbance needs to be added which should include a survey of the area during the same time of year in which the disturbance would occur.</p>	<p>Section 5.7.5 discusses rare and unique species, including lists of all federal and state-listed species known to be potentially present within each of the route alternatives. Presence of and potential impacts on these species, as well as eagles and migratory bird species, are also discussed. Mitigation proposed by the applicant and stipulated by DNR includes pre-construction surveys of the selected route for listed species</p>	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			A more robust discussion of possible threats to those species habitats should also be included. Both direct and indirect impacts should be evaluated for each threatened, endangered, and special concern species along the route. Thank you for taking these comments.	prior to construction. Nesting bird surveys would also be conducted to ensure that the Project is in compliance with the MBTA.	
	Menzel, Mike	2024-02-22	I am a physician and cofounder of health professionals for a healthy climate. There are many reasons why this pipeline should not go forward, and I am submitting one of them. The DEIS consistently fails to properly account for the real CO ₂ emission and climate impacts of the project. Lifetime of Project: The applicant states that the anticipated lifetime of this project is 25 years. This means at the end of its life; the project could stop capturing the CO ₂ from the ethanol plant. Unless the ethanol plant ceases operations at that point in time, it will continue to emit CO ₂ unabated into the future.	Thank you for your comment. Section 2.7 describes project decommissioning. If the ethanol plant continues to operate beyond the life of the proposed project, its CO ₂ emissions would not be captured.	20243-204403-01
	Menzel, Mike	2024-02-22	100% CO ₂ Capture Rate: Summit states that the capture facility “is designed to capture 100% of the CO ₂ produced by the ethanol plant.” There is no carbon capture facility in the world, ethanol or otherwise, that captures carbon at a rate of 100%. This claim is not supported by any data/information or verified by a third party. Additionally, the DEIS should emphasize that any CO ₂ capture is solely associated with emissions from the ethanol fermentation process and provides zero reductions on the significant emissions from the facility’s electricity use.	Section 2.1 has been revised to clarify that the captured CO ₂ is produced by the ethanol plant as part of its fermentation process and the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios of 100 percent, 70 percent, 40 percent, and 10 percent. Section 6.3 describes energy efficiency and energy alternatives that could reduce emissions from the ethanol plant's electricity and process fuel use.	20243-204403-01
	Menzel, Mike	2024-02-22	Added CO ₂ from electricity use: Carbon capture technologies are highly energy intensive and will significantly increase the carbon emissions at the facility from electricity use. The DEIS uses the Midwest Reliability Organization West Region average to calculate these emissions, which is unnecessarily inaccurate given the availability of the actual emissions factor from Great River Energy.	Electricity emissions are included in Table 5-39. These numbers have been revised to reflect the electricity emission factor associated with LREC, which would provide electricity to the project. The revised electricity emission factor is 132.2 gCO ₂ e/MWh. This was calculated from LREC’s energy resource mix in which nearly half comes from clean energy sources. Because LREC has a lower emission factor than the Midwest Reliability West Region emission factor (684.35 g CO ₂ e/kWh), which was used in the draft EIS, calculated electricity emissions have decreased.	20243-204403-01
	Menzel, Mike	2024-02-22	CO ₂ Storage: The DEIS assumes 100% of captured CO ₂ is being permanently stored underground. There is no guarantee that this will occur and no explanation of the monitoring and verification protocols that would ensure it.	Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios of 100 percent, 70 percent, 40 percent, and 10 percent.	20243-204403-01
	Menzel, Mike	2024-02-22	Enhanced Oil Recovery: The DEIS fails to explain whether the applicant can sell any of its captured CO ₂ to others for alternative uses instead of permanent sequestration and what the impacts of that would be. The DEIS incorrectly states that “Production of oil through EOR would not be dependent on the availability of CO ₂ produced by the ethanol plant.” This claim is contradicted by countless public statements from public officials in North Dakota and oil industry representatives.	The text questioned by the commenter in Section 5.7.2.3 was prefaced with the following: "if all the CO ₂ produced by the ethanol plant is sequestered as proposed, EOR would likely continue in North Dakota using other sources of CO ₂ , other gases, thermal methods, or chemical methods." Revisions are not necessary. However, Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	20243-204403-01
	Miersch, Janell	2024-02-22	I have read that these types of pipelines fail and are not as stable as purported. I think this is a poor "solution" and should be abandoned.	Thank you for your comment.	20243-204403-01
	Miller, Janet	2024-04-23	My name is Janet Miller, and I am a resident of Iowa, a state that shares concerns with Minnesota regarding the operations of Summit Carbon Solutions and their proposed CO ₂ pipeline and Carbon Capture project. While I may not reside in Minnesota, the decisions made by the Minnesota Public Utilities Commission regarding this project have significant implications for me and my community. As	Thank you for your comment.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			an Iowan, I am deeply concerned about the potential environmental, economic, and social impacts of the CO ₂ pipeline that extend beyond state borders. The environmental consequences of the project, such as air and water quality, land use, and climate change mitigation efforts, are issues that resonate with me as a resident of the region.		
	Miller, Janet	2024-04-23	Further, the economic repercussions of the project, including job creation, energy costs, and market dynamics, could have ripple effects on neighboring states like Iowa. Understanding how this project may influence the regional economy is a valid concern that I share with many others in the area.	Thank you for your comment. A full, independent, regional, economic analysis is outside the scope of this EIS.	20243-204403-01
	Miller, Janet	2024-04-23	I am also mindful of the community well-being aspects of the project, such as safety concerns, land use conflicts, and impacts on local communities. Ensuring the protection and well-being of communities in the region, regardless of state boundaries, is a shared responsibility that I take seriously.	Thank you for your comment.	20243-204403-01
	Miller, Janet	2024-04-23	I urge the authorities to consider the interconnected nature of these issues and conduct a thorough and transparent Environmental Impact Statement that addresses the concerns of residents in both Minnesota and Iowa. It is crucial that the interests of all individuals affected by these pipelines are taken into account in the decision-making process. Thank you for considering my perspective and concerns on this critical issue that impacts our shared region.	Thank you for your comment.	20243-204403-01
	Montgomery, JI	2024-04-23	I oppose any pipelines as this will cause more harm to our communities and our children health I am truly upset and concerned about this CO ₂ pipeline project this will cause more health problems to all living near this project it will cause countless cancers to all.	Thank you for your comment.	20243-204403-01
	Moss, Paul	2024-02-12	I am particularly concerned with the water related impacts of the proposed pipeline project. Minnesota's recent experience with pipeline construction demonstrates the serious harms that it causes on water resources as well as a tendency by state agencies to under-account for those impacts. Risks include: Dangers to water and waterbodies: The proposed route for Summit's pipeline network includes many water crossings, wetlands, aquifers, and other sensitive water bodies. More research and analysis are needed to understand how CO ₂ disperses in water and what risks a CO ₂ pipeline leak or rupture poses to Minnesota's precious waters and the fish, amphibians, reptiles, waterfowl, birds, and insects that rely on it to survive.	Potential impacts on surface water and aquatic resources from a possible CO ₂ release are addressed in Section 8.3. Stand-alone studies concerning impacts on water resources, wildlife, and wildlife habitat are outside the scope of the EIS.	20243-204403-01
	Moss, Paul	2024-02-12	Water use: Much of southern Minnesota is suffering from the consequences of drought and over-commitment of our fresh drinking water supplies. The DEIS fails to discuss the impacts of an increase in water use on local water supply. The carbon capture process can double water requirements at a facility and increase toxic wastewater discharge. The DEIS states that Summit "anticipates" an average water use for the operation of the carbon capture equipment of 13 million gallons per year, which is concerningly ambiguous. There must be a careful and case-specific assessment done of how the installation and operation of carbon capture will impact current drought conditions and exacerbate existing pollution sources. Moreover, Summit has not finalized its water appropriation sources or volumes needed for construction, so it is impossible to know the full impacts of those appropriations on water resources. Why should Minnesota risk our fresh drinking water supply and commit to an infrastructure when the proposing company has not been transparent with its true demands for water resources?	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-01
	Moss, Paul	2024-02-12	Aquifer Damage: Summit's preferred route, RA-South, crosses a surficial beach ridge aquifer in Otter Tail County. The DNR has said that the area is "prone to significant groundwater discharge," and the applicant's initial groundwater investigation confirmed that "artesian groundwater conditions are present" along that beach ridge system. In early feedback on the DEIS, the DNR noted that "Project construction has the potential to intersect shallow confined groundwater potentially causing a breach in a confined aquifer and that "breaching shallow confined aquifers could have significant long-term impacts to groundwater resources." This, along with our state's first-hand knowledge of how damaging pipelines can be, requires that the DEIS take potential damage to aquifers more seriously.	Section 5.7.8.2 acknowledges that damage to aquifers is a serious problem and indicates that an uncontrolled flow of water from a shallow confined aquifer could have a significant long-term impact on groundwater. Section 5.7.8.2 also describes geotechnical investigations that would be done to identify areas where breaching of a shallow confined aquifer could occur, and sheet piling would not be used. The applicant currently has an ongoing groundwater investigation underway to further inform construction practices and is continuing to consult with DNR. As part of its coordination with DNR, the applicant has agreed to use ground penetrating radar to study the depth of the confining layer through the entire beach ridge system area crossed by the pipeline to further define existing conditions and advise on	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				construction methodology. Furthermore, EERA staff recommends that the applicant develop, in coordination with DNR, a plan for pipeline construction in areas crossing the beach ridge system area. The plan would include, at a minimum, measures to minimize the potential for breaching a shallow confined aquifer during trenching and contingency measures to mitigate the impacts of a breach, should one occur. This information has been added to Section 5.7.8.2.	
	Moss, Paul	2024-02-12	<p>HDD Drilling: The DEIS also states that “drilling mud mixed with additives that are not on the MDH-approved additive list and/or do not meet [drinking water quality certification standards] would be disposed of as solid waste at an approved facility, or the applicant would obtain a land application permit from MPCA.” The DEIS does not discuss the risks of applying drilling mud, especially with additives not approved by MDH, to the land.</p> <p>The DEIS says that “drilling fluids and additives for the HDD would be non-toxic to the aquatic environment and humans,” however, even supposedly “non-toxic” drilling fluid is chemical waste that has been found to be harmful to plant and animal species. Summit’s preferred route and alternative route, RA-Hybrid, would both cross three rivers (Pelican River, Otter Tail River, and Bois de Sioux River) via the HDD mention.</p>	As described in Section 5.7.8.2, an additive approved by MDH or meeting NSF International/ANSI Standard 60, Drinking Water Treatment Chemicals – Health Effects, might need to be mixed with the drilling mud for viscosity or lubricating reasons and to reduce the potential for an inadvertent release or failed HDD. The specific additive used would depend on the conditions at the crossing location and would be determined by the HDD contractor. The EIS discloses the potential for an inadvertent release of drilling mud and describes potential impacts in Chapter 5. Land application of drilling mud and potential impacts are addressed in Section 5.7.6.2.	20243-204403-01
	Moss, Paul	2024-02-12	Wetlands: In Table 5-40 on p. 5-98 of the DEIS it states that “the loss of wetlands would be less than 0.01 acre.” However, Table 5-4 on p. 5-24 says that for Summit’s preferred route, operation impacts are expected to be 3.3 acres, and construction impacts are expected to be 4.7 acres. And Table 5-52 on p. 5-143 suggests that the total construction impact on wetlands for RA-South is 2.7 acres. Which is it??	Discrepancies between Table 5-4 and Table 5-54 result from different datasets and their associated resolutions. Table 5-4 uses NLCD data to analyze land cover, and Table 5-54 uses NWI data to analyze wetlands. Table 5-40 has been edited to be consistent with discussions of impacts on wetlands in Section 5.7.9 and Table 5-53 and Table 5-54.	20243-204403-01
	Moss, Paul	2024-02-12	<p>Impacts of a Leak or Rupture on Animals: According to the DEIS, CO₂ leaks would not affect mammals, birds, reptiles, amphibians, and insects and would be unlikely to impact fish and freshwater mussels. The DEIS reaches this conclusion without providing any reasoning or supporting evidence. Though the DEIS does note some harm may come to animals in the event of a rupture, it relies heavily on the assumption that animals will simply move out of the rupture area to avoid the release. The reason for this assumption is not provided and is contradicted by information in the rupture report in Appendix G which suggests the impacts of a rupture would be nearly immediate.</p> <p>Critical Habitats: Summit’s preferred route would cross over or near several waterfowl protection areas, including the Orwell 9 Unit and Ridgeway WPA in Otter Tail County. The DEIS notes that some of these areas will be avoided during construction but fails to consider the impacts to these features in the event of a leak or rupture.</p>	CO ₂ is a widespread, naturally occurring gas and is the primary byproduct of respiration—the conversion of sugars to usable energy. Minor leaks of CO ₂ from operation of the proposed pipeline would not elevate ambient CO ₂ to a level that is detrimental to local vegetation or wildlife. Potential impacts on wildlife from a CO ₂ rupture could result first from the physical force of a rupture and secondarily from localized short-term high levels of CO ₂ prior to dispersal and extreme cold temperatures associated with the depressurization of the CO ₂ from a supercritical state to a gas. Chapter 8 of the EIS acknowledges that wildlife in the immediate vicinity of a rupture might be killed or injured by this force; however, it is expected that most mobile wildlife species would follow their natural instincts and attempt to escape the direct effect of a rupture. Chapter 8 of the EIS also acknowledges that less-mobile species in the immediate vicinity of the point of a rupture would be less likely to escape the impacts and might be killed or injured. The data presented in Appendix G describes models of dispersal patterns in the immediate vicinity of a rupture. These models support the statements in Chapter 8 that wildlife in the immediate vicinity of a rupture might be exposed to high levels of CO ₂ , which could be toxic for species unable to leave the area of the release.	20243-204403-01
	Multiple	Multiple	I ask that the Public Utilities Commission and Department of Commerce take these issues into account in order to ensure that the Environmental Impact Statement (EIS) for the Otter Tail to Wilkin CO ₂ Pipeline Project in Otter Tail and Wilkin Counties (Docket Number: 22-422) is a factual and thorough account of the project impacts. Minnesotans need a robust environmental review, and we need transparency, accountability, and regulatory oversight to ensure the greater public good and interests of communities impacted by these pipelines and all Minnesotans are respected and protected.	Thank you for your comment.	Multiple

	Nauerth III, John	2024-02-22	Good afternoon, my name is John Nauerth III, I live in Jackson County, Mn., I am 82 years old (don't know how that happened!) and have done dirt work and drainage for many years, fixed lots of drain tiles. Looking at the DEIS for Otter tail, to Wilken CO ₂ pipeline, I do not feel comfortable with Summit mediation of soil property's, Enbridge petroleum suffered a huge spill in Kansas, upon investigation by NTSB, cause was determined the soil settled under the line causing a welded joint to crack apart. The good thing is the line was not a CO ₂ line with 1800 lbs. pressure transporting an odorless asphyxiant product. Any time soil is moved, shrinkage becomes a problem especially during dry weather conditions. I just don't want to see our citizens exposed to this danger.	Potential impacts associated with expansion and shrinkage of soils are described in Section 5.7.6.2.	20243-204403-01
	Nauerth III, John	2024-02-22	Bloomberg financials reports Poet has agreed to ship CO ₂ from 17 of their plants using Summit pipeline making the total of 51 ethanol plants in this project, water usage will be problematic, Summit has not properly addressed this water issue. in the Otter Tail DEIS.	Thank you for your comment. Detailed analysis of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01
	Norrgard, Lois	2024-02-23	I have lived in Minnesota my entire life, presently in Bloomington. For over 35 years now I have participated in numerous comment periods, commenting to our state agencies about numerous issues regarding new polluting industries and how our public lands, air and water are being industrialized. Air pollutants, water pollution, dumping chemicals into our soil - all have been historically overlooked by MN regulatory agencies year after year, decade after decade. We are in a state of decline, reaching major tipping points. I request all state agency staff who are in the positions of rubber stamping the permits that come across your desks review and understand this, (which now has an “official” name “Shifting Baselines Syndrome”): https://oceana.org/blog/daniel-paully-and-george-monbiot-conversation-about-shifting-baselines-syndrome/ I am extremely frustrated with the lack of oversight and regulation from Minnesota’s governmental agencies. I am so tired of the Regulatory Capture of our state agencies - agencies that we citizens are supposed to count on to protect our health and environment! Enough is enough! For decades, under pressure from polluting industries—including mining, coal, corporate agriculture—and now pipelines, the citizens of Minnesota have watched the deterioration of our wild places, waters, air, and soils – and importantly our own public health. From nitrates in our drinking water to PFAS to methane and the increasing climate crisis disrupting our seasons and weather patterns it is far past time those in our state agencies who rubber-stamp every permit that crosses their desks start to take notice.	Thank you for your comment.	20243-204403-01
	Norrgard, Lois	2024-02-23	In this new threat – CO ₂ pipelines - I am asking that true impacts to our environment be taken seriously. The DEIS consistently fails to properly account for the real CO ₂ emission and climate impacts of the project. This must be addressed. Carbon capture and storage is another industry green-washing that really is not – and should not be – considered a “climate solution.” <ul style="list-style-type: none"> • 100% CO₂ Capture Rate: Summit states that the capture facility “is designed to capture 100% of the CO₂ produced by the ethanol plant.” There is no carbon capture facility in the world, ethanol or otherwise, that captures carbon at a rate of 100%. This claim is not supported by any data/information or verified by a third party. Additionally, the DEIS should emphasize that any CO₂ capture is solely associated with emissions from the ethanol fermentation process and provides zero reductions on the significant emissions from the facility’s electricity use 	Section 2.1 has been revised to clarify that the captured CO ₂ is produced by the ethanol plant as part of its fermentation process, the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. Section 6.3 describes energy efficiency and energy alternatives that could reduce emissions from the ethanol plant's electricity and process fuel use.	20243-204403-01
	Norrgard, Lois	2024-02-23	<ul style="list-style-type: none"> • Added CO₂ from electricity use: Carbon capture technologies are highly energy intensive and will significantly increase the carbon emissions at the facility. The DEIS uses the Midwest Reliability Organization West Region average to calculate these emissions, which is unnecessarily inaccurate given the availability of the actual emissions factor from Great River Energy. 	Electricity emissions are included in Table 5-39. These numbers have been revised to reflect the electricity emission factor associated with LREC, which would provide electricity to the project. The revised electricity emission factor is 132.2 gCO ₂ e/MWh. Because LREC has a lower emission factor than the Midwest Reliability West Region emission factor (684.35 g CO ₂ e/kWh), which was used in the draft EIS, calculated electricity emissions have decreased.	20243-204403-01
	Norrgard, Lois	2024-02-23	<ul style="list-style-type: none"> • CO₂ Storage: The DEIS assumes 100% of captured CO₂ is being permanently stored underground. There is no guarantee that this will occur and no explanation of the monitoring and verification protocols that would ensure it. 	Text has been added to Section 2.1 describing the suitability of the Broom Creek Formation in North Dakota for CO ₂ sequestration, as well as the monitoring and testing that would be done to verify that the CO ₂ is contained in the storage reservoir.	20243-204403-01
	Norrgard, Lois	2024-02-23	<ul style="list-style-type: none"> • Enhanced Oil Recovery: The greatest threat and true intended goal of Summit - The DEIS fails to explain whether the applicant can sell any of its captured CO₂ to others for alternative uses instead of permanent sequestration and what the impacts of that would be. The DEIS incorrectly states that “Production of oil through EOR would not be dependent on the availability of CO₂ produced by the ethanol plant.” This claim is contradicted by countless public statements from public officials in North Dakota and oil industry representatives. 	Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Norrgard, Lois	2024-02-23	<p>Minnesota’s recent experience with pipeline construction demonstrates the serious harms that it causes on water resources as well as a tendency by state agencies to under-account for those impacts.</p> <ul style="list-style-type: none"> • Dangers to water and waterbodies: The proposed route for Summit’s pipeline network includes many water crossings, wetlands, aquifers, and other sensitive water bodies. More research and analysis are needed to understand how CO₂ disperses in water and what risks a CO₂ pipeline leak or rupture poses to Minnesota’s precious waters and the fish, amphibians, reptiles, waterfowl, birds, and insects that rely on it to survive. 	Potential impacts of a pipeline rupture on water resources and wildlife are addressed in Section 8.3.4. Stand-alone studies concerning impacts on water resources, wildlife, and wildlife habitat are outside the scope of the EIS.	20243-204403-01
	Norrgard, Lois	2024-02-23	<ul style="list-style-type: none"> • Water use and Minnesota’s drought conditions! Much of southern Minnesota is suffering from the consequences of drought and over-commitment of our fresh drinking water supplies. The DEIS fails to discuss the impacts of an increase in water use on local water supply. The carbon capture process can double water requirements at a facility and increase toxic wastewater discharge. The DEIS states that Summit “anticipates” an average water use for the operation of the carbon capture equipment of 13 million gallons per year, which is concerningly ambiguous. There must be a careful and case-specific assessment done of how the installation and operation of carbon capture will impact current drought conditions and exacerbate existing pollution sources. Moreover, Summit has not finalized its water appropriation sources or volumes needed for construction, so it is impossible to know the full impact of those appropriations on water resources. Why should Minnesota risk our fresh drinking water supply and commit to an infrastructure when the proposing company has not been transparent with its true demands for water resources? Again, I request our state agencies see through industry green washing. 	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-01
	Norrgard, Lois	2024-02-23	<p>Aquifer Damage: Summit’s preferred route, RA-South, crosses a surficial beach ridge aquifer in Otter Tail County. The DNR has said that the area is “prone to significant groundwater discharge,” and the applicant’s initial groundwater investigation confirmed that “artesian groundwater conditions are present” along that beach ridge system. In early feedback on the DEIS, the DNR noted that “Project construction has the potential to intersect shallow confined groundwater potentially causing a breach in a confined aquifer and that “breaching shallow confined aquifers could have significant long-term impacts to groundwater resources.” This, along with our state’s first-hand knowledge of how damaging pipelines can be, requires that the DEIS take potential damage to aquifers extremely seriously.</p>	<p>Section 5.7.8.2 acknowledges that damage to aquifers is a serious problem and indicates that an uncontrolled flow of water from a shallow confined aquifer could have a significant long-term impact on groundwater. Section 5.7.8.2 also describes geotechnical investigations that would be done to identify areas where breaching of a shallow confined aquifer could occur, and sheet piling would not be used.</p> <p>The applicant currently has an ongoing groundwater investigation underway to further inform construction practices and is continuing to consult with DNR. As part of its coordination with DNR, the applicant has agreed to use ground penetrating radar to study the depth of the confining layer through the entire beach ridge system area crossed by the pipeline to further define existing conditions and advise on construction methodology. Furthermore, EERA staff recommends that the applicant develop, in coordination with DNR, a plan for pipeline construction in areas crossing the beach ridge system area. The plan would include, at a minimum, measures to minimize the potential for breaching a shallow confined aquifer during trenching and contingency measures to mitigate the impacts of a breach, should one occur. This information has been added to Section 5.7.8.2.</p>	20243-204403-01
	Norrgard, Lois	2024-02-23	<ul style="list-style-type: none"> • HDD Drilling: The DEIS also states that “drilling mud mixed with additives that are not on the MDH-approved additive list and/or do not meet [drinking water quality certification standards] would be disposed of as solid waste at an approved facility, or the applicant would obtain a land application permit from MPCA.” The DEIS does not discuss the risks of applying drilling mud, especially with additives not approved by MDH, to the land. <p>The DEIS says that “drilling fluids and additives for the HDD would be non-toxic to the aquatic environment and humans,” however, even supposedly “non-toxic” drilling fluid is chemical waste that has been found to be harmful to plant and animal species. Summit’s preferred route and alternative route, RA-Hybrid, would both cross three rivers (Pelican River, Otter Tail River, and Bois de Sioux River) via the HDD mention. Even for a “lay-person” public citizen it is clear that creating these drilling fluids and additives – then discharging into our lands (and waters) is adding a toxic load to our plant and animal species.</p>	As described in Section 5.7.8.2, an additive approved by MDH or meeting NSF International/ANSI Standard 60, Drinking Water Treatment Chemicals – Health Effects, might need to be mixed with the drilling mud for viscosity or lubricating reasons and to reduce the potential for an inadvertent release or failed HDD. The specific additive used would depend on the conditions at the crossing location and would be determined by the HDD contractor. The EIS discloses the potential for an inadvertent release of drilling mud and describes potential impacts in Chapter 5. Land application of drilling mud and potential impacts are addressed in Section 5.7.6.2.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Norrgard, Lois	2024-02-23	<ul style="list-style-type: none">Impacts of a Leak or Rupture on Animals: According to the DEIS, CO₂ leaks would not affect mammals, birds, reptiles, amphibians, and insects and would be unlikely to impact fish and freshwater mussels. The DEIS reaches this conclusion without providing any reasoning or supporting evidence. Though the DEIS does note some harm may come to animals in the event of a rupture, it relies heavily on the assumption that animals will simply move out of the rupture area to avoid the release. THIS IS ABSURD! The reason for this assumption is not provided and is contradicted by information in the rupture report in Appendix G which suggests the impacts of a rupture would be nearly immediate.Critical Habitats: Summit’s preferred route would cross over or near several waterfowl protection areas, including the Orwell 9 Unit and Ridgeway WPA in Otter Tail County. The DEIS notes that some of these areas will be avoided during construction but fails to consider the impacts to these features in the event of a leak or rupture.	<p>CO₂ is a widespread, naturally occurring gas and is the primary byproduct of respiration—the conversion of sugars to usable energy. Minor leaks of CO₂ from operation of the proposed pipeline would not elevate ambient CO₂ to a level that is detrimental to local vegetation or wildlife. Potential impacts on wildlife from a CO₂ rupture could result first from the physical force of a rupture and secondarily from localized short-term high levels of CO₂ prior to dispersal and extreme cold temperatures associated with the depressurization of the CO₂ from a supercritical state to a gas. Chapter 8 of the EIS acknowledges that wildlife in the immediate vicinity of a rupture might be killed or injured by this force; however, it is expected that most mobile wildlife species would follow their natural instincts and attempt to escape the direct effect of a rupture. Chapter 8 of the EIS also acknowledges that less-mobile species in the immediate vicinity of the point of a rupture would be less likely to escape the impacts and might be killed or injured. The data presented in Appendix G describes models of dispersal patterns in the immediate vicinity of a rupture. These models support the statements in Chapter 8 that wildlife in the immediate vicinity of a rupture might be exposed to high levels of CO₂, which could be toxic for species unable to leave the area of the release.</p> <p>Operation of the proposed pipeline would include integrated systems for detecting leakages, as well as protocols for addressing leaks promptly. Minor leaks of CO₂ from operation of the proposed pipeline would not elevate ambient CO₂ to a level that is detrimental to waterfowl and other wildlife within the Orwell 9 Unit or Ridgeway WPAs. As the comment notes, the pipeline route would avoid these areas. As a result, there would be negligible risk of impacts on these areas due to a pipeline rupture, because the potential impacts of a pipeline rupture would be highly localized and outside of the WPA boundaries.</p>	20243-204403-01
	Norrgard, Lois	2024-02-23	<p>Cumulative Impacts must be clearly evaluated – it is arbitrary and capricious to do otherwise.</p> <ul style="list-style-type: none">Complete Network Impacts: In addition to the direct impacts of the 28 miles of pipeline included in Summit’s application, the DEIS does not account for the indirect and cumulative impacts of Summit’s entire project in Minnesota. This is despite Summit’s clear and public plans for a much larger buildout in Minnesota and recent statements that they will be applying for permits for additional parts of the network imminently. Allowing Summit to artificially segment permitting requests for multiple concurrent projects on one pipeline will prevent a thorough review of the cumulative impacts and potential environmental and climate damages of the project.	<p>Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.</p>	20243-204403-01
	Norrgard, Lois	2024-02-23	<p>In conclusion: As I have laid out in my introduction there is great frustration in Minnesota with the actions of our state agencies – I am just one of multitudes – I hope that the DOC is listening. There are many excellent, experienced and knowledgeable people commenting on this DEIS. I am asking that you give greater credence to those that are doing this from the place of fear, concern, care for our environment, etc. than those that are economically benefitting from this new (false climate solution) industrialization of Minnesota.</p>	<p>Thank you for your comment.</p>	20243-204403-01
	Olness, Rita Flaig	2024-02-20	<p>I am writing in opposition to the construction of the proposed Summit Carbon Recapture Pipeline in Redwood County. As a current landowner of a piece of property which has been in our family for over 150 years and is in the area near the proposed pipeline, I have concerns regarding this proposed project including the safety, gains, and long-term effects of the project.</p>	<p>Thank you for your comment. The commenter references an area in Redwood County. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.</p>	20243-204403-01
	Olness, Rita Flaig	2024-02-20	<p>First, there are short-term and long-term safety concerns. The pipeline is projected to go near land that has multiple water sources including the Redwood River, Coalmine Creek (which crosses my land) and the Cottonwood River.</p>	<p>Thank you for your comment. The commenter references an area in Redwood County. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.</p>	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Olness, Rita Flaig	2024-02-20	The pipeline would use technology that has not been proven to be totally safe and effective. A leak (from corrosion, improper installation, or land shifting) anywhere and at any time along the line at a minimum would be detrimental and hazardous to the residents in the area and generate additional costs for multiple players, including landowners and residents. In a worst-case leakage scenario, the health and lives of individuals would be at risk. A long-term or major leak could actually release more carbon in the air from the pressurized pipeline; thus, not alleviating the issue. It would also impact the land and waterways, changing the ph balance.	Risks of a potential CO ₂ release and potential impacts are described in Chapter 8 of the EIS.	20243-204403-01
	Olness, Rita Flaig	2024-02-20	This project crosses prime farmland and waterways which we need to be protecting in the best possible way, not opening them up for potential damage.	Potential impacts on and mitigations for prime farmland are discussed in section 5.5. Potential impacts on and mitigations for water resources and wetlands are discussed in sections 5.7.8 and 5.7.9.	20243-204403-01
	Olness, Rita Flaig	2024-02-20	Second, the gains of the project are questionable. Although proponents tout economic gains for the project, the main benefit would be to ethanol producers and oil companies who then in turn propose to use the carbon credits to create more carbon pollution. Economic gains to farmers and adjacent landowners would be limited. The carbon capture process generates high energy, thus affecting the overall net gain. This process does not create any less dependence on fossil fuel; in fact, it may produce more dependence depending on the implementation of the process. There are safer ways to remove CO ₂ from the atmosphere such as planting trees and/or planting carbon removing plants between row crop plants just to name a few. We need to explore more of these in the breadbasket area of the country.	The EIS analyzes the proposed project, including alternatives that lower the CI score of the ethanol produced at the ethanol plant. An alternative that does not include ethanol production was not studied in the EIS because it would not meet the purpose of the project. As stated in the final scoping decision, the appropriateness of federal and state policies regarding carbon capture and ethanol, including tax credits and other incentives, is also outside the scope of the EIS.	20243-204403-01
	Olness, Rita Flaig	2024-02-20	Third, the long-term effects of the project are not proven and are uncertain. Instead of solving a climate problem, we may be adding to it. It's too uncertain. With added regulations, costs, and the number of players involved, this process would be difficult to reverse if deemed ineffective or unsustainable. I understand that society's slow response in addressing carbon emissions has created a sense of urgency to handle the concern in the fastest way possible; however, please do not rush to implement a solution that gives economic gain to a few but ultimately jeopardizes the precious land and water resources as well as the health and welfare of citizens of Redwood County and surrounding areas. We will not have gained in that process. In simpler terms, we cannot "sweep the dirt under the rug," but rather look for ways to eliminate the dirt in the first place.	Thank you for your comment.	20243-204403-01
	Olness, Rita Flaig	2024-02-20	We have a duty to future generations to act judiciously and wisely now. The short-term and long-term potential hazards, inability to reduce long term dependence on fossil fuels, and uncertainty of the long-term environmental impact from the transfer and storage of the pressurized carbon dioxide are all imperative reasons for voting "no" to the Summit Carbon Recapture project in Redwood County. Thank you for your time and consideration. Rita Flaig Olness Redwood County Landowner	Thank you for your comment.	20243-204403-01
	OMeara, Colleen & Joe	2024-02-11	We ask that the Public Utilities Commission and Department of Commerce take these issues into account in order to ensure that the Environmental Impact Statement (EIS) for the Otter Tail to Wilkin CO ₂ Pipeline Project in Otter Tail and Wilkin Counties (Docket Number: 22-422) is a factual and thorough account of the project impacts. Minnesotans need a robust environmental review, and we need transparency, accountability, and regulatory oversight to ensure the greater public good and interests of communities impacted by these pipelines and all Minnesotans are respected and protected.	Thank you for your comment.	20243-204403-01
	Ostrove, Joan	2024-02-23	I am a resident of Saint Paul who is very concerned about the climate crisis. I'm writing to offer a few comments about the Draft Environmental Impact Statement for the Summit Carbon Solutions' proposed CO ₂ pipeline and carbon capture project. I am concerned that the claims in the DEIS that this pipeline will have a "minimal impact" across the board are unsupported by existing evidence about carbon pipelines and pipeline construction (and I note that neither Minnesota's state agencies nor Summit has any experience building, operating, or overseeing CO ₂ pipelines or carbon capture projects). Among many issues/concerns, the DEIS does not sufficiently address the known and unknown risks of transporting large amounts of CO ₂ at high pressures through a pipeline. It is vague on the actual impacts on the community (even as it acknowledges that the project will directly intersect a defined environmental justice community).	Thank you for your comment. Chapter 8 of the EIS describes risks of an unplanned release of CO ₂ from the project. Chapter 8 has been revised to include a new section (8.3.1.2) describing effects on environmental justice populations in the event of an accidental release of CO ₂ . Environmental justice is also analyzed in Section 5.4.3, and the analysis concludes that impacts from construction and operation of the project would not result in disproportionate adverse impacts for Environmental Justice areas of concern within the ROI.	20242-203795-01
	Ostrove, Joan	2024-02-23	And the DEIS says that Summit "anticipates" an average water use for the operation of the carbon capture equipment of 13 million gallons per year, which is problematically ambiguous. There must be a careful and case-specific assessment done of how the installation and operation of carbon capture will impact current drought conditions and exacerbate existing pollution sources.	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to	20242-203795-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	
	Otsea, Bob and Betty	2024-02-22	<p>My name is Betty Otsea; my husband Robert (Bob) Otsea and I live in Eden Prairie, Minnesota. We own farmland in Redwood County Minnesota that has been in our family since the late 1800's. This land has been rented to the same family for 50 years or more -- people who also care about the future of the land. We are all concerned that a project like this with unverifiable benefits and risks will permanently damage the qualify and usefulness of our land. Although we don't live in Otter Tail County where this tiny project is seeking approval, action taken on Docket #22-422 will influence the much larger project planned to go through our property in Redwood County and a larger area of the state. Neighboring states will also look to our actions on this pipeline issue.</p> <p>This Project will impact large amounts of agricultural land in this country to a great extent. The damage to the land will affect future generations. Yet the capture of carbon from ethanol plants may soon become a mote item because the shift of energy usage from fossil fuels to electric power seems to be the direction our nation is taking. In addition to the direction of the automotive industry, Minnesota Governor Walz has signed HF7/SF4 which mandates Minnesota utilities transition to carbon free energy by 2040.</p>	Thank you for your comment.	20243-204403-01
	Otsea, Bob and Betty	2024-02-22	<p>Although lucrative for Summit Carbon, this unprecedented project of carbon capture and storage would come at high cost of the American taxpayers with questionable benefits that are only limited and short-term. And what about our water resources, our aquifers? The construction and then the regular pipeline operation requires a tremendous amount of water.</p>	<p>Thank you for your comment. The appropriateness of federal and state policies regarding carbon capture and ethanol, including tax credits and other incentives, is outside the scope of the EIS.</p> <p>Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has also been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.</p>	20243-204403-01
	Otsea, Bob and Betty	2024-02-22	DECOMMISSIONING — What happens when the pipeline fails or is no longer useful? Who finances the REMOVAL of the pipeline? Of course, even if it were removed, the irreparable damage to the land has been done.	Section 2.7 describes project decommissioning. This section was revised to describe the financial assurances to be provided by the applicant for costs associated with decommissioning.	20243-204403-01
	Overby, Gary	2024-02-23	We don't need more pipelines; we need to manage our resources as if they were actually limited.	Thank you for your comment.	20243-204403-01
	Overland, Carol	2024-02-23	<p>I'm filing these comments as an individual, and not on behalf of any client.</p> <p>I'm concerned about this proposed CO₂ pipeline as Minnesota and Iowa have been selected as guinea pigs in an area without regulatory or operational experience. CO₂ capture and a pipeline, only to the plant gate, was proposed for the Mesaba Project, but it was nothing more than a stab at tossing out the words "CO₂ capture" for traction in that boondoggle of a project. Despite that, participants in that docket did learn much about CO₂ capture, particularly about feasibility, efficiency loss, and cost.</p>	Thank you for your comment.	20242-203790-01
	Overland, Carol	2024-02-23	<p>CONSTRUCTION AND LAYDOWN YARDS</p> <p>The EIS states, "The applicant is not proposing to use any construction or staging yards for the project." EIS, p. 2-3. This is absurd. Where will the materials be stored and staged? On trucks at some other location, with "on-time" delivery? That's simply not workable. The EIS must address the need for and impacts of storage and laydown yards, and the cost of such easements, which, even if temporary, and be significant. Return of these areas to prior condition must also be addressed.</p>	Section 2.2 has been updated to describe the applicant's plans for contractor yards.	20242-203790-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Overland, Carol	2024-02-23	<p>NOISE & NOISE STANDARDS – MINN. R. 7030.0040</p> <p>The EIS is inadequate in addressing impacts of noise, noise of construction, noise of operation, and noise of potential ruptures. For example, the EIS shows the cumulative numbers of “sensitive receptors” in the chart label, but the description is “Number of Residences and Businesses,” and which is NOT the number of “noise sensitive receptors.” <i>(included photo of Figure 5-6)</i></p> <p>This is misleading. The chart should be changed to show the “Number of Noise Sensitive Receptors” by taking the average number of people in a household and multiplying by the numbers shown in the X axis. The edge of the right-of-way numbers should also be displayed on Y axis, labeled as “250 – Edge of RoW” so that it can be easily determined the impacts on those outside of Right of Way.”</p> <p>From this chart, assuming there are additional impacts for those within 250 feet of centerline on each side of the RoW, it appears that there are more than 15 residences and businesses (and how many residents? Workers?). This is a serious flaw in the noise impact analysis. The EIS is inadequate as it does not address numbers of individual “receptors” in residences and businesses, and thus grossly understates impacts.</p> <p>The EIS also states, “The ROI for noise is the local vicinity (area within 1,600 feet of the route width).” The terminology is unclear – is that 1,600 feet of the centerline, or 1,600 feet on each side of the centerline, or 1,600 feet of the Right of Way edge? With the ROI extending so far beyond the Right of Way, the EIS must also address the impacts beyond the Right-of-Way to 1,600 feet.</p> <p>Noise does have a cumulative impact, and the EIS must address this. Instead, the EIS states: “Noise from the operation of the capture facility is not expected to result in a perceptible increase in the sound levels experienced at NSRs near the capture facility and would not be distinguishable from the noise already produced at the ethanol plant. Operation of the pipeline facilities would not have a noticeable impact on ambient sound levels.” P. 5-28. Cumulative impact of noise has been an issue in wind projects, and EERA staff and Summit attorney who has worked on wind projects should be well aware.</p>	<p>Section 5.4.5 has been updated to clarify the definitions of noise receptors. Noise standards are not based on the presence of an individual; rather, standards are based on noise area classifications, which are land use designations.</p> <p>As defined in Section 2.2 and Section 5.1.2, the route width is 500 feet centered on the centerline with exceptions where more width would be needed for construction. The route width for RA-South is wider in some areas, as described in Section 2.2. The route width is illustrated on the detailed route maps in Appendix B.</p> <p>Chapter 5 considers the impact of noise from the capture facility coupled with the ethanol plant. Cumulative impacts are discussed in Chapter 10.</p>	20242-203790-01
	Overland, Carol	2024-02-23	<p>The EIS is incorrect and inadequate in that it minimizes noise. There is no disclosure of ambient noise testing, and understatement of noise levels by discussing when changes in noise levels are noticeable,” but 5.4.5.1 does NOT state the fact that a 3 dB(A) increase in noise is a DOUBLING of sound pressure levels. This is a material diminishment of noise impacts. The EIS should state the various potential dB(A) of blowdown, and in the event of a rupture, the noise level of “sonic speed.” See e.g. 5-35; 8-2.</p>	<p>Thank you for your comment. Humans perceive sound pressure on a logarithmic basis, not a linear basis. For example, a 10-dB difference, which is perceived as a doubling in loudness, is a difference of a factor of 10 in actual sound pressure, while a 20-dB difference, which is perceived as a quadrupling, would be a 100x change to the sound pressure.</p>	20242-203790-01
	Overland, Carol	2024-02-23	<p>Another example of the inadequacy of the EIS is found after Table 5.5 on p. 5-29, which states: <i>(Photo of text that reads: "Noise associated with heavy equipment can range between 80 and 90 dBA at full power 50 feet from the source. Heavy equipment generally runs at full power up to 50 percent of the time. Point source sounds decrease by 6 dBA at each doubling of distance; therefore, a 90 dBA sound at 50 feet is perceived as a 72 dBA sound at 400 feet and a 60 dBA sound at 1,600 feet.)</i></p> <p>Following the table showing Minnesota Noise Standards, this paragraph should note that 90, 72, and 60 dBA are all above nighttime noise standards in a residential area. This is why the charts showing residents affected must be corrected, and show anticipated daytime and nighttime expected noise levels at various distances, RoW edge and beyond within the ROI.</p>	<p>This paragraph provides an example of how the sound pressure level changes over distance. It is not tied to a specific impact. Therefore, stating such a noise violates state noise standards is not necessary. The charts discussed in the comment are intended to show noise receptors within 1,600 feet of the route width; as such, they do not need to be corrected.</p>	20242-203790-01
	Overland, Carol	2024-02-23	<p>The EIS is inadequate as it does not address that with winter construction noise travels further due to hardpacked snow and frozen ground, a ground factor of 0.0, and that noise will not lessen as fast as it would with summertime ground cover of grasses and trees.</p>	<p>Construction impacts are expected to occur outside of winter conditions, as described in Section 2.9. of the EIS.</p> <p>As noted in Section 5.4.5.3, "The sample routing permit (Appendix H) includes the following mitigation for noise: the Permittee shall comply with noise standards established under Minnesota Rules 7030.0100 to 7030.0080, at all times at all appropriate locations during operation of the facility. Construction and maintenance activities shall be limited to daytime working hours to the extent practicable to ensure nighttime noise level standards will not be exceeded.”</p> <p>Additionally, the sample routing permit states that “the Permittee shall comply with all applicable state rules and statutes. The Permittee shall obtain all required permits for the project and comply with the conditions of those permits unless those permits conflict with or are preempted by federal or state permits and regulations.”</p>	20242-203790-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Overland, Carol	2024-02-23	The EIS is inadequate because Tables 5.6, 5.7. and 5.8 do not list modeled (projected) noise for each of the residences shown.	Thank you for your comment. Noise modeling studies at each receptor are outside the scope of the EIS.	20242-203790-01
	Overland, Carol	2024-02-23	The EIS is inadequate as it allows for mitigation based on landowner assertion rather than applicant compliance with noise standards – see EIS, p. 5-35: The applicant has stated that it would coordinate with nearby landowners prior to starting HDDs and determine the need for noise mitigation and noise monitoring based on feedback received from landowners during construction.	As noted in Section 5.4.5.3, "The sample routing permit (Appendix H) includes the following mitigation for noise: the Permittee shall comply with noise standards established under Minnesota Rules 7030.0100 to 7030.0080, at all times at all appropriate locations during operation of the facility. Construction and maintenance activities shall be limited to daytime working hours to the extent practicable to ensure nighttime noise level standards will not be exceeded." Additionally, the sample routing permit states that “the Permittee shall comply with all applicable state rules and statutes. The Permittee shall obtain all required permits for the project and comply with the conditions of those permits unless those permits conflict with or are preempted by federal or state permits and regulations.”	20242-203790-01
	Overland, Carol	2024-02-23	Increased Use of Coal Generated Electricity The CO ₂ capture and transport process will increase electricity use at the ethanol plants. If the idea is to capture CO ₂ to lessen CO ₂ in atmosphere, the increased use of fossil fuel to power the operation must be balanced with the level of CO ₂ captured and transported. <i>(Included photo of Figure 6-6 from the DEIS)</i> EIS is missing much information. When working on the Mesaba Project (PUC Dockets E-6472/GS-06-668; E-6472/M-05-1933), I learned that CO ₂ capture was expected to be less than 1/3 of CO ₂ generated from that project, generally the achievable rate of capture, and that roughly 1/3 capture would result in a marked decrease in plant efficiency. Capture of more than that is very difficult to do technically, and is very costly. I do not see information on various measures of CO ₂ capture and efficiency of that process in the EIS. The percentages of CO ₂ that can be, are feasible to be, captured is determinative of whether this project should be permitted – if there’s nominal CO ₂ capture, and a major efficiency loss, what's the point of all this cost and impact? The EIS must disclose and analyze the following information: •Annual total tons of CO ₂ produced at each ethanol plant proposed to be connected to this project. •Annual percentage of CO ₂ captured from each plant. •Annual tons of CO ₂ captured from each plant. •Ethanol plant efficiency loss expected with carbon capture for each plant. •Cost of loss of efficiency for each plant. •Quantification of production to compensate for loss of efficiency. •MW load for capture of CO ₂ at each plant. •MW parasitic load for pressurization into pipeline. •Transmission and transformer upgrades required at each plant. •Total MW parasitic load (itemized by location of pressurization facility) for pressurization from collection source to point of delivery. •MW of energy losses for each plant’s ethanol production and CO ₂ capture processes.	Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios of 100 percent, 70 percent, 40 percent, and 10 percent. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20242-203790-01
	Overland, Carol	2024-02-23	The EIS is inadequate because it does not address the potential harms to those many residents, businesses, and workers within the ROI. The EIS is inadequate because it does not address the increased cost of insurance for those households, farms, and businesses living with in the 1,600 ROI.	Section 5.4.8 and Chapter 8 discuss public health and safety concerns. Staff cannot predict the cost of insurance costs for individual parcels; however, should insurance rates increase, these increases could be mitigated though negotiated easement agreements. These agreements are outside the scope of the EIS. Section 5.4.7.2 has been revised to address the availability and cost of property insurance.	20242-203790-01
	Overland, Carol	2024-02-23	The EIS is inadequate as the operational psi is unclear. There is a range, but the likelihood of leak or rupture can be dependent on psi. The EIS should clearly state whether the operational is expected to be 1,320, and why, if the design is for 2,183 psi, and under what occasions the psi could be greater than the expected operational psi. See p. 4-4.	EERA staff agrees that the likelihood of leak or rupture can be dependent on pressure; therefore, the impact at the maximum (design) pressure was modeled. Chapter 4 discusses alternatives to the proposed pipeline, including different diameters. A 6-inch-diameter pipeline would operate	20242-203790-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				at a different pressure than the proposed 4-inch-diameter pipeline. The proposed pipeline design pressure is for 2,183 psi, which includes a safety factor. The 1,320 psi referenced in Chapter 4 is for the 6-inch-diameter alternative. EERA staff concluded that an alternative pipeline diameter would not result in a significant environmental benefit over the proposed project, and diameters smaller than 4 inches would pose challenges for pipeline inspection. Therefore, this alternative is not analyzed further in the EIS. The EIS is not inadequate as the psi for the proposed project is described in Chapter 2.	
	Overland, Carol	2024-02-23	The EIS is misleading, inadequate, as it refers to leaks and ruptures as “accidents,” which are too common to be “accidents.” Language should be changed and these should be labeled as incidents, or specifically labeled as leaks, ruptures, etc. The EIS states that: However, for CO ₂ pipelines, between 2010 and 2021, 66 CO ₂ pipeline accidents were reported to PHMSA. Of these 66 accidents, 56 were leaks, 2 were ruptures, and 8 were classified as “other.” ⁸ The analysis showed that leaks are the leading form of accident and rupture is the most uncommon form of accident for CO ₂ pipelines. EIS p. 8-1. Acknowledgement of 66 “accidents,” including 56 leaks, of which 2 were ruptures and 8 “other,” means that some leaks, ruptures and “other” can be expected, and are not reasonably characterized as “accidents.” Please correct that linguistic mischaracterization.	Accident is not a term developed for this EIS, but is instead terminology defined and used by PHMSA. PHMSA defines "accident" as a failure occurring in liquid pipeline systems for which the pipeline operator must make a report to the Office of Pipeline Safety (https://primis.phmsa.dot.gov/comm/glossary/index.htm#Accident). Leaks and ruptures are classified as types of accidents by PHMSA.	20242-203790-01
	Overland, Carol	2024-02-23	The EIS is deficient because the noise expected in a leak or rupture is not addressed.	Section 8.3.1.5 describes anticipated noise during a leak or rupture.	20242-203790-01
	Overland, Carol	2024-02-23	The EIS is inadequate as there is no wind rose provided. There should be a simple wind rose for the two ethanol plants, at the very least, and if the wind rose is different for other areas of this project, to include that. Commerce filed wind roses for sites across Minnesota decades ago that could be updated now.	Emissions from the ethanol plant are covered in the Title V Permit for the ethanol plant. The nearest automated weather observation station to the ethanol plant is located at the Fergus Falls Municipal Airport (46.28439, -96.15669). The wind rose has been added to Section 5.7.1.2. Other wind roses were evaluated in the vicinity of the project and found similar wind patterns. The wind rose was created using Iowa Environmental Mesonet (https://mesonet.agron.iastate.edu/sites/site.php?station=FFM&network=MN_ASOS).	20242-203790-01
	Overland, Carol	2024-02-23	The EIS is deficient because the word “evacuate” is not in the plan, and there is no characterization of the area to be evacuated in various scenarios of leak and rupture. The evacuation zone should be clarified, and be set at distances identified in dispersion modeling with additional distance for safety beyond the potential “toxic impact” distance of 910 feet. <i>(Includes a photo of text from the DEIS that reads: The dispersion modeling conducted by Allied calculated the maximum distance at which CO₂ concentrations from a pipeline rupture could reach toxic levels. The toxic impact distance at which CO₂ concentrations could reach 40,000 ppm (the immediately dangerous to life and health level) at -22°F and a humidity level of 74.3 percent was calculated at 617 feet, as shown in Table 4 in the Aerial and Thermal Dispersion Report (AD Report) in Appendix G. The toxic impact distance at which CO₂ concentrations could reach 30,000 ppm (the National Institute for Occupational Safety and Health Short Term Exposure Limit, which is the maximum time-weighted average concentration to which a person could be exposed over a 15-minute period without injury) would be 701 feet. The toxic impact distance at which CO₂ concentrations could reach 15,000 ppm would be 910 feet.)</i>	As stated in the EIS, the term "evacuation" is not used because the effects of a pipeline rupture would be brief and dissipate quickly. Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. EERA staff recommended special permit conditions to avoid impacts of a potential CO ₂ release, including information on a public education plan, as described in Section 8.5.3.	20242-203790-01
	Overland, Carol	2024-02-23	RECOMMENDED SPECIAL CONDITIONS AND EDITS Special conditions are necessary IF this project is permitted. Regarding those recommended by staff, here are comments and edits are in track changes: EERA staff believes that applicant-provided indoor CO ₂ detectors for residences within 1,600 feet of the project is a reasonable mitigation measure. This distance was chosen based on the most impactful scenario as described in Appendix G <u>ROI (and it depends</u>	Thank you for your comment. Staff agrees that special conditions are only required if a permit is issued for a project. EERA is neutral concerning the proposed edits and will retain its original recommendations, except that staff concurs with the idea of defining "neighboring landowners." Staff believes this distance should be, at minimum, 1,000 feet, and the text in Section 8.5.3 has been modified.	20242-203790-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p><u>on how that is defined, conservatively the greatest distance should be used. Is that 1,600 feet of ROI 1,600 feet of centerline? 1,600 feet of Right of Way? 1,600 feet centered on centerline – 800 feet on either side? .</u></p> <p>EERA staff believes that a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission is reasonable, <u>and should be filed with the Commission via eDockets prior to any permit approval and open for public comment.</u></p> <p>EERA staff believes that a special permit condition requiring the applicant to provide an accidental release plan, developed in coordination with local emergency responders, for Commission review 30 days prior to submittal of the Plan and Profile is reasonable. The accidental release plan could include the specific equipment, training, and reimbursement that could be provided to emergency managers. The plan could also list the names of the emergency responders and a provision to update contact information as needed. The plan could discuss the feasibility of a “reverse 911” notice that goes out to landowners’ telephones in the event of an emergency shutdown or rupture. The release plan could identify how the applicant would pay for costs of any repair to public infrastructure or private property (including crops and livestock) that might occur during an accidental release. <u>The plan must be filed with the Commission via eDockets and a link and phone number be included in mailing to all landowners, residents, farms, businesses within one-half mile of the centerline.</u></p> <p>EERA staff believes a special permit condition requiring the applicant to identify locations of fracture arrestors and any locations of thicker-walled pipe on the Plan and Profile filed with the Commission is reasonable.</p> <p>EERA staff believes a special permit condition requiring the applicant to provide its public education plan for Commission review 30 days prior to submittal of the Plan and Profile is reasonable. The public education plan could include specific safety information for neighboring landowners within one-half mile (one mile?), including what to do in case of a rupture.</p>		
	Overland, Carol	2024-02-23	<p>WHERE’S THE COST/BENEFIT ANALYSIS?</p> <p>The EIS is inadequate because there is no cost/benefit analysis for this project. Perhaps I’ve missed it in my quick skim, but ??? It should be front and center, addressing the claimed “benefits” in light of costs, mindful that costs are more than just the literal costs of physical pieces of the project, construction, labor, etc., and include those more difficult but quantifiable environmental, socio-economic, and human costs.</p> <p>This project is the test run for the larger part of Summit Carbon Solutions CO₂ pipeline dreams. It’s very important to get this right and to look at all aspects of this project. Further, state and federal CO₂ policy is NOT need.</p>	Impacts on resources, both negative and positive, are addressed in Chapter 5. Impacts on the natural environment are discussed in section 5.7, impacts on human settlement overall are discussed in section 5.4, and socioeconomics are addressed specifically in section 5.4.11. Financial costs of the project are discussed in section 2.8. A certificate of need is not required for the project.	20242-203790-01
	Pabst, Roger	2024-02-22	<p>I am concerned about the cost of the proposed CO₂ pipeline by Summit. First we all know structures fail with time. Also who will bared the cost to support and train all the EMS personal to react to a issue with the pipeline??</p>	<p>Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that would be revised as required by PHMSA, if the project is approved.</p> <p>Additionally, EERA staff recommended that a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.</p>	20243-204403-01
	Pabst, Roger	2024-02-22	<p>How many years will Summit pay for damaged land production? Who insures the pipeline if issues arise? Who owns the easement and what else can be put in that area??</p>	Thank you for your comment. Landowner agreements are outside the scope of the EIS. Section 5.4.7.2 has been revised to address the availability and cost of property insurance.	20243-204403-01
	Pabst, Roger	2024-02-22	<p>How much extra water will it use and where will it come form--the same aquifers our farm wells are using?? Who provides us with water if our wells go dry?? Where will the extra electricity come from--we were just told during a recent cold spell to cut our usage due to shortages???</p>	Impacts on water resources are discussed in section 5.7.8. Impacts on public services and infrastructure, including electricity, are discussed in section 5.4.9.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Pabst, Roger	2024-02-22	When the pipeline is decommissioned in 25 years what happens to it and what about the CO ₂ at that point? Let's not do things without answers to issues that might arise!!!!	Section 2.7 describes decommissioning of the project. This section was revised to describe the financial assurances to be provided by the applicant for costs associated with decommissioning.	20243-204403-01
	Pearson, Andy	2024-04-23	I am writing to comment on the DEIS for the Otter Tail Wilkin CO ₂ Pipeline. The DEIS needs improvement. The climate section in particular needs to have some of its premises reexamined, including the assumption of a 100% CO ₂ capture rate and 100% permanent storage underground as well as excluding consideration of Enhanced Oil Recovery as a potential use for the captured CO ₂ .	Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and that commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	20243-204403-01
	Pearson, Andy	2024-04-23	In addition, recent pipeline experience in MN has shown that aquifer damage from construction can be common and widespread. This damage needs to be taken more seriously by the DEIS.	Section 5.7.8.2 addresses potential impacts on groundwater, including aquifers.	20243-204403-01
	Petersen, Irene and Paul	2024-02-18	Thank you Andrew and to your team for being attentive to our recent Environmental Impact Statement (EIS) comments and your diligence to this task of ensuring the final EIS is complete and accurate. Paul, my husband, and I are lifetime residents of Minnesota (MN), a generational family who farm, and stewards of the land as we hold tight to safe soil and water practices in the best interest of the future of MN and her people. Therefore, in regards to the Green Plains Ethanol Plant, which is located near the city of Fergus Falls, and Summit Carbon Solutions LLC proposed construction of a pipeline for the purpose of carbon dioxide (CO ₂) transport to the MN - North Dakota (ND) border and geologic sequestration, we are requesting an extended research and implementation of biologic sequestration of the CO ₂ near and at the Fergus Falls Green Plains ethanol plant.	Thank you for your comment and request to extend research efforts to understand the impacts of biological sequestration of the CO ₂ near and at the Fergus Falls Green Plains ethanol plant. While the proposed Midwest Carbon Express project is considered geologic sequestration, specifically biomass (BECCS) technology, the EIS is an analysis of the project to assist the Commission with making a pipeline routing permit decision. A study of carbon capture technology is outside the scope of the EIS. The biological sequestration of carbon through alternative agricultural strategies is discussed in Section 6.2.3.	20243-204403-01
	Petersen, Irene and Paul	2024-02-18	The United States Global Change Research Program and the MN Board of Water and Soil Resources state that conservation practices, such as, deciduous tree planting, prescribed grazing, cover crops, wetland management, etc., remove CO ₂ from the atmosphere and sequester the CO ₂ in stable forms as biomass and soil organic carbon. The biologic sequestration of CO ₂ are proving to be safe and effective. The Fergus Falls Green Plains Ethanol Plant produced 55 million gallons of ethanol in 2022 . (https://gpreinc.com). In 2023, " A typical 50 million-gallon-per-year ethanol plant releases 14 tons of CO ₂ , a natural by-product of fermentation." (https://energypost.eu/using-wind-power-with-ethanol-production-to-turn-the-co2-by-product-into-efuels/#:~:text=A%20typical%2050%20million%2Dgallon,natural%20by%2Dproduct%20of%20). In 2021, the United States Department of Agriculture (USDA) reported, " In one year, a mature live tree can absorb more than 48 pounds of carbon dioxide, which is permanently stored in its fibers until the tree or wood experiences a physical event that releases it into the atmosphere, like fire or decomposition." (https://www.fs.usda.gov/features/trees-are-climate-change-carbon-storage-heroes) In a very, very simplified scenario, it is estimated 42 mature trees are needed to sequester one ton of CO ₂ .Therefore, on or near a site like Fergus Falls a plot of approximately 642 trees would be needed to help sequester the CO ₂ emissions. Implementing a CO ₂ biologic sequestration plan is very doable and practical. We have learned that CO ₂ transport and geologic sequestration employs highly engineered knowledge and practices which constantly undergo federal and state regulated processes of monitoring, reporting, and verification. Obviously, in this complex technical system, there are a number of things that can go wrong due to human/ technical/ mechanical errors. The federal 2022 Inflation Reduction Act has created a " gold rush" mindset to capture CO ₂ .	A study of carbon capture technology is outside the scope of the EIS. Moreover, an alternative that does not include ethanol production was not studied in the EIS because it would not meet the purpose of the project. The EIS is an analysis of the proposed project to assist the Commission with making a pipeline routing permit decision; as such, relevance of the information to a reasoned choice among alternatives. A study of the alternatives referenced by the commenter would not aid in the Commission's decision. The biological sequestration of carbon through alternative agricultural strategies is discussed in Section 6.2.3.	20243-204403-01
	Petersen, Irene and Paul	2024-02-18	In 2022, the US Department of Energy Research found, " ethanol is likely at least 24 percent more carbon-intensive than gasoline due to emissions resulting from land use changes to grow corn, along with processing and combustion." This has driven more research for alternative energy sources beyond biofuel. There is a pursuit for advanced research in MN, the United States, and the world, to reduce petroleum consumption and CO ₂ emissions. Therefore, if a routing permit is granted to Summit Carbon Solutions LLC to construct a pipeline and transport CO ₂ from the Fergus Falls Green Plains Ethanol Plant to the MN - ND border, the decision will not reflect critical and prudent future planning on the part of the MN Department of Commerce and the MN Public Utilities Commission that serve the people of MN as trusted public resources. In summary, the established scientific research of the biologic sequestration of CO ₂ should be on the forefront in this decision making. Biologic capture and sequestration of CO ₂ increases the safety and secures a healthy ecosystem that includes but not limited to	Where the research remains inconclusive on the average CI score for corn ethanol in the United States due to modeled emissions associated with land use change, the EIS has been revised to incorporate updated uncertainties and contradicting research sources to better represent the state of the science today. Section 6.1.3 has been revised to discuss the debate between Lark et. al. and GREET model authors on this topic. Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and that commenters have questioned the	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			surface water, aquifers, wildlife, land and livestock owners, and communities. Thank you again for your time and consideration in this critical decision that will carry a long-term consequential effect.	feasibility of this capture rate given the performance of existing capture facilities. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios of 100 percent, 70 percent, 40 percent, and 10 percent.	
	Peterson, Paul	2024-02-22	Thank you for taking the time to read my concerns and comments regarding the Summit Carbon Solutions (SCS) proposed pipeline in Otter Tail County (OTC) and the Environmental Impact Statement (EIS). I understand that the MN Department of Natural Resources (DNR) will not permit the SCS pipeline to cross any public wildlife production, wildlife refuge, and property. The concerns voiced by the MN DNR about placing the CO ₂ pipeline are not being disputed. These public lands are protected and deemed untouchable, therefore , I would appreciate the same standards applied to private property and land owners.It raises the question why and what makes the MN DNR property exempt from this proposed CO ₂ pipeline pathway that will transport hazardous materials and the same concerns are not applied to private property owners.	Thank you for your comment.	20243-204403-01
	Peterson, Paul	2024-02-22	My concern also includes safety and the unknown environmental impacts.This region has one of the largest aquifer in our country and the proposed pipeline crosses this area. In case of an accidental CO ₂ leak or rupture, what research guarantees that the ground water and aquatic life will not be adversely affected . Research has shown the technology of fracking oil has caused contamination of ground water. Should we not be concerned about this possibility happening with CO ₂ ?	Impacts on groundwater in event of a rupture or leak are described in Section 8.3.4.1. Impacts on aquatic life in the event of rupture or leak are described in a subheading within Section 8.3.4.2.	20243-204403-01
	Peterson, Paul	2024-02-22	The goal is to reduce CO ₂ atmosphere emissions I question how much CO ₂ will be produced and released with the production of materials used to construct this pipeline, the process to convert the CO ₂ to a supercritical fluid, and the construction site where the CO ₂ will be sequestered, and any future plan that will reuse the sequestered CO ₂ . I support alternative proven methods which require the ethanol facilities to implement planting trees- the "natural air scrubbers". As you know, trees convert CO ₂ to oxygen. Depending on each ethanol facility CO ₂ emissions, implement an environmental plan that each facility plants a sufficient number of trees, shrubs, and plants, with an additional 10 to 20 percent to reach their CO ₂ net neutral target. Without the federal government subsidizing the SCS CO ₂ pipeline, this project would not be the money grab from this company, "which is a multibillion- dollar private investment with support from a wide-range of investors including John Deere, Continental Resources, and ethanol plant partners " at the expense of MN landowners and residents. Thank you again for giving your attention to my concerns and comments. Paul Petersen	An alternative that does not include ethanol production was not studied in the EIS because it would not meet the purpose of the project. As stated in the final scoping decision, the appropriateness of federal and state policies regarding carbon capture and ethanol is also outside the scope of the EIS. This includes tax credits and other incentives.	20243-204403-01
	Petrich, Steve	2024-02-09	I urge you to carefully consider the impact any decisions or actions regarding this issue will have. My name is Steve Petrich and I am a retired physical science teacher, farmer and landowner in the path of this proposed CO ₂ pipeline project by Summit Carbon Solutions (CSC). There are a variety of issues that are of great concern. EMS Response: The DEIS accepts Summit’s assurances that it will “comply with federal emergency response requirements,” but as noted in a Pipeline Safety Trust report and by the Pipeline Hazardous Material Safety Administration (PHMSA) itself, the current emergency response requirements are dangerously outdated. PHMSA is in the process of updating their procedures and as a landowner, I want to be sure that the PUC does not “Grandfather” SCS under older, dangerously outdated requirements. Setbacks: The DEIS states that the PUC “cannot set safety standards” for Summit’s proposed pipeline. PHMSA has expressly said in public letters to CO ₂ pipeline companies like Summit that state and local authorities can exercise their powers to regulate land use—including setback distances—and that “nothing in the federal pipeline safety law impinges on these traditional prerogatives of local—or state—government.” The PUC must consider where the pipeline is placed and what is the safest option for Minnesotans, which means the PUC can and should determine what routing, setback, and depth requirements are necessary to adequately protect Minnesotans. In the event of a rupture, the impact zone would be well over a mile, more depending on weather, season, geography etc – this infrastructure poses serious risks to humans.	Although the Commission cannot set safety standards for pipeline construction or operation, state or local units of government may, to the extent authorized by law, set land use requirements that indirectly contribute to pipeline safety by regulating the activities of third parties located in the pipeline’s vicinity. The Commission’s obligation is to identify a pipeline route consistent with the criteria found in statutes and the applicable administrative rules. Federal law, by contrast, exclusively prescribes pipeline safety requirements.	20243-204403-01
	Petrich, Steve	2024-02-09	According to the DEIS, CO ₂ leaks would not affect mammals, birds, reptiles, amphibians, and insects and would be unlikely to impact fish and freshwater mussels. The DEIS reaches this conclusion without providing any reasoning or supporting evidence. Though the DEIS does note some harm may come to animals in the event of a rupture, it relies heavily on the assumption that animals will simply move out of the rupture area to avoid the release. The reason for this assumption is not provided and is contradicted by information in the rupture report in Appendix G which suggests the impacts of a rupture would be nearly immediate.	CO ₂ is a widespread, naturally occurring gas and is the primary byproduct of respiration—the conversion of sugars to usable energy. Minor leaks of CO ₂ from operation of the proposed pipeline would not elevate ambient CO ₂ to a level that is detrimental to local vegetation or wildlife. Potential impacts on wildlife from a CO ₂ rupture could result first from the physical force of a rupture and secondarily from localized short-term high levels of CO ₂ prior to dispersal and extreme cold temperatures associated with the depressurization of the CO ₂ from a supercritical state to a gas. Chapter 8 of the EIS acknowledges that	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				wildlife in the immediate vicinity of a rupture might be killed or injured by this force; however, it is expected that most mobile wildlife species would follow their natural instincts and attempt to escape the direct effect of a rupture. Chapter 8 of the EIS also acknowledges that less-mobile species in the immediate vicinity of the point of a rupture would be less likely to escape the impacts and might be killed or injured. The data presented in Appendix G describes models of dispersal patterns in the immediate vicinity of a rupture. These models support the statements in Chapter 8 that wildlife in the immediate vicinity of a rupture might be exposed to high levels of CO ₂ , which could be toxic for species unable to leave the area of the release.	
	Petrich, Steve	2024-02-09	Often time with the construction phase water is release with contaminates and without notice – how can we assure this is not going to damage the ecology of the river? This has happened in Minnesota with other projects when horizontal drilling has occurred and when the company tests the infrastructure with hydrostatic testing. How can the PUC ensure that this will not happen and in the event it does, the public will immediately be notified?	Minnesota law requires that people notify MPCA (through the Minnesota Duty Officer) immediately when more than 5 gallons of petroleum or any amount of any substance under their control is released into the environment that could cause pollution of waters of the state. The sample routing permit states that “the Permittee shall comply with all applicable state rules and statutes.” As described in Section 2.4.7, no chemicals or other contaminants would be added to hydrostatic test water, and the applicant would discharge the test water in accordance with MPCA discharge permits. Drilling mud used for HDDs consists primarily of bentonite, a type of clay. If additives are used in the drilling mud, they would be approved by MDH or meet NSF International/ANSI Standard 60, Drinking Water Treatment Chemicals – Health Effects. The applicant would implement its HDD contingency plan, which would include measures to reduce the risk for an inadvertent return as well as monitoring. Containment, response, and clean-up equipment would be available at both sides of an HDD crossing location prior to beginning the HDD to assure a timely response in the event of an inadvertent release.	20243-204403-01
	Petrich, Steve	2024-02-09	In addition to the direct impacts of the 28 miles of pipeline included in Summit’s application, the DEIS does not account for the indirect and cumulative impacts of Summit’s entire project in Minnesota. This is despite Summit’s clear and public plans for a much larger buildout in Minnesota and recent statements that they will be applying for permits for additional parts of the network imminently. Allowing Summit to artificially segment permitting requests for multiple concurrent projects on one pipeline will prevent a thorough review of the cumulative impacts and potential environmental and climate damages of the project. How can the PUC ignore the fact that this company has purchased easements in 10 counties and has been advertising that this project will cover 240 miles in Minnesota and only look at a 28-mile stretch? This seems like a waste of taxpayer dollars and when SCS applies for the other parts of the route, will the PUC site precedent? – I certainly hope not because the full route was not taken into consideration!	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01
	Petrich, Steve	2024-02-09	As a taxpayer and landowner in the pathway of this proposed project, the PUC needs to put Minnesota landowners over out of state corporate interests who are only after carbon tax credits and 45Q dollars and could care less about the long-term impacts this pilot project will have on our land, water and rural communities.	Thank you for your comment.	20243-204403-01
	Piekavski, Charles and Carol	2024-02-21	We are landowners and retired farmers living along County Road 11 in Carlisle Township, Oter Tail County, Minnesota. We are very unhappy the route chosen for the CO ₂ pipeline. We are also unhappy to have this pipeline near anyone. It is dangerous and very unhealthy for all of us if this should have a leak or burst. One of your representatives at the public meeting in Fergus Falls said if we hear anything sounding like a tornado, we would have three minutes to get indoors. Then we could “have a cup of coffee” and all would be clear to go back outside. For one thing, if we are outside, there is no way to get to the house to safety in three minutes. I guess that tells the story for the rest of our time.	Thank you for your comment. Informal conversations are outside of the public record, and we disagree with how the conversation is characterized in this comment.	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Piekavski, Charles and Carol	2024-02-21	If this pipeline is deemed unsafe for the wildlife, what about humans! We have a man-made dam and slough made possible from the efforts of Ducks Unlimited, U.S. Fish and Wildlife, and other agencies that has proven valuable for wildlife. We enjoy hearing and watching the many pheasants, deer and birds of all kinds that live there. This area should not be included if other wildlife areas are exempt.	Based on examination of aerial photography, the constructed dam and slough appear to be at least 500 feet to 800 feet from the RA-North and RA-Hybrid route alternatives, and much further from the RA-South route alternative. Based on these distances, the potential impact on the property from the construction and operation of the project would be negligible.	20243-204403-02
	Piekavski, Charles and Carol	2024-02-21	We live very close to the proposed site. It should be taken into consideration the heavy semis going in and out of our yard plus the many semis on county road 11 going to the ethanol plant or CHS loaded with corn or soybeans. We have dozens of trucks daily, and during harvest there are even more. We feel the weight of these trucks would cause damage to the pipeline in due time. We have a very high water table and the soil is soft and not as solid as it should be to handle the weight.	As indicated in Chapter 2, the applicant indicates that the project would meet or exceed state and federal safety requirements and, at a minimum, would be operated and maintained in accordance with PHMSA's regulations in 49 CFR Part 195. The pipeline would be constructed of high-strength carbon steel pipe that meets the American Petroleum Institute (API) 5L Pipe Specification.	20243-204403-02
	Piekavski, Charles and Carol	2024-02-21	Please reconsider this pipeline and take people's comments seriously. Why is this even necessary? You will never get permission to cross any of our land!	Thank you for your comment.	20243-204403-02
	Popowski, Christine	2024-02-22	CO ₂ is a hazardous material in high concentrations. The DEIS consistently underplays the known and unknown risks of transporting large amounts of CO ₂ at high pressures through a pipeline.	Risks of a potential CO ₂ release and potential impacts are described in Chapter 8 of the EIS.	20243-204403-01
	Popowski, Christine	2024-02-22	CO ₂ Rupture Impact Zone: According to the analysis in the DEIS, the potential impact radius for levels of CO ₂ that would be "immediately dangerous to life or health" is 617 feet. This expands to 910 feet for lower concentrations that cause dizziness, drowsiness, severe muscle twitching, and unconsciousness within a few minutes. Although Summit indicates that it will take 25 minutes for the system to shut off the relevant valves in the event of "abnormal operation," the DEIS does not mention any meaningful safety measures for a rupture and instead suggests that it is "reasonable" for Summit to simply supply indoor CO ₂ detectors for residences within 1,000 feet of the project. But the rupture report in Appendix G states that "a full rupture results in impact distances too quickly for an early warning device, such as an oxygen detector, to be effective." This pipeline should not be approved without a clear understanding of the risks to human health and meaningful measures to ensure the safety of people and animals in the area.	Text in Section 4.5 on valve closure time has been corrected from 25 minutes to 10 minutes. Elsewhere in the EIS, including the rupture analysis, valve closure time is listed/calculated as 10 minutes. Section 8.5.3 has been revised to note that, while acknowledging that the Commission does not set pipeline safety standards, EERA staff believes it reasonable for the applicant to voluntarily accept a special permit condition requiring the installation of check valves or pressure sensing valves that automatically close when pipeline decompression occurs. These valves could then close more quickly and reduce the impacts of a potential rupture.	20243-204403-01
	Popowski, Christine	2024-02-22	First responders and health professionals: CO ₂ pipelines pose unique problems for first responders and health care providers. Because CO ₂ is colorless and odorless, both victims and first responders have no way of knowing what is causing the health problems. In addition, first responders require special equipment, including non-internal combustion engines, to respond to a CO ₂ disaster. The DEIS does not consider the burdens this will put on local EMS and health providers in the case of a pipeline rupture or accident or an assessment of how they should be prepared to respond given the unique needs. The DEIS includes Summit's September 2022 Emergency Response Plan (Appendix N). This plan is not only outdated but also unclear as to how local EMS and first responders will interact with the applicant in the event of a leak or rupture. Though the plan talks of multiple company personnel as playing roles in emergency response, it ignores the fact that the applicant only plans on having one full-time employee at the capture facility. Local first responders deserve more clarity about how they will be expected to respond to an emergency and what the applicant will do to ensure they are adequately equipped and informed for such an event.	Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that is not outdated but would be revised as required by PHMSA, if the project is approved.	20243-204403-01
	Popowski, Christine	2024-02-22	Compliance with PHMSA Rules: The DEIS accepts Summit's assurances that it will "comply with federal emergency response requirements," but as noted in a Pipeline Safety Trust report and by the Pipeline Hazardous Material Safety Administration (PHMSA) itself, the current emergency response requirements are dangerously outdated. Setbacks: The DEIS states that the PUC "cannot set safety standards" for Summit's proposed pipeline. PHMSA has expressly said in public letters to CO ₂ pipeline companies like Summit that state and local authorities can exercise their powers to regulate land use—including setback distances—and that "nothing in the federal pipeline safety law impinges on these traditional prerogatives of local—or state—government." The PUC must consider where the pipeline is placed and what is the safest option for Minnesotans, which	Although the Commission cannot set safety standards for pipeline construction or operation, state or local units of government may, to the extent authorized by law, set land use requirements that indirectly contribute to pipeline safety by regulating the activities of third parties located in the pipeline's vicinity. The Commission's obligation is to identify a pipeline route consistent with the criteria found in statutes and the applicable administrative rules. Federal law, by contrast, exclusively prescribes pipeline safety requirements.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			means the PUC can and should determine what routing, setback, and depth requirements are necessary to adequately protect Minnesotans.		
	Raether, Kathy	2024-02-12	The meeting on Feb. 7th was very informative. We enjoyed talking to Andrew learning more about this project. I object to the northern route, the one straight west of the ethenol plant for two reasons. Number one because there are more people to get easements from and number two - there are at least a dozen homes close to the pipeline if there was a leak it could affect all their homes. Also, when you would get to North Dakota, you would be close to the Sugar Beet Plant. Thank you	Thank you for your comment.	20243-204403-01
	Reisenweber, Doretta	2024-02-22	Hello, I am now a citizen of Duluth, MN, but have lived in the eastern Dakotas and watched with concern Summit's CO ₂ risky pipeline proposal. These pipelines lack a fail-safe history and have no business being placed anywhere. As much as the world needs to capture carbon, please learn the facts and don't swallow the myths we'd all like to believe, as I did until I learned differently.	Thank you for your comment.	20243-204403-01
	Reisenweber, Doretta	2024-02-22	The PUC needs to decide first, IF the pipeline could even be safely placed and routed, yet the DEIS notes a considerable handicapping of the PUC when it says the PUC " cannot set safety standards " for Summit's proposed CO ₂ line. What? That is backwards when the company writing the DEIS tells the government agency charged with regulating and protecting the environment and public, what it may and may not do. The reality is that the PHMSA has written publicly to CO ₂ companies like Summit that "nothing in the federal pipeline safety law impinges on coal or state government. The PUC needs to decide IF the pipeline can be safely placed and routed. If not, then it is the duty of the agencies involved to reject the pipeline company's plan. Thank you for making the time to read the public's comments. It restores my faith in democracy to believe the people can still be heard and listened to.	Although the Commission cannot set safety standards for pipeline construction or operation, state or local units of government may, to the extent authorized by law, set land use requirements that indirectly contribute to pipeline safety by regulating the activities of third parties located in the pipeline's vicinity. The Commission's obligation is to identify a pipeline route consistent with the criteria found in statutes and the applicable administrative rules. Federal law, by contrast, exclusively prescribes pipeline safety requirements. Section 3.4 of the EIS has been revised with this information.	20243-204403-01
	Reisenweber, Doretta	2024-02-22	Greetings from Duluth, Mn, Having lived half my years in the eastern Dakotas, the CO ₂ lines proposed to run from Iowa and Nebraska up through the Dakotas and meandering into Minnesota, caused me no undue concernfor the land, the water, the people and animals.	Thank you for your comment.	20243-204403-01
	Reisenweber, Doretta	2024-02-22	A look at the decades long failures of the fossil fuel industry's PR plan and tax-funded boondoggle was concerning enough, but I was stunned to learn of the dire health and safety issues in the not unlikely event of a rupture. For example, 25 minutes are needed to shut off the valves of this pipeline carrying toxic, odorless, disabling gas. I see no safety measures such as CO ₂ detectors at the valves or elsewhere along the pipeline. Instead Summit claims it will provide folks living within 1,000 feet of the line indoor CO1 detectors. By the time this toxic gas reaches the homes, it will be too late for folks working outdoors, for animals, for children playing in the yard.... Appendix G clearly acknowledges that "a full rupture results in impact distances too quickly for an early warning device, such as an oxygen detector." The DEIS just pointed out a major health and safety problem.	Text in Section 4.5 on valve closure time has been corrected from 25 minutes to 10 minutes. Elsewhere in the EIS, including the rupture analysis, valve closure time is listed/calculated as 10 minutes. Section 8.5.3 has been revised to note that, while acknowledging that the Commission does not set pipeline safety standards, EERA staff believes it reasonable for the applicant to voluntarily accept a special permit condition requiring the installation of check valves or pressure sensing valves that automatically close when pipeline decompression occurs. These valves could then close more quickly and reduce the impacts of a potential rupture.	20243-204403-01
	Reisenweber, Doretta	2024-02-22	Please do not approve this pipeline with such considerable health and safety risks not only to folks living along the line, but that of the pipeline workers themselves and to the first responders. Given that Summit plans only one full-time worker at the capture facility, the DOC and PUC need to insist that Summit provide clear instructions on the measure first responders must take in a pipeline emergency and how the company (Summit) will make sure the first responders are well-equipped and well-informed when such an emergency arises. Please insist that Summit's line workers be as well- equipped and informed, too.	Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that would be revised as required by PHMSA, if the project is approved. The Emergency Response Plan includes steps that workers would take in the event of an incident. Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Reisenweber, Doretta	2024-02-22	My name is Doretta (Dorie) Reisenweber. I have lived in Duluth for over 15 years and been much concerned with water issues especially the failing Enbridge Line 3/93 and risky copper/nickel mining proposals which would threaten the waters of northeastern Minnesota, namely the Boundary Waters and, even more importantly, Lake Superior which contains one tenth of the world's fresh water supply, in this time when one fourth of the world's people do not have access to safe drinking water.... In a time when over half of Minnesota does not have safe water. This is not fly-over country. No governing nor advisory body dare risk contaminating our precious water no matter the cost/benefit ratio. No price can be put on clean water.	Thank you for your comment.	20243-204403-01
	Reisenweber, Doretta	2024-02-22	Missing from the scope of the DEIS are ramifications to northeastern Minnesota' where CO ₂ might be stored. Yes, that's right. In February of 2022, the DOE announced it was backing Rio Tinto's team to explore carbon storage at the proposed Talon (Rio Tinto major partner) nickel mine near Tamarack. All that to the tune of \$6.2 Million taxpayer dollars. Any contamination from the Talon mine were it to be permitted, would drain into the St. Croix and Mississippi Rivers affecting the drinking water of millions of people in addition to impacting the rich wild rice in area lakes and streams. What would prevent CO ₂ stored there from such leaking? Of course, that has not been addressed. It has not actually been proposed., but it sure has been put out there to consider. Fines would not suffice to restore any negative impact. Speaking of fines. An \$18 Million fine was leaved against global bad actor Rio Tinto recently. Fines are just part of big business. Fines don't stop bad actors. How might Rio Tinto with its notoriously bad reputation be connected to Summit? If so, the DOC or PUC must look beyond the CO ₂ pipeline's pipedream promises toward hard proof and examples of such storage processes ever working for a sustainable length of time in water-rich environments. Fractures in the bedrock of northeastern Minnesota should preclude the consideration of CO ₂ storage. Of course, that has not been addressed in the DEIS nor would it be in the EIS, as it has only been suggested, not officially proposed, Nonetheless, in my experience, what big money wants, big money usually gets. While I recognize the world needs solutions to carbon dioxide emissions, we must not let those needs and unproven storage methods usurp clean water north of Fergus Falls, or Tamarack, or anywhere else in the entire world. Please bear in mind the ramifications of the proposed OtterTail to Wilkin Counties CO ₂ Pipeline Project which could affect water well beyond its proposed route. Say no to this project, before the inch becomes a mile. The camel is already nosing around the edges of the tent. Thank you for listening and looking ahead.	Thank you for your comment. An alternative that does not transport CO ₂ into North Dakota as proposed by the applicant is outside the scope of the EIS.	20243-204403-01
	Roehl, Jonathan	2024-04-23	I feel the pipeline will create more pollution and use more energy than it is trying to solve.	Thank you for your comment.	20243-204403-01
	Rohlik, Gary	2024-02-13	I am Gary Rohlik I live in Vesta township and own and farm land where the co2 pipeline is purposed to go. I am very concerned what this pipeline could do to our roads during installation and how it will make our land go down in value and how it will affect our yields forever.	Road crossings are addressed in Section 5.4.9.2, property values are addressed in Section 5.4.7, and impacts on crop production are addressed in Section 5.5.1.	20243-204403-01
	Rohlik, Gary	2024-02-13	And if the pipeline would ever rupture how it would contaminate our water and air and how many people would be killed or injured before it is repaired.	Risks of a potential CO ₂ release and potential impacts are described in Chapter 8 of the EIS.	20243-204403-01
	Rohlik, Gary	2024-02-13	I am also very worried about the amount of water that is going to be used to cool the co2 to be able to put it in the pipeline that we will run short on water.	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has also been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-01
	Rohlik, Monica	2024-02-22	I live in Vesta township and am concerned how a Co2 pipeline would affect our water and air quality. And also what it would do to the value of our land and what construction would do to our roads. With the extra amount of water that would need to be used that we would run short on water also. I don't think it is worth risking so many human lives that could be lost in case of a rupture of a Co2 pipeline.	Thank you for your comment.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Ross, Jean	2024-02-09	I'm Jean Ross and I live in Minneapolis. I fought the Line 3 "reconstruction" from the beginning to the end because I didn't think Enbridge cared about preserving our pristine woods and waterways in their pursuit of profit. Minnesota's experience with the Line 3 / 93 pipeline construction demonstrates the serious harms that these types of projects cause to water resources and then state agencies don't hold them accountable for those harms.	Thank you for your comment.	20243-204403-01
	Ross, Jean	2024-02-09	The proposed route for Summit's pipeline network will pose dangers to the many water crossings, wetlands, aquifers, and other sensitive water bodies along the route. More research and analysis are needed to understand how a CO ₂ pipeline leak or rupture will impact Minnesota's precious waters and the fish, amphibians, reptiles, waterfowl, birds, and insects that rely on it.	Potential impacts on water resources are described in Section 5.7.8 and potential impacts on wildlife resources and their habitat are described in Section 5.7.10. Potential impacts of a CO ₂ release on water and wildlife resources are discussed in Section 8.3.4. Stand-alone studies concerning impacts on water resources, wildlife, and wildlife habitat are outside the scope of the EIS.	20243-204403-01
	Ross, Jean	2024-02-09	Much of southern Minnesota is suffering from a drought. The DEIS fails to discuss the impacts of an increase in water use on local water supply. The carbon capture process can double water requirements at a facility and increase toxic wastewater discharge. The DEIS states that Summit "anticipates" an average water use for the operation of the carbon capture equipment of 13 million gallons per year. There must be a careful, case-specific assessment done of how the installation and operation of carbon capture will exacerbate drought conditions and existing pollution sources. Summit has not been transparent with its true demands for water resources so it is impossible to know the full impacts. Why should Minnesota risk our fresh drinking water supply and commit to an infrastructure when the proposing company has not been transparent?	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-01
	Ross, Jean	2024-02-09	The DEIS says that "drilling fluids and additives for the HDD would be non-toxic to the aquatic environment and humans," however, even supposedly "non-toxic" drilling fluid is chemical waste that has been found to be harmful to plant and animal species. The DEIS also states that "drilling mud mixed with additives that are not on the MDH-approved additive list and/or do not meet drinking water quality certification standards would be disposed of as solid waste at an approved facility, or the applicant would obtain a land application permit from MPCA." The DEIS does not discuss the risks of applying drilling mud, especially with additives not approved by MDH, to the land.	As described in Section 5.7.8.2, an additive approved by MDH or meeting NSF International/ANSI Standard 60, Drinking Water Treatment Chemicals – Health Effects, might need to be mixed with the drilling mud for viscosity or lubricating reasons and to reduce the potential for an inadvertent release or failed HDD. The specific additive used would depend on the conditions at the crossing location and would be determined by the HDD contractor. The EIS discloses the potential for an inadvertent release of drilling mud and describes potential impacts in Chapter 5. Land application of drilling mud and potential impacts are addressed in Section 5.7.6.2.	20243-204403-01
	Rozek, Ellen	2024-02-22	As a person in her mid-thirties who has spent her whole life under the looming shadow of climate change, I have serious concerns about the long-term efficacy of this project and the risks it poses to the clean water supply all Minnesotans depend on.	Thank you for your comment.	20243-204403-01
	Rozek, Ellen	2024-02-22	For one thing, the DEIS consistently fails to properly account for the real CO ₂ emission and climate impacts of the project. Summit states that the capture facility "is designed to capture 100% of the CO ₂ produced by the ethanol plant." However, there is no carbon capture facility in the world, ethanol or otherwise, that captures carbon at a rate of 100%. Summit's claim is not supported by any data/information or verified by a third party, which renders it baseless.	Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios of 100 percent, 70 percent, 40 percent, and 10 percent.	20243-204403-01
	Rozek, Ellen	2024-02-22	Carbon capture technologies are also highly energy intensive and will significantly increase the carbon emissions at the facility from electricity use. The DEIS uses the Midwest Reliability Organization West Region average to calculate these emissions, which is unnecessarily inaccurate given the availability of the actual emissions factor from Great River Energy.	Electricity emissions are included in Table 5-39. These numbers have been revised to reflect the electricity emission factor associated with LREC, which would provide electricity to the project. The revised electricity emission factor is 132.2 gCO ₂ e/MWh. This was calculated from LREC's energy resource mix in which nearly half comes from clean energy sources. Because LREC has a lower emission factor than the Midwest Reliability West Region emission factor (684.35 gCO ₂ e/kWh),	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				which was used in the draft EIS, calculated electricity emissions have decreased.	
	Rozek, Ellen	2024-02-22	Finally, the applicant states that the anticipated lifetime of this project is 25 years. This means at the end of its life; the project could stop capturing the CO ₂ from the ethanol plant. Unless the ethanol plant ceases operations at that point in time, it will continue to emit CO ₂ unabated into the future. Given the urgent need to limit the amount of CO ₂ pollution in order to prevent a complete climate collapse, the high likelihood of ongoing CO ₂ pollution is a serious concern.	Section 2.7 describes project decommissioning. If the ethanol plant continues to operate beyond the life of the proposed project, its CO ₂ emissions would not be captured.	20243-204403-01
	Rozek, Ellen	2024-02-22	Since the proposed route for Summit’s pipeline network includes many water crossings, wetlands, aquifers, and other sensitive water bodies, it is imperative that the risk this pipeline poses to the surrounding water supply be comprehensively understood. More research and analysis are needed to understand how CO ₂ disperses in water and what risks a CO ₂ pipeline leak or rupture poses to Minnesota’s precious waters and the fish, amphibians, reptiles, waterfowl, birds, and insects that rely on it to survive.	Potential impacts of a pipeline rupture on water resources and wildlife are addressed in Section 8.3.4. Stand-alone studies concerning impacts on water resources, wildlife, and wildlife habitat are outside the scope of the EIS.	20243-204403-01
	Rozek, Ellen	2024-02-22	And because much of southern Minnesota is suffering from the consequences of drought and over-commitment of our fresh drinking water supplies, there must be a careful and case-specific assessment done of how the installation and operation of carbon capture will impact current drought conditions and exacerbate existing pollution sources. Moreover, Summit has not finalized its water appropriation sources or volumes needed for construction, so it is impossible to know the full impacts of those appropriations on water resources. Why should Minnesota risk our fresh drinking water supply and commit to an infrastructure when the proposing company has not been transparent with its true demands for water resources?	Additional information has been added to Section 5.7.8.2 to address the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	20243-204403-01
	Rufer, Stephen	2024-02-22	I am hopeful that the project gets approval as soon as possible. I believe it is a great step toward slowing/stopping climate change. I have no personal stake in the project except to improve our environment.	Thank you for your comment.	20243-204403-01
	Salfer, Jim	2024-02-23	I am asking that you look at this project very closely, the decition will effect other counties also. Please pay close attention to water usage, safety and future maintenance. Thanks	Thank you for your comment.	20243-204403-01
	Samargia, Jerry	2024-02-21	Summit Carbon Solutions’ proposed carbon capture project is an important part of our state’s and our nation’s climate agenda. Not only will it capture millions of tons of CO ₂ , but it also supports the low-carbon fuel market, which is an important initiative also aimed at lowering our country’s carbon footprint. In addition to lowering emissions in Minnesota, the project will create good-paying jobs while preserving the ethanol industry, an important part of our state’s economy. This project brings us closer to meeting our country’s and our state’s emissions goals and brings strong economic benefits to rural Minnesota. For those reasons, I urge the Public Utilities Commission to grant Summit Carbon Solutions a permit.	Thank you for your comment.	20243-204403-01
	Schaefer, Lee	2024-02-23	I am the Reverend Doctor Lee Schaefer. I am concerned with the impact this new oil pipeline will have on the environment. The potential for an oil leak or causing water to escape into the surrounding soil thus exacerbating our already diminished water resources due to the drought we are experiencing caused in part by climate change.	This EIS is for a CO ₂ pipeline, not an oil pipeline; therefore, there is no potential for an oil leak or other related incidents occurring as a result of this project. Potential impacts of a CO ₂ leak are discussed in Section 8.3.	20242-203795-01
	Schaefer, Lee	2024-02-23	Going forward this project has not taken sufficiently into account the continued disruption of the environment due to the continued reliance on fossil fuels. Thank you for your consideration to stop this hazard to humanity both now and in the future! Rev. Dr. Lee Schaefer	Thank you for your comment.	20242-203795-01
	Schmalle, Verlynn	2024-02-23	The EIS for this project “does not account for land use change.” Nor does it even reference in the footnotes the premier study on GHG life cycle emissions published by the National Academy of Sciences led by Tyler Lark which found that ethanol from corn is likely to increase GHG emissions by at least 24% due to the impacts of land use changes. This is a fatal error. To meaningfully address CO ₂ emissions, the State needs to protect and preserve at least 5 million acres just to reverse the damage caused by the overextension of row crops over the last 30 years. Since 1990, row crops have expanded over 4.2 million acres at the expense of cover crops (-3.4 million acres), CRP (-0.7 million acres), grasslands and pasture (- 0.9 million acres) per USDA reporting.	Section 6.1.3 has been revised to discuss the debate between Lark et. al. and GREET model authors.	20242-203808-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>This expansion has destroyed important GHG sinks such as peatlands and tall grass prairies as row crops have expanded from the traditional corn belt in southern Minnesota to more vulnerable ground in the west and north.</p> <p>In 2010, the Legislature directed the MPCA to develop a rule to protect fish and aquatic life in Minnesota from nitrogen and nitrites. The MPCA spent the money studying the issue but declined to propose any rules to the legislature. No rule, no responsibility.</p>		
	Schmalle, Verlynn	2024-02-23	<p>In 2013, Governor Dayton and Commissioner Stine developed a strategic plan for nutrient reduction with goals of a 20% reduction in nitrogen loads in the Mississippi by 2025 and a long-term goal of a 45% reduction as part of the hypoxia task force. No part of the plan has been meaningfully implemented.</p> <p>In 2019, Governor Walz issued executive order 19-35 establishing the Governor’s Council on Biofuels. Despite the language in the order to include environmental and conservation interests, environmental interests were not represented. The Council was composed of Minnesota Corn Growers, the ethanol industry, the biodiesel industry, service stations, the petroleum industry, and the appointed staff from state agencies. Executive Order 19-35 granted the Council extraordinary authority to define policy for the Department of Agriculture, Department of Transportation, Department of Commerce, and the MPCA. This pipeline is just another example of the regulatory capture resulting from Executive Order 19.35.</p>	Section 6.2.3.1 discusses some modeling platforms available to estimate various GHG emissions associated with agricultural systems. One of the alternative agricultural practices discussed in the EIS included reducing synthetic nitrogen-based fertilizers. A rigorous study of nitrogen application rates and their impact on emissions and soil sequestration rates is outside the scope of the EIS.	20242-203808-01
	Schmalle, Verlynn	2024-02-23	<p>Combined, the lack of regulation and the unchecked promotion of ethanol from corn has resulted in devastating adverse impacts on the state’s air, water, and native species. Consequently, the MPCA reported a 4% increase in GHG emissions from agriculture from 2005 to 2020 (excludes Forest land use) and a 62% increase in nitrogen loads in the Mississippi at Red Wing in 2018. The current load on the State's “working lands” is not sustainable and does not provide a path to the state’s greenhouse gas or nitrate reduction targets. There are four reasons for the failure to make meaningful reductions in GHG emissions from agriculture and nitrogen loads in both our state’s groundwater and surface waters.</p> <p>1) Agriculture pollution reduction programs are spread across multiple agencies – MPCA, DNR, BWSR, DOH, DOA, where they are small items and lower priority.</p> <p>2) Programs have been almost entirely voluntary.</p> <p>3) Federal and state promotion of row crops provide an overwhelming financial incentive not to participate.</p> <p>4) Lastly, there has been a lack of executive leadership.</p> <p>To correct, we need to reverse these items:</p> <p>1) We need Executive leadership. We need the Governor to prioritize GHG reduction, soil health, and nitrate reduction as a necessary goal and to designate an agency to lead and coordinate in the effort.</p> <p>2) We need the state to begin to move away from the promotion of row crops in general and begin weaning the state off ethanol from corn in particular. The state needs to acknowledge the science that ethanol from corn is a net GHG contributor and does not provide a path for the state to achieve GHG emissions reductions goals.</p> <p>3) We need to provide a bigger economic incentive to participate in GHG emission reduction, soil health, and nitrate reduction programs in agriculture and move beyond voluntary compliance where it is necessary to achieve the state’s stated goals.</p> <p>4) We need a comprehensive plan with specific programs across all agencies to assure meaningful action is made toward our GHG and nitrate reduction goals. The current Climate Action Framework (CAF) is not that plan.</p>	Thank you for your comment.	20242-203808-01
	Schmalle, Verlynn	2024-02-23	<p>I strongly encourage the PUC, the Governor, and the MPCA to stop advancing the false science that ethanol from corn is a sustainable biofuel and stop covering up the devastating impact on the air, water, and native species that Executive Order 19-35 has had on our state. It should start with the rejection of the Otter Tail to Wilkin Carbon Dioxide Pipeline.</p> <p>Thank you for the opportunity to comment on this important matter.</p>	Thank you for your comment.	20242-203808-01
	Schmalle, Verlynn	2024-02-27	<p>Attached are supporting documents that you may find useful in your write-up to the Commissioners and in your final EIS. I hope you find them useful.</p> <p>Attachments include: Environmental outcomes of the US Renewable Fuel Standard (Lark et al., 2022), USDA Crop Acres 1990-2020, MPCA Ag GHG ex Land Use, 5-Year Progress Report on Minnesota's Nutrient Reduction Strategy (2020), MPCA Aquatic Life Rule, Executive Order 19-35, Report in fulfillment of Executive Order 19-35 establishing the Governor's Council on Biofuels (2020), EPA Letter, Plowing away the prairie, at a price (Marcotty, 2012)</p>	Thank you for your comment.	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Schmidt, Dale	2024-02-26	<p>Summit Carbon Solutions of the State of Minnesota would follow and read Summit Carbon Solutions actions already, pushing, pushing eminent domain powers in Iowa, which would force unwilling landowners to sell them access to their property for the pipeline, which is unconstitutional in the aspect should be a waring along that it should be denied here. My family has lived and owned this farm since 1887 and has no intention of compromising that safety or beauty that is present.</p> <p>At the information meeting, May 3, 2023, and February 7, 2024, in Fergus Falls, Summit Carbon Solutions, said they were a private owned company that was mentioned in the meeting that they could not use eminent domain, so if I was to decline access, I really shouldn't have to work about my family's safety of a pipeline being built or constructed on my property.</p> <p>I am in the process of building a building structure along Highway 116 close to within the 40 foot setback required by Otter Tail County highway department. It will be built on either there or on County Highway 11 on property that is owned by either myself or spouse.</p>	Thank you for your comment. As indicated in Section 3.5, the applicant cannot exercise the power of eminent domain for the project.	20243-204403-02
	Schmidt, Jerry	2024-02-26	I have sold my farmstad on 240th St Fergus Falls and am moving to 24575 CO Hwy 11 soon. One of the proposed routes goes through my property. I do not want a pipeline on my property or even close if I have my say. Summit Carbon Solutions say its safe. But have read it is not. They have pushed for eminit domain of which is unconstituional. A foreign owned company backing projects like this should be stopped.	Thank you for your comment. Section 8.3 addresses effects on human health from an accidental release of CO ₂ . As indicated in Section 3.5, the applicant cannot exercise the power of eminent domain for the project.	20243-204403-02
	Schmidt, Sharlene	2024-02-26	I have attached a portion of an article that I ran across that explains my beliefs and/or position and agree 100% of this. As in the article our 135 plus years property in the family just gets taken away from us, WRONG! We are entitled to have our rights. We currently have bids to construct a building which will be in regulation with Otter Tail County, set back allowances. This stiuctional will be constructed along Highway 116 or County Highway 11, on property that myself of my spouse own. <i>[Attached is an article titled "There is not compromise on private property rights" by Amanda Radke]</i>	Thank you for your comment. As indicated in Section 3.5, the applicant cannot exercise the power of eminent domain for the project.	20243-204403-02
	Schuler, Kathleen	2024-02-22	I am a retired public health professional who is working for a healthy climate for all. I am opposed to putting more pipelines in the ground. We are seeing the adverse effects from the Line 3 project, which has experienced aquifer breaches and frac outs. The proposed summit pipeline has the same potential for harm to our waters, our land and our local economies.	Thank you for your comment.	20243-204403-01
	Schuler, Kathleen	2024-02-22	CO ₂ is a hazardous material in high concentrations. The DEIS consistently underplays the known and unknown risks of transporting large amounts of CO ₂ at high pressures through a pipeline. The DEIS does not consider the burdens this will put on local EMS and health providers in the case of a pipeline rupture or accident or an assessment of how they should be prepared to respond given the unique needs.	<p>Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that would be revised as required by PHMSA, if the project is approved.</p> <p>Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.</p>	20243-204403-01
	Schuler, Kathleen	2024-02-22	The DEIS fails to properly account for the real CO ₂ emission and climate impacts of the project. The estimated rate of capture is highly unlikely, and the project will likely result in increasing carbon emissions from electricity. in addition, there is no guarantee of permanent CO ₂ storage, and it is highly likely that most of the CO ₂ will be used for EOR, thus negating this project as a potential climate solution.	Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios of 100 percent, 70 percent, 40 percent, and 10 percent. Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	20243-204403-01
	Schutz, Elizabeth	2024-02-23	My name is Elizabeth Schutz and I oppose this project. We have to stop believing in the "magical" solutions like carbon capture that promise us an easy way out of the climate crisis. We have to do the hard work of moving beyond things like ethanol and oil - that means saying goodbye to their money and empty promises. This really shouldn't be hard - companies could be positioning themselves	Thank you for your comment.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			to capitalize on legitimately clean technology, they're just refusing to do so because they've invested so heavily into existing systems. They have blinders on. These companies are run by people who don't ever think about long term solutions or how their decisions impact people who are not like them.		
	Schutz, Elizabeth	2024-02-23	The DEIS consistently fails to properly account for the real CO ₂ emission and climate impacts of the project and the long term impact of carbon storage. Who's to say this company won't be gone in 25 years? Leaving the people who live here to clean up their messes? This has happened hundreds of times in the past - regular citizens left holding the bag once corporate entities have spoiled water, soil, and air with their toxic activities.	Section 2.7 describes decommissioning of the project. This section was revised to describe the financial assurances to be provided by the applicant for costs associated with decommissioning.	20243-204403-01
	Schutz, Elizabeth	2024-02-23	Please do not put regular people and the planet at further risk. We need to invest in clean energy solutions that actually work; not some oil executive's creative way to greenwash his company's pollution. Do not approve this project. Have some courage and call BS on this.	Thank you for your comment.	20243-204403-01
	Shayne, Al	2024-02-23	for nature, wildlife and the surrounding communities, the impact will be sensational, devastating, deleterious...the only #\$\$%ing "minimal impact" will manifest from the corporate industrial complex, and their benefactors and co-conspirators determined to promote a toxic agenda, a toxic wasteland of no benefit, collectively counterintuitive...	Thank you for your comment.	20243-204403-01
	Slama, Kay	2024-02-14	Dear Environmental Review Manager Andrew Levi, I urge you to carefully consider the impact any decisions or actions regarding this issue will have. there are loads of problems with carbon pipelines The North Dakota Public Service Commission denied Summit's siting permit application for underground sequestration, citing many issues that the company had not addressed adequately. Until ND allows the pipeline, the MN Public Utilities Commission should pause its permitting for the pipeline, since there's no place for the CO ₂ to go. Unfortunately, on August 31, the PUC refused to make that reasonable decision, and we need to let them know that was unwise for Minnesota.	Thank you for your comment.	20243-204403-01
	Slama, Kay	2024-02-14	What about human safety? CO ₂ is an asphyxiant-it keeps our lungs from getting oxygen when we breathe. CO ₂ pipelines must be pressurized at three times the rate of a natural gas pipeline (1,200-2,800 psi). Ruptures can occur for a number of reasons. One cause of ruptures can be shifting ground, whether from flooding or the ground sinking as water is used for irrigation. According to the Pipeline Safety Trust, many chemical impurities can get into the line. Any water molecules in the pipeline react with CO ₂ to form corrosive carbonic acid.	Risks of a potential CO ₂ release and potential impacts are described in Chapter 8. As noted in Chapter 2, the capture facility would include dehydration equipment to remove water from the CO ₂ . The text in Section 5.7.2 has been expanded to clarify that the pipeline would be buried underground with sufficient cover to protect it from flooding.	20243-204403-01
	Slama, Kay	2024-02-14	Ruptures have occurred in carbon pipelines, causing human and animal deaths. Carbon is heavier than air, and its unpredictable flow depends on terrain and changing weather. Without wind, it may just find low spots and sit there for a long time. NPR and other media reported on a pipeline rupture in Mississippi that caused 45 people to be hospitalized. It kept cars and emergency vehicles from working because combustion engines need oxygen. Emergency responders need breathing apparatuses that cost more than \$6,000 apiece, so they have to call in a specialized hazardous materials team, and our closest team is in St. Cloud. The planned carbon pipeline routes run close to homes, towns, and schools, so the CO ₂ plumes could reach them. PMHSA, the agency responsible for CO ₂ pipeline standards, is reviewing them in light of the dangers. These are more reasons construction of carbon pipelines should pause while safety is being worked out.	Thank you for your comment. Risks of a potential CO ₂ release and potential impacts are described in Chapter 8 of the EIS, including the incident in Satartia, Mississippi. As noted in Section 8.5, the applicant has committed to provide CO ₂ air monitoring equipment to first responders and to pay all costs associated with CO ₂ response training and air monitoring equipment.	20243-204403-01
	Slama, Kay	2024-02-14	Land issues need to be considered with carbon pipelines. Installation compacts a wide swath of soil that is almost impossible to loosen so roots can get into it. The pipelines heat land near 90 degrees, and both resulting evaporation and heat make it harder for plants to grow. Restoring soil health and productivity is a long-term struggle both current farmers and future generations will have to bear.	Impacts on soils and mitigation (including for soil compaction) are addressed in Section 5.7.6, and impacts on crops are addressed in Section 5.5.1 and 5.7.7. As indicated by the definitions found on Page 5-1 of the draft EIS, "long-term impacts extend beyond the end of construction and are generally associated with operation of the project." Disturbance to soils and crops from construction can result in impacts that extend beyond the construction phase, and the text in the final EIS has been revised to indicate that impacts can be long term.	20243-204403-01
	Slama, Kay	2024-02-14	There are many stories about Summit bullying landowners and using misinformation to obtain easements across farm property. Easement payments to farmers last 3 years, but the easements are permanent, so landowners are vulnerable to other uses after the 20-25-year life of the pipeline. Pipelines tend to be abandoned in place after they are no longer useable, so they remain a permanent hazard on the property and its underground water flow. Iowa is considering using eminent domain to run CO ₂ pipelines through farmers' lands without their consent. Under the Fifth Amendment, eminent domain must be for a "public use," which traditionally meant projects like roads or bridges, not the enrichment of private corporations.	As indicated in Section 3.5, the applicant cannot exercise the power of eminent domain for the project. Landowner agreements with the applicant are outside the scope of the EIS.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Slama, Kay	2024-02-14	In the big picture, pipelines encourage growing huge amounts of corn in the US, nearly half of which is used to produce ethanol. This discourages growing alternate crops that may be better for our land, need less fertilizer and irrigation, and send less pollution down our rivers and into our lakes.	Thank you for your comment.	20243-204403-01
	Slama, Kay	2024-02-14	Next are water issues. The buried carbon pipelines cross rivers and wetlands underground, which can puncture aquifers during construction, as we saw with the Enbridge Line 3 pipeline in northern MN.	Section 5.7.8.2 acknowledges that damage to aquifers is a serious problem and indicates that an uncontrolled flow of water from a shallow confined aquifer could have a significant long-term impact on groundwater. Section 5.7.8.2 also describes geotechnical investigations that would be done to identify areas where breaching of a shallow confined aquifer could occur, and sheet piling would not be used. The applicant currently has an ongoing groundwater investigation underway to further inform construction practices and is continuing to consult with DNR. As part of its coordination with DNR, the applicant has agreed to use ground penetrating radar to study the depth of the confining layer through the entire beach ridge system area crossed by the pipeline to further define existing conditions and advise on construction methodology. Furthermore, EERA staff recommends that the applicant develop, in coordination with DNR, a plan for pipeline construction in areas crossing the beach ridge system area. The plan would include, at a minimum, measures to minimize the potential for breaching a shallow confined aquifer during trenching and contingency measures to mitigate the impacts of a breach, should one occur. This information has been added to Section 5.7.8.2.	20243-204403-01
	Slama, Kay	2024-02-14	In addition to water used for testing during construction, the pipelines will require 13,000,000 gallons/per facility using the pipeline per year (from Summit's response to inquiry on water usage during Minnesota PUC 5/4/2023 scoping meeting). This constitutes a risk of drawing down our lake and river levels and aquifers.	Additional information has been added to Section 5.7.8.2 to address the volume of water that would be used by the project relative to available resources. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	
	Slama, Kay	2024-02-14	Energy issues: Much energy is needed to mine materials for carbon pipelines, which must be much thicker than any other kind to contain so much pressure. Much fuel is required to put the pipelines in the ground. Energy sources process the gases and condense CO ₂ at its sources, as well as run the pumps and bury the carbon. There is evidence that making ethanol out of corn is a life-cycle process that may use more CO ₂ than it saves. We have alternative land-use programs that encourage natural plants which sequester CO ₂ , as well as encourage more wildlife and pollute less. On top of that, a ND official admitted that pipeline CO ₂ will be used to compress fossil fuels out of the ground, a process known as fracking, which will put more CO ₂ in our atmosphere and cause more of the climate change effects we've been seeing so much lately.	The embodied carbon of CO ₂ pipelines, which includes the emissions associated with the sourcing raw materials, manufacture, and construction, was not discussed in the draft EIS. Such level of analysis is not commensurate with a reasoned choice among alternatives. The EPA's life cycle analysis for the Renewable Fuel Standard (RFS) includes emissions related to feedstock farming production and transportation, fuel production and distribution, and the end use of the finished fuel. This includes energy and material inputs used for handling, processing, and storing the feedstocks, co-products, intermediate products, and resulting fuel. The GHG emissions are calculated using emissions factors for all of the process energy (e.g., natural gas, coal) and electricity used for fuel production operations. These factors include the upstream emissions associated with extraction, transport, and distribution of the energy, and are generally determined on an average basis (e.g., grid average electricity in the United States). The upstream emissions associated with significant material inputs used to produce the renewable fuel, such as methanol for biodiesel production, are also included. The EPA's assessment of fuel production does not include	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				activities that are clearly unrelated to the fuel lifecycle (e.g., offset projects) or emissions associated with physical and organizational infrastructure (e.g., facility construction, employees commuting to the facility). Most studies, including this one, include only primary energy inputs in their estimates. Secondary inputs, such as energy required to build ethanol facilities, farm vehicles, and transportation equipment, are extremely difficult to quantify. Moreover, secondary inputs related to the ethanol plant would account for very little energy on a per gallon basis. This is because the energy embodied in fixed inputs, such as the cement used to build the plant, would have to be distributed over total production (including coproducts) during the lifetime of the plant. The life cycle phases of the ethanol being studied in the EIS focus on opportunities at the agriculture stage, as well as at the production stage, to lower the total CI score of the ethanol produced at the ethanol plant. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios of 100 percent, 70 percent, 40 percent, and 10 percent. Section 6.1.3. describes the ethanol fuel life cycle analysis used to determine CI score and low-carbon fuel standard regulatory framework. Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	
	Slama, Kay	2024-02-14	<p>So what can we do? We need to think ahead for our climate and our agriculture. We should be spending our “public” money on helping farms move away from growing so much corn. Help farmers feed people rather than make carbon-intensive ethanol, and help them diversify. We need to create markets in MN for their crops. It will take regular input to our lawmakers and state agencies to help them act with this future in mind.</p> <p>We need to do all we can to address the excess carbon that is warming our planet and causing global climate change. Carbon sequestration may indeed be one of the solutions, but not by crisscrossing our land with potentially unsafe pipelines that will threaten our land and waters and almost certainly lead to fracking for more fossil fuels. We need to focus on making our climate better, not worse.</p>	Thank you for your comment. The appropriateness of federal and state policies regarding carbon capture and ethanol is outside the scope of the EIS.	20243-204403-01
	Stamp, Amanda	2024-02-23	<p>As a Minnesota resident with family and friends impacted by multiple carbon dioxide (“CO₂”) pipeline proposals throughout the region, I am submitting the following comments regarding the draft environmental impact statement (“DEIS”) for the application for a Minnesota pipeline route permit (“Route Permit Application” or “Application”) submitted by Summit Carbon Solutions, LLC (“SCS” or “Applicant”).</p> <p>To begin, I don’t think sufficient time was given to the public to review the DEIS. Notification was made on January 23, 2024 with public informational meetings held on February 6, 7 and 8. Given the DEIS was prepared over many months, I don’t think giving the public less than 2 weeks to prepare to ask questions and just a month to review it for comments was sufficient.</p>	Minnesota Rule discusses review periods. Minnesota Rule 4410.2600, Subp. 8 requires that the information meeting must not be less than 15 days after publication of the EIS. Subp. 9 contemplates a comment period extending 10 days beyond the informational meeting.	20243-204403-02
	Stamp, Amanda	2024-02-23	<p>Environmental Impact Statement Preparation Team - I participated in the online public meeting related to the DEIS. I was alarmed by the speaker from Allied Solutions, Inc. (“Allied”) which is noted in the DEIS to be a subcontractor on behalf of the Energy Environmental Review and Analysis (“EERA”). The representative from Allied credentialed himself as someone who works with CO₂ pipelines throughout the United States. Without further disclosure as to Allied’s credentials and the selection process, how can the public know Allied is in fact impartial if its business is based on the need for CO₂ pipelines? The DEIS should clarify the credentials of the contractors relied upon, the companies assessed for hiring, disclose the contract terms and fee arrangements, and disclose why EERA determined a selected contractor is in fact qualified AND impartial.</p> <p>Additionally, the DEIS lists System Insight Engineering, LLC as a preparer, but this business is not referred to in the report making it unclear what external assistance was provided. Further, the HDR, Inc. preparers include a copy editor which indicates a report was provided. Why is that report not attached in its original form as evidence of what was considered in the DEIS?</p>	Chapter 12 has been updated to include the qualifications of the preparers of the EIS, including Allied and System Insight. The role of the copy editor was to correct grammar errors, improve text consistency, and generally improve the readability of the draft EIS for the public. No separate report was generated by this process.	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Stamp, Amanda	2024-02-23	<p>Water Resources - The DEIS water resource summary concludes the Department of Natural Resources (“DNR”) would regulate water supply appropriations, however, considering water usage is one of the most important issues that impacts all Minnesotans, the DEIS should not be deemed complete without consideration. The report includes generalities and no conclusion or analysis to water issues, and the issues noted are concerning given the recent weather in our state.</p> <p>For example, Table 5-40 concludes at underwater resources, “Minimal use of water and discharge of water is planned.” However, the report ignores water usage so there is no basis to include a statement of “minimal use”. Further, under the project design category it states “Drought could affect the project’s ability to appropriate water.” Considering parts of Minnesota are already in a drought, and I am now watering my trees to prevent them from dying, yes, water usage, allocation and the viability of this project is important even if there is a jurisdictional question related to the assessment of water. Further, “Contingency water sources would be required by permits should water not be available due to drought conditions.” It should be stated whether this location is in a drought already or close to being a drought. Isn’t the purpose of the DEIS to make these determinations for the general public rather than leaving open ended questions with significant consequences? Lastly, page 7-10 states it could take 100 to tens of thousands of years to recharge an underground reserve and that underground reserves of freshwater are limited. If we are allowing a private enterprise to use, without charge, a natural resource of the state that could take tens of thousands of years to recharge, would that not merit a complete, robust and publicly disclosed analysis?</p> <p>A complete analysis of the water usage, availability and impact to the general public must be included in the final DEIS. Further, considering the entire footprint of the project is much larger than this permit application component, the overall water usage should be considered prior to finalizing a DEIS.</p>	<p>Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.</p>	20243-204403-02
	Stamp, Amanda	2024-02-23	<p>CO₂ Release Impacts - Page ES-10 denotes a difference between leaks and ruptures and the provided context focuses on leaks. However, there is no consideration given as to the pressure within the pipe (approximately 2,000 psi), which in this case is much higher than other pipelines. As such, it is my understanding any opening in the pipeline likely would result in a rupture given the high pressure. The basis for this discussion is PHMSA data which is weighted towards other pipeline types which are under much less pressure. The report should clarify the basis for the PHMSA data and whether it is actually comparable to the specifications of the pipeline being proposed.</p>	<p>According to PHMSA Pipeline Flagged Incident Files, from 2010 through April of 2024, 136 incidents were recorded on pipelines carrying hazardous liquids (which includes CO₂) with a pressure of over 2,000 psi, across the US. Of those 136 incidents, 116 incidents were leaks, 2 incidents were ruptures, and the remaining 18 incidents were classified as "other." Based on the PHMSA Pipeline Flagged Incident Files, pressures greater than 2,000 psi did not result in more ruptures than leaks. Section 8.2.2 has been revised to include this information.</p>	20243-204403-02
	Stamp, Amanda	2024-02-23	<p>Region of Influence - The Table 5-1 Region of Influence for public health and safety is listed as Otter Tail and Wilkin Counties. However, later in Section 5.4.6, Populated Areas, it states the ROI is the local vicinity which was previously defined as 1,600 feet plus the 250 feet of route width. These 2 data points seem conflicting. The DEIS should disclose how the ROI was determined and why that was concluded to be sufficient. The dispersion modeling summary on page ES-10 states mild respiratory stimulation was calculated at 910 feet, and I presume this is based on the “conservative assumptions” that are not disclosed.</p>	<p>Public health and safety as discussed in Section 5.4.8 analyzes the effects that construction and operation accidents would have on public health services. Since the area of Minnesota that would be crossed by the project is rural, the ROI for public health and safety is defined as Otter Tail and Wilkin Counties to include the nearest hospitals and the range of first responders available to provide emergency response if needed during construction or operation of the project.</p> <p>The conservative assumptions mentioned in the Executive Summary are defined and discussed in Section 8.3.1.2 and Appendix G.</p>	20243-204403-02
	Stamp, Amanda	2024-02-23	<p>For avoidance of doubt, the DEIS should also confirm whether or not the city of Fergus Falls is deemed a high consequence area per PHMSA guidelines. While the ROI used is assistive, it would make most sense to include an assessment using PHMSA rules on whether the close proximity of the capture facility to the populated city of Fergus Falls has further impacts to populated areas. I don’t see how the Minnesota DEIS would be accurate without clearly linking how the proposed siting by SCS aligns with the criteria used by PHMSA to conclude there are no impacts to the health and human safety of populations.</p> <p>Additionally, page 8-14 indicates the Fergus Falls Municipal Airport could be within the toxic impact distance. If this is a PHMSA high consequence area, that designation should be stated clearly and the impacts discussed within this DEIS.</p>	<p>Fergus Falls is a high-consequence area. However, the impact distance (at the 30,000 ppm concentration) would intersect unused fields, but not intersect any of the buildings where people would congregate. Section 8.3.1 has been revised to clarify.</p>	20243-204403-02
	Stamp, Amanda	2024-02-23	<p>Lastly, while the DEIS states the Public Utility Commission (“PUC”) can’t set safety standards, PHMSA has stated publicly that “nothing in the federal pipeline safety law impinges on these traditional prerogatives of local - or state - government.” The PUC should consider whether the pipeline is placed in the most logical location, including safety.</p>	<p>Although the Commission cannot set safety standards for pipeline construction or operation, state or local units of government may, to the extent authorized by law, set land use requirements that indirectly contribute to pipeline safety by regulating the activities of third parties located in the pipeline’s vicinity. The Commission’s obligation is to</p>	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				identify a pipeline route consistent with the criteria found in statutes and the applicable administrative rules. Federal law, by contrast, exclusively prescribes pipeline safety requirements. Chapter 3.4 of the EIS has been revised with this information.	
	Stamp, Amanda	2024-02-23	<p>PHMSA Data on Accidents Involving Liquid Pipelines - Section 8.2.2 discusses the criteria of what is deemed an “accident” per PHMSA guidelines. Of note is “personal injury necessitating hospitalization” which differs from personal injury necessitating medical attention. This distinction under-reports the actual accidents and injuries from pipelines. As such, these data points should be qualified in the report to more accurately portray the risks. For example, page 8-3 states, accurately, the CO₂ pipeline rupture in Satartia, Mississippi caused 45 people to be hospitalized and 200 to be evacuated. However, this mass injury event won’t be reported under PHMSA rules denoting how catastrophic the impacts were.</p> <p>Additionally, citation 31 infers PHMSA has declared pipelines to be the safest mode of transportation for carbon dioxide. However, my assessmet of this citation is that there is no conclusion from PHMSA that pipeline transportation for carbon dioxide is indeed safer than other modes of transportation. Given the dangerous attributes of CO₂, in order to make this conclusion there would need to be a scientific assessment of how the CO₂ in a truck or railcar is indeed less safe than having a 20 mile pipeline section of highly pressurized CO₂ escape upon an unknowing person who can’t see or smell it. Where is the science supporting this assertion? As already noted, PHMSA’s subpar standards for determining an “accident” means the widely marketed viewpoint of safety is not what a normal person would deem to be an accident. If someone must seek medical attention, I would consider that an accident.</p>	<p>It is outside the scope of this EIS to redefine the term "accident" since it is a PHMSA term and definition, as noted in this comment.</p> <p>As cited in Section 8.2.2, (General Pipeline FAQs): Question 2 on the PHMSA FAQ page defines pipelines carrying liquefied gases, such as carbon dioxide, as liquid petroleum pipelines. Question 6 states: "The nation's more than 2.6 million miles of pipelines safely deliver trillions of cubic feet of natural gas and hundreds of billions of ton/miles of liquid petroleum products each year. They are essential: the volumes of energy products they move are well beyond the capacity of other forms of transportation. It would take a constant line of tanker trucks, about 750 per day, loading up and moving out every two minutes, 24 hours a day, seven days a week, to move the volume of even a modest pipeline. The railroad-equivalent of this single pipeline would be a train of 225, 28,000 gallon tank cars. <i>Pipeline systems are the safest means to move these products.</i>" (Note that due to new citations being added during the review and revisions to the EIS, this citation is no longer Citation 31).</p>	20243-204403-02
	Stamp, Amanda	2024-02-23	<p>In addition, the DEIS doesn’t consider that PHMSA is currently undergoing a rule making process for CO₂ pipelines which is being undertaken because there is an acknowledgement after the Satartia, Mississippi disaster there is a lack of science and regulations regarding these pipelines. To know PHMSA is currently improving its rules but not requiring compliance, nor acknowledging the impacts in the DEIS, is disappointing. Why is EERA not proposing a permit condition or recommendations requiring compliance with PHMSA’s forthcoming rules? Alternatively, how is the DEIS comfortable with the forthcoming rules and what analysis is provided that informs the DEIS is adequate given its silence on that matter? The DEIS should be qualified to denote further safety considerations as well as conclude on the impact of the forthcoming PHMSA regulations.</p>	<p>Thank you for your comment. The draft EIS discusses PHMSA rules and regulations, and the pending rulemaking process it is undertaking for CO₂ pipelines, and acknowledges pending PHMSA changes to such regulations (see draft EIS, Chapter 3, Chapter 8, and Appendix G). However, PHMSA regulations (that is, their appropriateness) and related standards for CO₂ pipelines are outside the scope of the EIS (Appendix A). PHMSA regulations apply to the project and the applicant is required to comply with these regulations; thus, EERA staff believes there is no need to propose a special permit condition or compliance recommendation.</p> <p>Although the Commission cannot set safety standards for pipeline construction or operation, state or local units of government may, to the extent authorized by law, set land use requirements that indirectly contribute to pipeline safety by regulating the activities of third parties located in the pipeline’s vicinity. The Commission’s obligation is to identify a pipeline route consistent with the criteria found in statutes and the applicable administrative rules. Federal law, by contrast, exclusively prescribes pipeline safety requirements. Section 3.4 of the EIS has been revised with this information.</p> <p>The applicant has stated its proposed CO₂ pipeline would be designed, constructed, and operated to meet current PHMSA regulations, including any operational changes to PHMSA regulations that may occur in the future. To the extent applicable and in response to this and similar comments, Section 3.6 and Appendix G of the EIS have been updated to include this information.</p>	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Stamp, Amanda	2024-02-23	Greenhouse Gas (“GHG”) Emissions - The DEIS should be modified to differentiate, in detail, whether the CO ₂ discussed is biogenic or fossil fuel created. The DEIS doesn’t distinguish between the sources nor the environmental impacts of either. Further, the data presented is not clear as to its meaning. o start, the DEIS should define its meaning of greenhouse gas. The United States Environmental Protection Agency (“EPA”) doesn’t include biogenic CO ₂ in its greenhouse gas reporting as it isn’t considered a greenhouse gas emission. Given the EPA does not believe biogenic CO ₂ is a greenhouse gas, I don’t know how the state of Minnesota can determine this project decreases greenhouse gas emissions. Page 5-93 states the project provides a “net benefit to GHG emissions”, but based upon EPA guidelines, no greenhouse gas emissions are actually being captured by this project.	The project would capture and sequester the biogenic CO ₂ produced by the ethanol fermentation process at the ethanol plant. The analysis in Section 5.7.1 includes both air pollutant and GHG emissions from fossil fuel sources that would be used during construction and operation. Text has been added to the beginning of Section 5.7.1 to clarify.	20243-204403-02
	Stamp, Amanda	2024-02-23	The discussion of the emissions from the ethanol facility focuses on the CO ₂ from the fermentation process, or the biogenic CO ₂ . There is no discussion about the fossil fuel emissions from the natural gas used which undoubtedly are the emissions which are causing climate change. For example, Table 5-36 and its footnotes focus on the CO ₂ conversion from corn. The report doesn’t appear to expressly acknowledge the fossil fuels generated are not being captured nor whether they plan to be captured in the future. The process to capture biogenic CO ₂ varies from the process required to capture fossil fuel CO ₂ . Without the permit application and the DEIS being clear on which components of the emissions are being captured and transported, nothing in the DEIS can be deemed accurate. The varying emissions to be captured require distinct processes and chemicals, and the DEIS analysis and application can not be silent on this distinction as the accuracy of the entire analysis is dependent upon the distinction.	AQ and GHG emissions from the capture facility are addressed in Table 5-38 and compared to the air permit thresholds. This includes potential natural gas usage for space heating. The ethanol plant is under a Title V Permit, which regulates the allowable emissions from the plant. This project will not alter the production of ethanol from the plant. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios for 100 percent, 70 percent, 40 percent, and 10 percent.	20243-204403-02
	Stamp, Amanda	2024-02-23	Enhanced Oil Recovery (“EOR”) - The DEIS states this project does not plan or propose to use the CO ₂ to recover oil which obviously defeats the stated purpose of this project, and while the DEIS acknowledges it can not speculate on EOR use, it provides no analysis or assurances the issue is appropriately considered. For example, it is well documented government officials in the state of North Dakota publicly state the future of the Bakken oil reserves is in EOR. The DEIS page 5-101 states, “If all the CO ₂ produced by the ethanol plant is sequestered as proposed, EOR would likely continue in North Dakota using other sources of CO ₂ , other gasses, thermal methods, or chemical methods. Production of oil through EOR would not be dependent on the availability of CO ₂ produced by the ethanol plant.” The issue in this conclusion is “the ethanol plant”, because this proposal is a small component of a much larger and integrated project to aggregate significant volumes of CO ₂ and pipe it to an area of known oil reserves which require EOR. Given this point, none of the EOR discussion is actually valid in the broader context of what is happening and the broader assessment the state of Minnesota is being asked to consider. Had SCS been required to treat the multiple Minnesota pipelines of its project as one total project, this entire discussion in the DEIS would be different. Alternatively, the broader footprint should be considered to determine if the overall purpose, goals and merits of this project, even if one facility is in Minnesota, achieves the same analysis in the DEIS.	Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	20243-204403-02
	Stamp, Amanda	2024-02-23	In addition, the DEIS does not apply speculation versus facts equally. Ethanol production can’t be predicted, as stated on page 7-1, “It might fluctuate up and down.” There is an attempt to explain alternatives which root heavily in speculation, but the DEIS can be silent on EOR as it is speculative. However, more importantly, the DEIS ignores the fact the purported business plan is reliant on Federal tax credits that expire, and this is a fact. This is not speculative. Given the business plan, as disclosed, has revenue that will expire much sooner than the useful, operating or design life of the project, then the underpinnings of the project must be examined. How is this a viable business plan? To review this DEIS without that consideration, particularly as to the financial viability of the project and the obvious secondary revenue stream of enhanced oil recovery in North Dakota, the sequestration area, would be a grave disservice to Minnesotans. If the value of this project can’t prove there is revenue that is not speculative after the expiration of Federal tax credits, then it must be assumed the CO ₂ will be sold for EOR in which case the DEIS is missing a complete analysis of the impacts. Imagine if the state of Minnesota permits this project only to have the CO ₂ potentially be used in EOR in 15 years; can you imagine what the public perception of this process would be at that point?	Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	20243-204403-02
	Stamp, Amanda	2024-02-23	Corn Usage - The DEIS should include consideration of how much ethanol by product is consumed by animals and would otherwise be consumed without an ethanol plant. The amount of corn processed by ethanol producers doesn’t translate directly into lost consumption. Further, there is no consideration given to the economics of this proposed project, plus the rest of its footprint, relative to corn prices and impacts to animal producers and food prices. News reports state the sustainable aviation fuel market (which ethanol plants desire to create) could require 60additional ethanol plants in the midwest, and I can not understand how that much corn and water can possibly be grown or allocated without severe societal and economic impacts.	Potential socioeconomic impacts concerning corn crop prices, animal producers, and food prices are addressed in Section 7.2.2.1.	20243-204403-02

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Stamp, Amanda	2024-02-23	Odorant - DEIS page 8-25 states an odorant can't be included because it would require multiple injection facilities and would introduce additional logistic and design changes needed for the safe storage and overland transport of odorant. While the DEIS states safety standards can't be set, I would ask whether the applicant truly can't odorize this pipeline, and if unwilling or unable whether the siting makes any sense at all. The DEIS should focus more on this point rather than passing the buck to PHMSA.	As indicated in the EIS, CO ₂ is odorless at low concentrations but has a sharp, acidic odor at very high concentrations, such as would occur in the event of a rupture. EERA staff evaluated the addition of an odorant, as described in Section 8.5.2. Adding an odorant would fall under safety standards. The Commission cannot set safety standards for pipeline construction or operation. The Commission's obligation is to identify a pipeline route consistent with the criteria found in statutes and the applicable administrative rules. Federal law, by contrast, exclusively prescribes pipeline safety requirements.	20243-204403-02
	Stamp, Amanda	2024-02-23	I'd like to remind the PUC and other government agencies that just because something can be done, doesn't mean it should be done. The citizens of Minnesota are relying on government watch dogs to ensure the safety of our people and our resources regardless of what private businesses, non-government organizations and others think would advance commerce, labor and tax rolls. The size and novelty of this high pressure CO ₂ pipeline with multiple on-takers is truly a new proposal which has not been done before. It is important the State of Minnesota fully considers all aspects of the proposal without prejudice as there are people in rural Minnesota counting on you all to get this right. Thank you for your consideration.	Thank you for your comment.	20243-204403-02
	Steitz, Jim	2024-02-23	Carbon capture and storage is a technological mirage that the industry has dangled before legislators and regulators for decades, promising at an indeterminate future date to clean their carbon mess, while continuing to flood our atmosphere with carbon. Any scientifically literate government official should understand that the creation of carbon dioxide is an innate, inexorable aspect of releasing energy from fossil carbon, and that industry lobbyists who promise to capture their carbon are preying on either the scientific illiteracy or knowing cynicism of government officials. Do not issue pipeline permits to perpetuate the charade that burning carbon will one day be compatible with human survival.	Thank you for your comment.	20243-204403-01
	Steva, Keith	2024-02-22	Hi, my name is Keith Steva. I live in Beatty Township, St. Louis County MN. I have a technical education in engineering and have been studying carbon capture proposals of various types for years. The "solutions" I have seen appear to be false solutions to greenhouse gas emission and CO ₂ release. In fact, I'd be so bold to say these seem like public scams to convince people that continued burning of fossil fuels and indirectly consuming fossil fuel for farm equipment and related support industries including the big consumer of fossil fuel, nitrogen-based fertilizer for agriculture is ok because we are going to "capture" the CO ₂ . This is a very high-risk venture and likely to fail financially and certainly fail environmentally. The developers will take the money and leave the problems to the citizens of Minnesota. Clean water and NO BURNING or use of fossil fuels should be the goal. Not a shell game to deceive the public. The environmental costs are enormous, and risks are not controlled. This is a very bad project. I am adamantly against the pipeline.	Thank you for your comment.	20243-204403-01
	Strand, Jeffrey	2024-02-23	Comments from Jeffrey Strand, rural resident and farmland property owner in Highwater Township, Cottonwood County, MN. I am concerned about proposed CO ₂ "Carbon" Pipelines Otter Tail to Wilkin project because this IS of statewide concern and of great concern as well to rural residents in Southern and Southwest Minnesota. After living in Minneapolis and having a second home on the farm these past 21 years, we are now permanent farm home residents in another proposed project area. CO ₂ Pipelines are destructive and can wreck soil structure, disrupt drain tile systems, along with other serious and long-term impacts on productivity of agricultural lands. Large-scale and multi-state CO ₂ pipeline networks are being proposed by out-of-state corporations from various industrial facilities, but largely benefit the companies, investors and billionaires to reap windfalls from 45Q tax credits (26 USC S 45Q - Credit for carbon oxide sequestration). The economic and environmental burdens, however, are shifted to surrounding rural communities, farmers and taxpayers. There is NO actual cost-benefit for CO ₂ carbon capture pipelines is unproven as an effective way to reduce greenhouse gas emissions to combat global climate change. The proposed CO ₂ pipeline for 11 rural Minnesota counties is an unproved pilot project. Rural communities that rely upon mostly volunteer EMS services are NOT equipped to effectively respond to ruptures or leaks, thus putting rural residents at risk. The proposed CO ₂ pipeline setbacks do NOT adequately protect rural communities. The heavy use of groundwater resources by the CO ₂ pipelines puts scarce rural water resources at risk. Creation of carbonic acid in processes related to the project presents a toxic and corrosive threat to the environment.	See responses to detailed comments on each topic below.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Strand, Jeffrey	2024-02-23	CO ₂ is a hazardous material in high concentrations. The DEIS consistently underplays the known and unknown risks of transporting large amounts of CO ₂ at high pressures through a pipeline.	Chapter 8 describes the properties of CO ₂ and the impacts of a potential rupture.	20243-204403-01
	Strand, Jeffrey	2024-02-23	CO ₂ Rupture Impact Zone: According to the analysis in the DEIS, the potential impact radius for levels of CO ₂ that would be “immediately dangerous to life or health” is 617 feet. This expands to 910 feet for lower concentrations that cause dizziness, drowsiness, severe muscle twitching, and unconsciousness within a few minutes. Although Summit indicates that it will take 25 minutes for the system to shut off the relevant valves in the event of “abnormal operation,” the DEIS does not mention any meaningful safety measures for a rupture and instead suggests that it is “reasonable” for Summit to simply supply indoor CO ₂ detectors for residences within 1,000 feet of the project. But the rupture report in Appendix G states that “a full rupture results in impact distances too quickly for an early warning device, such as an oxygen detector, to be effective.” This pipeline should not be approved without a clear understanding of the risks to human health and meaningful measures to ensure the safety of people and animals in the area.	Text in Section 4.5 on valve closure time has been corrected from 25 minutes to 10 minutes. Elsewhere in the EIS, including the rupture analysis, valve closure time is listed/calculated as 10 minutes. Section 8.3.1 has been revised to note that, while acknowledging that the Commission does not set pipeline safety standards, EERA staff believes a special permit condition requiring the applicant to consider installing check valves or pressure sensing valves that automatically close when pipeline decompression occurs is reasonable. These valves could then close more quickly and reduce the impacts of a potential rupture.	20243-204403-01
	Strand, Jeffrey	2024-02-23	First responders and health professionals: CO ₂ pipelines pose unique problems for first responders and health care providers. Because CO ₂ is colorless and odorless, both victims and first responders have no way of knowing what is causing the health problems. In addition, first responders require special equipment, including non-internal combustion engines, to respond to a CO ₂ disaster. The DEIS does not consider the burdens this will put on local EMS and health providers in the case of a pipeline rupture or accident or an assessment of how they should be prepared to respond given the unique needs. The DEIS includes Summit’s September 2022 Emergency Response Plan (Appendix N). This plan is not only outdated but also unclear as to how local EMS and first responders will interact with the applicant in the event of a leak or rupture. Though the plan talks of multiple company personnel as playing roles in an emergency response, it ignores the fact that the applicant only plans on having one full-time employee at the capture facility. Local first responders deserve more clarity about how they will be expected to respond to an emergency situation and what the applicant will do to ensure they are adequately equipped and informed for such an event.	Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that is not outdated but would be revised as required by PHMSA, if the project is approved. Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.	20243-204403-01
	Strand, Jeffrey	2024-02-23	Compliance with PHMSA Rules: The DEIS accepts Summit’s assurances that it will “comply with federal emergency response requirements,” but as noted in a Pipeline Safety Trust report and by the Pipeline Hazardous Material Safety Administration (PHMSA) itself, the current emergency response requirements are dangerously outdated.	<p>Thank you for your comment. The draft EIS discusses PHMSA rules and regulations, and the pending rulemaking process it is undertaking for CO₂ pipelines, and acknowledges pending PHMSA changes to such regulations (see draft EIS, Chapter 3, Chapter 8, and Appendix G). PHMSA regulations (that is, their appropriateness) and related standards for CO₂ pipelines are outside the scope of the EIS (Appendix A). PHMSA regulations apply to the project, and the applicant is required to comply with these regulations; thus, EERA staff do not believe there is a need to propose a special permit condition or compliance recommendation.</p> <p>Although the Commission cannot set safety standards for pipeline construction or operation, state or local units of government may, to the extent authorized by law, set land use requirements that indirectly contribute to pipeline safety by regulating the activities of third parties located in the pipeline’s vicinity. The Commission’s obligation is to identify a pipeline route consistent with the criteria found in statutes and the applicable administrative rules. Federal law, by contrast, exclusively prescribes pipeline safety requirements. Section 3.4 of the EIS has been revised with this information.</p> <p>Additionally, the Applicant has stated its proposed CO₂ pipeline would be designed, constructed, and operated to meet current PHMSA regulations, including any operational changes to PHMSA regulations that may occur in the future. To the extent applicable, and in response to</p>	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				this and similar comments, Section 3.6 and Appendix G of the EIS have been updated with this information.	
	Strand, Jeffrey	2024-02-23	Setbacks: The DEIS states that the PUC “cannot set safety standards” for Summit’s proposed pipeline. PHMSA has expressly said in public letters to CO ₂ pipeline companies like Summit that state and local authorities can exercise their powers to regulate land use—including setback distances—and that “nothing in the federal pipeline safety law impinges on these traditional prerogatives of local—or state—government.” The PUC must consider where the pipeline is placed and what is the safest option for Minnesotans, which means the PUC can and should determine what routing, setback, and depth requirements are necessary to adequately protect Minnesotans. Minnesota’s recent experience with pipeline construction demonstrates the serious harms that it causes on water resources as well as a tendency by state agencies to under-account for those impacts.	Although the Commission cannot set safety standards for pipeline construction or operation, state or local units of government may, to the extent authorized by law, set land use requirements that indirectly contribute to pipeline safety by regulating the activities of third parties located in the pipeline’s vicinity. The Commission’s obligation is to identify a pipeline route consistent with the criteria found in statutes and the applicable administrative rules. Federal law, by contrast, exclusively prescribes pipeline safety requirements.	20243-204403-01
	Strand, Jeffrey	2024-02-23	Dangers to water and waterbodies: The proposed route for Summit’s pipeline network includes many water crossings, wetlands, aquifers, and other sensitive water bodies. More research and analysis are needed to understand how CO ₂ disperses in water and what risks a CO ₂ pipeline leak or rupture poses to Minnesota’s precious waters and the fish, amphibians, reptiles, waterfowl, birds, and insects that rely on it to survive.	Potential impacts of a pipeline rupture on water resources and wildlife are addressed in Section 8.3.4. Stand-alone studies concerning impacts on water resources, wildlife, and wildlife habitat are outside the scope of the EIS.	20243-204403-01
	Strand, Jeffrey	2024-02-23	Water use: Much of southern Minnesota is suffering from the consequences of drought and over-commitment of our fresh drinking water supplies. The DEIS fails to discuss the impacts of an increase in water use on local water supply. The carbon capture process can double water requirements at a facility and increase toxic wastewater discharge. The DEIS states that Summit “anticipates” an average water use for the operation of the carbon capture equipment of 13 million gallons per year, which is concerningly ambiguous. There must be a careful and case-specific assessment done of how the installation and operation of carbon capture will impact current drought conditions and exacerbate existing pollution sources. Moreover, Summit has not finalized its water appropriation sources or volumes needed for construction, so it is impossible to know the full impacts of those appropriations on water resources. Why should Minnesota risk our fresh drinking water supply and commit to an infrastructure when the proposing company has not been transparent with its true demands for water resources?	Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources. Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2. As stated in Section 5.7.8, water supply appropriations would be regulated by DNR-issued permits that would have conditions to minimize impacts on groundwater resources. DNR would review permit applications and would not issue a permit if the amount of water to be withdrawn would adversely affect the aquifer or other users.	20243-204403-01
	Strand, Jeffrey	2024-02-23	Aquifer Damage: Summit’s preferred route, RA-South, crosses a surficial beach ridge aquifer in Otter Tail County. The DNR has said that the area is “prone to significant groundwater discharge,” and the applicant’s initial groundwater investigation confirmed that “artesian groundwater conditions are present” along that beach ridge system. In early feedback on the DEIS, the DNR noted that “Project construction has the potential to intersect shallow confined groundwater potentially causing a breach in a confined aquifer and that “breaching shallow confined aquifers could have significant long-term impacts to groundwater resources.” This, along with our state’s first-hand knowledge of how damaging pipelines can be, requires that the DEIS take potential damage to aquifers more seriously.	Section 5.7.8.2 acknowledges that damage to aquifers is a serious problem and indicates that an uncontrolled flow of water from a shallow confined aquifer could have a significant, long-term impact on groundwater. Section 5.7.8.2 also describes geotechnical investigations that would be done to identify areas where breaching of a shallow confined aquifer could occur, and sheet piling would not be used. The applicant currently has an ongoing groundwater investigation underway to further inform construction practices and is continuing to consult with DNR. As part of its coordination with DNR, the applicant has agreed to use ground penetrating radar to study the depth of the confining layer through the entire beach ridge system area crossed by the pipeline to further define existing conditions and advise on construction methodology. Furthermore, EERA staff recommends that the applicant develop, in coordination with DNR, a plan for pipeline construction in areas crossing the beach ridge system area. The plan would include, at a minimum, measures to minimize the potential for breaching a shallow confined aquifer during trenching and contingency	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				measures to mitigate the impacts of a breach, should one occur. This information has been added to Section 5.7.8.2.	
	Strand, Jeffrey	2024-02-23	HDD Drilling: The DEIS also states that “drilling mud mixed with additives that are not on the MDH-approved additive list and/or do not meet [drinking water quality certification standards] would be disposed of as solid waste at an approved facility, or the applicant would obtain a land application permit from MPCA.” The DEIS does not discuss the risks of applying drilling mud, especially with additives not approved by MDH, to the land. The DEIS says that “drilling fluids and additives for the HDD would be non-toxic to the aquatic environment and humans,” however, even supposedly “non-toxic” drilling fluid is chemical waste that has been found to be harmful to plant and animal species. Summit’s preferred route and alternative route, RA-Hybrid, would both cross three rivers (Pelican River, Otter Tail River, and Bois de Sioux River) via the HDD mention.	As described in Section 5.7.8.2, an additive approved by MDH or meeting NSF International/ANSI Standard 60, Drinking Water Treatment Chemicals – Health Effects, might need to be mixed with the drilling mud for viscosity or lubricating reasons and to reduce the potential for an inadvertent release or failed HDD. The specific additive used would depend on the conditions at the crossing location and would be determined by the HDD contractor. The EIS discloses the potential for an inadvertent release of drilling mud and describes potential impacts in Chapter 5. Land application of drilling mud and potential impacts are addressed in Section 5.7.6.2.	20243-204403-01
	Strand, Jeffrey	2024-02-23	Wetlands: In Table 5-40 on p. 5-98 of the DEIS it states that “the loss of wetlands would be less than 0.01 acre.” However, Table 5-4 on p. 5-24 says that for Summit’s preferred route, operation impacts are expected to be 3.3 acres, and construction impacts are expected to be 4.7 acres. And Table 5-52 on p. 5-143 suggests that the total construction impact on wetlands for RA-South is 2.7 acres.	Discrepancies between Table 5-4 and Table 5-54 result from different datasets and their associated resolutions. Table 5-4 uses NLCD data to analyze land cover, and Table 5-54 uses NWI data to analyze wetlands. Table 5-40 has been edited to be consistent with discussions of impacts on wetlands in Section 5.7.9 and Table 5-53 and Table 5-54.	20243-204403-01
	Strand, Jeffrey	2024-02-23	Impacts of a Leak or Rupture on Animals: According to the DEIS, CO ₂ leaks would not affect mammals, birds, reptiles, amphibians, and insects and would be unlikely to impact fish and freshwater mussels. The DEIS reaches this conclusion without providing any reasoning or supporting evidence. Though the DEIS does note some harm may come to animals in the event of a rupture, it relies heavily on the assumption that animals will simply move out of the rupture area to avoid the release. The reason for this assumption is not provided and is contradicted by information in the rupture report in Appendix G which suggests the impacts of a rupture would be nearly immediate. Critical Habitats: Summit’s preferred route would cross over or near several waterfowl protection areas, including the Orwell 9 Unit and Ridgeway WPA in Otter Tail County. The DEIS notes that some of these areas will be avoided during construction but fails to consider the impacts to these features in the event of a leak or rupture.	CO ₂ is a widespread, naturally occurring gas and is the primary byproduct of respiration—the conversion of sugars to usable energy. Minor leaks of CO ₂ from operation of the proposed pipeline would not elevate ambient CO ₂ to a level that is detrimental to local vegetation or wildlife. Potential impacts on wildlife from a CO ₂ rupture could result first from the physical force of a rupture and secondarily from localized short-term high levels of CO ₂ prior to dispersal and extreme cold temperatures associated with the depressurization of the CO ₂ from a supercritical state to a gas. Chapter 8 of the EIS acknowledges that wildlife in the immediate vicinity of a rupture might be killed or injured by this force; however, it is expected that most mobile wildlife species would follow their natural instincts and attempt to escape the direct effect of a rupture. Chapter 8 of the EIS also acknowledges that less-mobile species in the immediate vicinity of the point of a rupture would be less likely to escape the impacts and might be killed or injured. The data presented in Appendix G describes models of dispersal patterns in the immediate vicinity of a rupture. These models support the statements in Chapter 8 that wildlife in the immediate vicinity of a rupture might be exposed to high levels of CO ₂ , which could be toxic for species unable to leave the area of the release.	20243-204403-01
	Strand, Jeffrey	2024-02-23	The DEIS consistently fails to properly account for the real CO ₂ emission and climate impacts of the project.	Thank you for your comment.	20243-204403-01
	Strand, Jeffrey	2024-02-23	Lifetime of Project: The applicant states that the anticipated lifetime of this project is 25 years. This means at the end of its life; the project could stop capturing the CO ₂ from the ethanol plant. Unless the ethanol plant will also cease operations at that point in time, it will continue to emit CO ₂ unabated into the future.	Section 2.7 describes decommissioning of the project. If the ethanol plant continues to operate beyond the life of the proposed project, its CO ₂ emissions would not be captured.	20243-204403-01
	Strand, Jeffrey	2024-02-23	100% CO ₂ Capture Rate: Summit states that the capture facility “is designed to capture 100% of the CO ₂ produced by the ethanol plant.” There is no carbon capture facility in the world, ethanol or otherwise, that captures carbon at a rate of 100%. This claim is not supported by any data/information or verified by a third party.	Section 2.1 has been revised to clarify that the captured CO ₂ is produced by the ethanol plant as part of its fermentation process, the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			Additionally, the DEIS should emphasize that any CO ₂ capture is solely associated with emissions from the ethanol fermentation process and provides zero reductions on the significant emissions from the facility's electricity use.	questioned the feasibility of this capture rate given the performance of existing capture facilities. Section 6.3 describes energy efficiency and energy alternatives that could reduce emissions from the ethanol plant's electricity and process fuel use.	
	Strand, Jeffrey	2024-02-23	Added CO ₂ from electricity use: Carbon capture technologies are highly energy intensive and will significantly increase the carbon emissions at the facility from electricity use. The DEIS uses the Midwest Reliability Organization West Region average to calculate these emissions, which is unnecessarily inaccurate given the availability of the actual emissions factor from Great River Energy.	Electricity emissions are included in Table 5-39. These numbers have been revised to reflect the electricity emission factor associated with LREC, which would provide electricity to the project. The revised electricity emission factor is 132.2 gCO ₂ e/MWh. This was calculated from LREC's energy resource mix in which nearly half comes from clean energy sources. Because LREC has a lower emission factor than the Midwest Reliability West Region emission factor (684.35 gCO ₂ e/kWh), which was used in the draft EIS, calculated electricity emissions have decreased.	20243-204403-01
	Strand, Jeffrey	2024-02-23	CO ₂ Storage: The DEIS assumes 100% of captured CO ₂ is being permanently stored underground. There is no guarantee that this will occur and no explanation of the monitoring and verification protocols that would ensure it.	Text has been added to Section 2.1 describing the suitability of the Broom Creek Formation in North Dakota for CO ₂ sequestration, as well as the monitoring and testing that would be done to verify that the CO ₂ is contained in the storage reservoir.	20243-204403-01
	Strand, Jeffrey	2024-02-23	Enhanced Oil Recovery: The DEIS fails to explain whether the applicant can sell any of its captured CO ₂ to others for alternative uses instead of permanent sequestration and what the impacts of that would be. The DEIS incorrectly states that "Production of oil through EOR would not be dependent on the availability of CO ₂ produced by the ethanol plant." This claim is contradicted by countless public statements from public officials in North Dakota and oil industry representatives.	The text questioned by the commenter in Section 5.7.2.3 was prefaced with the following: "if all the CO ₂ produced by the ethanol plant is sequestered as proposed, EOR would likely continue in North Dakota using other sources of CO ₂ , other gases, thermal methods, or chemical methods." Revisions are not necessary. However, Section 5.7.2.3 was revised to reference additional information regarding the possibility that the captured CO ₂ transported by the project could be used for EOR.	20243-204403-01
	Strand, Jeffrey	2024-02-23	Environmental Justice Communities: The DEIS acknowledges that the project will directly intersect a defined environmental justice community but does not account for the burden of the potential health and safety impacts of a leak or a rupture, not to mention any negative impacts from construction on the ecosystem. The DEIS also fails to assess the cumulative impacts of this project in relation to existing pollution or health disparities in the area.	Chapter 8 has been revised to include a new Section (8.3.1.2) describing effects on environmental justice populations in the event of an accidental release of CO ₂ .	20243-204403-01
	Strand, Jeffrey	2024-02-23	The DEIS states that during operation the proposed project will require about 38,501,733 kilowatt hours per year, and that this amount is "not anticipated to require the addition of power generation capacity." However, the DEIS fails to clearly state how much electricity the ethanol refinery is currently using. For that information, the public must look in Appendix I. The DEIS does not explain how this doubling of the electricity use at the ethanol refinery will impact overall electricity for Lake Region Electric Cooperative. Who is paying for that electricity? Summit or the ethanol facility? And if the latter, will those cost increases be passed on to producers or other member-owners?	Section 5.4.9.2 contains relevant information regarding how LREC would support the project. This section has been updated to indicate that the applicant is solely responsible for necessary infrastructure upgrades (see Appendix I, Supplemental Information Inquiry 13 response and email from LREC).	20243-204403-01
	Strand, Jeffrey	2024-02-23	Complete Network Impacts: In addition to the direct impacts of the 28 miles of pipeline included in Summit's application, the DEIS does not account for the indirect and cumulative impacts of Summit's entire project in Minnesota. This is despite Summit's clear and public plans for a much larger buildout in Minnesota and recent statements that they will be applying for permits for additional parts of the network imminently. Allowing Summit to artificially segment permitting requests for multiple concurrent projects on one pipeline will prevent a thorough review of the cumulative impacts and potential environmental and climate damages of the project.	Thank you for your comment. A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01
	Strand, Jeffrey	2024-02-23	Decommissioning: Summit appears to indicate that once the pipeline is decommissioned, it will no longer monitor or maintain the pipeline. This is despite the DEIS acknowledging that pipeline segments left in place "would degrade over time and could serve as potential conduits for groundwater or cause minor subsidence when they collapse." There is no information about who would be responsible for any damage caused by the deteriorating pipeline [see pg. 2-15 of the DEIS]. The DEIS references the Decommissioning Plan, but it is not included as an Appendix to the DEIS, nor was it included as an Appendix to the EAW. Without a detailed discussion of decommissioning, the public and state agencies cannot know what human and environmental impacts the plan will have into the future.	Section 2.7 describes decommissioning of the project. This section was revised to describe the financial assurances to be provided by the applicant for costs associated with decommissioning.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Strand, Jeffrey	2024-02-23	In conclusion, we opposed construction of CO ₂ pipelines in Minnesota Rural and Farming Communities, including the Otter Tail Wilkin project as well as other planned elements across the state of Minnesota.	Thank you for your comment.	20243-204403-01
	Striegel, Gerald	2024-02-23	I challenge the DEIS’s assessment which concludes that the Summit Carbon Solutions proposal delivers a net benefit of emissions reduction. I am hopeful that an accurate and all-encompassing evaluation of this proposal will follow.	Thank you for your comment.	20243-204403-01
	Striegel, Gerald	2024-02-23	It is important to view the proposed pipeline network and possible injection site as part of a much larger system. An evaluation must consider: • ethanol plants; • acreage of corn crop destined for ethanol production; • fertilizers and/or manure needed to sustain a corn crop while continuously depleting soil; • petrochemical plants supplying the fertilizers; • concentrated animal feeding operations (CAFOs) supplying the manure; • water needed for crop production; • water required for the ethanol plant process; • water needed for the carbon capture process; • water required for CAFOs; • water contamination resulting from field runoff and CAFOs; • water contamination generated by the processes; • continued addition of and consolidation of farming acreage to enhance efficiency, and last but not least; • energy to drive each leg of this process along—each leg with its own emissions.	A detailed study of the full Midwest Carbon Express project is outside the scope of the EIS.	20243-204403-01
	Striegel, Gerald	2024-02-23	We can see from this list that ethanol is not a sustainable energy solution. Why, then, does ethanol production continue to be greenwashed and blanketed with subsidies? Summit Carbon Solutions suggests that we do not have enough to burn and that this fuel is cleaner. Neither is true, and the industry is chasing an enormous government handout. While this DEIS is being considered, the EPA has approved an even higher ethanol blend, furthering the harm caused. We continue to expand fossil fuel infrastructure and its use to the point of threatening our very existence. As a citizen and a tax payer, I urge the Department of Commerce to truly consider these points in their evaluation.	Thank you for your comment. The appropriateness of federal and state policies regarding carbon capture and ethanol is outside the scope of the EIS.	20243-204403-01
	Theship-Rosales, Alex	2024-02-22	Thank you for taking a minute to read my perspective. Please consider children, youth, adults, and elders 1,000 years from now - will this pipeline be a long-term blessing or curse for them? Water, land, air, and all God has created must be honored and protected for the sake of future generations.	Thank you for your comment.	20243-204403-01
	Thorne, Erika	2024-02-23	I've lived in Minneapolis and St. Paul since 1978. I've witnessed decades of environmental degradation by "public" utilities (including but not limited to Minnegasco, Northern States Power & their successors), aided & abetted by MN lawmakers and bureaucrats. So I applaud the MN PUC deciding to require an Environmental Impact Statement about the proposed Otter Tail CO ₂ Pipeline. Thank you!	Thank you for your comment.	20243-204403-01
	Thorne, Erika	2024-02-23	However, this draft is not adequate. My biggest concerns with it are: A) Neither Minnesota’s state agencies nor Summit has any experience building, operating, or overseeing CO ₂ pipelines. B) The so-called carbon capture aspects of the pipeline are, if you'll excuse my pun, PIPE DREAMS! So are your claims in the DEIS that this pipeline will have “minimal impact” across the board. Such claims are unsupported by the existing evidence about carbon pipelines and pipeline construction generally.	Thank you for your comment.	20243-204403-01
	Thorne, Erika	2024-02-23	Finally, I wish to point out that Minnesota and surrounding states have already been ravaged by pipeline construction. We know they damage the immediate surroundings and directly contradict commonly held goals for climate recovery. We in civil society have demonstrated, in person and through correspondence, our displeasure with each of these pipelines. Your decision to require an EIS at least recognizes that. Yet we need you to produce an Impact Statement that plainly names the high risk today and in our families’, futures posed by this CO ₂ pipeline. We're counting on you.	Thank you for your comment.	20243-204403-01
	Tjepkema, Jim	2024-02-12	My name is Jim Tjepkema. I am a retired person living in Minneapolis. I have a PhD in Agriculture from Purdue University and worked as an agricultural consultant on sustainable agriculture before retiring. I am currently a volunteer at MN350 supporting their work on climate change. It is well known that we must greatly reduce our use of fossil fuels to prevent very destructive changes in our climate that are already under way. Almost all of the ethanol produced by ethanol plants is mixed with gasoline that is burn in vehicles. Instead of investing in capturing CO ₂ from ethanol plants , such as the one involved in the project under consideration here, and sending the captured CO ₂ through pipelines, we should plan on shutting down these plants in the near future. We should do everything we can to stop burning ethanol and gasoline in vehicles. If we don't do this we will be failing to take an important step toward stopping the advance of very destructive changes in our environment. Putting money into capturing CO ₂ from ethanol plants and sending it through pipelines is a waste of money which is needed to fund other projects such as promoting more use of electric vehicles.	Reducing gasoline and ethanol usage would not meet the purpose of the project as defined in the EIS; therefore, it is outside the scope of the EIS.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Tjepkema, Jim	2024-02-12	<p>A large portion of the corn that is grown in Minnesota and other states is used to make ethanol. This not a good use of agricultural land. We need a reduction in the amount of corn grown to diversify crop production. It will easier to do more cover cropping and follow other practices that increase the sequestering of carbon in the soil under a diversified cropping system where the amount of corn grown is reduced. Increasing the carbon content of agricultural soils is one of the leading ways climate scientists have brought forward for reducing greenhouse gases that cause climate change.</p> <p>Extreme weather, including droughts and floods, due to climate change are already reducing the production of food to feed the world. We should not be using land that could be used to produce food to produce corn used for ethanol production. Due to our failure to deal as quickly as was and is needed to stop the advance of climate change, there will be an increase in droughts and floods that cause even greater reduction in food production. This is not just my opinion. This is what we are being told by climate scientist. We need to start using the land where corn is being grow to use for ethanol production for food production and not use it for growing corn to produce ethanol to burn in vehicles.</p>	Using corn for food instead of ethanol would not meet the purpose of the project; therefore, it is outside the scope of the EIS.	20243-204403-01
	Tokheim, Lucy	2024-04-23	My husband and I have run a business in rural Lac qui Parle County near Dawson for over 50 years. Companies have no credible research that CO carbon Capture pipelines have minimal risk of negative environmental impact. In fact, there is a history of destructive pipeline impact and we trust that the state of Minnesota will organize a thorough assessment of possible risks to public health, and degradation to land, water, animals and to vulnerable ecosystems. I am not convinced that Ethanol itself has been an effective climate protection, and the Carbon Capture Pipeline appears to benefit only investors in these energy intensive and potentially destructive storage systems. In sum, we don't need this. We need more protection from the impact of chemicals and over farming our fragile prairie environments, and the CO 2 pipelines are the wrong direction.	Thank you for your comment.	20243-204403-01
	Ulrich, Wendy	2024-02-23	I am Wendy Ulrich residing in the Twin Cities. I'm extremely concerned about climate change and the rapid evidence of it that has been predicted, happening now in Minnesota. I want to see RIGHT STEPS taken to address it rather than those that hoodwink citizens showing negligible if any positive effects while financially benefiting others and harming MN's natural environment.	Thank you for your comment.	20243-204403-01
	Ulrich, Wendy	2024-02-23	My comments on the DEIS: First, it does not emphasize that the CO ₂ captured is only from the fermentation process in the ethanol plant. This capturing doesn't reduce emissions from the facility's electricity use. This is a highly intensive energy use technology. The statistics used in the DEIS to calculate this CO ₂ emission from the plant's power source are not taken from better data, that from Great River Energy.	<p>As stated in the beginning of the Operations section on Page 5-91 of Section 5.7.1.3, the CO₂ captured is specifically stated to only come from the fermentation process. The CI score developed in Chapter 6 takes into account the energy used for ethanol production. Section 6.3 describes energy efficiency and energy alternatives that could reduce emissions from the ethanol plant's electricity and process fuel use.</p> <p>Electricity emissions are included in Table 5-39 and have been revised to 5,032 MT CO₂e/year using the carbon intensity from LREC, which provides electricity to the ethanol plant. Because LREC has a lower carbon intensity than the MROW average emission factor used in the draft EIS, the electricity emissions have decreased.</p>	20243-204403-01
	Ulrich, Wendy	2024-02-23	There is no guarantee in the DEIS that all CO ₂ captured will be permanently stored underground., no monitoring. Is it possible it could be sold to use in fracking e.g., creating ugly landscapes at those sites to produce yet more oil to fuel climate crisis?	Text has been added to Section 2.1 describing the suitability of the Broom Creek Formation in North Dakota for CO ₂ sequestration, as well as the monitoring and testing that would be done to verify that the CO ₂ is contained in the storage reservoir. Section 5.7.2.3 addresses the possibility that the captured CO ₂ transported by the project could be used for EOR.	20243-204403-01
	Ulrich, Wendy	2024-02-23	In exchange for the dubious limits of good will to our environment by the ethanol plants (and possibly the fossil fuels industry behind them), concern blossoms in many directions for risks to southern Minnesota's water and natural resources. Two specific areas are #1, the impact of a pipeline leak on many types of water bodies, including aquifers. The DEIS needs to show more research in understanding the risks to our waters and the animal life that live in or on them to survive. The second specific area to mention here, one the DEIS doesn't address, is the effect of increased water use by pipeline construction on the local supply following recent drought years. More serious attention is needed in the DEIS to the potential to breach aquifers. Shallow confined ones are known in Summit's preferred route according to the DNR.	<p>Potential impacts of a CO₂ release on water resources and wildlife are addressed in Section 8.3.4.</p> <p>Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources.</p> <p>Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement</p>	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.	
	van der Leeue, Tracy	2024-02-23	Thank you for your work in serving our state. As a resident of Minnesota who was born here I am writing to express my deep reservations and concerns with the Otter Tail Wilkin CO ₂ Pipeline Project and ask that the PUC take in to account the flaws in the reasoning for the pipeline's need as a climate solution, the extremely high risks for negative impacts in both the construction and operational phases to what are increasingly precious habitats and resources, and prioritize their protection as the highest order.	Thank you for your comment.	20243-204403-01
	van der Leeue, Tracy	2024-02-23	We are rich in water, forests and viably vibrant ecosystems that have far more permanent economic and planetary value that benefits us Minnesotans directly. This is in contrast to the carbon capture strategy and CO ₂ that will pass through our borders with only small temporary benefits during the construction phase but permanent risks to our increasingly valuable environmental resources.	Thank you for your comment.	20243-204403-01
	Van Hee, Bob	2024-02-23	I'm going to make this short: I'm swamped with deadlines. I'm TOTALLY against ANY CO ₂ project--anywhere! This is an attempted takeover by Corps, such as BLACK ROCK, Banking Systems, Big Corps such as JD and others- to control the Food Supply, Quality Farmland, etc. This is Part of the Federal Gov't's "Green Reset"! Other Companies. such as: are Valero Energy Corp, Navigator, Summit Carbon Solutions, etc. Caron Dioxide is NEEDED for the Process of Photosynthesis !! Instead of burning corn and sending CO ₂ thousands of miles away, use crops for food!! What a Great Concept The future of power lies in Nuclear Fusion, NOT shoveling your dinner into the gas tank!! I have much more information available, but do not have the time at this moment to work on this, this afternoon. You can call me this afternoon -- leave a message----questions and your phone # You have my permission to share this with anybody! This is simply a WAR with the Wealthy Oligarchs for Power/Control! do NOT back off!!	Thank you for your comment.	20243-204403-01
	Vogel, Anita	2024-04-22	I hail from southwestern Minnesota, reaching out once more to express my deep-seated apprehensions regarding the Midwest Carbon Express. I implore you to empathize with our plight. As I compose this message, my gaze falls upon the serene waters of the Cottonwood River. Just down the road, bald eagles grace us with their majestic presence, nesting in the very vicinity where the pipeline is slated to traverse. Each species plays a vital role in the delicate balance of our ecosystem. Its construction would not only jeopardize the habitats of these creatures but also imperil the very fabric of our community. We cannot stand idly by as the essence of our home is threatened by shortsighted endeavors and false promises. Our region is bestowed with countless natural wonders, each a testament to the divine hand of creation. Yet, the looming specter of this pipeline threatens to mar and despoil these precious gifts irreparably. The very fabric of our community recoils at the notion of its construction, for we know that its presence will bring naught but harm and devastation. We stand united in our resolve, resolute in our stance against this encroachment upon our land and our way of life. Our voices ring out in unison, pleading for preservation, for the safeguarding of our cherished environment. The Midwest Carbon Express finds no welcome here, for it represents not progress, but regression—a regression towards the degradation of our natural heritage and so many dangers to all (humans, plants, animals, etc.) I beseech you, heed our fervent plea and recognize the gravity of our concerns. Stand with us in defense of our land, our wildlife, and our collective future. Together, let us forge a path towards sustainability and stewardship, ensuring that generations yet unborn may inherit a world unspoiled by the folly of short-sighted pursuits.	Thank you for your comment.	20244-205834-01
	Vogel, Anita	2024-04-22	Please see the attached letter and take some consideration. I know you have a lot on your plate but so do we...our lives... (Attached is an article titled: "'Wake-up call': pipeline leak exposes carbon capture safety gaps, advocates say." by The Guardian from Apr. 18 2024, reporting on the recent Exxon Delhi pipeline leak near Sulphur, Louisiana that ocured on Apr. 3, 2024)	Thank you for your comment. A new section (8.2.1.3) has been added to Chapter 8 that contains information on the recent CO ₂ pipeline leak near Sulphur, Louisiana.	20244-205834-01
	Vogel, Anita	2024-02-22	Thank you sincerely for affording the public the opportunity to provide feedback on the Draft Environmental Impact Statement (DEIS) for the upper branch of Minnesota. As a lifelong resident deeply rooted in Lamberton, MN, alongside my husband and four young children, I feel compelled to express my profound concerns regarding the proposed Midwest Carbon Express project. Living in close proximity to both the proposed pipeline route and our farmland (Summit Carbon Solutions (SCS) has contacted for easement) along	Thank you for your comment.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			the Cottonwood River, the potential impacts of this project weigh heavily on my mind. However, beyond mere proximity, it is the manner in which this project has been presented and the potential consequences that greatly trouble me.		
	Vogel, Anita	2024-02-22	<p>It has become more of a personal matter to me as I firmly believe that my vulnerable parents were taken advantage of in their time of need to secure an easement. My mother, who was the primary caregiver for my late father who was afflicted with dementia, found herself in an incredibly stressful situation. During that time, the SCS agent was relentlessly pursuing her signature (as well as my siblings) for an easement agreement, my father suffered a stroke, resulting in two ambulance rides, two emergency room visits, and a hospital admission and nursing home admission. Despite this turmoil, my mother signed the easement agreement on the very morning my father was discharged from the nursing home. It's clear to me that my mother was under immense duress during that time, overwhelmed by the challenges she was facing. Fortunately, SCS required more than just her signature for the two parcels they were after, sparing us from further exploitation. However, I am acutely aware that not everyone is as fortunate as our family was in this situation.</p> <p>Firstly, I am deeply troubled by the conduct of SCS, particularly their lack of transparency and seemingly targeted outreach efforts. It is disheartening to witness a disregard for the broader community's involvement, with meetings seemingly designed to cater only to select landowners. By failing to adequately inform the public, especially regarding safety concerns, SCS has deprived community members of the opportunity to engage meaningfully in the decision-making process.</p>	Thank you for your comment. Landowner agreements are outside the scope of the EIS.	20243-204403-01
	Vogel, Anita	2024-02-22	Upon reviewing the DEIS, I am struck by the prevalence of conditional language throughout the document. Phrases such as "if" and "could" create a sense of ambiguity and fail to acknowledge the inevitability of certain risks associated with the project. It is imperative that we acknowledge the reality that pipeline ruptures are not a matter of "if" but rather "when," as evidenced by the insufficiently studied impacts highlighted in the DEIS.	The EIS uses conditional language because it is not known if the project will be approved. Additionally, staff cannot predict future events--a potential impact could occur or could not. Staff indicates what is anticipated to be most probable. For example, Chapter 8 indicates a rupture of the pipeline is possible but is unlikely based on safety records maintained by PHMSA. In 2022, there were a total of three incidents (two classified as leaks and one as "other") reported on 5,385 miles of CO ₂ pipeline, or 0.00056 incidents per mile of CO ₂ pipeline in the United States.	20243-204403-01
	Vogel, Anita	2024-02-22	Moreover, the reliance on technology, such as MVL systems and CO ₂ detectors for only those who only apparently warrant the need, to mitigate potential risks is deeply concerning. Depending solely on a control center's notification in the event of a rupture is a false sense of security, potentially endangering lives. The thought of a child being harmed due to such negligence is heartbreaking. Placing the safety of our families and communities in the hands of such systems, particularly in the harsh conditions of a Minnesota winter where the weather is unpredictable and when a rupture happens and those in the question who are outside of the "circle" are not notified but the wind shifts and it is too late for them, is a risk too great to bear. The thought of lives being endangered due to a false sense of security is simply unacceptable.	Thank you for your comment.	20243-204403-01
	Vogel, Anita	2024-02-22	In the section 8.3.4, The limited research on CO ₂ leakage into near-surface environments, particularly from pipelines, underscores a concerning lack of understanding regarding the potential risks involved. While it's acknowledged that low concentrations of CO ₂ usually have minimal effects, the consequences of high concentrations WILL be catastrophic, leading to asphyxiation and death. The density of CO ₂ relative to air means that when a significant release occurs, it will form a dense cloud or fog that settles into lower-lying areas, depriving EVERY BEING of oxygen. In our community, we reside in a lower lying area, a fact shared by many of our neighbors and friends who also dwell along the proposed pipeline route. It begs the question: do our lives, or the lives of anyone/anything situated along this trajectory, hold no significance?	Thank you for your comment.	20243-204403-01
	Vogel, Anita	2024-02-22	Such an event would undoubtedly have profound and varied impacts on natural resources, affecting not only individual life forms but ENTIRE ecosystems. This poses a grave threat to biodiversity and ecological stability. As advocates for the sanctity of all life, it is imperative that we recognize the potential harm posed by pipelines carrying CO ₂ . Every living being, from the smallest insect to the largest mammal, deserves protection from such risks!	Thank you for your comment.	20243-204403-01
	Vogel, Anita	2024-02-22	Moreover, the uncertainty surrounding the long-term effects of slow, persistent leakage further emphasizes the need for caution and thorough investigation before proceeding with such projects. As stewards of the environment, we cannot afford to gamble with the well-being of our planet and its inhabitants.	Risks of a potential CO ₂ release and potential impacts are described in Chapter 8 of the EIS.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Vogel, Anita	2024-02-22	In conclusion, the potential dangers associated with CO ₂ pipelines cannot be ignored. It is our moral obligation to prioritize the protection of all lives and ecosystems, advocating for sustainable alternatives that do not jeopardize the health and safety of present and future generations. All lives matter, and we must act accordingly to safeguard them.	Thank you for your comment.	20243-204403-01
	Vogel, Anita	2024-02-22	Section 8.3.2.1 Agriculture: The potential consequences of an accidental CO ₂ release on agricultural economies cannot be overstated. While some studies tout the benefits of elevated CO ₂ levels on crop yields, the flip side presents a grim reality. Increased CO ₂ concentrations in the soil spell disaster for root water absorption, chlorophyll levels, starch content, and overall biomass. Consider the chilling aftermath of a rupture: vegetation and soil in the immediate vicinity are ravaged, with roots frozen, soil pH plummeting, and vital soil microbes annihilated. economic fallout is immediate and devastating, with frozen crops leading to immediate losses and acidic soil rendering future cultivation a Herculean task. And let's not forget about the innocent victims caught in the crossfire. Livestock, much like humans, would suffer dire physiological effects, succumbing to a concentrated gas plume if they're unlucky enough to be in the wrong place at the wrong time. The loss of livestock isn't just a tragedy—it's an economic catastrophe!	Impacts of a potential CO ₂ release on agriculture economies are discussed in Section 8.3.2.1. As described in Section 8.5.3, EERA staff recommends as a special permit condition that the applicant provide information on how it would pay for costs of any repair to public infrastructure or private property (including crops and livestock) that could occur during an accidental release	20243-204403-01
	Vogel, Anita	2024-02-22	So, when authorities "recommend" an accidental release plan to cover potential damages, it's not just a bureaucratic formality—it's a vital lifeline for those whose lives and livelihoods hang in the balance, ensuring that those responsible are held fully accountable for the catastrophic aftermath.	Thank you for your comment.	20243-204403-01
	Vogel, Anita	2024-02-22	I implore you to consider the profound impact of this project on the lives and well-being of countless individuals and communities. It is imperative that we prioritize thorough research, transparency, and the safety of all stakeholders involved. The decisions made today WILL resonate for generations to come, and it is our responsibility to ensure that they are made with the utmost care and consideration for the welfare of all.	Thank you for your comment.	20243-204403-01
	W, Tim	2024-02-13	Land owner from Lamberton area u all can shove this pipeline up your ass so far you'll be able to use it for a tail light in laymen's terms I don't want no people trespass on my fuckn land for no reason Ever u have been warned!!	Thank you for your comment.	20243-204403-01
	Walkup, John	2024-02-17	As a farmer agricultural producer, who would have one and a half miles of land adjacent to the proposed pipeline south route, I believe the two alternate technologies of (1) a suite of agricultural practices to be implemented by farmer producers, and (2) a suite of energy use and efficiency changes to be implemented by the ethanol plant, would be by far the right way to go. I think it makes very little sense to take CO ₂ gas, which is non-toxic by itself and used by growing crops, plants, and trees to make oxygen, and compress it into a hazardous liquid that would be put in a hundreds of miles long pipeline that could potentially have the possibility to rupture. The environmental effects of that to people and landscape along the route could be huge. I also don't think the long term effects or results of pumping this CO ₂ into the ground in North Dakota has been fully addressed or will be known for years to come. Thank you for your consideration, John Walkup	Thank you for your comment. As noted in Chapter 6, the Commission cannot select any of these alternative technologies as an alternative; however, the information provided will inform the Commission's decision to issue a pipeline routing permit. The impacts of CO ₂ sequestration are outside the scope of the EIS.	20243-204403-01
	Ward, Jamison	2024-02-23	My name is Jamison, and I'm a University of MN college student who has grown up in MN all my life and greatly values our state's natural and cultural resources. I'm writing to express my concerns about the Draft Environmental Impact Statement (DEIS) on the safety of Summit Carbon Solutions' proposed CO ₂ pipeline.	Thank you for your comment.	20243-204403-01
	Ward, Jamison	2024-02-23	As an Earth Sciences student and aspiring geochemist, I can testify that CO ₂ is a hazardous material in high concentrations. The DEIS consistently underplays the known and unknown risks of transporting large amounts of CO ₂ at high pressures through a pipeline. According to the analysis in the DEIS, the potential impact radius for levels of CO ₂ that would be “immediately dangerous to life or health” is 617 feet. This expands to 910 feet for lower concentrations that cause dizziness, drowsiness, severe muscle twitching, and unconsciousness within a few minutes. Although Summit indicates that it will take 25 minutes for the system to shut off the relevant valves in the event of “abnormal operation,” the DEIS does not mention any meaningful safety measures for a rupture and instead suggests that it is “reasonable” for Summit to simply supply indoor CO ₂ detectors for residences within 1,000 feet of the project. However, the rupture report in Appendix G states that “a full rupture results in impact distances too quickly for an early warning device, such as an oxygen detector, to be effective.” This pipeline should not be approved without a clear understanding of the risks to human health and meaningful measures to ensure the safety of people and animals in the area.	Text in Section 4.5 on valve closure time has been corrected from 25 minutes to 10 minutes. Elsewhere in the EIS, including the rupture analysis, valve closure time is listed/calculated as 10 minutes. Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that is not outdated but would be revised as required by PHMSA, if the project is approved. Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3.	
	Ward, Jamison	2024-02-23	<p>Additionally, as a student who has studied hydrogeology, I am well aware that Minnesota’s recent experience with pipeline construction demonstrates the serious harm that the process incurs on water resources as well as a tendency by state agencies to under-account for those impacts. Summit’s preferred route, RA-South, crosses a surficial beach ridge aquifer in Otter Tail County. The DNR has said that the area is “prone to significant groundwater discharge,” and the applicant’s initial groundwater investigation confirmed that “artesian groundwater conditions are present” along that beach ridge system. In early feedback on the DEIS, the DNR noted that “Project construction has the potential to intersect shallow confined groundwater potentially causing a breach in a confined aquifer and that “breaching shallow confined aquifers could have significant long-term impacts to groundwater resources.” This, along with our state’s first-hand knowledge of how damaging pipelines can be, requires that the DEIS take potential damage to aquifers more seriously.</p>	<p>Section 5.7.8.2 acknowledges that damage to aquifers is a serious problem and indicates that an uncontrolled flow of water from a shallow confined aquifer could have a significant long-term impact on groundwater. Section 5.7.8.2 also describes geotechnical investigations that would be done to identify areas where breaching of a shallow confined aquifer could occur, and sheet piling would not be used.</p> <p>The applicant currently has an ongoing groundwater investigation underway to further inform construction practices and is continuing to consult with DNR. As part of its coordination with DNR, the applicant has agreed to use ground penetrating radar to study the depth of the confining layer through the entire beach ridge system area crossed by the pipeline to further define existing conditions and advise on construction methodology. Furthermore, EERA staff recommends that the applicant develop, in coordination with DNR, a plan for pipeline construction in areas crossing the beach ridge system area. The plan would include, at a minimum, measures to minimize the potential for breaching a shallow confined aquifer during trenching and contingency measures to mitigate the impacts of a breach, should one occur. This information has been added to Section 5.7.8.2.</p>	20243-204403-01
	Ward, Jamison	2024-02-23	<p>Finally, the DEIS consistently fails to properly account for the real CO₂ emission and climate impacts of the project. Summit states that the capture facility “is designed to capture 100% of the CO₂ produced by the ethanol plant.” There is no carbon capture facility in the world, ethanol or otherwise, that captures carbon at a rate of 100%. This claim is not supported by any data/information or verified by a third party. Additionally, the DEIS should emphasize that any CO₂ capture is solely associated with emissions from the ethanol fermentation process and provides zero reductions on the significant emissions from the facility’s electricity use. Furthermore, the DEIS assumes 100% of captured CO₂ is being permanently stored underground. There is no guarantee that this will occur and no explanation of the monitoring and verification protocols that would ensure it. I urge a critical review of this project's climate impacts to protect the health of future generations of Minnesotans such as myself.</p>	<p>Section 2.1 has been revised to clarify that the captured CO₂ is produced by the ethanol plant as part of its fermentation process, the amount of CO₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. Text has been added to Section 2.1 describing the suitability of the Broom Creek Formation in North Dakota for CO₂ sequestration, as well as the monitoring and testing that would be done to verify that the CO₂ is contained in the storage reservoir. Section 6.3 describes energy efficiency and energy alternatives that could reduce emissions from the ethanol plant's electricity and process fuel use.</p>	20243-204403-01
	Ward, Jamison	2024-02-23	<p>Furthermore, the DEIS assumes 100% of captured CO₂ is being permanently stored underground. 	Webb, Sherri	2024-02-23	<p>My name is Sherri Webb and I live in Iowa. Our Grandma's land (in our family for over 124 years) is being threatened by Summit's scam. This is NOT a green project and should be denied since it IS a huge waste of taxpayer dollars. We are NOT covered by liability insurance – CO₂ is considered a pollutant. A rupture on our land would be not only devastating but would bankrupt us. WHO are we supposed to be doing business with? The only answer I heard from Summit’s Jimmy Powell was “private investors”. “PRIVATE”! The COO doesn’t know? We know John Deere, South Korea, Saudi Arabia, and China are also involved.</p>	<p>Thank you for your comment.</p>	20243-204403-01
	Webb, Sherri	2024-02-23	<p>SOIL EROSION is a term that every farmer knows and fears. Soil is a natural resource that may look endless and healthy, but it is a fragile product that has taken thousands of years to form. Soil is not simply dirt, but a combination of living organisms (microbes), nutrients, rock, and other minerals that are an outer layer over the bedrock of the planet. And it's a busy environment, providing habitat for plants and animals while helping regulate the flow of water and temperature. Topsoil contains the essential nutrients for crops and erosion decreases soil fertility and that can, and will, negatively affect crop yields. Soils could potentially sequester enough greenhouse gas emissions in a year to equal about 5 percent of all annual human made GHG emissions. “North America showed the</p>	<p>Thank you for your comment. Impacts on soil, including erosion, are discussed in Section 5.7.6.</p>	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>highest potential for total carbon storage, globally, with between 0.17 and 0.35 Pg C (0.60 to 1.22 t/ha) sequestered annually.” Zomer, R.J., Bossio, D.A., Sommer, R. et al. Global Sequestration Potential of Increased Organic Carbon in Cropland Soils. Sci Rep 7, 15554 (2017). https://doi.org/10.1038/s41598-017-15794-8</p> <p>“When the Iowa prairie was first plowed, the settlers found 14 to 16 inches of topsoil. But by 2000, the average thickness was only 6 to 8 inches, and the remaining topsoil had lost 30 to 50 percent of its organic matter. In 1982, the average rate of erosion on cultivated land in Iowa was so high that the erosion map of the United States showed a jarring purple bulls-eye centered on Iowa and northern Missouri. By 2017, the rate had improved considerably, but Iowa still stood out as a vivid orange on the map – it had lost 150 million tons of soil that year.... What’s more, the erosion of our topsoil affects not only those of us living in Iowa, but also populations and ecosystems downstream from our state. Nitrate from runoff and phosphorus attached to the sediment produced by soil erosion are the main culprits contributing to the expansion of the Dead Zone in the Gulf of Mexico that is greatly damaging the ecosystem and the shrimp industry.” (Iowa's Remarkable Soils: the story of our most vital resource and how we can save it. Woida, Kathleen - University of Iowa Press – 2021 – quoted with author’s permission)</p> <p>Summit’s contribution to soil erosion in Iowa will be a hefty one and I have no doubt that Minnesota's soil will also suffer. (The addition of POET plants have not been considered in the following figures since Summit has not released that information.) Nearly 8000 acres!! 7982.86 acres – cultivated crops. A total of 8777.32 acres that includes hay/pasture, wetland, open areas, grasslands, deciduous forest, and others. Once the bulldozers have finished, this land will be ripped apart and the erosion will be inevitable. If you look at the economics of soil erosion, as stated by Farm Progress, the average soil loss rate is 5.8 tons per acre per year. When you’re losing soil, you’re losing yield – to the tune of about 15 bushels per acre per year of lost potential. 46,400 tons per year soil loss with 8000 acres. Stan Buman, head of Land O’ Lakes Sustain program stated in 2017, “Under the best case scenario, soil can only rebuild at a rate of 0.24 tons per acre per year.”</p> <p>https://wcc.efs.iowa.gov/cs/idcplg?IdcService=GET_FILE&allowInterrupt=1&RevisionSelectionMethod=latest&dDocName=2082371&noSaveAs=1 - 2.1 land use https://www.farmprogress.com/soil-health/economics-of-soil-loss</p> <p>Summit “promises” to restore the land. Summit CANNOT restore no-till land. In fact, Summit openly admits that land will be “restored as nearly as possible” – in other words, they won’t be able to restore the land. Summit states, “Approximately 94% of the proposed route is in agricultural lands, a common and generally preferred area for infrastructure.” Over 8000 acres will be left in poor condition and erosion will be the end and continuing result.</p> <p>https://wcc.efs.iowa.gov/cs/idcplg?IdcService=GET_FILE&allowInterrupt=1&RevisionSelectionMethod=latest&dDocName=2082373&noSaveAs=1 5.8 tons/acre, on the average, would be lost every year. Areas with slopes, highly erodible soils, tilled land would lose more than that. 57 billion metric tons of Midwestern topsoil has eroded over the last 160 years. Crowell, Rachel. Science News APRIL 12, 2022</p> <p>“‘Black Gold’ - Iowa’s rich, nutrient-dense topsoil has provided for generations of farmers, but it’s slowly losing its nutrients. Researchers at Iowa State University say Iowa has lost half of its soil richness, due in part to farming practices. Bradley Miller, an agronomist at Iowa State University, says the soil has changed since settlers came and converted the prairie into farmland. ‘Since that time, we have been draining the soil as well as tilling it. And so now that, so it’s a little drier, a little more exposed to oxygen to that tillage practice, that is actually burning off some of that organic matter,’ Miller said. That tilling is one of the main reasons for the loss of nutrients. ‘If the soil is intact, it’s a little bit protected from the air. And when you till it, you are flipping it overexposing it more to the air and the more exposed to the air, the oxygen in the air actually allows for that organic matter to decompose more and be released into the air,’ Miller said. This summer’s (2023) drought is expected to impact crop yields, but Miller says it’s not the same with soil health. ‘This summer we had less rainfall, but overall we’ve seen an increase in the intensity of rainfall events. And so that sets us up for more erosion,’ Miller said.” Hendricks, Connor; Omaha WOW TV, 9/13/23</p>		
	Webb, Sherri	2024-02-23	<p>The more research I do, the more I believe that the proposed hazardous waste supercritical CO₂ pipelines are a HUGE mistake and Iowa and Minnesota will pay the price for it. The fact that almost 80% of Iowans believe that using eminent domain, for a private company for private gain, is wrong should be a red flag. There will be no turning back if this is granted – the landowners will pay the biggest price, but land values will deteriorate, and the threat of eminent domain being used for any boondoggle project will prove to be a Pandora’s Box. The CCS is rapidly becoming an obsolete technology and the huge amounts of water and electricity that is needed does not reflect “green” practices, unless lining their pockets with our taxpayer dollars in tax credits is considered a “climate change” technique. There are numerous reports that CCS is NOT working.</p>	<p>Thank you for your comment. As indicated in Section 3.5, the applicant cannot exercise the power of eminent domain for the project.</p>	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Webb, Sherri	2024-02-23	<p>“But environmentalists are skeptical of funding a technology they say is too expensive and rarely works, as many high-profile carbon capture projects shutter or run into snags. Just this month, reports found that two carbon capture facilities in Canada were underperforming — one power plant was capturing just half the carbon it had advertised, while a facility supposed to be creating clean hydrogen was actually emitting the equivalent of 1.2 million cars. ‘We've got 10 years to solve the climate crisis and we need to spend our money wisely,” said John Noël, senior climate campaigner at Greenpeace. "Putting it in things that we know work makes more sense than funding something that's been promised for 20 years and still is ending up in failed projects.”</p> <p>https://www.cbsnews.com/news/carbon-capture-technology-billions-congressional-funding/?fbclid=IwAR0pMTvCXJKM71W0RZClsgZrAQ_BlYg245mDln385NFRSHXQY1whw4R-l https://www.globalwitness.org/en/campaigns/fossil-gas/shell-hydrogen-true-emissions/ https://www.eenews.net/articles/ccs-red-flag-worlds-sole-coal-project-hits-snag/ https://www.cnbc.com/2022/01/24/shell-ccs-facility-in-canada-emits-more-than-it-captures-study-says.html?fbclid=IwAR0UT4VN-NS_LIMYYQryazA4bq_-ljiZP0Bi9F6VK9NGNx_KIzEZel5fafU https://www.globalenergyworld.com/news/traditional-energy/2021/07/19/chevron-concedes-ccs-failures-at-gorgon-seeks-deal-with-wa-regulators</p>	Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and that commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities. The analyses in Section 5.7.1.3 and Chapter 6 have been revised to include capture rate scenarios of 100 percent, 70 percent, 40 percent, and 10 percent.	20243-204403-01
	Webb, Sherri	2024-02-23	<p>Iowa State University -- Soil erosion is a major environmental issue because it can lead to water pollution. But did you know that soil erosion also can seriously impair crop productivity? Most agriculture activities, especially on sloping landscapes, increase the potential for soil erosion. When soil erosion is severe, soil erodes faster than it can be renewed. For most areas of Iowa, the loss of 1 inch per acre of topsoil represents approximately 167 tons per acre and approximately 30 years is required to develop 1 inch of soil with properties of typical topsoil. Therefore, most Iowa soils (those with deep rooting potential, formed in permeable parent materials with favorable soil characteristics) can experience soil removal rates of 2 to 5 tons per acre per year.</p> <p>Even limited soil erosion can be harmful to productivity in other soils. Soils with little rooting depth potential, slowly permeable subsoils, and fragile soils structure, or those that are shallow to bedrock or coarse sands and gravels, definitely are adversely affected by erosion. No amount of management can compensate for the lack of suitable soil material.</p> <p>Al-Kaisi, Mahdi, Hanna, Mark, Miller, Gerald & Tidman, Michael. Soil erosion: effect on soil productivity. Integrated Crop Management News page 163 of the IC-488(20) -- August 19, 2002 issue. https://dr.lib.iastate.edu/server/api/core/bitstreams/fd848c67-d0cb-414e-8c77-7759ce5001ed/content</p>	Thank you for your comment.	20243-204403-01
	Webb, Sherri	2024-02-23	<p>They continue to hide and lie about the safety issues. They refuse to look at more than one "worst case scenario" and it's amazing that they claim a rupture or explosion will only affect a small area - 500+ feet. The Satartia, MS residents would disagree with that. This is not an "if" it will happen. This is a when and where it will happen.</p> <p>PHMSA is issued this updated advisory bulletin to remind owners and operators of gas and hazardous liquid pipelines, including supercritical carbon dioxide pipelines, of the potential for damage to those pipeline facilities caused by earth movement in variable, steep, and rugged terrain and terrain with varied or changing subsurface geological conditions. Additionally, changing weather patterns due to climate change, including increased rainfall and higher temperatures, may impact soil stability in areas that have historically been stable. These phenomena can pose a threat to the integrity of pipeline facilities if those threats are not identified and mitigated. Owners and operators should consider monitoring geological and environmental conditions, including changing weather patterns, in proximity to their facilities.</p> <p>PHMSA is aware of recent earth movement and other geological-related incidents and accidents and safety-related conditions throughout the country. Some of the more notable events, including those discussed in a prior advisory bulletin (ADB-2019-02; 84 FR 18919, 05/02/2019) are briefly described below:</p> <ul style="list-style-type: none"> • On March 11, 2022, a 22-inch hazardous liquid pipeline spilled 3,900 barrels of crude oil adjacent to the Cahokia Creek approximately 15 miles east of St. Louis, Missouri. Preliminary information indicates land movement may have contributed to this failure. The National Transportation Safety Board (NTSB) investigation into the cause continues as of the date of this notice. • On May 30, 2021, a hazardous liquid pipeline spilled 640 barrels of gasoline in Greens Bayou affecting high consequence areas near Houston, Texas. The operator's reported cause indicated earth movement/progressive ground movement over time on a bayou bank. • On February 19, 2021, 22,318 one thousand cubic feet [1] (Mcf) of natural gas was released from a Type A gathering pipeline system in Belmont, Ohio. A third-party subject matter expert determined the proximate cause of this incident was land movement, or slip, that exerted force on the pipe causing a circumferential crack in an area where evidence of stress corrosion cracking and general corrosion were found. • On December 23, 2020, 4,450 Mcf natural gas was released from a gas distribution main line in the City of Newport News, Virginia. 	<p>The text in Section 5.7.2 has been expanded to clarify that the pipeline would be buried underground with sufficient cover to protect it from flooding. The minimum depth of cover would be 54 inches, extended to 60 inches at waterbody crossings, and the depth would be greater at the waterbody crossings installed via HDD. All perennial streams would be crossed by HDD or bore, as shown in Tables 5-48 through 5-50. Other streams that would be crossed are intermittent or ephemeral streams, many of which are drainage ditches, and they would not be at significant risk of flooding-related problems like scour.</p> <p>Text has been added to Section 5.7.3.4 describing geohazard assessments for the project designed to comply with PHMSA Advisory Bulletin 2022-01. As noted in Section 5.7.3.4 and Section 8.1, the applicant has committed to conducting a Phase I Geohazard Assessment to identify areas surrounding the pipeline that may be prone to large earth movement, as recommended by PHMSA in its June 2022 Advisory Bulletin, and EERA staff recommends that the results of the Phase I assessment, and any subsequent assessments, should be provided to the Commission.</p>	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>The operator report indicated that the apparent cause was pipe stress created by ground settlement which caused misalignment of a flange resulting in a pinhole leak on gasket.</p> <ul style="list-style-type: none"> • On November 19, 2020, a pipeline spilled 17.50 barrels of crude oil east of I-5 in Kern, California during routine start-up. A metallurgical analysis determined the root cause to be related to external factors (i.e., historical land movement, terrain, and cyclic weather patterns around this pipeline segment). There is a history of land movement in the area, all of which contributed to unintentional bending of the pipeline causing the circumferential cracking found at the leak site. • On October 4, 2020, an intrastate gas transmission pipeline in Goodrich, Texas released 118,724 Mcf of natural gas below the Trinity River. While no definitive root cause was determined, the operator used the geological, meteorological, site-gathered information and historical data in its computer modeling and identified earth movement of the soil surrounding the pipe as the most plausible cause of the rupture. Circumferential stress corrosion cracking may have been a contributing factor to the failure. • On May 19, 2020, 447 Mcf was released from a gas distribution main pipeline in Edenville Township, Michigan due to heavy rain fall. An investigation confirmed a 4-inch steel pipeline was severed when significant flooding in the area caused a road washout/scouring. • On May 4, 2020, a 30-inch natural gas pipeline ruptured and ignited near Hillsboro, Kentucky. Preliminary information indicates land movement may have contributed to this failure. The NTSB investigation into the cause continues as of the date of this notice. • On February 22, 2020, a carbon dioxide pipeline failed approximately one mile southeast of Satartia, Mississippi, releasing approximately 30,000 barrels of liquid carbon dioxide that immediately began to vaporize at atmospheric conditions. The pipeline failed on a steep embankment which had subsided adjacent to a local highway. Heavy rains are believed to have triggered a landslide, which created axial strain on the pipeline and resulted in a full circumferential girth weld failure. • On January 29, 2019, a pipeline ruptured near the town of Lumberport in Harrison County, West Virginia. The rupture was located at a girth weld of an elbow on the 12-inch interstate pipeline. The root cause investigation concluded that a landslide about 150 yards from the rupture moved the pipeline approximately 10 feet from its original location causing excessive stress on the pipe resulting in the rupture. • On January 21, 2019, a 30-inch natural gas pipeline ruptured and ignited near Summerfield, Ohio. A metallurgical analysis indicates a girth weld failed due to ductile overload from a longitudinal tensile or bending force, likely from land movement. • On June 7, 2018, a 36-inch pipeline ruptured in a rural, mountainous area near Moundsville, West Virginia, resulting in the release of approximately 165,000 Mcf of natural gas. According to a metallurgical analysis, the rupture was caused by earth movement on the right-of-way due to a single overload event. Overloading of the pipeline likely resulted from a series of lateral displacements with accompanying bending. • On April 30, 2018, an 8-inch intrastate pipeline failed in a remote mountainous region of Marshall County, West Virginia resulting in the release of 2,658 barrels of propane. The failure was caused by lateral movement of the pipeline due to earth movement along the right-of-way. • On January 31, 2018, a 24-inch interstate pipeline ruptured near the city of Summerfield, Ohio releasing approximately 23,500 Mcf of natural gas in a rural forested area. A root cause analysis concluded that the girth weld failure was caused by axial stress due to movement of the pipe that exceeded the cross-sectional tensile strength of the net section weld zone surrounding the crack initiation location. • On January 9, 2018, a 22-inch transmission pipeline failed in Montecito, California. The incident resulted in a fire and explosion and the release of an estimated 12,000 Mcf of natural gas. Heavy rains and localized flooding contributed to the pipe failure. • On December 5, 2016, approximately 14,400 barrels of crude oil were spilled into an unnamed tributary to Ash Coulee Creek, Ash Coulee Creek itself, the Little Missouri River, and their adjoining shorelines in Billings County, North Dakota. The metallurgical and root cause failure analysis indicated the failure was caused by compressive and bending forces due to a landslide impacting the pipeline. The landslide was the result of excessive moisture within the hillside creating unstable soil conditions. • On October 21, 2016, a pipeline release of over 1,238 barrels of gasoline spilled into the Loyalsock Creek in Lycoming County, Pennsylvania. The release was caused by extreme localized flooding and soil erosion.” <p>Pipeline Safety: Potential for Damage to Pipeline Facilities Caused by Earth Movement and Other Geological Hazards Federal Register / Vol. 87, No. 106 / Thursday, June 2, 2022 / Notices p 33756-33759 DEPARTMENT OF TRANSPORTATION Pipeline and Hazardous Materials Safety Administration [Docket No. PHMSA–2022–0063]</p>		
	Webb, Sherri	2024-02-23	On June 9th I wrote/filed an objection with the IUB regarding the lack of knowledge about the water that Summit would need.	The applicant indicates it has not requested 13 water well permits (see Supplemental Information Inquiry #13 in Appendix I). Water use impacts, mitigations, and permit requirements are discussed in section 5.7.8.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
			<p>Subsequently we found that 13 permit applications had been requested. Summit Carbon Solutions (SCS) cleverly hid their little individual LLCs using SCS in their request. If they are so proud of their work, why are they trying to hide this from the DNR? These 13 requests total an estimated 478,296,000 gallons/year – without POET plants.</p> <p>IF ethanol plants grow by 25%, as reported by Bruce Rastetter at the American Alliance event on 8/14/23, then an additional 119,574,000 gallons may be needed. Nearly 598,000,000 gallons of water/year!!!</p> <p>Ethanol plants already use 3.5 gallons of water to produce 1 gallon of ethanol. 4.5 billion gallons of ethanol will be produced in Iowa in 2023. 15.75 billion gallons of water used!!</p> <p>I am assuming that Summit is not aware that Iowa and Minnesota are in year 4 of a drought. An Iowa State scientist mentioned that those figures are probably an underestimate of what will actually be needed. There are rural wells drying up, rural water refusing new customers, and serious issues with aquifer levels. How much water are they asking from Minnesota?</p>		
	Webb, Sherri	2024-02-23	Summit is NOT a utility and is NOT a public service. The CO ₂ pipeline companies are NOT utilities, they are private companies and will make billions of dollars in tax credits every year – private gain.	Thank you for your comment.	20243-204403-01
	Wenisch, Gregory	2024-02-13	I am a landowner in SW Mn. This would be a big step back from an environment standpoint. Why would we build thousands of miles of pipeline when ethanol will be extinct in 10 years? Self interest groups have no interest....but their own. Invest these subsidies elsewhere instead of throwing it away.	Thank you for your comment.	20243-204403-01
	Wenisch, Teresa	2024-02-13	I have 20 grandchildren & so far 5 great grandchildren. I won't be around to experience all the devastating effects from all the pollution we have created thru our careless treatment of our environment. I remember when my 7 children were at home & loved to take long showers, I told them not to waste water as some day you may wish you had some of that clean fresh water. Now we have to drill hundreds of feet into the ground to find good clean water. We pipe water for hundreds of miles to different farms & cities so they can have clean water. Please, no more underground or above ground emissions that will cause our future generations to suffer from all our mistakes.	Thank you for your comment.	20243-204403-01
	Wills, Aurelia	2024-02-23	My name is Aurelia Wills. I have lived in Minnesota for 33 years. I am concerned about the degraded environment and concerned about how the proposed Summit Carbon Solutions Pipeline Otter Tail to Wilkin will further that degradation. I am concerned that the recently released EIS is inadequate and downplays the dangers of a carbon pipeline. CO ₂ is a hazardous material in high concentrations. The DEIS consistently underplays the known and unknown risks of transporting large amounts of CO ₂ at high pressures through a pipeline. I am concerned about the hazards and burdens to rural residents near the pipeline and to local first responders. An adequate DEIS would take these risks and dangers, both known and unknown, extremely seriously.	Sections 8.5.1.3 and 8.5.1.5 describe potential mitigation in case of a pipeline rupture, including the applicant's commitment to train and coordinate with first responders and provide them with equipment to safely respond to any ruptures or leaks that may occur. Section 8.5.1.4 also describes the applicant's commitment to education for the public on potential safety risks of a CO ₂ rupture or leak, prevention of third-party damage to the pipeline, and other safety topics. The Emergency Response Plan included as Appendix N is a draft plan that is not outdated but would be revised as required by PHMSA, if the project is approved. Additionally, EERA staff recommended a special permit condition requiring the applicant to file its Emergency Response Plan that is filed with PHMSA with the Commission, and other special permit conditions as described in Section 8.5.3	20243-204403-01
	Wills, Aurelia	2024-02-23	I am concerned about breaches, with unknown consequences, of Minnesota aquifers. As we have seen with the Line 3 pipeline, breaches happen. Given climate change and unregulated farming practices, the water situation in Minnesota is in critical condition. Moreover, the Summit pipeline would use enormous, vaguely specified, amounts of water, and increase toxic discharge. The situation is too serious for dangers relating to aquifers and water usage to be blown off and minimized in a DEIS.	Section 5.7.8.2 acknowledges that damage to aquifers is a serious problem and indicates that an uncontrolled flow of water from a shallow confined aquifer could have a significant long-term impact on groundwater. Section 5.7.8.2 also describes geotechnical investigations that would be done to identify areas where breaching of a shallow confined aquifer could occur, and sheet piling would not be used. The applicant currently has an ongoing groundwater investigation underway to further inform construction practices and is continuing to consult with DNR. As part of its coordination with DNR, the applicant has agreed to use ground penetrating radar to study the depth of the confining layer through the entire beach ridge system area crossed by the pipeline to further define existing conditions and advise on	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
				<p>construction methodology. This information has been added to Section 5.7.8.2. Furthermore, as described in Section 5.7.8.2, EERA staff recommends that the applicant develop, in coordination with DNR, a plan for pipeline construction in areas crossing the beach ridge system area. The plan would include, at a minimum, measures to minimize the potential for breaching a shallow confined aquifer during trenching and contingency measures to mitigate the impacts of a breach, should one occur.</p> <p>Additional information has been added to Section 5.7.8.2 to address wastewater discharge from the capture facility and the volume of water that would be used by the project relative to available resources.</p> <p>Information on the Minnesota Statewide Drought Plan has been added to Section 5.7.8.2. In addition, the applicant has recently committed to include a contingency plan as part of its appropriation permit application to identify potential alternate water supply sources and/or a statement that the applicant agrees in advance to a suspension of withdrawals following a DNR request, when necessary. This information has also been added to Section 5.7.8.2.</p>	
	Wills, Aurelia	2024-02-23	Finally, a CO ₂ pipeline is a false, industry-friendly solution. We are in the midst of a climate crisis that is accelerating. As a society, we have to lower our carbon output. I want government officials to look for solutions that actually help society work toward this difficult goal, rather than getting behind expensive, damaging "solutions" such as the CO ₂ pipeline that simply allow the oil industry to carry on. Please have a conscience.	Thank you for your comment.	20243-204403-01
	Workman, Lisa	2024-02-23	<p>As the President of the Fergus Falls Chamber of Commerce, I am happy to support Summit Carbon Solutions' proposed pipeline in Fergus Falls, Minnesota.</p> <p>The construction and operation of Summit's proposed pipeline will stimulate our local economy. As heard at the public meetings in February, Summit plans to hire local workers during both the construction and operational phases of the project. These workers will in turn spend a portion of their incomes at other local businesses in our community.</p> <p>Once the pipeline is operational, economic benefits will continue to pour into Otter Tail County via property taxes, which will be paid by Summit. This new tax revenue can be used to improve infrastructure and fund projects in Otter Tail County.</p> <p>The proposed pipeline will also support the Green Plains ethanol plant and its employees in Fergus Falls. By capturing the emissions from the ethanol plant, Summit will open the low-carbon fuel market for Green Plains' ethanol, ensuring the plant and its employees are secure for decades to come.</p> <p>Summit's proposed pipeline will bring millions of dollars of economic revenue to the Fergus Falls area. I urge the Public Utilities Commission to approve application and I look forward to the pipeline becoming operational in Fergus Falls.</p>	Thank you for your comment.	20243-204403-01
	Wulling, T	2024-02-24	<p>I am opposed to the Otter Tail Wilkin CO₂ pipeline (docket 22-422).</p> <p>Carbon capture and sequestration (CCS) results in the continued use of fossil fuels at a time when meeting climate goals require drastically cutting back on fossil fuels. Carbon capture would involve CO₂ pipelines. So, CO₂ pipelines should not be built.</p> <p>Therefore, I ask the Commissioners to not approve the CO₂ pipeline before the Commission.</p>	Thank you for your comment.	20242-203846-01
	Wyse, Margo	2024-02-12	WHEN WILL HUMANS EVER LEARN!!!!	Thank you for your comment.	20243-204403-01
	Wyse, Margo	2024-02-22	When will you idiots EVER learn.....pipelines ALWAYS leak!!!!	Risks of a potential CO ₂ release and potential impacts are described in Chapter 8 of the EIS.	20243-204403-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Yaggie, Charles	2024-02-13	The WEB Ex drew my attention to the large amount of water needed for both the ethanol side and the CO ₂ recovery side of this project. I assume that water recycling ponds will be used. Any idea as to how much this will save in total amount of water needed? Assuming that the EIS is established, any idea when the pipeline construction will begin? Thank you.	Water recycling ponds are not proposed for the capture facility. The water would be circulated through a cooling tower. Information has been added to Section 5.7.8.2 regarding this process. Information on the project schedule is provided in Section 2.9 and has been added to the Executive Summary.	20243-204403-01
	Zaudtke, Mary	2024-02-23	My name is Mary Zaudtke and I am very concerned with this approach being suggested as a solution for climate change We should be looking to reduce our fossil fuel emissions not storing them.	Thank you for your comment.	20243-204403-01
	Zaudtke, Mary	2024-02-23	We know how storage goes. It is time limited and then what? Our water, soil and air gets polluted. From what I understand there are plans for a network of this storage. You tell me who wants this on their land? Our money would be better spent on geothermal infrastructure to heat and cool our buildings and electric vehicles that don't require gasoline. This approach is a Band-Aid that will waste our time and energy from working on real solutions and frankly we don't have time for it.	An alternative that does not include ethanol production was not studied in the EIS because it would not meet the purpose of the project. Text has been added to Section 2.1 describing the suitability of the Broom Creek Formation in North Dakota for CO ₂ sequestration, as well as the monitoring and testing that would be done to verify that the CO ₂ is contained in the storage reservoir.	20243-204403-01
	Zilverberg, Laura	2024-02-23	I'm very concerned about ensuring that solutions to the climate crisis here in MN are solutions grounded in science and that they avoid damage to our local communities and ecosystems. Carbon capture, while likely to be important in our drawdown scenario, is right now a technology still in its infancy and MN's agencies don't have experience with CO ₂ pipelines or carbon capture projects. Based on past pipeline construction it seems unlikely that this project will have "minimal impact." I have numerous concerns about the proposed project's safety, impacts to communities/land and our water and natural resources.	Impacts on communities, public safety, land, water and natural resources are addressed in Chapter 5. Sections 8.4 and 8.5 describe the steps that would be taken in the event of an accidental release of CO ₂ and to prevent an accidental release. Additionally, the applicant's draft Emergency Response Plan is included in Appendix N of the EIS.	20242-203795-01
	Zilverberg, Laura	2024-02-24	But I'm especially concerned about the false promise of the pipeline. The DEIS hasn't accurately accounted for the real CO ₂ emissions and climate impacts of the project. A few key concerns:	GHG emissions are quantified in Section 5.7.1.3, while Section 5.7.2.2 addresses interactions between the project and climate trends.	20242-203795-01
	Zilverberg, Laura	2024-02-25	The anticipated lifetime of the project is only 25 years. At the end of its life, there will be no more C02 capture from the ethanol plan.	Section 2.7 describes decommissioning of the project. If the ethanol plant continues to operate beyond the life of the proposed project, its CO ₂ emissions would not be captured.	20242-203795-01
	Zilverberg, Laura	2024-02-26	It is unlikely that this facility will truly be able to capture 100% of emitted CO ₂ . No carbon capture technology is achieving that rate (or even close to that rate) and that claim is not supported by any third-party data.	Section 2.1 has been revised to clarify that the amount of CO ₂ that would be captured annually was determined by the applicant based on a capture rate of 100 percent, and that commenters have questioned the feasibility of this capture rate given the performance of existing capture facilities.	20242-203795-01
	Zilverberg, Laura	2024-02-27	This technology is likely to be highly energy intensive and will increase carbon emissions from added electricity use.	Electricity emissions are included in Table 5-39. These numbers have been revised to reflect the electricity emission factor associated with LREC, which would provide electricity to the project. The revised electricity emission factor is 132.2 gCO ₂ e/MWh. This was calculated from LREC's energy resource mix in which nearly half comes from clean energy sources. Because LREC has a lower emission factor than the Midwest Reliability West Region emission factor (684.35 gCO ₂ e/kWh), which was used in the draft EIS, calculated electricity emissions have decreased.	20242-203795-01
	Zilverberg, Laura	2024-02-28	The DEIS assumes captured C02 will be stored permanently underground, but there is no guarantee or protocols to ensure that. The climate crisis is here. It is already impacting Minnesota, our winters and our wilderness. And we need real solutions that reduce emissions rather than smoke and mirrors that promise continued emissions with no impact.	Text has been added to Section 2.1 describing the suitability of the Broom Creek Formation in North Dakota for CO ₂ sequestration, as well as the monitoring and testing that would be done to verify that the CO ₂ is contained in the storage reservoir.	20242-203795-01

Agency or Org	Name	Date	Comment	Response	eDocket Document ID
	Zollner, Allen	2024-02-26	I am a landowner in Redwood County and I am opposed to the pipeline that is proposed. Docket # (22-422). It will be an environmental hazard using taxpayer money to benefit a few. Vote it down.	Thank you for your comment.	20243-204403-02

Appendix O

Comments on the Draft EIS and Responses

Attachment 2 DNR Conservation Planning Reports

Conservation Planning Report: SCS_CO2 Pipeline_RA-Hybrid

This document is intended for planning purposes only for the area of interest defined by the user. The report identifies ecologically significant areas documented within the defined area of interest plus any additional search distance indicated below. These ecologically significant areas can be viewed in the Explore Tab of the Minnesota Conservation Explorer. Please visit [MN Geospatial Commons](#) for downloadable GIS data.

This document does not meet the criteria for a Natural Heritage Review. If a Natural Heritage Review is needed, please define an Area of Interest in the Explore Tab and click on the Natural Heritage Review option.

This document does not include known occurrences of state-listed or federally listed species.

MBS Sites of Biodiversity Significance

Search distance = 330 feet

Minnesota Biological Survey (MBS) Sites of Biodiversity Significance are areas with varying levels of native biodiversity that may contain high quality native plant communities, rare plants, rare animals, and/or animal aggregations. A [Biodiversity Significance Rank](#) is assigned on the basis of the number of rare species, the quality of the native plant communities, size of the site, and context within the landscape. MBS Sites are ranked Outstanding, High, or Moderate. Areas ranked as Below were found to be disturbed and are retained in the layer as negative data. These areas do not meet the minimum biodiversity threshold for statewide significance but may have conservation value at the local level as habitat for native plants and animals, corridors for animal movements, buffers surrounding higher quality natural areas, or as areas with high potential for restoration of native habitat. The DNR recommends avoidance of MBS Sites of Biodiversity Significance ranked High or Outstanding.

Wetlands within MBS Sites of Outstanding or High Biodiversity Significance may be considered Rare Natural Communities under the Wetland Conservation Act. For technical guidance on Rare Natural Communities, please visit [WCA Program Guidance and Information](#).

For more information please visit [MBS Sites of Biodiversity Significance](#).

The following MBS Sites of Biodiversity Significance are within the search area:

MBS Site Name	Biodiversity Significance	Status
Everts 21	Moderate	final
FOXHOME PRAIRIE	High	final

DNR Native Plant Communities

Search distance = 330 feet

A native plant community is a group of native plants that interact with each other and with their environment in ways not greatly altered by modern human activity or by introduced organisms. These groups of native plant species form recognizable units, such as oak savannas, pine forests, or marshes, that tend to repeat over space and time. Native plant communities are classified and described by considering vegetation, hydrology, landforms, soils, and natural disturbance regimes.

DNR Native Plant Community types and subtypes are given a [Conservation Status Rank](#) that reflects the relative rarity and endangerment of the community type in Minnesota. Conservation Status Ranks range from S1 (critically imperiled) to S5 (secure, common, widespread, and abundant). Native plant communities with a Conservation Status Rank of S1 through S3 are considered rare in the state. The DNR recommends avoidance of rare native plant communities.

Wetland native plant communities with a conservation status rank of S1 through S3 may also be considered Rare Natural Communities under the Wetland Conservation Act. For technical guidance on Rare Natural Communities, please visit [WCA Program Guidance and Information](#).

DNR Native Plant Communities may be given a Condition Rank that reflects the degree of ecological integrity of a specific occurrence of a native plant community. The Condition Rank is based on species composition, vegetation structure, ecological processes and functions, level of human disturbance, presence of exotic species, and other factors. Condition Ranks range from A-rank (excellent ecological integrity) to D-rank (poor ecological integrity). A Condition Rank of NR means Not Ranked and a Condition Rank of MULTI mean multiple ranks are present because the record is a native plant community complex.

For more information please visit [Minnesota's Native Plant Communities](#).

The following DNR Native Plant Communities are within the search area:

MBS Site Name	NPC Code	Native Plant Community Classification	Conservation Status Rank	Number of Communities
Everts 21	WPn53c	Wet Prairie (Northern)	S3	2
FOXHOME PRAIRIE	PWL_CX	Prairie Wetland Complex	(S1, S2, S3)	1
Not Within MBS Site	PWL_CX	Prairie Wetland Complex	(S1, S2, S3)	1

Calcareous Fens

Search distance = 5 miles

A calcareous fen is a rare and distinctive peat-accumulating wetland that is legally protected in Minnesota under the Wetland Conservation Act (*Minnesota Statutes*, [section 103G.223](#)). Many of the unique characteristics of calcareous fens result from the upwelling of groundwater through calcareous substrates. Because of this dependence on groundwater hydrology, calcareous fens can be affected by nearby activities or even those several miles away. For more information regarding calcareous fens, please see the [Calcareous Fen Fact Sheet](#) or review the [List of Known Calcareous Fens](#).

SEARCH RESULTS: No features were found within the search area.

DNR Old Growth Stands

Search distance = 330 feet

[Old-growth forests](#) are natural forests that have developed over a long period of time, generally at least 120 years, without experiencing severe, stand-replacing disturbances such as fires, windstorms, or logging. Old-growth forests are a unique, nearly vanished piece of Minnesota's history and ecology; less than 4% of Minnesota's old-growth forests remain. The DNR recommends avoidance of all DNR Old Growth Stands. The following DNR Old Growth Stands have been documented within the search area.

SEARCH RESULTS: No features were found within the search area.

MN Prairie Conservation Plan

Search distance = 330 feet

The [Minnesota Prairie Conservation Plan](#), a twenty-five year strategy for accelerating prairie conservation in the state, identifies Core Areas, Corridors, and Corridor Complexes as areas to focus conservation efforts. The Plan's strategies include protection, enhancement, and restoration of grassland and wetland habitat. To meet the Plan's goals, approaches within Core Areas will need to include restoration and approaches within Corridors will need to include conservation of grassland habitat which can provide stepping stones between larger Core Areas.

The following MN Prairie Conservation Plan Designations are within the search area:

- Corridor: Agassiz Beach Ridges
- Corridor: Alexandria Moraine
- Corridor Complex: Foxhome Prairie

Important Bird Areas

Search distance = 1 mile

[Important Bird Areas](#), identified by Audubon Minnesota in partnership with the DNR, are part of an international conservation effort aimed at conserving globally important bird habitats. They are voluntary and non-regulatory, but the designation demonstrates the significant ecological value of the area.

SEARCH RESULTS: No features were found within the search area.

Lakes of Biological Significance

Search distance = 330 feet

[Lakes of Biological Significance](#) are high quality lakes as determined by the aquatic plant, fish, bird, or amphibian communities present within the lake. To be included in this layer, a lake only needs to meet the criteria for one of these four community types. The lake is assigned a biological significance of Outstanding, High, or Moderate based on the community with the highest quality.

SEARCH RESULTS: No features were found within the search area.

USFWS Habitat Conservation Plans

A [Habitat Conservation Plan \(HCP\)](#) is a mechanism for compliance with the federal Endangered Species Act for a given set of activities and protected species. An HCP is required by the U.S. Fish and Wildlife Service (USFWS) as part of an application for an [incidental take permit \(ITP\)](#). The ITP allows the permit holder to proceed with activities covered in the HCP that could result in the unintentional take of federally listed species.

[Lakes States Forest Management Bat Habitat Conservation Plan \(Bat HCP\)](#): (search distance = 0; within area of interest only) This HCP was created to provide flexibility to the Minnesota Department of Natural Resources (DNR) to manage forests while addressing federal Endangered Species Act (ESA) regulations related to federally threatened and endangered bat species. The Bat HCP covers three bat species within Minnesota: northern long-eared bat, little brown bat, and tricolored bat. This report is intended to help non-federal, non-DNR landowners evaluate their potential eligibility for the Landowner Enrollment Program of the Bat HCP (For DNR-administered land, DNR staff should refer to the Bat HCP Implementation Policy).

[Landowner Enrollment Program](#) – DNR's incidental take permit may be extended through the Landowner Enrollment Program (LEP) to eligible non-federal landowners who conduct forest management activities. Landowners may be eligible to enroll in the LEP if they are a county land administrator, own more than 10,000 acres, or own land that overlaps a Bat HCP feature. The results below indicate if the defined area of interest overlaps a Bat HCP feature. For more information on how to enroll in the LEP, please visit the [Landowner Enrollment Program \(LEP\)](#).

SEARCH RESULTS: No Bat HCP features were found within the area of interest. Landowners are only eligible to apply for the Landowner Enrollment Program if they are a county land administrator or they own more than 10,000 acres.

USFWS Regulatory Layers

To ensure compliance with federal law, conduct a federal regulatory review using the U.S. Fish and Wildlife Service's (USFWS) online [Information for Planning and Consultation \(IPaC\) tool](#). This report is not a substitution for a Section 7 review.

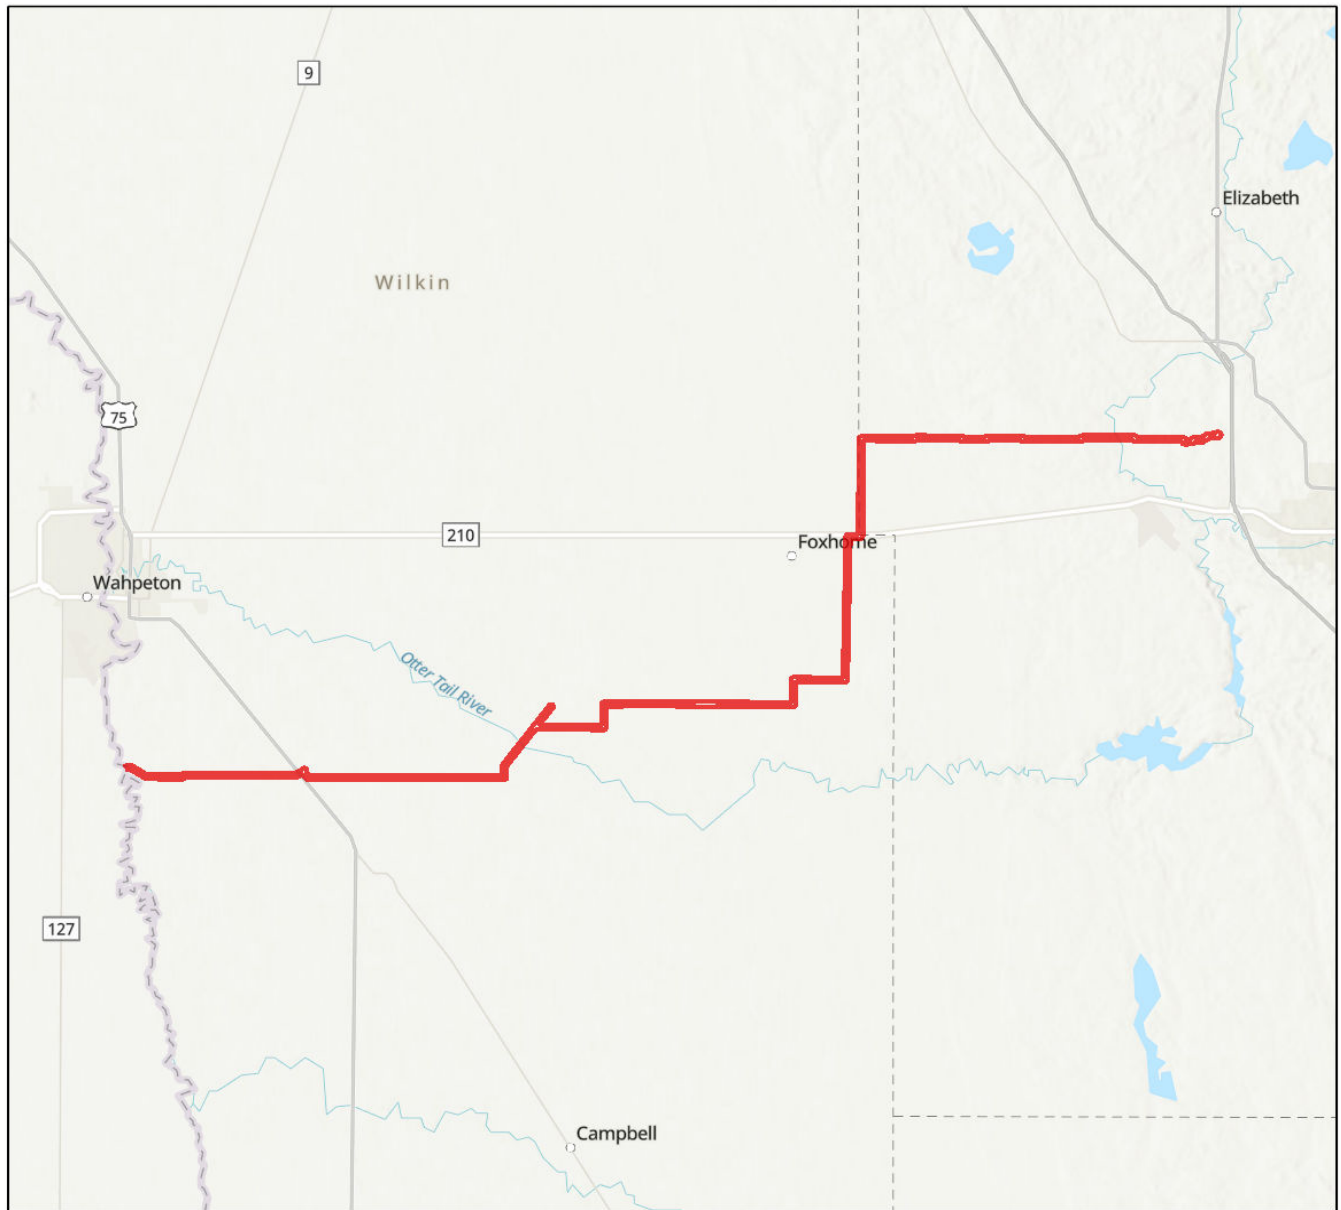

For informational purposes only, this tool currently checks the following USFWS Regulatory Layers:

Rusty Patched Bumblebee High Potential Zones: (*search distance = 0; within area of interest only*) The rusty patched bumble bee (*Bombus affinis*), federally listed as endangered, is likely to be present in suitable habitat within the high potential zones. From April through October this species uses underground nests in upland grasslands, shrublands, and forest edges, and forages where nectar and pollen are available. From October through April the species overwinters under tree litter in upland forests and woodlands. The rusty patched bumble bee may be impacted by a variety of land management activities including, but not limited to, prescribed fire, tree-removal, haying, grazing, herbicide use, pesticide use, land-clearing, soil disturbance or compaction, or use of non-native bees. The [USFWS RPBB guidance](#) provides guidance on avoiding impacts to rusty patched bumble bee and a key for determining if actions are likely to affect the species; the determination key can be found in the appendix. Please visit the [USFWS Rusty Patched Bumble Bee Map](#) for the most current locations of High Potential Zones.

SEARCH RESULTS: No features were found within the search area.

MBS Sites of Biodiversity Significance

Search distance = 330 feet

Minnesota Biological Survey (MBS) Sites of Biodiversity Significance are areas with varying levels of native biodiversity that may contain high quality native plant communities, rare plants, rare animals, and/or animal aggregations. A [Biodiversity Significance Rank](#) is assigned on the basis of the number of rare species, the quality of the native plant communities, size of the site, and context within the landscape. MBS Sites are ranked Outstanding, High, or Moderate. Areas ranked as Below were found to be disturbed and are retained in the layer as negative data. These areas do not meet the minimum biodiversity threshold for statewide significance but may have conservation value at the local level as habitat for native plants and animals, corridors for animal movements, buffers surrounding higher quality natural areas, or as areas with high potential for restoration of native habitat. The DNR recommends avoidance of MBS Sites of Biodiversity Significance ranked High or Outstanding.

Wetlands within MBS Sites of Outstanding or High Biodiversity Significance may be considered Rare Natural Communities under the Wetland Conservation Act. For technical guidance on Rare Natural Communities, please visit [WCA Program Guidance and Information](#).

For more information please visit [MBS Sites of Biodiversity Significance](#).

The following MBS Sites of Biodiversity Significance are within the search area:

MBS Site Name	Biodiversity Significance	Status
Everts 21	Moderate	final
FOXHOME PRAIRIE	High	final

DNR Native Plant Communities

Search distance = 330 feet

A native plant community is a group of native plants that interact with each other and with their environment in ways not greatly altered by modern human activity or by introduced organisms. These groups of native plant species form recognizable units, such as oak savannas, pine forests, or marshes, that tend to repeat over space and time. Native plant communities are classified and described by considering vegetation, hydrology, landforms, soils, and natural disturbance regimes.

DNR Native Plant Community types and subtypes are given a [Conservation Status Rank](#) that reflects the relative rarity and endangerment of the community type in Minnesota. Conservation Status Ranks range from S1 (critically imperiled) to S5 (secure, common, widespread, and abundant). Native plant communities with a Conservation Status Rank of S1 through S3 are considered rare in the state. The DNR recommends avoidance of rare native plant communities.

Wetland native plant communities with a conservation status rank of S1 through S3 may also be considered Rare Natural Communities under the Wetland Conservation Act. For technical guidance on Rare Natural Communities, please visit [WCA Program Guidance and Information](#).

DNR Native Plant Communities may be given a Condition Rank that reflects the degree of ecological integrity of a specific occurrence of a native plant community. The Condition Rank is based on species composition, vegetation structure, ecological processes and functions, level of human disturbance, presence of exotic species, and other factors. Condition Ranks range from A-rank (excellent ecological integrity) to D-rank (poor ecological integrity). A Condition Rank of NR means Not Ranked and a Condition Rank of MULTI mean multiple ranks are present because the record is a native plant community complex.

For more information please visit [Minnesota's Native Plant Communities](#).

The following DNR Native Plant Communities are within the search area:

MBS Site Name	NPC Code	Native Plant Community Classification	Conservation Status Rank	Number of Communities
Everts 21	WPn53c	Wet Prairie (Northern)	S3	2
FOXHOME PRAIRIE	PWL_CX	Prairie Wetland Complex	(S1, S2, S3)	1
Not Within MBS Site	PWL_CX	Prairie Wetland Complex	(S1, S2, S3)	1

Calcareous Fens

Search distance = 5 miles

A calcareous fen is a rare and distinctive peat-accumulating wetland that is legally protected in Minnesota under the Wetland Conservation Act (*Minnesota Statutes*, [section 103G.223](#)). Many of the unique characteristics of calcareous fens result from the upwelling of groundwater through calcareous substrates. Because of this dependence on groundwater hydrology, calcareous fens can be affected by nearby activities or even those several miles away. For more information regarding calcareous fens, please see the [Calcareous Fen Fact Sheet](#) or review the [List of Known Calcareous Fens](#).

SEARCH RESULTS: No features were found within the search area.

DNR Old Growth Stands

Search distance = 330 feet

[Old-growth forests](#) are natural forests that have developed over a long period of time, generally at least 120 years, without experiencing severe, stand-replacing disturbances such as fires, windstorms, or logging. Old-growth forests are a unique, nearly vanished piece of Minnesota's history and ecology; less than 4% of Minnesota's old-growth forests remain. The DNR recommends avoidance of all DNR Old Growth Stands. The following DNR Old Growth Stands have been documented within the search area.

SEARCH RESULTS: No features were found within the search area.

MN Prairie Conservation Plan

Search distance = 330 feet

The [Minnesota Prairie Conservation Plan](#), a twenty-five year strategy for accelerating prairie conservation in the state, identifies Core Areas, Corridors, and Corridor Complexes as areas to focus conservation efforts. The Plan's strategies include protection, enhancement, and restoration of grassland and wetland habitat. To meet the Plan's goals, approaches within Core Areas will need to include restoration and approaches within Corridors will need to include conservation of grassland habitat which can provide stepping stones between larger Core Areas.

The following MN Prairie Conservation Plan Designations are within the search area:

- Corridor: Agassiz Beach Ridges
- Corridor: Alexandria Moraine
- Corridor Complex: Foxhome Prairie

Important Bird Areas

Search distance = 1 mile

[Important Bird Areas](#), identified by Audubon Minnesota in partnership with the DNR, are part of an international conservation effort aimed at conserving globally important bird habitats. They are voluntary and non-regulatory, but the designation demonstrates the significant ecological value of the area.

SEARCH RESULTS: No features were found within the search area.

Lakes of Biological Significance

Search distance = 330 feet

[Lakes of Biological Significance](#) are high quality lakes as determined by the aquatic plant, fish, bird, or amphibian communities present within the lake. To be included in this layer, a lake only needs to meet the criteria for one of these four community types. The lake is assigned a biological significance of Outstanding, High, or Moderate based on the community with the highest quality.

SEARCH RESULTS: No features were found within the search area.

USFWS Habitat Conservation Plans

A [Habitat Conservation Plan \(HCP\)](#) is a mechanism for compliance with the federal Endangered Species Act for a given set of activities and protected species. An HCP is required by the U.S. Fish and Wildlife Service (USFWS) as part of an application for an [incidental take permit \(ITP\)](#). The ITP allows the permit holder to proceed with activities covered in the HCP that could result in the unintentional take of federally listed species.

[Lakes States Forest Management Bat Habitat Conservation Plan \(Bat HCP\)](#): (search distance = 0; within area of interest only) This HCP was created to provide flexibility to the Minnesota Department of Natural Resources (DNR) to manage forests while addressing federal Endangered Species Act (ESA) regulations related to federally threatened and endangered bat species. The Bat HCP covers three bat species within Minnesota: northern long-eared bat, little brown bat, and tricolored bat. This report is intended to help non-federal, non-DNR landowners evaluate their potential eligibility for the Landowner Enrollment Program of the Bat HCP (For DNR-administered land, DNR staff should refer to the Bat HCP Implementation Policy).

[Landowner Enrollment Program](#) – DNR's incidental take permit may be extended through the Landowner Enrollment Program (LEP) to eligible non-federal landowners who conduct forest management activities. Landowners may be eligible to enroll in the LEP if they are a county land administrator, own more than 10,000 acres, or own land that overlaps a Bat HCP feature. The results below indicate if the defined area of interest overlaps a Bat HCP feature. For more information on how to enroll in the LEP, please visit the [Landowner Enrollment Program \(LEP\)](#).

SEARCH RESULTS: No Bat HCP features were found within the area of interest. Landowners are only eligible to apply for the Landowner Enrollment Program if they are a county land administrator or they own more than 10,000 acres.

USFWS Regulatory Layers

To ensure compliance with federal law, conduct a federal regulatory review using the U.S. Fish and Wildlife Service's (USFWS) online [Information for Planning and Consultation \(IPaC\) tool](#). This report is not a substitution for a Section 7 review.

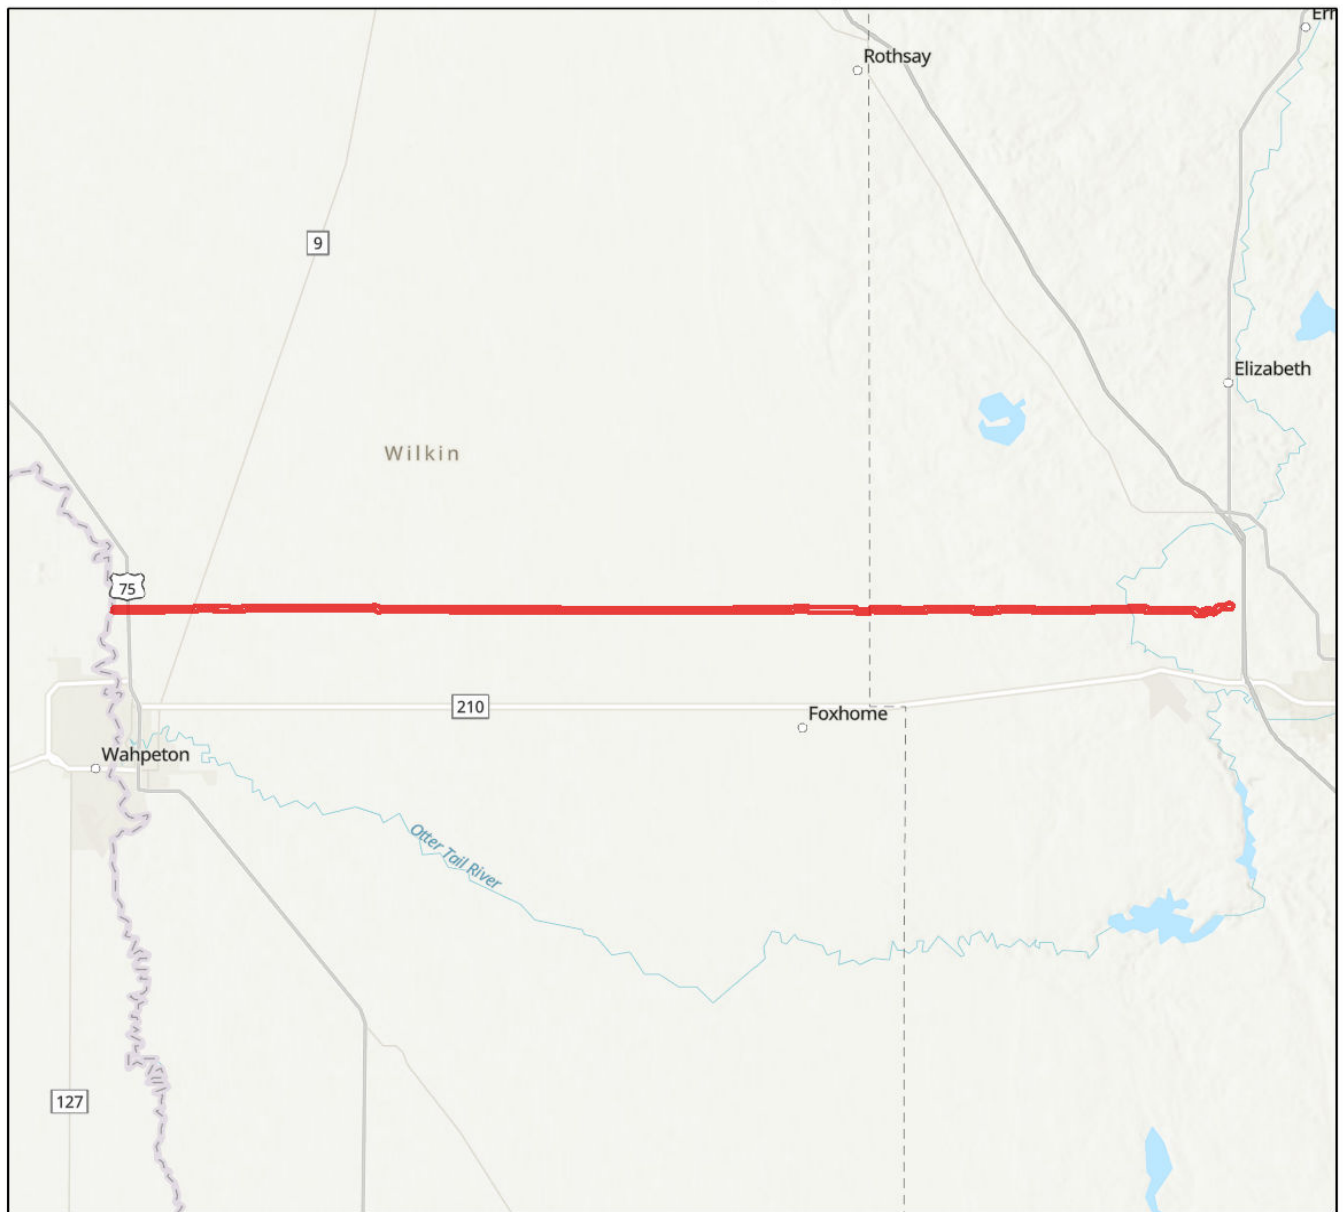

For informational purposes only, this tool currently checks the following USFWS Regulatory Layers:

Rusty Patched Bumblebee High Potential Zones: (*search distance = 0; within area of interest only*) The rusty patched bumble bee (*Bombus affinis*), federally listed as endangered, is likely to be present in suitable habitat within the high potential zones. From April through October this species uses underground nests in upland grasslands, shrublands, and forest edges, and forages where nectar and pollen are available. From October through April the species overwinters under tree litter in upland forests and woodlands. The rusty patched bumble bee may be impacted by a variety of land management activities including, but not limited to, prescribed fire, tree-removal, haying, grazing, herbicide use, pesticide use, land-clearing, soil disturbance or compaction, or use of non-native bees. The [USFWS RPBB guidance](#) provides guidance on avoiding impacts to rusty patched bumble bee and a key for determining if actions are likely to affect the species; the determination key can be found in the appendix. Please visit the [USFWS Rusty Patched Bumble Bee Map](#) for the most current locations of High Potential Zones.

SEARCH RESULTS: No features were found within the search area.

HUDSON@curemn.org
Attorneys for CURE

1. Please provide a detailed summary of the qualifications of Daniel Prascher and any other modeler(s) who conducted the modeling described in Appendix G and wrote the accompanying report.

Mr. Prascher and Dr. Ward conducted the modeling. Ms. Hart provided technical writing support. The enclosed attachment details the credentials of Mr. Prascher, Dr. Ward, and Ms. Hart.

2. Has Daniel Prascher conducted aerial and thermal dispersion analyses and/or Computational Fluid Dynamics (CFD) analyses on any other carbon dioxide pipelines? If yes, please provide a list with the names of those pipelines.

Yes, Mr. Prascher has conducted the analyses mentioned above for several operators in the continental United States. Please see the enclosed attachment for additional details. A list of specific pipelines cannot be provided because that work is governed by nondisclosure agreements.

3. Regarding the CFD model referenced in Appendix G, what were the boundary conditions? (e.g., was an atmospheric boundary layer profile used or a flat/uniform wind velocity? Was there thermal radiation? How was the CO₂ introduced (phase)? How were the winter conditions (snow) taken into account?).

Mr. Prascher and Dr. Ward modeled boundary conditions at the surface, which included a boundary layer in the moving air against the stationary ground. The upwind boundary layer (atmospheric boundary layer) was defined as a fully developed profile and all other boundaries were open.

Thermal radiation was not included in the model because the temperatures involved in the worst-case scenario being modeled were extremely cold – both the temperature of the product upon release and the ambient temperature. Since both were extremely cold, it greatly reduced the need for thermal radiation modeling. By not including thermal radiation modeling, the model is more conservative because thermal radiation would warm up the CO₂ release faster – reducing the impact distance.

The phase of the CO₂ was defined as a gas at atmospheric pressure as the lowest possible gas phase temperature at 1 atm. Winter conditions were modeled through the selection of air and ground temperatures reflective of the worst-case scenario (See the aerial dispersion report, Appendix B, for a discussion on how the worst-case scenario was determined.)

4. Regarding the CFD model, how large was the solution domain compared to the area of interest?

For the terrain model, it was the size of the digital elevation model (DEM) – 365 meters crosswind by 556 meters downwind) with a 100-meter height. The windbreak models were 400-meter square with a height of 100 m.

5. Regarding the CFD model, what was the ruptured pipe geometry, and was it created to match the scenario analyzed by the CANARY software?

Two circular boundaries were used for the upstream and downstream pipeline rupture geometry. The internal diameter of the pipeline was used for both rupture geometries used for the CO₂ insertion flow. This would match a full pipeline break and flow from each side of the ruptured pipeline for a guillotine break.

6. Regarding the CFD model, what was the justification for using such a simplified model (Darcy's Law approach) to account for the windbreaks?

Darcy's law is appropriate for modeling low-velocity flows or media with low permeability and porosity. It's also suitable for small pressure drops and low velocities, all of which apply to this application. Darcy's law is often used for flow through structure-restricted voids, including porous filters, capillary beds in biological tissue, and other places where a distributed structure occupies a significant fraction of the free-flow volume.

7. Regarding the CFD model, were any steps taken to ensure this simplified model and the values for the porous media used were accurate and appropriate for modeling trees?

Yes, please refer to the references in the Allied CFD report.

8. Regarding the modeled terrain and geometry in the CFD, what was upstream of the pipe rupture? Please provide images or diagrams to illustrate the scenarios.

To the extent this question is asking "What was the modeled terrain *upwind* of the pipe rupture," Mr. Prascher and Dr. Ward modeled no terrain upwind of the pipeline rupture so as not to obstruct wind flow to the CO₂ being carried downwind. This ensured that the model produced a potential worst-case scenario.

9. Regarding the CFD model, how were the fluids modeled (laminar or turbulent flow regimes)?

Mr. Prascher and Dr. Ward modeled everything assuming a laminar flow. The CO₂ leaving the pipeline had relatively low Reynold's numbers, meaning that it was not fully turbulent. Regardless, they

modeled everything in a laminar flow to create a worst-case scenario. This approach is more conservative than the actual case because laminar flows create the greatest impact distances.

10. Regarding the CFD model, how was the flow regime determined for the wind and the CO₂ rupture?

The flow regime was determined by calculating the maximum Reynolds number of mixture of air and CO₂ and comparing to the published value for the transition from laminar to turbulent regimes for external flow.

11. Regarding the CFD model, how was the multicomponent mixture of CO₂ and air modeled?

Local volume fractions of mixture of CO₂ and air were used to calculate the volumetric properties at each node.

12. Regarding the CFD model, what turbulence model was used if the fluid flow was treated as turbulent?

N/A

13. Regarding the CFD model, were phase change, variable material properties, and buoyancy (natural convection) included in the analysis? If yes, how were they implemented?

No, Mr. Prascher and Dr. Ward did not model a phase change. Mr. Prascher and Dr. Ward assumed that all the CO₂ in the pipeline became gaseous, which is more conservative than what happens in reality. This simplifies the modeling process. At the same time, the downwind results are not affected because they set the release CO₂ mass to be the same as the mass released in the CANARY model.

Yes, Mr. Prascher and Dr. Ward did model the variable material properties – they modeled the properties with both temperature and gas volume fraction dependent functions.

Likewise, they also modeled buoyancy as a volume force created by the difference in densities.

14. Regarding the CFD model, was there a grid/mesh/cells study performed to ensure it was sufficient to model the scenario and get accurate results?

Yes, a discretization study was conducted as part of the model creation to determine the maximum mesh size that would provide converged results. This study was done manually using COMSOL settings.

15. Regarding the CFD model, was a time-step sensitivity study used to ensure the relevant physical phenomena were modeled accurately?

No. The implicit solver in COMSOL used a backwards differentiation formula that was free to choose an appropriate time step based on the local error estimation in the previous solution step. In effect, this approach allows the software to optimize the time-steps automatically to increase accuracy of the model on the fly – in CFD modeling, different time-steps are appropriate at different points in each

model. Mr. Prascher and Dr. Ward preferred this approach over trying to determine a “one size fits all” time-step via a time-step sensitivity study.

16. Regarding the CFD model, what were the convergence criteria used for determining if the simulation was acceptable?

Velocity, pressure, temperature, and CO₂ concentration were solved with an absolute tolerance of less than 10⁻⁴ m/s, Pa, K, and mol/m³ respectively.

17. Was any validation or verification of the CFD model performed? Please provide records of the verification and validation.

Yes, Mr. Prascher and Dr. Ward validated the CFD model (Scenario 2 in the CFD report) against the CANARY model (Scenario 1 in the CFD report). Using two different modeling software applications with completely different computational approaches they applied them to the same scenario¹ and validated the CFD model against the CANARY model on a macro level—comparing the final result of one model to the final result of another model—which accounts for any and all variations in data, assumptions, and modeling between the two approaches. As is shown in the CFD report, the results of Scenarios 1 and 2 are very close, which validates that both approaches are reasonable and appropriate. If the results of Scenarios 1 and 2 would not have been reasonably close, neither model would have been validated and a different validation approach would have become necessary.

Furthermore, CANARY is the accepted industry standard for aerial dispersion modeling. Thereby providing a reasonable standard by which to compare and validate the CFD model in Scenario 2.

¹ Since the terrain modeled in Scenario 2 is so flat, the CANARY model in Scenario 1, which cannot account for terrain, can reasonably be compared to Scenario 2.

1 MR. ANDREW LEVI: Good evening, everyone.
2 Let's go ahead and get started.

3 My name is Andrew, I work with the
4 Minnesota Department of Commerce. We're here in
5 Breckenridge for the Draft Environmental Impact
6 Statement meetings for the Otter Tail to Wilkin
7 Carbon Dioxide Pipeline Project proposed by Summit
8 Carbon Solutions.

9 There's a PowerPoint, but the projector
10 is not working, so a couple things we'll just chat
11 about. We'll do some introductions very quickly,
12 very quickly talk about the proposed project, the
13 state permitting process and Draft Environmental
14 Impact Statement, or EIS, itself. And then we'll
15 open it up to your questions and comments.

16 So before I get started, I do want to
17 thank you for being here this evening. Your
18 comments and thoughts on the Draft EIS make for a
19 better Final EIS, and we really appreciate your
20 feedback.

21 Again, I'm Andrew with the Minnesota
22 Department of Commerce. We were tasked -- the
23 Energy Environmental Review and Analysis Unit, we
24 were tasked with writing the EIS. With me is
25 Jessica, she is in the back, she greeted you at the

1 door.

2 Also here from HDR, they are our
3 consultant on this project, is Joe, Will and Pat.
4 They're here to help answer any questions that I
5 need help with. Let's face it, there will be some.

6 And then Dan from Allied Solutions. Dan
7 did the rupture modeling for the EIS.

8 From Summit Carbon Solutions, Scott
9 O'Konek is here, along with Alex and Jason and
10 Christy and Britta.

11 And most importantly, Janet, our court
12 reporter, is here. Janet is transcribing what we're
13 saying and she'll get your comments spoken here
14 tonight into the record.

15 So, again, this is the Summit Carbon
16 Pipeline Project, Otter Tail to Wilkin. The
17 Applicant proposes to construct and operate
18 approximately 28.1 miles of four-inch carbon steel
19 pipeline and associated facilities, which are
20 mainline valves, a cathodic protection system, and
21 access roads that would transport captured CO2 from
22 the Green Plains Ethanol Plant to just south of
23 here, and on to North Dakota as part of the Midwest
24 Carbon Express Project.

25 The project is designed to capture

1 approximately .19 million metric tons of CO2
2 annually generated at the ethanol plant and
3 transported to North Dakota.

4 A pipeline routing permit is required
5 from the Public Utilities Commission because it
6 meets the definition of a pipeline in Minnesota
7 statute. Basically, it's designed to operate at a
8 pressure of more than 275 pounds per square inch
9 gauge and carry a gas. Various other approvals
10 would be required if the Applicant is granted a
11 route permit, such as commonly referred to as
12 downstream permits. Examples include like a license
13 to cross state lands and waters from the DNR, or a
14 permit from MnDOT to cross state highways, state
15 roads, et cetera.

16 The state permitting process so far, we
17 were out here I believe in May and had scoping
18 meetings. And then we disappeared for a while and
19 worked on a Draft Environmental Impact Statement
20 that is now done.

21 What we're doing now is the comment
22 period on the Draft EIS, which will be followed by a
23 Final EIS that will be issued. There will be a
24 comment period on the adequacy of that Final EIS,
25 and after that there will be a public hearing and

1 comment period that will be sometime in May. We'll
2 be back out here, most of us I think will all be
3 here, except an Administrative Law Judge will be
4 sitting in this chair running the meeting.

5 That's the meeting where we take the
6 information, you take the information that's in the
7 Environmental Impact Statement and tell the judge
8 what it means.

9 What we're trying to do with the EIS is
10 gather facts and, you know, at the public hearing is
11 when you get to tell the judge what you believe
12 those facts mean.

13 After the public hearing, there will be a
14 Commission decision on the adequacy of the EIS, and
15 then the judge, the Administrative Law Judge will
16 issue a report and recommendation as to what they
17 think should be done, what the Commission should do,
18 and then the Commission will make a final decision
19 on the route permit.

20 Sorry, that makes a lot more sense when
21 there's a slide on the screen.

22 So the EIS, it's in the back, there's
23 three copies you can look at in the back. It's also
24 available electronically.

25 It's all about informed decision-making.

1 Just a comment. We're trying to develop a common
2 set of facts that everyone can use to comment on the
3 project. The EIS doesn't advocate, it's an
4 information document.

5 It was prepared based on several
6 documents. The Applicant's application, along with
7 the scoping and environmental assessment worksheet.
8 Then we were here, you all provided scoping
9 comments. We incorporated those scoping comments
10 into a scoping decision. And that was essentially,
11 then, the table of contents of the EIS.

12 Information was provided by tribes and
13 state agencies on the preliminary Draft EIS, and
14 different tools were used to prepare a EIS. And
15 then, also, of course, it couldn't have been done
16 without the work of HDR and Allied Solutions.

17 There's a lot of information in the EIS.
18 It talks a little bit about the proposed project,
19 the regulatory requirements, the environmental
20 setting. It studies three alternative routes. It
21 studies alternative technologies to the project
22 itself. Alternative agricultural practices and
23 energy efficiency practices at the ethanol plant
24 itself. It discusses normal operation of the
25 pipeline and associated facilities as well as what

1 would happen if there was an accidental release of
2 CO2.

3 The EIS describes potential impacts and
4 tries to put them into context and characterize
5 those impacts as minimal, moderate, or significant.
6 It also discusses mitigation measures.

7 Again, the EIS is available
8 electronically on our website. And there's a flash
9 drive on the table in the back if you'd like to take
10 home a copy tonight. The print copy of it is
11 available in the local Breckenridge and Fergus Falls
12 libraries. Print copies are available for review in
13 the back here tonight, and there's summaries
14 available for you to take home, it's the Executive
15 Summary, and that's printed off for you to take
16 home.

17 So that's really all I had. We'll just
18 move on to your questions and comments on the Draft
19 EIS.

20 I think the comments that are most useful
21 at this time for us is we're trying to move from a
22 draft document to a final document, or what needs to
23 be -- what needs to be clarified. What needs to be
24 clarified in the EIS. What didn't you understand,
25 what is missing. Is there something that we didn't

1 talk about that we said we would talk about in the
2 scoping decision.

3 And is there anything that needs to be
4 added so that the Final EIS is more complete and
5 more accurate. Maybe there's something we could
6 discuss a little bit more that would be helpful.
7 Comments on the Draft EIS, any comments we receive
8 will be included as an appendix in the final and we
9 will respond to substantive comments in the final
10 and make changes as necessary.

11 And basically kind of the think about
12 that as if you provide some information that
13 convinces us, that changes our mind, and basically
14 kind of convinces us that, yeah, this should be
15 changed, then, yeah, our mind is changed and we can
16 go ahead and make those types of changes to the
17 Final EIS.

18 So a substantive comment then is a
19 comment on a specific section. This is what we see,
20 this is the concern and this would fix it. And
21 we'll take a look at those and we'll get to see, you
22 know, how that gets incorporated in the final.

23 So verbal comments can be -- are accepted
24 at the draft just tonight, just when we have the
25 court reporter here to take down the transcript so

1 we catch what you're saying for sure.

2 Other than that, you can submit comments
3 in writing. There's a comment form on the table in
4 the back that outlines different ways you can do
5 that. But basically you can do it, you can email
6 me, you can send me a letter, or there's an online
7 commenting tool that you can use. It's a fillable
8 form and it just pops up and you fill it out, fill
9 the form out, and you can attach PDFs or anything
10 you might want to attach to it.

11 You can comment any way you like. If you
12 don't like speaking in front of folks, you don't
13 have to just to submit a comment. You can submit
14 your comments in writing. We end up reviewing them
15 all in writing anyway, so they're all pretty equal
16 with regards to their format because they all get
17 read. So whatever is most comfortable for you,
18 please comment that way.

19 The comment period closes on
20 February 23rd, so please do get your comments in on
21 or before the 23rd.

22 So that's all I really have tonight.
23 We'll open it up to your questions and comments.

24 If you could please state and spell your
25 name for Janet when you come up to the podium. If

1 you could -- yeah, I think that that's all we really
2 have.

3 You can of course comment on anything
4 you'd like. I just want to remind you that in May
5 there will be an Administrative Law Judge here and
6 that's the person who is writing the report that
7 recommends what to do about the project. You can
8 certainly do that tonight, but our response to that
9 will just be comment noted because that's all we can
10 do right now. We're just trying to develop, you
11 know, a Final EIS. You can of course comment on
12 anything you'd like. Again, those questions are,
13 you know, what needs to be clarified, what is
14 missing and what needs to be added so that the Final
15 EIS is more complete and accurate.

16 And that's all I have. No one signed up
17 to speak.

18 Does anyone have any questions?

19 Yes, sir.

20 MR. DALE ANDERSON: I have a few.

21 MR. ANDREW LEVI: Can you come up to the
22 microphone, please, so Janet can hear you?

23 MR. DALE ANDERSON: My name is Dale
24 Anderson. The first name is D-A-L-E, last name,
25 A-N-D-E-R-S-O-N.

1 Some of the questions I got.

2 It's going to be a steel pipeline. Now,
3 am I under the impression that the CO2 gas is like a
4 freezing agent when it hits the air?

5 MR. ANDREW LEVI: Yes. Well, if there is
6 a -- are you speaking just in terms of a rupture?

7 MR. DALE ANDERSON: Right.

8 MR. ANDREW LEVI: Yeah. So if the
9 pipeline ruptures, the release -- and Dan can come
10 up and give you more of the specifics, but, yes,
11 it's cold, very cold.

12 MR. DALE ANDERSON: Okay. The next
13 question is what type of -- the pipes itself, they
14 come in so many lengths, but the connections are
15 what? I take it they're going to be welded.

16 MR. ANDREW LEVI: Yes.

17 MR. DALE ANDERSON: Okay. So that would
18 be like a hydro seam, in hydro you can only weld the
19 pipes together, so they can't be braced, they're
20 only welded; is that correct?

21 MR. ANDREW LEVI: I can't comment on
22 that, but I know these will be welded.

23 MR. DALE ANDERSON: Also, when the pipe
24 is in the ground, is there some way of doing it so
25 that they do not move as far as the freezing and

1 thawing so the pipes don't rupture?

2 MR. ANDREW LEVI: We took a look at that
3 in the EIS and basically what we concluded was that
4 the pipe would be deep enough for that freezing and
5 thawing, that lifting.

6 MR. DALE ANDERSON: It should be below
7 six feet.

8 MR. ANDREW LEVI: It will be 54 inches to
9 the top. The top of the pipe.

10 MR. DALE ANDERSON: And then around the
11 pipes there will be some kind of sand base so
12 there's no aggregate to rub on that pipe?

13 MR. ANDREW LEVI: Scott, do you want to
14 expand on if you're using padding or not?

15 MR. SCOTT O'KONEK: Sure. So the pipe
16 itself has a protective coating that's around it.
17 That, you know, will protect it from chips and
18 cracks and dings and dents. The entire coating, it
19 is an epoxy coating that goes over the entire pipe
20 and actually gets checked. Generally, that is
21 called jeeping. So to make sure that's a continuous
22 filled piece of pipe, so when you actually weld
23 that, you know, that comes epoxied from the factory,
24 but they check to find that it is complete. And
25 then the welds themselves get filled, too, before

1 they actually set down. And then, you know, there's
2 aggregate sizes that, you know, cannot go back into
3 the trench, that's correct.

4 MR. DALE ANDERSON: And then when it does
5 cross the Otter Tail River, the river varies at
6 depth and it becomes safe for that also so that the
7 river is above that pipe?

8 MR. SCOTT O'KONEK: Can you repeat that?

9 MR. DALE ANDERSON: Okay. When it
10 crosses the Otter Tail River to the North Dakota
11 side, then the elevation will change probably,
12 however deep that river elevation is?

13 MR. SCOTT O'KONEK: Yes. So, I mean,
14 there's an engineered design to make sure that, I
15 mean, I don't have the exact number, but we are
16 many, many feet below the river there. And actually
17 it's a bore that actually goes through there. And
18 it keeps it at that level the entire time. So the
19 entrance and the exit will be part of an engineering
20 draft, but also with the depth, and then we'll
21 actually use HDD drilling to put it from one side to
22 the other.

23 MR. DALE ANDERSON: Okay. That concludes
24 my questions. Thanks.

25 MR. ANDREW LEVI: Thank you.

1 Dan, would you want to come up real quick
2 and expand a little bit more to the temperature
3 question with regards to what happens if there's a
4 rupture?

5 MR. DAN PRASCHER: My name is Dan
6 Prascher. That's D-A-N, P-R-A-S-C-H-E-R.

7 Okay. Yeah. So it stays at a
8 temperature that is -- this is kind of embarrassing.
9 Okay. So it stays at a temperature that's
10 consistent with the ground and stays in liquid form.
11 And, yes, if there's a rapid decompression, then as
12 it flashes to gas, it releases -- it becomes very
13 cold. Similar to if you had one of those canisters
14 that cleans out your keyboard, pressed air, same
15 deal, you're triggering it, air is coming out, it's
16 decompressing it so the can gets cold. Same deal.

17 MR. ANDREW LEVI: Yes, sir. Come on up.

18 MR. DALE SCHNEIDER: Yeah. I got a
19 couple of questions here.

20 MR. ANDREW LEVI: Sir, could you state
21 and spell your name for Janet?

22 MR. DALE SCHNEIDER: Sure. Dale
23 Schneider, D-A-L-E, S-C-H-N-E-I-D-E-R.

24 Okay. I see here in the summary you got
25 some routing here. What is the north, RA north,

1 this is 23 miles long. And it says here parallels
2 roadways from the ethanol plant straight west to the
3 North Dakota border just north of Breckenridge.

4 Okay. What roads are those and where
5 does it come into Breckenridge? Where up north?
6 North ain't a good place for this shit. Is it a --
7 what do you call it? Bringing it into a facility
8 and then ship back out of there, a holding point?

9 MR. ANDREW LEVI: No. What happens is
10 the pipe will -- the pipe will continue into North
11 Dakota. The sequestration facilities are west of
12 Bismarck. So this document covers the Minnesota
13 portion of that, of this project.

14 MR. DALE SCHNEIDER: Okay.

15 MR. ANDREW LEVI: But once it hits the
16 river, there will be another HDD, another
17 directional drill, as Scott described it earlier.
18 And that --

19 MR. DALE SCHNEIDER: How far below the
20 riverbed is that?

21 MR. ANDREW LEVI: Again, Scott said it
22 would vary based on geotechnical work. I think we
23 found at minimum it's 20?

24 MS. PAT TERHAAR: Yeah, the minimum depth
25 would be 20, but likely it would be deeper than

1 that. It could be 30, 40, 50, it just depends on
2 the geology. And I don't think they're done with
3 their geotechnical studies yet for those.

4 MR. DALE SCHNEIDER: What is
5 geotechnical? What is the difference there that
6 makes a difference in height as it's buried?

7 MR. ANDREW LEVI: Scott, if you want to
8 expand on it.

9 MR. SCOTT O'KONEK: A lot of it has to do
10 with what types of rocks and geological layers are
11 in there, you know. What, you know, we want to be
12 below the bedrock, we want to be in an area that you
13 can actually efficiently and effectively run a drill
14 without having collapses. And we also want to make
15 sure there's enough protection that we won't have a
16 frac-out or a blowout when that drilling is
17 happening, you know.

18 So that's what I mean, too, you know,
19 we'll talk about minimum depths of 20 feet, or
20 whatever the case may be, but when you're talking
21 about these different routes, that you have to
22 realize, too, that whatever route it would be would
23 get an engineered design prior to an approval of
24 before that drill will take place.

25 MR. DALE SCHNEIDER: Yeah, but it would

1 be nice to know where it is up north of
2 Breckenridge, you know. But a 23-mile line means
3 that another one here of 29.1 miles, you know, the
4 hybrid --

5 MR. ANDREW LEVI: Sir, there's some real
6 big maps just outside the room that have -- that
7 have all of those routes detailed on an aerial with
8 the roads and you can see exactly where they are.

9 MR. DALE SCHNEIDER: I didn't see them
10 when I come up.

11 MR. ANDREW LEVI: Sorry, they're there.

12 MR. DALE SCHNEIDER: I have another
13 question here. I thought it was said that that
14 pipeline was going to be 54 inches below grade. So
15 that's not even below the frost. And that frost
16 does some hellacious things, you know. So why isn't
17 it deeper than that if it is going to be coming
18 through here?

19 MR. ANDREW LEVI: It's proposed to be
20 that deep, that's the depth --

21 MR. DALE SCHNEIDER: So it's just
22 proposed?

23 MR. ANDREW LEVI: Yeah. That's the best
24 that the company proposes to bury the tube. That's
25 also what's required, the minimum depth of cover in

1 Minnesota statute through agricultural areas.

2 MR. DALE SCHNEIDER: So we're supposed to
3 be out there with that.

4 And another question, what is this
5 schedule pipe business? Schedule 40, schedule 80,
6 schedule 120? Or are we just putting plastic in the
7 ground? What's the deal with it?

8 MR. SCOTT O'KONEK: It's actually a
9 carbon high grade steel pipe, American made. It
10 actually has a wall thickness of 1.89 -- .189
11 inches.

12 MR. DALE SCHNEIDER: .189.

13 MR. SCOTT O'KONEK: So if you look at the
14 idea of the pipe, they say that the inside diameter
15 is the four-inch and the outside diameter is four
16 and a half inches, okay. So what you're looking at
17 is about that difference around the pipe.

18 MR. DALE SCHNEIDER: So it's not any more
19 than schedule 40 pipe through the countryside?

20 MR. SCOTT O'KONEK: Yes, it is designed
21 and tested for this purpose.

22 MR. DALE SCHNEIDER: Yeah. It's designed
23 and tested, but you're putting it 54 inches in the
24 ground where it will be subject to the frost and
25 freezing. And it will be, you know, Mother Nature

1 does some hellacious things, I know that. So how
2 safe is it? What's the deal with that stuff? It's
3 lighter than air, correct? So the seven-inch is the
4 low pockets?

5 MR. ANDREW LEVI: Yeah. Heavier than
6 that, I guess.

7 MR. DALE SCHNEIDER: Heavier than that.

8 MR. ANDREW LEVI: Yes.

9 MR. DALE SCHNEIDER: Okay. So what about
10 going across the pastures where we got cattle and
11 stuff out there? To take a water hole, where is it
12 going to settle down to in the watering hole? So
13 the cattle come down there and take a drink and,
14 bam. And I know that stuff puts you down.

15 So that's my thoughts on it. Everybody
16 should be thinking about things like that.

17 I got another question, by the way. What
18 is this going to be used for after all these storage
19 areas, is it going to be stuck in the ground and
20 left there so it can get into the water aquifers and
21 everything? What's it for? What are you collecting
22 it for? I know to get it out of the atmosphere, but
23 I don't think it's going -- and partly for the
24 ethanol, but what's it going to be used for once
25 it's collected? Just to put it in a hole in the

1 ground?

2 MR. ANDREW LEVI: Yeah, it will be
3 permanently sequestered.

4 MR. DALE SCHNEIDER: So there's no use
5 for it afterwards?

6 MR. ANDREW LEVI: No, I don't believe so.

7 MR. DALE SCHNEIDER: So there's a
8 possibility of getting into water aquifers and
9 everything else around the countryside.

10 MR. ANDREW LEVI: Scott, do you --

11 MR. SCOTT O'KONEK: No. The way that
12 this works -- I know what you're thinking, what
13 you're talking to. And, you know, I'd like to touch
14 on a bunch of the safety aspects, the maintenance,
15 and, you know, this thing gets a smart pig, it's a
16 tool.

17 I'm going to start here, where we make
18 sure there is no shifting. We send a tool there
19 that actually can read the thickness of the location
20 dings or dents. So if there was any other shifting
21 or third-party damage that didn't get reported,
22 anything, these tools can pick that up. And that'll
23 be properly responded to.

24 And as far as sequestration, in permit
25 sequestration, what that does is this is far, far

1 underground in North Dakota. And what there is is
2 there's actually a salt water reservoir, is kind of
3 what it is, and it's more of what everybody thinks
4 of as a void, but it's like a core or a sponge space
5 a mile underground, a half a mile, whatever. And
6 when the CO2 goes in there over time and mixes with
7 that salt water, it solidifies and calcifies over
8 time, too. So I don't know the exact time frame on
9 it. It depends on the amount of volume that's down
10 there, too, and it solidifies and calcifies in the
11 ground.

12 MR. DALE SCHNEIDER: What's the time
13 frame?

14 MR. SCOTT O'KONEK: I don't know the time
15 frame on that.

16 MR. DALE SCHNEIDER: So it's got a whole
17 lot of time to get out into the aquifers and through
18 the ground.

19 What about going down holes?

20 MR. SCOTT O'KONEK: We actually have
21 monitoring wells around there, too. We have them
22 right now because we had to prove what was down
23 there. And with those monitoring wells, we're
24 always watching that movement and that down there to
25 make sure it's not doing anything it's not supposed

1 to.

2 MR. DALE SCHNEIDER: So what about
3 putting it down the hole?

4 MR. SCOTT O'KONEK: So the pressures are
5 going to be kind of what we're at right now, what
6 the pipeline is operating at. Because the pump
7 itself, it's all rated for that 2,185. So that
8 pressure would be the max operating pressure that it
9 goes down there, and then when it diffuses,
10 basically, or defers into that saltwater tavern, it
11 will be at ground pressure at that point. And I'm
12 not sure what it is, it can be up to 4,000 psi in
13 the ground at that point.

14 MR. DALE SCHNEIDER: In the ground?

15 MR. SCOTT O'KONEK: Yes.

16 MR. DALE SCHNEIDER: So if you have a
17 blowout, where does it go?

18 MR. SCOTT O'KONEK: It's already at that
19 4,000 psi.

20 MR. DALE SCHNEIDER: Will it be coming
21 back up? You got that much pressure, there's a lot
22 of things that --

23 MR. SCOTT O'KONEK: So the important
24 thing here, too, is the layers above that, the
25 layers above this sequestration zone, too, there's a

1 layer called the cap rock and it's a very hard layer
2 of rock that we had to prove was there. That way
3 you know safe storage can happen. So penetrating
4 that, that layers of rock, would be, you know,
5 unlikely.

6 MR. DALE SCHNEIDER: Um-hmm. When
7 possible. Okay. Yeah, okay.

8 I don't like it. Just so everybody knows
9 what the heck is going on with it.

10 MR. ANDREW LEVI: Thank you.

11 Are there -- I'm sure there's more
12 questions.

13 MS. SHARON LEINEN: Sharon Leinen,
14 L-E-I-N-E-N.

15 I have a lot of issues with this whole
16 project, but tonight I want to talk about the water
17 usage.

18 Now, I've read a lot of reports about
19 this project that nowhere has the water usage
20 coincided and I always get a different number. So
21 it seems like nobody really knows how much water
22 this whole thing is going to take. And with most of
23 the country in a drought right now, is this really
24 wise to be using water for this? Is the end result
25 going to be worth the loss of dripping water?

1 Also, the water will be coming out of
2 aquifers. I live in the country and have a well, I
3 don't want to have to drill a new well when the
4 aquifer goes down. The city of Breckenridge has
5 wells, I don't think they'd be too happy to have to
6 drill new wells as the aquifer goes down.

7 I know there's constant projects being
8 developed that would also capture carbon. The
9 University of Wisconsin is on the cutting edge of
10 that. And they are a lot less invasive than this
11 project. It wouldn't involve laying pipelines, they
12 capture the carbon right at the source.

13 I -- I just think this whole project
14 is -- it's kind of strange. I mean, digging all
15 this pipeline, all this expense, when it probably
16 could be done another way. And by the time this
17 pipeline is in the ground, if it goes in, is it
18 going to be obsolete? Is there going to be some
19 other method of capturing this carbon at that point
20 that we don't even use the pipeline?

21 There's just new technology coming out
22 every day and I have to wonder about that. I just
23 don't think the tradeoff in the water is going to be
24 worth the benefits we're getting back because once
25 the water is gone, it's gone.

1 So, I don't know, I don't know why I
2 can't find the amount of water that this is going to
3 take. I don't know.

4 MR. SCOTT O'KONEK: So this is in there.
5 So in our application, for our permit application,
6 which is, you know, part of this docket that
7 currently is there, the water number is actually in
8 there. We've actually had it there the entire time.

9 MS. SHARON LEINEN: Every report I read
10 it's a different amount of water.

11 MR. SCOTT O'KONEK: That number never
12 changed in that document since we put it in there.
13 What you might be referring to is you're looking
14 further than the Fergus Falls plant and you're
15 probably looking at other plants that are
16 potentially on this project. Because every plant is
17 different sized and would take a different amount.
18 But the amount that we've actually stated in our
19 permit application has not changed since the day we
20 submitted it.

21 MR. ANDREW LEVI: That number is in the
22 EIS, too. The Applicant estimates that the entire
23 facility would require about eight gallons per
24 minute in the winter and about 41 gallons per minute
25 in the summer. And it would be on average about 13

1 million gallons a year.

2 MS. SHARON LEINEN: That's a lot of
3 water.

4 MR. ANDREW LEVI: Yeah, that's a lot of
5 water.

6 MS. SHARON LEINEN: Yeah, it's a lot.

7 So, I mean, this is our water we're
8 talking about. Are we going to have drinking water
9 or are we going to give it up to sequester this
10 carbon? The tradeoff doesn't seem like it's worth
11 it. And I worry about the water supply because
12 everybody is running out of water and once it's
13 gone, it's gone.

14 MR. ANDREW LEVI: And water is one of
15 those things, when we talked about the downstream
16 permits, it's the DNR that appropriates the water.
17 So the Applicant would, you know, if they are issued
18 a permit and do construct the project, they would
19 need a water appropriation from DNR for use of
20 groundwater.

21 MS. SHARON LEINEN: Well, I mean, it
22 doesn't matter if you get the permit or not, you're
23 still using the water.

24 MR. ANDREW LEVI: Yeah, I guess. Yeah.
25 Yeah, that's true. And DNR looks at it holistically

1 and so there is a check there. But, yes, you're
2 correct, you're still using water, it would still be
3 using water.

4 MS. SHARON LEINEN: And I wonder also why
5 you're still moving forward with this when North
6 Dakota and South Dakota have rejected the permits
7 and put a stop to it. So why are you continuing on
8 with this when you have no place to go if you get
9 the pipeline in the ground?

10 MR. SCOTT O'KONEK: So Dave or Alex? You
11 guys. We are in the other states and that statement
12 in general is not true. Every state is in a
13 different position or a different spot in the
14 permitting.

15 MS. SHARON LEINEN: Yes, but you don't
16 have the permits.

17 MR. SCOTT O'KONEK: Iowa, we're waiting
18 on a permit, which we're thinking would be the first
19 quarter here at some point. South Dakota, we're in
20 a different spot with county engagement and line
21 routing in there, preparing to submit in South
22 Dakota. And actually tomorrow we get to hear a
23 ruling on one of the first steps that's going to
24 reboot our hearing process in North Dakota on
25 preemption. So we expect some movement in North

1 Dakota here. And I would say, you know, in the near
2 future, I don't have a time frame on that, but the
3 permits are actually still moving forward in all the
4 states.

5 MS. SHARON LEINEN: But you don't have
6 them.

7 MR. SCOTT O'KONEK: No, no. Just like
8 here, we're working through the state process.
9 Every state has their own process and that's what
10 we're working through, is each individual process
11 like we have here tonight in Minnesota.

12 MS. SHARON LEINEN: I know Summit is
13 going to make a lot of money, tax incentives, the
14 federal program. I pay federal taxes, I don't like
15 my tax money going for something like this that I
16 don't approve of.

17 Thank you.

18 MR. ANDREW LEVI: Thank you.

19 If I could just quick comment on the
20 permitting in other states. Yes, you're right, they
21 don't have the other permits from a state's
22 perspective. It's a state process and an
23 application came to us and we're required to, you
24 know, to review it. I think that, you know, you're
25 right, if they are issued a permit and they end up

1 not getting a permit in North Dakota, I don't think
2 they'd use it because there's nothing to connect to.
3 But just as a permit already in North Dakota
4 wouldn't impact this Commission's decisions-making.
5 It kind of flips the other way, too, in that it's a
6 Minnesota-specific decision and what happens in
7 North Dakota happens in North Dakota.

8 Does anyone else who hasn't asked a
9 question want to ask one? I just want to give folks
10 that opportunity.

11 MR. DALE SCHNEIDER: I just got one
12 question.

13 MR. ANDREW LEVI: Sure. Come on up and
14 ask.

15 MR. DALE SCHNEIDER: Okay. Dale
16 Schneider back at the podium again.

17 And I got an email from a buddy that said
18 the article came from his insurance company and they
19 said with this pipeline product going across his
20 land that he was not going to get any insurance,
21 they would no longer insure him. So, you know, it's
22 something -- I don't have the land, but it's just
23 something that people want to check on, you know,
24 what's going on with that. I just want to bring
25 that up.

1 MR. ANDREW LEVI: Thank you.

2 Yeah, sure.

3 MR. JAMES VISSERS: My name is James,
4 last name Vissers, V-I-S-S-E-R-S.

5 And I have a question about some of the
6 safety equipment you were just talking about. Is it
7 monitored kind of around the clock? How often are
8 those safety checks occurring?

9 MR. SCOTT O'KONEK: So a great question.
10 I love talking about safety because that's what we
11 need to do here, because if we can't prove the
12 safety, we're not going to get a permit. So thank
13 you for the question.

14 So this pipeline is monitored 24/7/365 by
15 a trained team of people that are qualified to
16 operate and to monitor a normal operating system, to
17 operate a system that may see an abnormal operating
18 condition. We will even have a redundant -- right
19 now I have a control center in Ames, Iowa, but we'll
20 have a redundant one somewhere else simply for the
21 fact of what if Mother Nature throws a tornado at
22 Ames, right, so you have a backup, a fail-safe.

23 This pipeline is monitoring measurement
24 temperature pressure 365. Even if we have a model,
25 a hydraulic model running side by side saying this

1 is normal operating parameters, and as long as
2 they're both acting the same and not stepping out of
3 bounds, that's normal operation. If something steps
4 out, instantly the system will let somebody know.

5 What is the action taken, right, is it an
6 alert to an operator or an automatic shutdown. It
7 all depends on what you're coming at, but there is
8 many aspects of the monitoring of the pipeline
9 systems, stations, compressors, valve sites, all
10 that stuff is happening all the time realtime.

11 MR. JAMES VISSERS: And what are some of
12 the response times if a leak was detected, or a
13 rupture?

14 MR. SCOTT O'KONEK: You know, they did a
15 good job in the Draft EIS here talking about that
16 stuff. The reality is, I think what got put in
17 there was 20 minutes, if I'm not mistaken. The
18 reality of what we had in there was ten minutes.
19 But what that encounters is the time it takes for
20 somebody to make a phone call and react on it, but
21 the valve closure or shut down actually happens in
22 seconds.

23 MR. JAMES VISSERS: And I suppose to take
24 it a little further, if there are damages from like
25 a leak or rupture and you speak about

1 accountability, who would be covering the costs of
2 the cleanup?

3 MR. SCOTT O'KONEK: Yep. Summit Carbon
4 Solutions, 100 percent, the total costs are on them.

5 MR. JAMES VISSERS: Thank you.

6 MR. ANDREW LEVI: I see you coming from
7 the back.

8 MR. VANCE WIERTZEMA: My name is Vance,
9 V-A-N-C-E, Wiertzema, W-I-E-R-T-Z-E-M-A.

10 With permitting, you said you don't have
11 the permits with North Dakota and South Dakota quite
12 yet, correct?

13 MR. ANDREW LEVI: They don't, no.

14 MR. VANCE WIERTZEMA: Okay. What if you
15 don't get the permits, like the previous question
16 was asked, are you going to start on the Minnesota
17 side if you don't have nowhere to go, or you can't
18 start it?

19 MR. ANDREW LEVI: I don't suspect they
20 would.

21 MR. SCOTT O'KONEK: What's that?

22 MR. ANDREW LEVI: If you didn't get a
23 permit in North Dakota, but here.

24 MR. SCOTT O'KONEK: No, because we would
25 not have sequestration at that point either, so

1 there would be no building.

2 MR. VANCE WIERTZEMA: Do you have like an
3 estimated cost of what this will cost from Otter
4 Tail to the Breckenridge?

5 MR. SCOTT O'KONEK: Yeah, actually. In
6 the Draft EIS, I don't have the number off the top
7 of my head because it has costs for all three lines,
8 the northern route, the hybrid, and the southern
9 route. And the cost to build all of them are in
10 there. If you give me a second I'll pull it up
11 here. I don't want to mistake anything. I have the
12 numbers in my head, but I don't want to misspeak.

13 MR. VANCE WIERTZEMA: Okay. If you don't
14 get the permits, is there a possibility that you
15 guys could use eminent domain?

16 MR. SCOTT O'KONEK: No. No, eminent
17 domain in Minnesota for CO2 is not listed as one of
18 the things that fall underneath eminent domain.

19 MR. VANCE WIERTZEMA: How about North or
20 South Dakota?

21 MR. SCOTT O'KONEK: It is within statute
22 of the other states, but not in Minnesota.

23 MR. VANCE WIERTZEMA: So you can force
24 this and just put the pipeline through?

25 MR. SCOTT O'KONEK: You have to go

1 through a state process that, you know, nobody wants
2 to use that in the end. There's a process for
3 filing and moving forward and how things go, but,
4 you know, I really can't speak to that.

5 MR. ANDREW LEVI: Before your next
6 question, the capture facility would cost about 30
7 million bucks and the pipeline itself would cost
8 about \$37 million.

9 MR. VANCE WIERTZEMA: Wow. That's a lot
10 of taxpayer money.

11 MR. SCOTT O'KONEK: That money actually
12 to build this thing is actually self-funded.
13 There's a 45 cube tax credit on the back side, but
14 actually to build all of this infrastructure is
15 actually all done in private, private money.

16 MR. VANCE WIERTZEMA: Private money from
17 who?

18 MR. SCOTT O'KONEK: Well, many different
19 investors, ethanol investors, John Deere. If you go
20 to our website, and please do, the list is all
21 there. You know, there's a lot of them.

22 MR. VANCE WIERTZEMA: Is there funding
23 from the USDA?

24 MR. SCOTT O'KONEK: Not that I'm aware
25 of, no.

1 MR. VANCE WIERTZEMA: Do you have a study
2 showing that the CO2 is a real problem around here
3 from the ethanol plants, like by Fergus and
4 Hankinson, is there a study showing, oh, man, it's
5 so high it's off the charts?

6 MR. SCOTT O'KONEK: I can't say right
7 here, but if you go look when and what the EPA is
8 saying about greenhouse gases, I mean, there's a lot
9 of material out there on that.

10 MR. VANCE WIERTZEMA: Yeah. I personally
11 do not believe in that. Our good Lord is the one
12 that makes climate change.

13 Thank you.

14 MR. SCOTT O'KONEK: Thank you.

15 MR. ANDREW LEVI: Thank you.

16 Sarah. And then, Sarah, only if you're
17 comfortable, could you take your mask off?

18 MS. SARAH MOORADIAN: Absolutely. That
19 would be hard to hear, absolutely.

20 Hi. I'm Sarah Mooradian, S-A-R-A H,
21 M-O-O-R-A-D-I-A-N.

22 UNIDENTIFIED: We can't hear you.

23 MS. SARAH MOORADIAN: All right. How is
24 that? Any better? I can try to speak up, too.

25 So just kind of going back to the

1 question a couple before about safety, I wanted to
2 ask, just reading first from page 4-5 in the DEIS,
3 so it says about halfway down the page, therefore in
4 the time it would take for the valves to close in
5 case of an emergency (25 minutes according to the
6 Applicant).

7 So I'm just kind of wondering, you know,
8 you said the Department put that in incorrectly, and
9 it says here the Applicant put it in. So what's the
10 actual time for the valves to close? Why is there
11 discrepancy?

12 MR. SCOTT O'KONEK: I can take you to the
13 spot where you can find it. It's actually in there.
14 It's in Exhibit G -- Appendix G, if you go in there
15 it talks about the dispersion inputs and all that
16 kind of stuff. So it actually talks in there of
17 that time frame.

18 MS. SARAH MOORADIAN: So what is the 25
19 referring to here?

20 MR. SCOTT O'KONEK: I don't know. You'd
21 have to ask who created it.

22 MR. ANDREW LEVI: What page?

23 MS. PAT TERHAAR: 4-5, it's about halfway
24 down.

25 MR. ANDREW LEVI: I think that that 25

1 minutes is wrong and we need to fix it, I think is
2 what that is. I'm sure that's the only mistake
3 you'll find, though.

4 MS. SARAH MOORADIAN: I wanted to be
5 sure.

6 Thank you very much.

7 MR. ANDREW LEVI: I'm glad you found it.

8 MS. SARAH MOORADIAN: I just wanted to be
9 sure. Thank you very much.

10 MR. ANDREW LEVI: Does anyone else have
11 any questions?

12 MS. CHRISTY BRUSVEN: Andrew, to follow
13 up on Scott's comment about Appendix G -- I have to
14 get the table number, maybe I should have gone to
15 the page. So it's Appendix G, Table 7, on page 12
16 of 19. It notes ten minutes for valve closure, and
17 we'll have that in our DEIS comments as well.

18 MR. SCOTT O'KONEK: In reality the cycle
19 time is 17 seconds.

20 MR. ANDREW LEVI: Yeah. And the ten
21 minutes is what we used in the dispersion modeling.
22 So, yeah, Sarah, I think that 25 minutes is just a
23 mistake, an oversight.

24 Yes, sir. Come on up.

25 MR. DALE SCHNEIDER: I do have another

1 question. As it goes on -- Dale Schneider again.

2 So what are the corrosion factors of CO2?
3 How hard are they? Are they like crude oil, are
4 they like, you know, what is -- what's in it that
5 corrode that pipe?

6 MR. SCOTT O'KONEK: Do you want to hear
7 from me?

8 MR. DALE SCHNEIDER: Whoever has
9 authority.

10 MR. SCOTT O'KONEK: So CO2 in carbon
11 steel, the toxicity is nil, nothing.

12 MR. DALE SCHNEIDER: Okay. So -- but
13 there is some, how much is it? What is it?

14 MR. DAN PRASCHER: You're talking about
15 the corrosion?

16 MR. DALE SCHNEIDER: Yes, sir.

17 MR. DAN PRASCHER: Dan Prascher.

18 When CO2 combines with water it can
19 become carbonic acid. And that can corrode the
20 inside of the pipeline. The way that pipelines
21 typically, and please, any time you want to jump in
22 here, because I know you know this, too. Yeah.

23 The way that pipeline operators control
24 that sort of thing is they have to be extremely
25 diligent about taking all of the water out of the

1 system, that's the same if you're talking about
2 crude oil, some other sort of liquid that's being
3 transported, or CO2. You know, a corrosion tech
4 who's been doing that sort of thing, that's
5 corrosion mitigation 101, which they down out all
6 the water.

7 MR. DALE SCHNEIDER: Um-hmm. So if it
8 doesn't all get taken out of there, some residual is
9 left in there and it can come out with carbonic
10 acid?

11 MR. DAN PRASCHER: You can say that with
12 any pipeline, but sure.

13 MR. DALE SCHNEIDER: The reason I'm
14 asking, is I worked in the North Scope for several
15 years. And BP had to blow all of that out of there.
16 And I hauled some of those pipes away from the wash
17 station and there was nothing left of it.

18 And running a pig down there, the pig
19 wasn't going down that line because it didn't meet
20 the full diameter of that line.

21 So then it had a magnum oil spill up
22 there. So, I mean, it's only as good as the people
23 operating it, you know. And, you know, I'm not
24 saying that they won't be diligent, but you never
25 know what kind of corners you're going to cut.

1 I'm just saying this for everybody to
2 hear because I've been involved with it. You know,
3 the aftermath of it. And I'd hate to see that CO2
4 coming across this country. That's probably the
5 worst place north of Breckenridge, because the
6 northwest wind, you know, how far does it disperse
7 in the wind before it's gone, before it's dispersed
8 to a livable amount?

9 MR. DAN PRASCHER: It doesn't take far
10 for it to disperse. The thing that's interesting
11 about CO2, is the very thing that's propelling the
12 wind is also the thing that's dispersing, mixing it.
13 The more it gets mixed, the more the CO2
14 concentration drops. It becomes safe actually very
15 quickly.

16 And this is a very small line. Very,
17 very small, four inches. And the less product that
18 you have to potentially, you know, in the very
19 remote chance that you do have a rupture, you have
20 less quantity to start with and so it disperses much
21 faster. And kind of what we haven't really been
22 talking about today is all of the safety stuff that
23 every company has to put into this. And especially
24 Summit. You know, that's their bread and butter.
25 Because it may sound kind of hokey, but it's true

1 that the one thing that we can all agree on is we
2 all benefit if the product stays in the pipe. It
3 benefits them, it benefits all of us.

4 MR. DALE SCHNEIDER: Yeah. But how are
5 these things all monitored, you know,
6 electronically?

7 MR. SCOTT O'KONEK: So the DEIS
8 actually -- you know, the cool part is a lot of
9 these questions are in the DEIS. You know, they
10 actually have answered a lot of these, too. So, I
11 mean, really it is monitored with the best
12 connectivity, you know, is that fiber, is that
13 satellite, is that solar, is that cellular, is that
14 redundant, which one is the main, which is the
15 redundant backup? But it's constantly, all of the
16 temperature pressure, temperature pressure and
17 measurement instruments are constantly realtime
18 feeding back into our control center, so it has a
19 live stream feed of what's going on, and the
20 stations and valve sites and everything can be
21 operated and initiated from that control center,
22 too.

23 MR. DALE SCHNEIDER: And this is all --
24 this is all recorded when it comes back to your
25 station?

1 MR. SCOTT O'KONEK: Recorded?

2 MR. DALE SCHNEIDER: Yeah.

3 MR. SCOTT O'KONEK: Absolutely. So if
4 PHMSA wanted to come in, to Dan's point, too, like
5 the regulation on this is not like what we decide,
6 right? It's being decided what we regulate, what we
7 did. PHMSA gets to put their foot in the door
8 whenever they want, whatever way they want.

9 The way I can actually, like, put it into
10 the best common way for everybody to realize is
11 let's look at it, let's think of it on the OSHA
12 side. You know how OSHA likes to implant themselves
13 wherever they want, whenever they want, for whatever
14 they want, and you have to give everything you have
15 on-the-spot, basically, or have a, you know, that's
16 what PHMSA does, too. They might be at our pipe
17 mills watching our pipe being made, okay. They have
18 shown up to me filling a pipeline in Wyoming, right.

19 They came in, they're checking my
20 documents to make sure all those documents -- cause
21 actually a lot of those documents we had already
22 submitted to them, they wanted to make sure they're
23 the same ones that are there.

24 The other thing they'll do is they'll
25 pull a guy off and start interviewing him over here

1 and see what his answers are. And these are just
2 small examples. But they get to choose when, where,
3 and how they insert themselves all the time. The
4 only thing I can guarantee you, is they will. I
5 just don't know when or what they're going to ask
6 about.

7 MR. ANDREW LEVI: Scott, can you remind
8 everybody what PHMSA is?

9 MR. SCOTT O'KONEK: Pipeline Hazardous
10 Safety --

11 MR. DAN PRASCHER: Pipeline Hazardous
12 Material and Safety Administration.

13 MR. SCOTT O'KONEK: I know it, too, I
14 just can't say it.

15 Thank you for that question.

16 MR. BUTCH JIRAK: Butch Jirak, B-U-T-C-H,
17 J-I-R-A-K.

18 You stated that the water, 13 million a
19 year?

20 MR. ANDREW LEVI: On average, yes, I
21 believe that's right.

22 MR. BUTCH JIRAK: Just to get perspective
23 of what's going there, if you divide that by 365,
24 and 24, and divide that by 60, somebody else can do
25 the math, but I got 25 gallons a minute.

1 MR. ANDREW LEVI: It varies by time of
2 year. Nine gallons per minute in the winter and I'd
3 say 40 in the summer.

4 MR. BUTCH JIRAK: You said that was the
5 usage of the water. That was the usage going
6 through the line. You made a comment earlier, that
7 that was winter time, the water usage. Because 13
8 million, divided backwards, upside, comes out to 25
9 gallons a minute, hypothetically.

10 MR. ANDREW LEVI: Sure.

11 MR. BUTCH JIRAK: Sure. Anyway, that was
12 an educated --

13 MR. SCOTT O'KONEK: Yeah, it's eight to
14 ten gallons a minute.

15 MR. BUTCH JIRAK: Eight to ten gallons a
16 minute.

17 MR. SCOTT O'KONEK: Eight to ten on Table
18 42 in the EIS.

19 MR. BUTCH JIRAK: All right. So then if
20 you do the math, it isn't 13 million gallons?

21 MR. SCOTT O'KONEK: I would have to --
22 what we have here annually is that number right
23 there, correct? So it's 20.9 million gallons a
24 year, daily is 11,800. You know, and we are using,
25 and when we say this, too, we're using our largest

1 numbers we can, you know, we're trying to make sure
2 we have the highest volume possibility.

3 MR. BUTCH JIRAK: Right.

4 MR. SCOTT O'KONEK: You have to remember,
5 too, these numbers don't account for shutdowns,
6 changeovers.

7 MR. BUTCH JIRAK: Yeah, on a good day
8 it's running and it's a good enough answer.

9 Okay. Thank you.

10 MR. SCOTT O'KONEK: Thank you.

11 MR. ANDREW LEVI: Thanks. And we'll
12 double check that paragraph versus that table.

13 MS. SHARON LEINEN: Sharon Leinen again.

14 Okay. I take issue with the fact that no
15 one is very concerned about this. If there's a
16 rupture, you say the wind is going to disperse it.

17 There's a video online about a rupture, I
18 believe it was in Missouri a few years ago, and
19 animals and people within a three-mile radius of
20 that rupture were either killed or severely injured.
21 Nobody in the closest town knew how to deal with the
22 CO2 because nobody had any experience with it. They
23 weren't equipped, they didn't know how, they didn't
24 have the equipment to deal with it.

25 Are you willing to train people, say, in

1 Breckenridge, or supply them with the equipment they
2 would need if there's ever an emergency? Because
3 there's going to be a rupture or a leak somewhere, I
4 don't care how safe it is and how many protocols you
5 have in place, it's going to break at some point or
6 another.

7 MR. SCOTT O'KONEK: So I want to back up
8 a little bit. I think you're talking about
9 Satartia, Mississippi.

10 MS. SHARON LEINEN: Yes.

11 MR. SCOTT O'KONEK: You may be right, but
12 this DEIS covers it very well. And I do want to
13 tell you, no animals were injured in this, or
14 people, you know, no animals at all, and you just
15 said many were killed and that's not true. But
16 anyways --

17 MS. SHARON LEINEN: They had it all in
18 the video.

19 MR. SCOTT O'KONEK: But, I mean, I don't
20 know who made this video you're talking about, but
21 if you actually go to PHMSA, the regulating body,
22 and read the DEIS in Chapter 8, I believe it talks
23 about exactly what you're discussing.

24 But, anyways, back to your other
25 question. Absolutely, we are working with emergency

1 responders, county commissioners, to do training, to
2 keep training up. We actually have to do this
3 regularly, annually, at least, you know, where we
4 actually run scenarios. We'll run, say, if this
5 happens at this location, how do we respond to it?

6 If first responders reach out to us, you
7 know, we have a lot of turnover and it's hard to
8 find enough people to fill all these boots, you
9 know. If they reached out to us with a bunch of new
10 people, we'll be training again. We're out there,
11 that's what we do.

12 Actually, our public outreach never
13 stops. It has to continue on forever and ever. But
14 I do hope and ask you to actually read the Satartia,
15 Mississippi report.

16 MS. SHARON LEINEN: I have a friend who
17 is an EMT here in town and if I ask him if there's
18 been any training for this, what is he going to tell
19 me?

20 MR. SCOTT O'KONEK: So at this point,
21 before this would ever go in, emergency managers
22 have been talked to, reached out to, to say, hey,
23 this is what we got going, this is what we're doing,
24 there will be a follow-up later when we know where
25 we're at, what you need and where you need it. And

1 how we should do training, they're going to tell us
2 a lot of it, this is what we need to cover, how,
3 what, and where they want to do it. And we in
4 operations, that will be done, even if we had done
5 it today, and we don't even know today if we're
6 permitting the northern route, the hybrid, or the
7 southern route.

8 MS. SHARON LEINEN: So who is paying for
9 the equipment?

10 MR. SCOTT O'KONEK: We do.

11 MS. SHARON LEINEN: Is that in writing?

12 MR. SCOTT O'KONEK: No, it's actually
13 public. If you go look, it's been sworn in
14 testimony in all of the states that we have
15 permitting going on. So it's sworn testimony at
16 this time.

17 MS. SHARON LEINEN: So if I go look, I'll
18 find it?

19 MR. SCOTT O'KONEK: If you have a lot of
20 time to listen to all the videos, you can find it.
21 Except South Dakota, we didn't get that far.

22 MS. SHARON LEINEN: Okay. I'm going to
23 check.

24 MR. ANDREW LEVI: Ma'am, the state, we
25 recommended a -- a consideration, anyway, of a

1 special permit condition requiring the Applicant to
2 provide a copy of that accidental release plan
3 developed in coordination with local emergency
4 responders to the Commission to review, should they
5 get a permit. And, you know, listed a few things
6 that we thought could be discussed in there,
7 including specific equipment, training, or
8 reimbursement that could be provided to emergency
9 managers.

10 So the state is very -- we're thinking
11 about the same thing you're thinking about and we're
12 recommending -- well, we believe that a plan that
13 discusses that information be, you know, would be a
14 good idea to provide that as a condition so that is
15 in writing, like what you're talking about.

16 MR. DAVE DAUM: If I could just add to
17 that?

18 MR. ANDREW LEVI: Can you come up? And
19 state your name, and spell it, too.

20 MR. DAVE DAUM: Yep. Dave Daum, D-A-V-E,
21 D-A-U, M as in Mary.

22 I would also state that PHMSA does
23 require us to provide training to emergency
24 responders annually, not to exceed 15 months, as
25 well as develop an emergency response plan in every

1 area that we operate. So those are requirements
2 that we have to follow.

3 MR. ANDREW LEVI: Does anyone else have
4 any questions?

5 It's 7:10. Do folks want to take a break
6 for five-ten minutes, stretch your legs, look at the
7 maps? And we can reconvene at 7:20, if you want to
8 stick around, or if not, thanks for coming. But
9 maybe that'll get some more questions rolling.

10 I see one person nodding their head so
11 we're going to go with that. So, yeah, let's just
12 take a break for ten minutes and come back at 7:20
13 and we can see if there's any more questions.

14 The Applicant provided some refreshments
15 there in the back, and there's also those maps, the
16 detailed maps in the back.

17 MR. DALE SCHNEIDER: Yeah. I'll take a
18 look.

19 (Break taken from 7:08 to 7:23.)

20 MR. ANDREW LEVI: Okay. Does anyone --
21 does anyone have any additional comment or question?

22 Come on up, sir.

23 MR. DALE ANDERSON: This is Dale Anderson
24 again.

25 By looking at the map out there, exactly

1 how far south does it actually come to, the
2 pipeline? Is there a township it goes through or
3 anything like that? Or -- well, is it western? It
4 doesn't really say.

5 MR. ANDREW LEVI: I believe that's listed
6 in here.

7 Scott, do you know off the top of your
8 head?

9 MR. SCOTT O'KONEK: I don't know off the
10 top of my head. Sorry about that. I don't know
11 them off the top of my head, but they're listed in
12 the permit application and the Draft EIS.

13 MR. DALE ANDERSON: So the general
14 public -- so is the general public going to see
15 where they go through or are we going to be Horsey
16 Puckett and not know where they're going?

17 MR. SCOTT O'KONEK: No, that map is
18 publicly available.

19 MR. DALE ANDERSON: Okay. And I got a
20 question as far as static electricity, is that going
21 to effect it?

22 MR. DAN PRASCHER: The pipeline?

23 MR. DALE ANDERSON: Yes. No doubt, it
24 goes into the ground.

25 MR. SCOTT O'KONEK: I don't know any

1 effect that static electricity would have on this.
2 You know, I'm just assuming that you're probably
3 referring to like oil and gas and stuff like that as
4 an igniter and things of that nature, maybe?

5 MR. DALE ANDERSON: Well, anything that
6 is metal is going to travel to the weakest spot and
7 that's where it's going to go.

8 MR. SCOTT O'KONEK: So in listening to,
9 like, we have a system -- cathodic protection
10 system. Alex, do you want to give the whole generic
11 overlay of how it works?

12 But basically we put a DC charge on the
13 pipe all the time, it's a constant charge on the
14 pipeline and then it is actually being delivered to
15 an annual bed instead of actually corroding or
16 eating away on the pipeline. So this always has a
17 charge on it.

18 So with the static electricity side, if
19 you're looking at it as a charge, the CO2 is not
20 combustible or ignitable. So if you're looking at
21 the soil and gas side, it's not comparative.

22 MR. DALE ANDERSON: So how far are the
23 check valves between each one that you can monitor?
24 Is it a mile, two miles or so?

25 MR. SCOTT O'KONEK: No, on this it's all

1 less than 12 miles throughout -- 13 miles, yeah, all
2 less than 13 miles from Fergus Falls to the border.

3 MR. DALE ANDERSON: But those valves are
4 close, right, automatically, unless there's an
5 interruption in the line, then, right?

6 MR. SCOTT O'KONEK: One more time.

7 MR. DALE ANDERSON: Interruption on the
8 line, if those valves are close, is that going to
9 affect the back pressure on it?

10 MR. SCOTT O'KONEK: No. Actually, it is
11 all designed to handle that. And this design and
12 this capacity, even if you would slam these shut,
13 there wouldn't be any hammer issue like probably
14 what you're used to in your oil and gas background.
15 But we could slam these valves shut and it wouldn't
16 even over pressurize the pipeline.

17 I do have those townships, if you want.
18 It's Foxholm, Sunnyside, and Breckenridge. It's in
19 the project description on the third paragraph --
20 section. There we go.

21 MR. DALE ANDERSON: Okay. Thank you.

22 MR. SCOTT O'KONEK: Thank you. Thank you
23 for coming out tonight.

24 MR. ANDREW LEVI: Anyone else have a
25 question or comment? I'm not seeing any hands.

1 Thank you very much for coming out
2 tonight.

3 I want to remind you of February 23rd,
4 the comment period closes on February 23rd. Please
5 do comment by that date. If you comment once and
6 decide you want to comment again, please do comment
7 as many times as you'd like.

8 If you have any questions along the way,
9 please feel free to get in contact with me and I can
10 help answer those questions or direct you to who
11 can.

12 So, again, thank you very much for being
13 here and get home safe.

DEIS MEETING - 22-422
FERGUS FALLS - FEBRUARY 7, 2024 - 1:00 P.M.
BEFORE THE MINNESOTA PUBLIC UTILITIES COMMISSION
AND DEPARTMENT OF COMMERCE

In the Matter of the Application of Summit Carbon
Solutions, LLC, for a Routing Permit for the Otter Tail
to Wilkin Carbon Dioxide Pipeline Project in Otter Tail
and Wilkin Counties, Minnesota

MPUC DOCKET NO. IP-7093/PPL-22-422

Fergus Falls, Minnesota
1:00 P.M.

February 7, 2024

COURT REPORTER: Janet Shaddix Elling, RPR

Kevin Pranis	22
Craig Winters	24

1 MR. ANDREW LEVI: Good afternoon,
2 everyone. Thanks for joining us.

3 My name is Andrew, I work with the
4 Minnesota Department of Commerce.

5 We are here in Fergus Falls at 1:00 in
6 the afternoon to discuss the Otter Tail to Wilkin
7 Carbon Dioxide Project Draft Environmental Impact
8 Statement.

9 There's a few things that I'd like to
10 touch on real quickly before we open up the meeting
11 to your questions and comments.

12 The first is introductions. There's a
13 lot of folks here today.

14 With me, Jessica, she was at the front
15 table, she also works with us at the Minnesota
16 Department of Commerce Energy Environmental Review
17 and Analysis Unit. Our group is the group that
18 drafted the Environmental Impact Statement.

19 Craig from the Public Utilities
20 Commission is here.

21 HDR, the consultant, they helped put
22 together the EIS. Joe and Pat and Will are here to
23 help answer any questions.

24 And Dan, up here with me, is from Allied
25 Solutions. Dan did the rupture study, the

1 dispersion modeling, that's in Appendix G of the
2 Draft EIS.

3 Summit Carbon Solutions is here, Scott,
4 Alex, and Jason. As well as Christy and Britta.

5 And the most important person here today
6 is Janet. She's our court reporter. She is getting
7 everything into the record and ensuring that your
8 comments and questions get in front of the Public
9 Utilities Commission.

10 So the Applicant proposes to construct
11 and operate approximately a 28.1 mile four-inch
12 diameter carbon steel pipeline and associated
13 facilities, including line valves, a capture
14 facility, and access roads, a cathodic protection
15 system, that would transport captured CO2 from Green
16 Plains Ethanol Plant to a permanent sequestration
17 facility in North Dakota.

18 So this project is regulated by the state
19 of Minnesota and so it ends, from a permitting
20 standpoint, the project ends at the border, but it
21 would pick up with a pipeline in North Dakota and
22 travel to a sequestration area west of Bismarck.

23 A pipeline routing permit is required
24 from the Public Utilities Commission because this
25 project would be signed to operate at pressure

1 greater than 275 pounds per square inch and carry
2 gas. Various other approvals might be required for
3 the project. If the Commission issues a route
4 permit, this might be a road crossing permit, for
5 example, from MnDOT.

6 Also, the company does not have the power
7 of eminent domain, so while it's not a permit, it
8 is -- it would be required that they have approval
9 for that, the easement that they need to construct
10 the pipeline.

11 Just a little bit about the process, the
12 state process so far.

13 The Applicant submitted a route permit
14 application and a Scoping Environmental Assessment
15 Worksheet was prepared. That Environmental
16 Assessment Worksheet is on the back table. It was
17 last night, it is not there now, but it will be by
18 the time we're done talking.

19 Scoping meetings were held here in May.
20 We met in Breckenridge and here in this room. And
21 also at a virtual meeting. And then the scoping
22 decision came out, and that scoping decision
23 outlined the table of contents that were to be
24 discussed in the study, in the Environmental Impact
25 Statement, and the Draft EIS was issued. So

1 everything on this page, on this slide, rather, has
2 been completed so far.

3 And this is the process that's left.

4 Today we're at the public meetings with a
5 comment period associated with the Draft EIS. The
6 Draft EIS will be issued as final, so what we're
7 after for these meetings and this comment period --
8 this comment period is what can be improved upon in
9 the draft, is there anything missing, so that is the
10 purpose of these meetings here today.

11 Once that's done, we will finalize the
12 EIS, and then there will be a comment period on the
13 accuracy of the EIS.

14 After that, we'll be back out here again,
15 I'm sure in Breckenridge on a Tuesday night and in
16 Fergus, here in the same place, in the afternoon and
17 evening for the project and we'll have a public
18 hearing. So we'll all be here, except the hearing
19 will be administered by an Administrative Law Judge.
20 And the Administrative Law Judge will issue a report
21 and recommendation to the Commission on whether or
22 not to issue a route permit for the project. And if
23 so, where should it go.

24 The Draft EIS studies three route
25 alternatives, so the report and recommendation would

1 recommend the route to choose, should the
2 recommendation be to issue a permit for the project.

3 After that report is issued, the
4 Commission then will make a final decision on
5 whether or not to issue a route permit and that
6 should happen sometime in August, I think.

7 So today we're here to talk about the
8 Draft EIS. We can talk a little bit about what it
9 is. There's three copies on the back table that you
10 can review and take a look at. The purpose of --
11 so, oh, there's sirens in the background.

12 MS. CHRISTY BRUSVEN: It's 1:00.

13 MR. ANDREW LEVI: This Draft DEIS is for
14 informed decision-making. We want to provide as
15 much information as we can to the Public Utilities
16 Commission so they can make an informed decision.
17 It is hopefully a common set of facts that everyone
18 can use to wrap their head around the project and
19 provide comments to the Commission. The EIS does
20 not advocate, it informs, and that is the purpose of
21 the EIS.

22 The EIS took some time to prepare,
23 several months. It is based on the Applicant's
24 route permit application, as well as the scoping
25 EAW. And it is also based on public comments that

1 we received during the scoping meetings when we were
2 here in May.

3 It also is based on additional
4 information provided by the Applicant. And all that
5 additional information that they provided is in the
6 appendix in the back of the EIS.

7 We had information, we had feedback from
8 tribes and agencies on the preliminary Draft EIS.
9 We used GIS to prepare a lot of the maps and figures
10 and acreage calculations, and we also used the
11 services of HDR as a consultant, and Allied
12 Solutions as a sub-consultant for the preparation of
13 the EIS.

14 The document covers a lot of information.
15 It's about 350 pages long, plus the appendices.
16 It's always hard for us in length, you know, if it's
17 too short then it's too short and not enough
18 information, and when it's too long, there's too
19 much information and we can't work our way through
20 that. I understand that.

21 I encourage you, there's an executive
22 summary that's available for a handout today, it's
23 on the back table. This is pretty short and you can
24 read through this and if there's any topic that
25 catches your attention, you can certainly find that

1 in the table of contents and read it in more detail
2 for that.

3 But it discusses the proposed project,
4 the regulatory setting, the environmental setting.
5 It talks about three routes around the maps on the
6 side of the room. It discusses alternative
7 technologies. So are there farming practices or
8 actions that could be taken at the ethanol plant
9 that could reduce the carbon intensity score or the
10 ethanol produced. And, yes, there are. It also
11 turns out that in combination, those two options,
12 it's better than individually, and it turns out that
13 if you did carbon capture on top of those two
14 things, that's the best scenario in terms of
15 reducing the carbon intensity score at the ethanol
16 plant.

17 It also talks about potential impacts and
18 mitigation measures both for normal operations and
19 then also for an accidental release. And Dan is
20 going to just summarize the results of that after
21 this.

22 Let's do that right now.

23 MR. DAN PRASCHER: Hi. I'm sorry. It's
24 Dan Prascher, D-A-N, P-R-A-S-C-H-E-R.

25 So Andrew asked me to kind of summarize

1 what was in Appendix G, in that gigantic thing that
2 the ethanol plant is based through that. But, you
3 know, if you have trouble sleeping tonight and you
4 need something, it's free, so it'll put you right to
5 sleep.

6 But I did help HDR write this part of it
7 and Andrew asked me to summarize what is in G. And
8 what G talks about is all of the types of
9 regulations that Summit has to abide by, all gas
10 operations have to abide by.

11 It has eight subchapters and it starts at
12 construction -- starts at actually manufacturing the
13 pipe itself, as regulations for that, for design,
14 for construction, and how you test it before it goes
15 into operation.

16 All of the people involved in that have
17 to be qualified and requalified every one to five
18 years, depending on how complex their jobs are.
19 Anybody who touches or can effect the integrity of
20 the pipeline have to be qualified. They also are
21 part of a antidrug and alcohol misuse program. So
22 they not only have to qualify, they have to be not
23 under the influence of anything if they do. They
24 are more stringent on any drug test you can take.

25 And in addition to that, there's gigantic

1 requirements for operating, and a subset. There's
2 many parts to that controlling the pipeline, talking
3 to the public, educating them, providing damage
4 control that might occur through the pipeline. And
5 then something called an integrity management plan,
6 which is extremely rigorous.

7 And the Applicant, Summit, understands
8 that if they are going to get in the business of
9 this, that an organization called PHMSA, which is a
10 subdepartment of the Department of Transportation,
11 is going to regulate it and they have the power to
12 shut them down. They have power to fine them
13 millions of dollars. They have power to make them
14 do whatever they feel is correct and to make sure
15 they're being safe about how they operate and they
16 know that. And so they're going to do everything
17 they can to avoid all of that.

18 I'm sure if you were in that position,
19 you would, too. I was an operator at one time and
20 we wanted to make our audits with PHMSA go very
21 smoothly.

22 In addition to that, the state, as I
23 understand it, is also going to have something to do
24 above that before they give them the right to
25 construct. And Summit understands that.

1 So that's not a brief summary, but
2 there's quite a few sections to it. And then in
3 compliance with that, Summit has to do an air
4 dispersion, they are required to understand that and
5 be able to present how a rupture or a leak could
6 affect people in the environment around it. So they
7 did that, they submitted it to the state. I checked
8 what they did, I ran my own independent study,
9 double checked it, and they're doing everything that
10 they should be doing and thinking about things that
11 I would think about.

12 And I've been in oil and gas, I've done
13 pipeline integrity for almost 20 years now, plus,
14 and so it's not a trust thing, it's just to verify,
15 right. And so I looked into that. The results of
16 that was yes, that the things that they chose and
17 how they did the analysis seemed appropriate.

18 We did go farther just to make sure. We
19 did what's called a computational fluid magnanimous
20 analysis. It used a multiphysics engine so that we
21 can model in realtime how a release would roll
22 across terrain. And we all have windbreaks in this
23 area, that's always the marks, right, is that is it
24 stopping the wind and the wind is doing the
25 dispersion, so we wanted to model that, too, and we

1 did. And in short it shows that if you're in a
2 south of wind you're going to stop these kinds of
3 dispersions really well. Really, really well.

4 And then also, just to be thorough, we
5 took a look at the sensitivity analysis and said
6 okay, well, what kinds of things are going impact a
7 release, a potential release. And, you know, we
8 discovered that the data shows that wind speed and
9 pressure, pipeline pressure are the two biggest
10 things.

11 And something to note about that. The
12 higher the wind, the less the dispersion. It's a
13 little bit not -- it's not intuitive, because if
14 everything that pushes it, if it pushes it too fast,
15 it actually causes a mix with the surrounding
16 atmosphere, when it causes the mix, it lowers the
17 concentration of the carbon dioxide in the air and
18 disperses faster. So, low, slow speeds, very calm,
19 very nondeterminant flow, that's what produces the
20 worst case scenario. And in Appendix G, if you feel
21 inclined to look at that, it shows all of this.

22 And assumptions I've made, we try to take
23 in all the reasonable things into account. The last
24 thing that anybody wants is to see something like
25 that and say, hey, this thing went worse than that.

1 So we want to make sure everyone understands this.

2 And that is a small pipeline. But anyway.

3 Sorry if that wasn't very good.

4 MR. ANDREW LEVI: I'm impressed to know
5 that, so don't worry about it.

6 So the EIS is available. There's printed
7 copies in the back if you want to take a look at
8 those during the meeting today. There's electronic
9 copies, they're available on our website. Which is
10 actually on the handout, that's on the comment form,
11 you can get it there. It's also available on the
12 eDockets application. I don't recommend getting it
13 there, but you can get it there, if you like.

14 There's also flash drives available to
15 take home. They're on the desk, you're welcome to
16 take one. They look like a credit card, but it's a
17 USB flash drive and you can bring that home and the
18 entire EIS is on that.

19 And they're also available in print at
20 the Breckenridge and Fergus Falls libraries and, as
21 I said, the summary is also available, the executive
22 summary is also available in print at the front
23 table.

24 That's all that we really have in the way
25 of a presentation.

1 Now I'll move to your questions and
2 comments at this point. And talk about quickly what
3 comments are most useful to us right now, as we're
4 preparing, as we move to preparing the Draft EIS
5 into a Final EIS.

6 We're looking for your points of view on
7 what needs to be clarified. Is there something in
8 there that is confusing that could be simpler and
9 could be easier to understand? Is there anything
10 that's missing? There's a scoping decision issued
11 for the project, is there anything that we said we
12 were going to talk about that we missed? You know,
13 let us know. And is there anything that needs to be
14 added so that the Final EIS is just more complete
15 and more accurate? What information would you like
16 to see?

17 So we'll use the comments on the Draft
18 EIS, we'll respond to substantive comments, and
19 we'll also make changes based on those substantive
20 comments as appropriate. So, you know, substantive
21 comment is more along the lines of, you know, here's
22 this paragraph, or section, or whatever, it might be
23 in the Draft EIS, this is what I'm seeing is a
24 concern and these are the things and this is why.
25 And so that's kind of what we're looking for. We're

1 looking if you can tell us what's wrong and provide
2 some information as to why and if you convince us
3 we'll be more than happy to change it.

4 Comments, you know, along the lines of,
5 you know, well, you know, we don't agree with this,
6 but if you don't tell us why, then we don't really
7 have anything to go on. So we kind of need that
8 whole story of comments so we can react and decide
9 if we need to change the EIS.

10 So, like I said, we'll take a look at
11 those comments and submit a final as appropriate of
12 the provisions, and that should happen I think in
13 April when that comes out.

14 So, again, you know, commenting tonight
15 is to focus on those things that we talked about.
16 And whatever you would like to comment on today,
17 verbal comments are only accepted here at the public
18 meetings, we have Janet available to record those.

19 You can also submit comments in other
20 ways, if it's something you'd like to do. You
21 certainly don't have to. You can provide comments,
22 written comments on this comment form. That's why
23 it's there. You can fold it and throw a stamp on
24 there and mail it in. You can also use the address
25 for your own envelope.

1 We have an online commenting tool on our
2 website, and you click on it and it brings up a
3 fillable form and you can attach a PDF and
4 attachments there and provide your comments that
5 way. You can also send me an email directly.

6 The important thing is that these
7 comments are received before the comment period
8 closes, which is February 23rd.

9 So commenting today, we need to have one
10 speaker at a time. Janet can't keep track of two
11 people talking at once and she will certainly stop
12 us if that happens.

13 So just a reminder that, yes, we need one
14 speaker at a time. I'll call on you -- there's one
15 speaker who signed up and then we'll go to a show of
16 hands. But when it is your turn to speak, if you
17 can come up to the microphone and state and spell
18 your name for Janet.

19 And then if you could direct your
20 comments to the questions pertaining to the content
21 of the Draft EIS, or comment on anything you like
22 today.

23 I just want to remind you that there will
24 be an Administrative Law Judge here in a few months,
25 in May, and it will be the Administrative Law Judge

1 that makes the recommendation and drafts a report
2 and recommendation on whether or not to issue a
3 route permit. Questions, like, comments and
4 questions concerning that today, of course, are
5 fine, but our response to that will be comment
6 noted. It is the Administrative Law Judge in May
7 that will actually do something with those comments.

8 So, again, I believe that's all I have.

9 If Nathan would like to come up. Nathan
10 Runke.

11 MR. NATHAN RUNKE: My name is Nathan
12 Runke, N-A-T-H-A-N, R-U-N-K-E.

13 I'm with the International Union of
14 Operating Engineers Local 49. Local 49 is a
15 construction labor union in Minnesota and the
16 Dakotas representing about 15,000 members, or 15,000
17 operators, mechanics, and stationary engineers. Our
18 members have extensive experience in constructing
19 and maintaining pipeline in Minnesota. Use of
20 pipelines has been consistently shown to be the
21 safest, most cost-effective means of transporting
22 liquids, gases, and slurries.

23 As Minnesota seeks to reduce its
24 greenhouse gas emissions, carbon capture and storage
25 technology has increasingly become more important

1 and in ongoing efforts. Carbon dioxide pipelines
2 are needed components, and it is critical that we
3 are constructing pipelines for people in Minnesota
4 who wish to reduce carbon emissions.

5 Our members and their families live,
6 work, and recreate across Minnesota and the Dakotas.
7 Like all Minnesotans, we value the safety of workers
8 and members of the public, as well as protection of
9 natural resources. As such, we advocate that
10 pipelines in Minnesota should meet high safety and
11 environmental protection standards, and should be
12 built by well-trained local construction
13 professionals and experienced contractors.

14 Pipelines can deliver economic benefits
15 to workers, but only if the project is committed to
16 using local labor. Our union has had extensive
17 conversations with Summit over the past few years
18 and we believe they are committed to ensuring that
19 this pipeline is built safely and it is an advantage
20 to Minnesota local workers and communities.

21 It is our belief that the Draft EIS is
22 complete and accurate and adequately captures the
23 benefits and impacts of the project.

24 Thanks for your time.

25 MR. ANDREW LEVI: Thank you.

1 Nathan, you are the only one who signed
2 up to speak.

3 Does anyone else want to come up?

4 Yeah.

5 MS. PATRICIA MABEY: Hi. I'm Patricia
6 Mabey, P-A-T-R-I-C-I-A, M-A-B-E-Y. I have a frog in
7 my throat.

8 I'm a 563 laborer. I've been doing this
9 for 23 and a half years. I've done building and
10 trades and building pipelines. And by keeping it
11 local, I'm from Fergus Falls, so I'm local, I've got
12 family that still lives here and works here and we
13 farm here, too. And by putting this in, it's going
14 to keep everything up to date, it's going to keep it
15 in the ground. We want to stay competitive. We
16 need to help farmers and reduce the carbon
17 emissions, and that's a good way to do this for this
18 project.

19 The report by Northstar Policy Action
20 states that local workers contribute five times more
21 to the community than the outside workers. I do
22 believe in employing local versus out of state. In
23 addition to helping local economies, this project
24 will provide opportunities for local community
25 members to get into a career.

1 Before I came into the trades, I worked
2 in a factory for seven-fifty an hour. Now I make
3 way more than that, and I was able to provide a good
4 economy for my family. And if the local members
5 here could do the same for their families, it would
6 be a win all around.

7 Sorry, I'm a little nervous.

8 It's not just about labor. We build
9 pipelines using modern equipment and engineering
10 technology so the product stays in the pipe.

11 I've worked in Minnesota, I've worked in
12 North Dakota. And it's got to stay local. And the
13 union trades is what's going to build it safe.

14 Thank you for your time.

15 MR. ANDREW LEVI: Thank you.

16 Who wants to come up next?

17 Yes, sir.

18 MR. CRAIG WINTERS: Craig Winters,
19 C-R-A-I-G, W-I-N-T-E-R-S.

20 This pipeline has, since we're only
21 dealing with Minnesota, as I understand, unless
22 things have changed. North Dakota and South Dakota
23 has denied permits to build this pipeline. I hope
24 this pipeline is not going to be a pipeline to
25 nowhere that is just going to be built just because

1 it can be built, but nothing will be done in that to
2 serve its purpose.

3 MR. ANDREW LEVI: Do you want to address
4 that question, Scott?

5 MR. SCOTT O'KONEK: This Minnesota
6 portion of the project would not be constructed
7 without North Dakota and South Dakota permits. So,
8 you know, it would be, you know, we need everything
9 to complete the project. There would be no
10 construction if there is no permits there.

11 MR. ANDREW LEVI: Anyone else have a
12 comment or question?

13 MR. KEVIN PRANIS: Kevin Pranis,
14 P-R-A-N-I-S. I've met her before once or twice.

15 So I'll start by thanking the EERA staff,
16 you know, and the Commission, for the excellent
17 Draft Environmental Impact Statement. They have
18 comprehensively looked at all of the different
19 effects.

20 I think people have a lot of questions
21 about this pipeline. This is not new in the United
22 States, but they are not certainly used to the
23 extent of the gas pipeline that we are more familiar
24 with.

25 And I think, you know, we heard maybe

1 them talk about the skills that our folks from the
2 operating chairs, I could say, I work with laborers
3 that build pipelines of all types, and the
4 construction techniques are very consistent. I'm
5 sure we have to keep the product under pressure, and
6 fluid dynamics, and less so with particular
7 substances and the like.

8 The carbon dioxide is toxic, but we have
9 too much in one place and that's a problem. You
10 know, we take it very seriously, the need to
11 construct a pipeline properly, engineer it properly,
12 site it properly, to minimize those risks and to
13 make sure we understand how to deal with it with
14 less impact if there were a release.

15 Summit's willingness to prioritize local
16 workers and labor ensure a high quality project and
17 also maximizing the benefits and policy action and
18 review and found incremental of, like, \$73 million
19 worth of benefits for using local workers in
20 Minnesota, as well as the southern Minnesota
21 segments and then North Dakota it's more like \$93
22 million in incremental benefits just for using local
23 workers, right, and relying on state workers.

24 And so I appreciate that commitment and
25 can say I agree, I think the EIS does a good job of

1 talking about these local and not local workers. I
2 would say that typically 50 percent is local workers
3 as a minimum for these projects, and the contractors
4 bring fewer people from elsewhere, but our contract
5 requires at least 50 percent be available to the
6 local work force.

7 So thanks.

8 MR. ANDREW LEVI: Thank you.

9 Nobody is jumping up.

10 Does anybody else have anything right
11 now?

12 Let's take a ten-minute break and look at
13 the maps and just chat amongst ourselves and see if
14 that spurs any additional comments or questions. We
15 can come back at 1:45 and reconvene and hopefully
16 we'll have some more questions and comments then.

17 So let's meet back here in about ten
18 minutes.

19 (Break taken from 1:35 to 1:51.)

20 MR. ANDREW LEVI: All right. Let's go
21 back on the record.

22 Does anyone have any questions or
23 comments?

24 Yes, sir, come on up.

25 MR. CRAIG WINTERS: Craig Winters.

1 I would like to comment on the modeling
2 that was done. Now, you tested it with wind rates
3 and so forth. Has the modeling been tested dealing
4 with, if a rupture occurs during a rain storm, and
5 all the CO2 would not get dispersed, it probably
6 actually would get dissolved in rain water and then
7 get into the groundwater and stuff. Has that been
8 addressed as far as the modeling?

9 MR. DAN PRASCHER: It hasn't.

10 MR. CRAIG WINTERS: Okay. And then
11 another question is kind of maybe not directly to
12 the EIS, but if it goes out to where it's being
13 sequestered, is the sequestering being done where
14 there is going to be no damage in North Dakota
15 dealing with the aquifers that are located there?

16 MR. ALEX LANGE: Alex Lange, L-A-N-G-E.

17 Yeah, so sequestration falls under the
18 North Dakota Industrial Commission for the
19 permitting side of things. But some of the things
20 we do look at is formations that we're injecting
21 into, and we pull fluid samples and validate that.
22 Although it can't be used for drinking water. So
23 that's a process we go through as part of the NDIC
24 permitting process, validating that it would be
25 drinking water.

1 MR. CRAIG WINTERS: So can you verify
2 that that won't be affecting any of the aquifers of
3 the residents of North Dakota?

4 MR. ALEX LANGE: That's correct. There's
5 multiple layers of rock formations, so there are a
6 lot of layers higher up elevation-wise than where
7 we're at for our injection rates.

8 MR. CRAIG WINTERS: Okay. Thank you.

9 MR. ANDREW LEVI: Thank you.

10 Can you hear me? Is this better? Can
11 you hear me better in the back? Okay, good.

12 Does anyone else have a question or
13 comment?

14 All right. Well, it doesn't appear so.

15 I just want to remind everyone that the
16 comment period closes February 23rd. If you have
17 any questions in the meantime, feel free to get in
18 touch with me.

19 My contact information is on the handout
20 here, it's also on the EIS.

21 We're meeting tonight at 6:00, feel free
22 to come back, and there's also a virtual meeting
23 tomorrow night so feel free to join, if you'd like.

24 And with that, thank you very much for
25 your time and thanks for being here today.

DEIS MEETING - 22-422
FERGUS FALLS - FEBRUARY 7, 2024 - 6:00 P.M.
BEFORE THE MINNESOTA PUBLIC UTILITIES COMMISSION
AND DEPARTMENT OF COMMERCE

In the Matter of the Application of Summit Carbon
Solutions, LLC, for a Routing Permit for the Otter Tail
to Wilkin Carbon Dioxide Pipeline Project in Otter Tail
and Wilkin Counties, Minnesota

MPUC DOCKET NO. IP-7093/PPL-22-422

Fergus Falls, Minnesota
6:00 P.M.

February 7, 2024

1 MR. ANDREW LEVI: Good evening, everyone.
2 Thanks for joining us tonight.

3 My name is Andrew, I work with the
4 Minnesota Department of Commerce.

5 And we're here in Fergus Falls at 6:00 to
6 discuss the Otter Tail to Wilkin Carbon Dioxide
7 Pipeline Project proposed by Summit Carbon
8 Solutions.

9 We'll start tonight with some brief
10 introductions. We'll talk about the proposed
11 project. We'll talk about the state permitting
12 process, where we've been and where we're going, and
13 discuss the Environmental Impact Statement and then
14 get to your comments and questions.

15 So, again, my name is Andrew, I work with
16 the Energy Environmental Review and Analysis Unit
17 within the Department of Commerce. We prepared the
18 Environmental Impact Statement for the project.

19 With me today is Jessica, she was at the
20 table.

21 Also with us today is HDR, they are a
22 consultant. Joe, Pat, and Will here are in the
23 front to help answer any questions you might have.

24 Also with me is Dan from Allied
25 Solutions. Dan helped us with dispersion modeling

1 and what might happen if there's an accidental
2 release.

3 Summit Carbon Solutions is here, they are
4 the Applicants here. Scott, Alex, and Jason are
5 here to answer any questions, along with Christy.

6 And, most importantly, Janet is here, she
7 is our court reporter and she's getting everything
8 down for the record so the comments do get to the
9 Commission.

10 So I'm sure everyone is aware, but the
11 Applicant proposes to construct and operate an
12 approximate 28 miles of four-inch diameter carbon
13 steel pipeline and associated facilities, access
14 roads, valves, the carbon capture facility itself,
15 to capture CO2 from Green Plains Ethanol Plant and
16 transport it to North Dakota for permanent
17 sequestration.

18 Pipeline routing permits in the Minnesota
19 Public Utilities Commission is required of this
20 project because it meets the definition of what is
21 required to operate at pressure above 275 pounds per
22 square inch and carry a gas. Various other permits
23 would be required if the company is issued a route
24 permit from the Commission, such as a crossing
25 permit from the Minnesota Department of

1 Transportation, local road authorities to cross
2 roads, a license to cross state lands and waters
3 from DNR for river crossings. And while this isn't
4 a permit, say, because the company does not have the
5 power of eminent domain, they would need landowner
6 permission, they need an easement from landowners to
7 cross their property.

8 So this slide just talks about what we've
9 done so far. The Applicant submitted a route permit
10 application, which we are then required to review.
11 We submitted -- prepared a Scoping Environmental
12 Assessment Worksheet and held scoping meetings. We
13 were here in May and received scoping comments. And
14 those comments were used to develop the scope for
15 the Environmental Impact Statement, especially the
16 table of contents. That scoping decision was issued
17 and then we prepared the Draft EIS, which was
18 published last month.

19 So there is still plenty of process left.
20 We're right now in the middle of a comment period on
21 the Draft EIS. The purpose of this comment period
22 is you told us what you wanted to see in the Draft
23 EIS and now we want to know how we did. Is there
24 anything that needs to be improved upon, expanded
25 upon, and that is what we're doing here with this

1 comment period.

2 After that comment period is closed,
3 we'll issue a Final EIS and then there will be
4 another comment period on the adequacy of the EIS.
5 Does the EIS adequately address the scoping
6 decision? Does the scoping decision say what was
7 going to be in the document? Is it adequately
8 covered?

9 After that, there will be a public
10 hearing and comment period so that will be here in
11 Breckenridge and Fergus Falls again. That would be
12 in May. We will all be here, except the meeting
13 will be run by an Administrative Law Judge from the
14 Minnesota Office of Administrative Hearings.

15 And the Administrative Law Judge will
16 prepare a report and recommendation to the Public
17 Utilities Commission on issuance of a route permit.
18 So that comment period in May is the comment period
19 of, you know, telling the Judge, should we issue a
20 permit, should we not issue a permit, you know, kind
21 of what to do with the facts that the EIS plays out.

22 And after the Administrative Law Judge
23 report comes out, the Public Utilities Commission
24 will make a decision on whether to issue a route
25 permit and that should happen sometime in August or

1 early September.

2 So there's a Draft EIS. Kind of what is
3 it? You know, it's an information document. The
4 whole point of the EIS is to help decision-makers
5 make informed decisions and also to inform the
6 public and interested parties about the potential
7 impacts. It doesn't advocate, it's just trying to
8 develop a common set of facts that everyone can use
9 to wrap their head around the project.

10 The Administrative Law Judge is here in
11 May and that's when you can tell the Administrative
12 Law Judge what those facts mean, the information in
13 the EIS says this and this is what we think you
14 should do about it.

15 This is just a little bit about how it
16 was prepared. It's based on, you know, of course,
17 the application submitted by the Applicant and the
18 scoping EAW that was prepared and your scoping
19 comments. Those were all used to develop the table
20 of contents for the document. As we worked through
21 and started addressing those issues, we had to ask
22 for additional information from the Applicant. All
23 of that additional information, questions and
24 answers, they are provided as an appendix in the
25 back of the EIS, so that information is there.

1 We shared the preliminary -- at the
2 request of the Public Utilities Commission, we
3 shared the preliminary draft of the document with
4 tribes and state agencies and received feedback from
5 several of them.

6 And we also, of course, HDR helped
7 prepare it with their team across the country, and
8 Allied Solutions helped with the CFE modeling and
9 dispersion modeling.

10 So the EIS covers a lot of different
11 things. It's long. It's 300 and some odd pages.
12 We told you we were going to take a hard look and we
13 did. It talks about the proposed project, the
14 regulatory framework. It talks about different
15 alternatives that were studied. It compares three
16 route alternatives against each other. It discusses
17 alternative technologies.

18 So part of the purpose of the project
19 from the state is to help lower the carbon intensity
20 score of the ethanol produced at Green Plains. So
21 Chapter 6 discusses different ways that the CI score
22 can be reduced without using the project. So
23 alternative formula practices were discussed as well
24 as implementation of energy efficiency changes at
25 the ethanol plant. In Chapter 6 both of those

1 things could produce the score board of those things
2 and in combination could produce the CI score more.
3 And if the project also demands it, those three
4 things together, obviously, would reduce the CI
5 score the most.

6 The Chapter 5 prepared the alternative
7 routes. Talked about normal operation of the
8 pipeline. There's also a chapter, Chapter 8, which
9 is what happens if there's an accidental release, a
10 leak or a rupture, along the pipeline. Appendix G
11 is associated with Chapter 8 and that is the work
12 that Dan did with dispersion modeling. And the CFD
13 analysis, and I think all of this is right here, and
14 I'll let Dan go ahead and discuss and summarize what
15 he did for the Draft EIS.

16 MR. DAN PRASCHER: Oh, I'm sorry.

17 Okay. My name is Dan Prascher, D-A-N,
18 last name is P like Paul, R-A-S-C-H-E-R.

19 And like Andrew said, I did the modeling
20 for the dispersion models that is Appendix G. The
21 other thing he mentioned is HDR did one of the parts
22 in that appendix, and that is the summary of all of
23 the various PHMSA regulations that all operators of
24 hazardous liquid and gas pipelines must adhere to.

25 And not just after what's being asked in

1 these proceedings, but if they are allowed to do
2 this, then they will go under the jurisdiction of
3 PHMSA, which stands for the Pipeline Hazardous
4 Material Safety Administration. And they're a very
5 large branch of the Department of Transportation.

6 And so if they are given the opportunity
7 to operate, then they would have to adhere to eight
8 different subchapters that are extremely long, and
9 they have to do that from day one and then every day
10 henceforth till death do you part.

11 So they cover everything from
12 constructing the actual building of the pipe where
13 it's manufactured, design of the pipeline itself,
14 how it's all constructed, put together. How it's
15 all tested. It all has to be tested before any
16 hazardous liquids are introduced. And then
17 operated.

18 And of course, when you're operating a
19 pipeline like that, the folks who are doing it then
20 could possibly affect the integrity of the pipeline
21 so they have to be trained, they have to be
22 certified. And I didn't mention this before, that's
23 both a written and a performance evaluation, and
24 they have to do that every so often. It's not just
25 like you're qualified once and you go off on your

1 way, they have to recognize that diligence and being
2 able to replicate that you're doing right, you're
3 doing it the same way. They have certifications
4 they have to go through and they have to recertify
5 every year. I mean, depending on how complicated
6 the task is that they are doing.

7 In addition to that, they also have to
8 submit to a antidrug and alcohol misuse program,
9 under which they also have to take random drug
10 tests. And these drug tests are much more stringent
11 than the type of drug test that is performed when
12 you hire into a new job.

13 And so in that way they're ensuring that
14 everybody who could possibly affect the integrity of
15 the pipeline will train and they're not under the
16 influence of anything, and there's documentation to
17 show that every so often.

18 In addition to that, the operation part
19 is how they control it, how they communicate with
20 the public, how to help them understand where the
21 pipe is, what to look out for.

22 They also have to have an intervention
23 program, which also is very involved. The public
24 excavators and other folks, emergency responders.

25 And then one of the largest parts is the

1 intervention plan. And one thing there is, you
2 don't just create one of these plans and then it's
3 stamped and you move on about your business, what
4 you have to do as part of what PHMSA expects, is you
5 do that and then you improve on it all the time. If
6 something is wrong, you need to bring it in before
7 something goes wrong and it actually affects anyone
8 else and they deal with it up front to bolster your
9 program and you get better, and that's from now
10 until forever.

11 So anyway, the point of all that is there
12 are several things that they have to do and they
13 need to do over and over again. You get better at
14 it. Not just do the same thing, but figure out how
15 to do better. And that's all with PHMSA, who makes
16 sure what they do.

17 So if you'd like to see, you know, the
18 major bullets of what all that is, I didn't even go
19 over all of it, and I'm going to wrap it up because
20 I'm supposed to be brief and I'm not being brief.

21 So I will just say that is in there to
22 give an idea of what they will have to do. And also
23 to that point, one of the other things that they
24 have to do on the integrity management plan is they
25 have to be able to find what this pipeline could

1 potentially intersect with good influence, good
2 effect, and how much.

3 And so part of that is an aerial
4 dispersion model, and in the event, a very small
5 event likelihood that there was a rupture, they have
6 to be able to define how big does this get and where
7 do you go and when is it not going to be of harm
8 anymore. And so we did that, the Applicant did
9 that.

10 And what I was asked to do by the state,
11 by HDR, is to take a look at what they did. And
12 they presented all of the materials to me, I checked
13 it, I did my own independent analysis as well, and
14 what they did we agreed with it. I then did a
15 little more conservatism and put a little more
16 conservatism into what I was doing and I did that
17 just to check things. And, again, it's not because
18 we don't trust them, that's like already said, it's
19 just to verify, right. And because these things are
20 important, they actually affect people's lives and
21 we've got to make sure that they're right and the
22 Applicant has to do that.

23 And so in doing that, we wanted to also
24 take it a few steps further and just make sure we're
25 covering all the bases. Like Andrew said, a lot of

1 work went into this. We tried to think of
2 everything possibly that could affect folks and
3 account for it.

4 And so one of those things is we did a
5 computational fluid dynamics model, it's something
6 accomplished through a multiphysics engine in order
7 to do a realtime simulation model of a potential
8 release. How it mixes with the environment from the
9 fluid dynamic, thermodynamics standpoint. And what
10 are the worst case possible conditions that may get
11 over terrain and interact with windbreak and
12 possibly, you know, affect other folk.

13 And then the final thing that we did with
14 part of that is we said, okay, well, what are the --
15 what are the sensitivity analysis, what are the
16 inputs that make the biggest, that create the
17 biggest effect on the dispersion. And it turns out
18 that wind speed and pipeline pressure are the two
19 most influential.

20 And so one thing to keep in mind with
21 that is it's actually the opposite with wind speed.
22 The higher the wind speed, the less of the
23 dispersion happens, or it travels the least amount
24 of distance away from the pipeline. And I know that
25 sounds counterintuitive, but the reason it is that

1 way is the thing that pushes it out is the wind. So
2 if the wind is moving quickly, is pushing it, and
3 it's also mixing it more, and as it mixes more the
4 CO2 concentration goes down and becomes safer
5 faster. And so that's what we did.

6 And, again, all of this, I'm being overly
7 plump with it, all of this is in there, all the
8 results, all the numbers are all there if you have
9 any questions.

10 MR. ANDREW LEVI: Thanks, Dan.

11 So the DEIS is available electronically
12 on our website. That website is on the bottom of
13 this handout. It's also available on the Minnesota
14 Public Utilities Commission's eDocket site. I don't
15 recommend that you get it there, but you can if you
16 want.

17 The problem with eDockets is everything
18 has to be under ten megabyte chunks, so it just
19 turned into a whole bunch of files. But it is most
20 convenient for either the flash drives on the table
21 to look, but the whole EIS is on there and you can
22 take it home and just plug it into your machine and
23 it's all there electronically.

24 It's available in print at the
25 Breckenridge and Fergus Falls public libraries.

1 There's review copies in the back. There's three
2 copies in the back by the cookies. So you can
3 certainly take a look at that tonight.

4 And there are summaries available on the
5 front table. This is the executive summary from the
6 EIS. It's this long document, I understand that,
7 but if you were to review the executive summary and
8 dive into the document itself through the table of
9 contents you'll get to the subjects that interest
10 you the most and that might be one way to tackle it.

11 I have written about as many pages as the
12 Harry Potter series. So the table of contents is
13 certainly a good way to go about it.

14 So we will move on to comments tonight.
15 We want comments most useful tonight and we're
16 looking for what needs to be clarified in the EIS.
17 Is there something in there that's confusing, that
18 can be written differently? Is there anything
19 missing?

20 So we issued the scoping decision, it's
21 what the table of the contents of the document is.
22 Did we miss something? And let us know if we did
23 and we can get that in there. And then is there
24 anything else that you think needs to be added to
25 the EIS to be complete and accurate based on that

1 scoping decision.

2 So comments on the Draft EIS along with
3 our responses to those comments will be included in
4 the Final EIS. And the Final EIS will include
5 appropriate revisions to the draft based on
6 substantive comments.

7 So a substantive comment is it kind of
8 gets to the heart of the issue. Here's a paragraph,
9 here's what, you know, you think is wrong with it,
10 what you think needs help, and then provide the fix,
11 basically. And then we'll take a look at it and we
12 will certainly fix it, we'll certainly make that
13 change if appropriate. A nonsubstantive comment
14 might be something along the lines of, I don't like
15 that paragraph, and we have nothing really to go on
16 and all we can do is say, comment, thanks for your
17 comment. So with these, you know, substantive
18 comments an any changes that you feel are necessary
19 to the EIS, that fix is what we're looking for.

20 So there's several ways to provide
21 comments. Verbal comments tonight and tomorrow
22 night at the virtual public hearing are the only two
23 opportunities left to provide your comments
24 verbally. We have a court reporter to be able to
25 take those comments down.

1 You can complete and submit this comment
2 form, fold it and tape it and throw a stamp on it
3 and that will come to me. You can of course also
4 use your own envelope and use the address that's on
5 here. We have our website. You can provide a
6 comment on the website. You can click a link,
7 submit a comment, and there's a fillable form that
8 pops up and you can attach documents to that. And
9 you can also email me directly.

10 And just a reminder that the comment
11 period for this is February 23rd, that is the
12 comment period for comments on the Draft EIS. It
13 closes on the 23rd, so you need to get your comments
14 in before then.

15 So tonight, the next thing is for your
16 comments and questions. If we could get you to come
17 up to the microphone and state and spell your name,
18 if you could. Janet can only get one person down at
19 a time, so if we could just remember that it is one
20 speaker at a time.

21 And if you could, you can honestly
22 provide comments on anything you'd like and ask, you
23 know, questions about it if you'd like to change the
24 project; however, from EERA's perspective in moving
25 from a Draft to a Final EIS, you know, those

1 questions that we talked about before are what needs
2 to be clarified. Is there anything missing,
3 anything that needs to be added for a more accurate
4 EIS are most useful for us right now.

5 And I forgot to grab the sheet, the
6 sign-in sheet, so I don't know if anybody has asked
7 to speak. So I think we can just move to a show of
8 hands.

9 Does anyone want to come up and provide
10 the first comment or ask a question? Two or three?

11 Seriously?

12 Do you want to come up?

13 MS. SUE BRIESE: Yes. So I'm Sue Briese,
14 B-R-I-E-S-E. And we're landowners.

15 I appreciate the process. I learned a
16 lot. And studying the procedure on this. So thank
17 you for all that information on things, and you
18 talked to us since then as well, since those last
19 things when we met last May.

20 I have some comments and I kind of jumped
21 around in this -- sorry, nobody else is going to
22 speak so I don't have to rush through it, do I? In
23 this summary? Anyway --

24 MR. ANDREW LEVI: Would it be easier to
25 move it to the side?

1 MS. SUE BRIESE: Oh. So, first of all,
2 and this has been something that we wondered about
3 for a long time, we had to do something, and that's
4 the reasons why.

5 But on page ES2 it talks about the
6 alternative routes, the three routes, the RA North,
7 the hybrid, the RA South, but to look it up we have
8 to go to a different spot to try to find it. And
9 then every time we have looked at it, the font is
10 very small. So we pulled up plat books and all that
11 stuff and the easements are all covered, 160 acres.
12 But we had to try to find out where it's going to,
13 kind of picture that and drop it into the overall
14 scheme. It would be nice if it would say, see
15 attached map, or put the map where it talks about
16 the three routes.

17 MR. ANDREW LEVI: Okay. That's a good
18 point.

19 MS. SUE BRIESE: So that's for my comment
20 on vagueness and transparency. Some things aren't
21 transparent but to you. But we don't read these
22 type of documents, we're not engineers and, you
23 know, we don't know a lot of, for the state of
24 Minnesota, we don't know enough to be dangerous, as
25 we say. So it's really hard to know.

1 And then, again, that's where we have to
2 rely on, like, hey, Dan said what's your capacity.
3 Dan, you've looked at this PHMSA, I listened to one
4 of the hearings in Iowa that was online while people
5 came and testified, and it was emotional for the
6 farmers. And one question is did they ever pass
7 anything based on those hearings they had? It was
8 like early summer.

9 MR. ANDREW LEVI: They are in the
10 process. They're in the process. They haven't done
11 anything yet.

12 Joe, do you want to come up and give a
13 brief little summary of where we're at with the
14 PHMSA regs? The short answer is they're in the
15 process, but nothing has been finalized.

16 MS. SUE BRIESE: And they override the
17 state?

18 MR. ANDREW LEVI: Yes, PHMSA sets the
19 safety standards, the state of Minnesota does not.

20 MR. JOE SEDARSKI: Joe Sedarski,
21 S-E-D-A-R-S-K-I, I work with HDR.

22 Very brief, but essentially the PHMSA
23 means that they -- sorry, I attended those hearings
24 as well virtually, and their whole purpose was to go
25 out and explain what they're trying to do for

1 getting potential rulemaking that they're looking
2 at. So there's a schedule that they're going to
3 actually provide new rules that may or may not come
4 out, depending.

5 The formal notices haven't come out.
6 It's getting close, we expect it sometime this June.
7 And we're watching that, as well as part of the EIS
8 order from the PUC was that we would monitor that
9 and provide an update within the Draft EIS, which
10 we've done nothing, there is no answer. There will
11 be rulemaking, like a formal rulemaking coming, and
12 something will come out of this.

13 MS. SUE BRIESE: Will anything change
14 with the PHMSA or the pipeline? Will anything
15 change with the psi?

16 MR. JOE SUDARSKY: That detail, I don't
17 know what is going to happen.

18 MS. SUE BRIESE: The letter --

19 MR. ANDREW LEVI: That might be a better
20 question for Summit to try to answer.

21 MR. ALEX LANGE: Alex Lange, L-A-N-G-E.

22 Based on the PHMSA rules -- let me back
23 up.

24 The diameter of the pipeline, the
25 pressure under which it operates is driven more by

1 the CO2 moving more. So then kind of the federal
2 regulations, federal regulations dictate kind of
3 what strength in pipeline wall thickness based on
4 the pressure rating. The pressure rating also falls
5 towards the hydraulic of the line and what pressure
6 we need to hit so we can move CO2 through the
7 pipeline.

8 MS. SUE BRIESE: So that's basically --
9 the design is from PHMSA?

10 MR. ALEX LANGE: Correct.

11 MS. SUE BRIESE: And then you pull the
12 psi through it?

13 MR. ALEX LANGE: Correct. So volume
14 height, define what our pressure is, and going from
15 the pressure rating that we need to the actual pipe
16 specifications that's defined if you follow the
17 equation which falls into PHMSA regulations.

18 MS. SUE BRIESE: Okay. Another question
19 I had. So the PUC in North Dakota denied the
20 permit. I imagine these other states are watching
21 Minnesota and there's counties in the southern part
22 of the state that you are kind of like the trail
23 maker?

24 MR. ANDREW LEVI: Am I kind of the
25 troublemaker?

1 MS. SUE BRIESE: The trail maker. I
2 don't know, maybe the troublemaker.

3 MR. ANDREW LEVI: It depends on your
4 perspective, I suppose.

5 We are required, the state of Minnesota
6 is required to process applications as they come in
7 in time frames associated with those. So we're
8 moving forward based on those time frames.

9 I think that where the state of Minnesota
10 process ends up with some of these other states I
11 guess is just where it ends up. We have the
12 timeline that we're following based on the rules
13 that we have to follow and that's what -- that's
14 kind of where we're at.

15 Does that answer? Is that what you were
16 asking?

17 MS. SUE BRIESE: Yeah. Kind of. I
18 imagine I looked at what you guys did, as to what
19 they're going to do.

20 MR. ANDREW LEVI: I know that from our
21 perspective we were asked by -- the Public Utilities
22 Commission was asked to delay looking at this
23 project because there's not a permit yet issued yet
24 in North Dakota. And the PUC's stance is
25 essentially that we, the state of Minnesota, has our

1 process and that process isn't influenced by what's
2 going on in North Dakota. Just like if North Dakota
3 had already issued a pipeline permit, it was being
4 built or whatever, that would influence the PUC's
5 decision on whether or not to issue a permit, so it
6 kind of goes both ways.

7 MS. SUE BRIESE: You have a statutory
8 obligation, you have to do that?

9 MR. ANDREW LEVI: Right. 280 days is
10 what we have.

11 MS. SUE BRIESE: Exactly, right.

12 MR. ANDREW LEVI: One more.

13 MS. SUE BRIESE: So if I ask a question
14 of you, if I have a copy and do comment, you know, I
15 probably will, but do you return comments
16 personally, like if I just had a question like
17 tonight?

18 MR. ANDREW LEVI: If you were to call and
19 ask I can try to answer your questions the best I
20 can. Formal comments that come in during the formal
21 comment period, we'll reply to those as we need to.

22 MS. SUE BRIESE: So if I ask you to
23 reply, you'll reply?

24 MR. ANDREW LEVI: I guess we'll find out.

25 MS. SUE BRIESE: And I have some comments

1 already written out, but I'm going to run through
2 them real quickly and maybe expand upon them at some
3 point.

4 But we've talked about before the land is
5 different, in different areas where the pipeline is
6 going to run through some of these differently than
7 way out west versus our land, which is on the river,
8 okay.

9 Water concerns. I don't know what I read
10 that, you know, the water tables will be decreased
11 when the CO2 is converted. I don't know enough
12 about it and I'm just asking that question.

13 Talking about this Appendix G, the leak,
14 and you identified that tonight so we do maybe need
15 to read through that ourself before we ask questions
16 on that.

17 And just the routes on page 2 talks about
18 the north route, and the three routes, sometimes I
19 think it could be prejudicial to certain landowners
20 because of their goals for their property versus
21 other people's goals. And everybody has a right to
22 deal with their own property.

23 You know, again, labor, I don't get the
24 details when it talked about transparency. Human
25 settlement is an area that it talks about, the RA

1 North would have several more residents, and then,
2 you know, I counted in our little area just west of
3 town, yeah, there's a lot of like maybe 99 people
4 potentially in those building sites and so I don't
5 know what it means when it talks about several more
6 residents.

7 MR. ANDREW LEVI: All we can do is count
8 houses.

9 MS. SUE BRIESE: Yeah.

10 MR. ANDREW LEVI: I don't know how many
11 people live in there.

12 MS. SUE BRIESE: Yeah. The biggest -- so
13 the people that are affected, it talks about Fish
14 and Game and my question is why isn't there more
15 concerning that? There would be further noise and
16 visual impacts on this land versus other residences.
17 It just -- I went to, like, the Fish and Game plan
18 is more important than a residence, and you can --

19 MR. ANDREW LEVI: I think that that, you
20 know, we talk about things in categories. We talk
21 about recreation, we talk about the human side of
22 things. But we don't necessarily -- we don't
23 necessarily weigh those against each other in the
24 EIS, we just try to outline what the impacts are for
25 the decision-makers, for the Public Utilities

1 Commission. And then it's basically, you know, it's
2 the Public Utilities Commission that then decides.

3 So if they decide that this project, or
4 any project, for that matter, if they're issuing a
5 permit and there's certain impacts over here and
6 certain resources and there's certain impacts over
7 here and certain resources, then they have to weigh
8 those two against each other and basically make that
9 decision as to what kind of gets mitigated and what
10 gets impacted and they make that decision.

11 So I hear what you're saying, but --

12 MS. SUE BRIESE: So they counted itself,
13 the project within that paragraph, that's what
14 you're referring to?

15 MR. ANDREW LEVI: Yes. So in the
16 recreation section, we're talking about recreation.
17 In the human health and safety section we're talking
18 about human health and safety. You know, they're --

19 MS. SUE BRIESE: They don't piggyback off
20 of the other.

21 MR. ANDREW LEVI: No. There's recreation
22 and tourism kind of goes together a little bit, so
23 there's some of that, but for the most part they're
24 not piggybacked onto each other.

25 MS. SUE BRIESE: Um-hmm.

1 MR. ANDREW LEVI: They stand alone.

2 MS. SUE BRIESE: Explain populated areas.
3 That's on ES4. It says there will be no impacts on
4 populated areas because no population areas are
5 within 1,600 feet of the route width. And I have
6 some maps, some GIS maps that, I mean, all these
7 sites are closer than 1,600 feet. What does that
8 mean?

9 MR. ANDREW LEVI: We used a definition
10 for populated area that is an incorporated area or a
11 legal entity, and since this is a designated place,
12 this is a statistical map based on the incorporated
13 places.

14 MS. SUE BRIESE: So, like, developments,
15 but not individual residents, individual people are
16 not counted --

17 MR. ANDREW LEVI: Yes.

18 MS. SUE BRIESE: -- in the 1,600 feet?

19 MR. ANDREW LEVI: If a residence is
20 outside of one of those areas, then, yes, for the
21 purposes of this it is not considered a populated
22 area.

23 MS. SUE BRIESE: See, and that's kind of
24 a little twist on words, is populated, you know. I
25 mean, because I know it's within 200 feet of some

1 residences.

2 MR. ANDREW LEVI: We do talk about
3 residences themselves further on, this is just the
4 executive summary, you know. Chapter 5, is really
5 preparing these routes and going through this, I
6 think it is around 150 pages long.

7 MS. SUE BRIESE: Good one.

8 MR. ANDREW LEVI: So we get into it, but
9 we do talk about the residences within certain
10 distances. It just didn't happen in the executive
11 summary.

12 MS. SUE BRIESE: Okay. I did appreciate
13 that Summit Carbon agreed to provide monitors for
14 houses, for residences within X amount of feet.

15 MR. ANDREW LEVI: We recommended that
16 they do that, they haven't, and we don't know if
17 they will.

18 MS. SUE BRIESE: Okay. Well, I like that
19 recommendation anyway.

20 So then, say, for example, not that it's
21 something that -- say, somebody wanted to agree to
22 solar panels on their land, with this pipeline
23 there, could they do it?

24 MR. ANDREW LEVI: I can let Summit expand
25 on that. But I think it would all be -- I'll just

1 let Summit expand on it.

2 MR. ALEX LANGE: So the 50-foot easement,
3 permanent easement, that will go through the
4 property, you know, we cannot have anything solid
5 built on top of 50 foot, mostly for safety reasons.
6 In case we have to inspect it, dig it up, and repair
7 and respond. So on that 50-foot input area, if it
8 would be a permanent impact, a permanent structure
9 on there, it, you know, would go on there. But a
10 lot of that, you know, and when I say that, too,
11 it's going to be negotiated with the contractor,
12 things of that nature, so a lot of that is a
13 negotiated period to make sure that the line is
14 still accessible.

15 MS. SUE BRIESE: And I know landowners
16 have been approached, obviously, for solar panels.

17 I think I'm done.

18 MR. ANDREW LEVI: Sounds good.

19 MS. SUE BRIESE: Thank you.

20 MR. ANDREW LEVI: If you think of any
21 more, come on up. Thank you, Sue.

22 Does anyone else have any questions or
23 comments?

24 MR. ANTHONY HICKS: I'm Anthony Hicks,
25 H-I-C-K-S.

1 And I actually just wanted to thank the
2 folks for this initial draft. Obviously, my
3 position is general manager of the ethanol plant
4 and, actually, I was quite surprised that it was as
5 neutral in its opinion as it was. I felt -- I was
6 concerned that it would be biased in one way or
7 another, but I think you've done an excellent job.
8 And I thank you for the time and effort you put into
9 it. And hopefully that, you know, the comments,
10 that you receive all of them.

11 It will be a tremendous benefit to our
12 community, and the plan itself adds 10 to 15 cents a
13 bushel bases to corn, and we are going to consume
14 about 20 to 22 million bushels a year. If we go
15 away, that corn will basically go on rail and
16 probably to the west coast. And the bases will
17 obviously reflect that because it bears on the
18 market, and that's a destination market. So it's a
19 positive approach for us and it will retain jobs
20 here.

21 Thank you.

22 MR. ANDREW LEVI: Thank you.

23 Anyone else?

24 Well, does anyone else -- yeah, come on
25 up.

1 MS. SUE BRIESE: Sue Briese.

2 At the last hearings, we did have some
3 comments, and thanks to Mr. Hicks we did have some
4 comments about some things that were outside the
5 scope where somebody wanted to bring in some other
6 type of project. And we realize there's been talk
7 about the economical benefits, and I think we're
8 here talking about the safety effects of the routing
9 and not how much money -- or how much money might
10 not be projected into our community.

11 MR. ANDREW LEVI: Um-hmm. Yep.

12 The Commission weighs all those factors
13 in their decision. Economics is one of those
14 things. Safety is one of those things. Impacts
15 to -- other impacts to humans, noise, aesthetics are
16 things. So, yeah, it's not just one thing that the
17 Commission looks at.

18 Yeah.

19 MS. LELA ROBINSON: Lela Robinson,
20 R-O-B-I-N-S-O-N.

21 I'd like to thank Mr. Hicks for coming
22 and sharing that, because I've been a part of
23 multiple pipelines for drilling and pulling pipe,
24 and I tell you what, it's been amazing. The kids,
25 the schools, the communities. It brings so many

1 workers, and we need that, you know. It helps keep
2 the money here and it supports the community itself.
3 And I just think it's a wonderful idea.

4 And I also work for LIUNA Local 563 with
5 another one here, and I thank you guys for the
6 opportunity of having that here, it's going to bring
7 up lots of work and help lots of families.

8 Thank you.

9 MR. ANDREW LEVI: Thank you.

10 MR. DALE SCHMIDT: My name is Dale
11 Schmidt, S-C-H-M-I-D-T.

12 I have not reviewed the literature I got
13 yesterday from the Chamber of Commerce, but I'd like
14 to read one article that came out in the paper on
15 February 7th. I'll make it short.

16 Math is not only the basis of truth and
17 duty, it means the same thing. That Gulligan,
18 beautiful truth comes to mind when reading a
19 just-published state case study that compares costs
20 and for a permanent dioxide field to output on the
21 plan on the 2,000 mile Summit steel pipeline to
22 wind- and solar-based electricity that fuel battery,
23 electric vehicles, or BEVs.

24 And as part of that, the new study, what
25 gives the better environmental and financial

1 returns, building cement on CO2 pipelines, that
2 encourages more ethanol use. Or investing in the
3 same amount on solar and wind generators to power
4 BEVs.

5 The resulting math presented by the
6 study, author Mark V. Jacobson, a civil and
7 environmental engineer at Sanford University was
8 detailed, and it's very beautiful in its conclusion,
9 don't spend another penny on Summit's five-state CO2
10 pipeline.

11 MR. ANDREW LEVI: Thank you.

12 Does anyone else want to come up?

13 I don't think so. I'll again stall for a
14 little bit and then if anybody wants to come up I'll
15 ask again.

16 But I'll just remind everyone about the
17 open comment period, and that's through
18 February 23rd. You can submit those comments in
19 writing, via email, regular mail, or the online
20 commenting tool. That's all laid out on this
21 handout. You can mail this in, too, if you'd like.

22 There's a virtual public meeting tomorrow
23 night, it starts at 6:00, and we'll start with the
24 same brief discussions from the other night, and
25 then we'll open it up to folks' questions and

1 comments.

2 So please do get your -- you can comment
3 verbally tomorrow night, too, at that virtual public
4 hearing. Please do get those comments in by
5 February 23rd. If you comment once, you're more
6 than welcome to comment again should something come
7 to mind.

8 So we look forward to reading all those
9 when they come in. I think that's all of what I had
10 to say.

11 Does anyone else want to come out and
12 would like to comment or ask a question?

13 All right. Well, thank you -- oh, yes,
14 come on up.

15 MR. SCOTT LANKOW: My name is Scott
16 Lankow, L-A-N-K-O-W.

17 I worked in manufacturing for 30 years
18 and typically projects like this, if anything, are
19 over engineered for safety's sake. And due to our
20 geographical location and proximity to the plant, we
21 will have the smallest diameter pipeline in the
22 whole route. It will be the least invasive as far
23 as construction because it is only four inches in
24 diameter. And because there will be no step-up
25 pumps in the line along the route, we will have the

1 lowest pressures, thereby reducing chances of
2 rupture, fractures, cracking, any kind of damage to
3 the pipeline.

4 So because we have, in my view, only
5 benefits to gain from this and the least amount of
6 risk of anybody in the whole route, I see nothing
7 but positives and positive outcomes for this
8 project. And I urge positive, you know, approval
9 for this project.

10 I'll just comment that typically these
11 pipes, you know, as was brought up earlier, these
12 pipes, this material, is going to be heavily
13 inspected. The workers will be -- I've been through
14 this, I mean, you're not just going to let somebody
15 off the street who doesn't hardly know what the
16 process is to be working on this. These people will
17 be heavily qualified.

18 I have no problem with this. I think
19 it's nothing but a good green light.

20 Thank you.

21 MR. ANDREW LEVI: Thank you.

22 Anyone else?

23 All right. Well, thanks for coming this
24 evening, and everyone drive home safe, and we'll see
25 you in May.

DEIS MEETING - 22-422

WEBEX - FEBRUARY 8, 2024 - 6:00 p.m.

BEFORE THE MINNESOTA PUBLIC UTILITIES COMMISSION

AND DEPARTMENT OF COMMERCE

In the Matter of the Application of Summit Carbon
Solutions, LLC, for a Routing Permit for the Otter Tail
to Wilkin Carbon Dioxide Pipeline Project in Otter Tail
and Wilkin Counties, Minnesota

MPUC DOCKET NO. IP-7093/PPL-22-422

Meeting held remotely via:

WebEx and Telephone

FEBRUARY 8, 2024

1 MR. ANDREW LEVI: Good evening, everyone.
2 My name is Andrew -- excuse me -- my name is Andrew
3 from the Minnesota Department of Commerce.

4 We're here tonight for the virtual
5 meeting for the Otter Tail to Wilkin Carbon Dioxide
6 Pipeline Project.

7 If we could move to the next slide,
8 please.

9 So just a little bit about tonight's
10 meeting before we get started. All attendees are
11 muted during the presentation. Following the
12 presentation, we will open the meeting up to your
13 comments and questions.

14 You can comment or ask a question tonight
15 by raising your hand. The raise-the-hand function
16 is down, kind of, on the bottom of the screen by the
17 smiley face down there. You can raise your hand; or
18 if you're on the phone, you can dial *3. That will
19 put you in a queue, and the host will then address
20 you and unmute your phone and unmute your line. And
21 you can go ahead and ask your question and comment.

22 So if you'd like to get in the queue now,
23 you certainly can. We will repeat these
24 instructions when we get to that point in the
25 meeting, but I just wanted to let you know how that

1 will work when we get there.

2 Next slide, please.

3 So these are the things we'd like to
4 briefly discuss tonight before we open the meeting
5 up to your questions and comments. We'd just like
6 to introduce everyone who is on the call today, talk
7 briefly about the proposed project, as well as the
8 state permitting process: Where we've been and
9 where we still need to go. And talk about the draft
10 environmental impact statement, and then, of course,
11 how you can submit your comments during this open
12 comment period and this evening.

13 So I guess we can start with instructions
14 again -- introductions again. My name is Andrew.
15 I'm with Energy Environmental Review and Analysis
16 within the Department of Commerce. We prepared the
17 draft environmental impact statement on behalf of
18 the Public Utilities Commission.

19 With me tonight from HDR -- HDR was our
20 consultant on this project, as well as Allied
21 Solutions, they were a sub-consultant -- we have
22 Joe, Pat, and Will. Will is on the call. He's
23 stuck in the car, so he's not going to turn the
24 screen on, but he will later if he needs to. And
25 Cathy is also with us this evening from HDR; and Dan

1 from Allied Solutions is with us. From the company,
2 from Summit Carbon Solutions, the applicant, we have
3 Scott, Alex, Jason, and Christy and Britta.

4 And she's a little bit busy right now, so
5 we won't ask her to turn on her screen, Christine is
6 here. She is a court reporter, and she is
7 transcribing this meeting so that your comments are
8 taken down and part of the record.

9 Next slide, please.

10 So, again, just to remind everyone, we're
11 here talking about the Otter Tail to Wilkin Carbon
12 Dioxide Pipeline Project. Summit Carbon Solutions
13 proposes to construct and operate approximately
14 28.1 miles of 4-inch diameter carbon steel pipeline
15 and associated facilities, which are mainline
16 valves, a cathodic protection system, and access
17 roads, as well as a capture facility to transport --
18 to capture and transport CO2 from the Green Plains
19 ethanol plant to the border where it would -- to the
20 North Dakota-Minnesota border near Breckenridge,
21 where it would interconnect with the larger Midwest
22 Carbon Express project. And that CO2 from the
23 ethanol plant would eventually find its way west of
24 Bismark, North Dakota, where it would be permanently
25 sequestered underground.

1 Next slide, please.

2 A pipeline routing permit is required
3 from the Public Utilities Commission because the
4 proposed project would operate at a -- is designed
5 to operate at a pressure of more than 275 pounds per
6 square inch and carry a gas. If a route permit is
7 issued by the Public Utilities Commission, various
8 other approvals might be required for the project,
9 such as a road-crossing permit from local road
10 authorities or the Minnesota Department of
11 Transportation; river crossings would require a
12 permit from the DNR, a license to cross state land
13 and waters.

14 Additionally, the company does not have
15 the power of eminent domain for this project, so
16 landowner permission would also be required for the
17 company to build the project.

18 Next slide, please.

19 This slide shows what steps in the
20 permitting process have already been completed. So
21 the applicant submitted a route permit application,
22 and, by law, once a route permit application is
23 submitted, the State needs to process those
24 applications.

25 The scoping environmental assessment

1 worksheet was prepared and scoping meetings were
2 held. Those scoping meetings allowed you the
3 opportunity to tell us what you thought we should
4 discuss and study in the draft environmental impact
5 statement.

6 The scoping decision was issued. Which
7 is, essentially, the table of contents for the --
8 for the draft EIS, and we worked -- EERA staff
9 worked with HDR and Allied to prepare the draft EIS,
10 and that was issued in late January.

11 Next slide, please.

12 As you can see from this slide, there's
13 still plenty of process left to go. There's
14 currently, right now, an open comment period on the
15 draft EIS. Once we receive and incorporate your
16 comments, we will issue a final EIS, and then there
17 will be a comment period on the adequacy of the
18 final EIS: Does the EIS address -- does the final
19 EIS address the questions -- excuse me, address the
20 information in the scoping decision? Essentially,
21 is what we said would be there, there?

22 After that, there will be a public
23 hearing and comment period. That will happen in
24 May. That will be in the project area, I believe in
25 Fergus Falls. This is an -- these same folks will

1 be there, except an Administrative Law Judge will
2 also be there. They will oversee the meeting.

3 And that is the meeting where you have
4 the opportunity to express your opinion, you know,
5 on the project: Should it be built, should it not
6 be built, and why? And the Administrative Law Judge
7 will prepare a report and recommendation to the
8 Public Utilities Commission.

9 While the ALJ is preparing that report,
10 the Public Utilities Commission will make a decision
11 on whether or not the EIS is adequate, and after
12 that ALJ report is issued, the Commission will make
13 a decision on whether or not to issue a route
14 permit. That decision is expected some time in late
15 August, early September.

16 Next slide, please.

17 So this is just a couple slides about the
18 draft EIS. You know, what is it? Well, it's an
19 information document. It is not designed to
20 advocate one way or the other. It is designed to
21 develop a common set of facts that folks can use to
22 wrap their head around the project. Is it designed
23 to inform decision-makers when they make a decision
24 about the project.

25 Next slide, please.

1 So the draft EIS was prepared. It was
2 based on several documents, including the
3 application submitted by the applicant and the
4 scoping environmental assessment worksheet published
5 by our -- by the Department of Commerce.

6 Scoping comments helped develop the table
7 of contents for the document, and as we developed
8 the draft EIS, we needed additional information.
9 Some questions came up and we asked the applicant to
10 provide that additional information, and there --
11 all of our questions and their responses are
12 included as an appendix in the EIS.

13 There was an opportunity, at the request
14 of the Public Utilities Commission, to allow tribes
15 and state agencies the opportunity to comment on a
16 preliminary draft EIS. We received feedback from
17 several tribes and agencies during that time. We
18 used geographic information, GIS desktop analysis to
19 prepare the document. We drove through the -- you
20 know, site visits, and as stated previously, this
21 would not have -- I couldn't, obviously, do this
22 myself, so it needed HDR and Allied to help prepare
23 that. Allied Solutions, Dan, prepared a rupture
24 analysis and really took a hard look at what would
25 happen if there was an accidental release of CO2.

1 Next slide, please.

2 There's a lot of information in the draft
3 EIS. You know, it's 350 pages long, plus
4 appendices. We told you that we would take a hard
5 look, and we most certainly did. It discusses the
6 proposed project. It discusses the regulatory
7 framework. It discusses the different alternatives
8 that were included for detailed analysis.

9 And there are three route alternatives
10 that were studied in the draft. There were
11 alternative technologies that were studied in the
12 draft, alternative practices that could be
13 undertaken by farmers or the ethanol plant to lower
14 the carbon intensity score of the ethanol produced.

15 We found that those alternative
16 practices -- both the farming practices and the
17 energy-efficiency practices -- could reduce the
18 carbon intensity score independently; more so in
19 combination. We also concluded that all three
20 practices -- both the proposed project, the energy
21 efficiency practices and the farming practices -- in
22 combination would, of course, reduce the CI score
23 even more.

24 We studied a no-action alternative, what
25 we expected to occur if the project was not

1 constructed. We also looked at lifecycle impacts of
2 ethanol.

3 These potential impacts were described.
4 We tried our best to put them into context and
5 characterize them as negligible, minimal, moderate,
6 or significant. We also suggested and recommended
7 mitigation measures to, you know, mitigate potential
8 impacts.

9 Another thing that we did is we looked at
10 operation of the pipeline. And we looked at
11 operation of the pipeline under normal operating
12 conditions, and then we looked at it under what --
13 if there was an accidental release of carbon
14 dioxide, either a leak or a rupture.

15 Again, I have mentioned a couple times
16 already that Dan prepared that -- the modeling --
17 and worked with Cathy and others at HDR to develop
18 Chapter 8, which is the accidental release chapter.
19 And I'll just take a quick break here and let Dan
20 briefly summarize his work in the preparation of the
21 EIS.

22 MR. DAN PRASCHER: Thanks, Andrew.

23 Like Andrew said, I'm Dan Prascher. I
24 spell my last name P as in Paul, R-A-S-C-H-E-R.

25 And I worked with -- I was asked by the

1 State and HDR to do a set of modeling to try and
2 figure out -- try and couch where the affected areas
3 would be and to how much -- if there ever was a
4 release. And the work that we did that he mentioned
5 in Appendix G, there are four sections, actually, in
6 there. The first one talks about PHMSA, what -- the
7 kind of regulations that they required -- that all
8 operators are required to adhere to, and then the
9 other three are studies that Allied did for this
10 effort.

11 PHMSA, the first section, that stands for
12 Pipeline Hazardous Material Safety Administration.
13 They're a branch -- major branch of the Department
14 of Transportation, and they regulate any entity that
15 is shipping hazardous substances across state lines.
16 And in certain states, they also regulate more than
17 that if there happens to be an agreement between the
18 state and PHMSA, but they are -- regardless of who
19 is doing that, the federal regs set down by PHMSA
20 are what each operator of oil and gas -- you know,
21 oil and gas have to adhere to. They have to -- they
22 are subject to those.

23 And to kind of give you a flavor of what
24 that is, I'll kind of go through that. I'll try and
25 be brief. And this would be in addition to gaining

1 the ability to build. So going through this process
2 that we're all here talking about today, and if the
3 State does allow Summit Carbon to build this. And
4 then they are asking for several things that
5 Summit -- they're asking for several things for
6 Summit Carbon to do.

7 But on top of all of that, once they
8 begin operation, they'll be required to do a litany
9 of things. There are eight major categories of
10 types of regulation that they will have to do,
11 starting on day 1 and continuing through for
12 forever. It's something that they are required to
13 do. And that starts with construction, it starts
14 with materials that are used in the pipe mill
15 creating the pipe from steel. There are regulations
16 that specify how that is to be done. Standards have
17 to be met all the way through construction and
18 design -- of course, before that -- and then how
19 everything is tested before it gets put into
20 service.

21 And then, of course, through operation --
22 and there are many different parts of that
23 operation. If there's a, you know -- if they're
24 being controlled through a control room, then there
25 are a lot of different regulations they have to

1 follow there.

2 Public awareness, damage prevention, how
3 they interact with the public. Not just the public,
4 but also emergency responders. Excavation
5 professionals that may be doing excavation in their
6 areas -- in the area of this project, and different
7 efforts that they go through to ensure that damage
8 doesn't come to the pipe. And corrosion control:
9 Finding it, dealing with it, preventing it, and one
10 of the major parts of that is the integrity
11 management plan.

12 And so they're required to put that
13 together, but it doesn't stop there. They don't
14 just make it and then they can go about their merry
15 way and put it on a shelf somewhere. It's in many
16 places of the IMP, the integrity measurement plan.
17 It talks about how there has to be review. There
18 has to be metrics met.

19 They're expected -- in summary, they're
20 expected to create an integrity measurement plan
21 that addresses all relevant risks. Not necessarily
22 the things that are imminent, but things that could
23 happen. You've got to prevent them so they never
24 come to fruition. And so what that means is they
25 have to test for that, that sort of thing. They

1 don't think they have an issue, but they don't know
2 that they don't, so they have to do tests.

3 And it's a continual improvement
4 situation where they do tests, they learn more
5 information. They use that information to bolster
6 what their plan is. Maybe they need to change
7 things, maybe they need to analyze things more
8 frequently. There's a -- it's a very large thing
9 that happens every year, and the expectation is that
10 it needs to get better, and it needs to show a
11 definitive and measurable progress over time.

12 Part of that plan, the requirements for
13 doing that, is to do an aerial dispersion model, and
14 so that's -- they're required to say, okay, through
15 this modeling, we -- worst-case scenario, we see how
16 far a potential impact could go and to what severity
17 could it go, and use that for planning purposes.
18 And that's also part of what was included in this
19 DEIS. The details of which are in Appendix G that
20 talk about -- talk about that, and so Summit did do
21 that.

22 And as a -- you know, a check, and we --
23 it's not that we don't trust Summit, but it's, you
24 know, trust, but verify, right? And so they
25 provided us -- they were very good about providing

1 us with information about that. They were really
2 good to work with in that way. They gave us their
3 analysis, all the information we asked for, and then
4 I checked what they did, agree with their approach,
5 and how they did that.

6 And then I also did an independent
7 analysis to check, and part of that analysis was we
8 went a little bit further. Because we want to -- as
9 Andrew said, we want to make sure that we're looking
10 at all of the relevant possible items that could be
11 useful to folks, and to help them really understand,
12 what are the total consequences? What are the total
13 benefits of this?

14 And so in that light, we took it a bit
15 farther. I did the modeling for the -- what's
16 called a computational fluid dynamics model. It's a
17 multiphysics software that we use that we can use
18 the model in realtime, a potential rupture, worst
19 case -- of course, we're trying to put our hands
20 around what could be the worst case. And what does
21 that do over terrain, specifically terrain that
22 would be common in -- you know, for this project in
23 those rights-of-way.

24 But then also encounter -- if it can
25 encounter something like windbreaks, because there

1 are a lot of windbreaks out there, what does that
2 do? And so through this -- the acronym is CFD
3 analysis. We were able to show that, yeah, the
4 terrain doesn't really affect it. And the windbreak
5 really does stop it, as you might suspect, right?
6 Because if the whole design of a windbreak is to
7 stop the wind, well, the wind is what's carrying a
8 potential release, so that kind of follows.

9 In addition to that, we also did a
10 sensitivity study. So what we were doing there is
11 we're saying, here are the key attributes that add
12 to or could affect CO2 release, and what are the
13 things that really, really show the biggest
14 impact -- or potential impact to release.

15 And it may be no surprise, the pressure
16 of the pipeline -- pipeline pressure and the wind,
17 and the one thing to note is it's not -- it's not --
18 it's not the higher the wind, the bigger the impact;
19 it's actually the opposite. The more wind that's
20 involved, the faster it actually mixes. Because the
21 thing that's propelling it is also -- it's
22 propelling the -- the thing that's propelling the
23 CO2 is also the thing that helps it mix with the
24 surrounding air, the environment.

25 And so the more wind you have, the less

1 impact distance you actually release. Just kind of
2 at first blush, it seems kind of counterintuitive,
3 but those are the two things that we found were
4 really impactful, were most impactful of the
5 other -- of all of the attributes that we looked at
6 and tested using machine learning and
7 gradient-boosted trees, which I -- now that I say it
8 out loud, I realize that always doesn't mean
9 anything to anyone. But we analyzed many, many
10 different models in order to build our final model.

11 And at any rate -- and again, I
12 apologize, that was not very brief. Those are the
13 kind of things that we did. If you are able to look
14 at Appendix G, it has all of the results in there.
15 Of course, this is a little different than the
16 meetings that we've had previous to this, and so I'm
17 happy to answer any questions that I can, any
18 questions that you might have. Thanks.

19 MR. ANDREW LEVI: Thank you, Dan.

20 Next slide, please.

21 So we talked a little bit how we
22 prepared -- what the draft EIS is, what's in it, how
23 it was prepared, and, of course, the big question
24 now is, where is it? It's available electronically
25 at the website there. That is the Department of

1 Commerce, that's the Environmental Review and
2 Analysis webpage, the EERA webpage.

3 I believe they're going to put these
4 links into the chat which will make them live, is my
5 understanding. And you can click on them and kind
6 of bring them up and bookmark them quick, if you'd
7 like to, but that is available there.

8 It is also available on the official
9 project docket, on the eDockets system. That gets
10 broken up for filing, and it ends up in a whole
11 bunch of chunks. So it's, of course, available
12 there, but it is easier to access it through our
13 website.

14 It is also available in print for your
15 review at the Breckenridge and Fergus Falls public
16 libraries.

17 Next slide, please.

18 So now we'll move on to commenting on the
19 draft EIS, and, you know, at this time, there's
20 certain comments that are most useful to us as we
21 are trying to move this draft document into a final
22 document. And those three things are listed there.
23 The first, is there anything that needs to be
24 clarified? Is there anything that's written in a
25 way that's confusing, or could be written, you know,

1 better so that it's easier to understand? You know,
2 what are those sorts of things. Is there
3 information that's missing? You know, let us know.
4 You know, perhaps we connected the dots without
5 including the information, you know, some of those
6 pieces, which made it difficult to follow.

7 And, also, is there anything that needs
8 to be added to the EIS -- to the final EIS so that
9 it is complete and accurate? Again, the scoping
10 decision was issued, and that is the table of
11 contents for the document. And so we need to make
12 sure that we are covering everything that is listed
13 in that table of contents in a complete and accurate
14 way.

15 So comments on the draft EIS, along with
16 responses -- EERA staff responses to substantive
17 comments will be included in the final EIS, and the
18 final EIS will also include appropriate revisions to
19 the draft EIS based on substantive comments.

20 So a quick way to think about a
21 substantive comment is just that a comment that
22 points out a concern and identifies, you know, why
23 it's a concern, and how it can be fixed. And then,
24 essentially, we'll take a look at that comment, and
25 if we're convinced, we'll change -- we'll change the

1 information in the draft as it turns to final.

2 A non-substantive comment would be, you
3 know, perhaps something along the lines of, you
4 know, I disagree with this paragraph or whatnot,
5 this analysis. But, you know, any information to go
6 along with that, there's nothing that we can really
7 do with that. All we can kind of say is, you know,
8 thank you for your comment, comment noted, but we
9 don't have any information to build on to determine
10 if we, you know, agree that that section of the EIS
11 should be changed.

12 Next slide, please.

13 So there's several ways to comment. You
14 don't have to speak over the Internet in front of a
15 whole bunch of folks you don't know who they are if
16 you don't want, but verbal comments are only
17 accepted at the public meetings. They were accepted
18 in Breckenridge and in Fergus Falls yesterday and
19 now tonight. And the reason they are is because of
20 Christine, because we have a court reporter here to
21 take down your comments. So tonight is the last
22 time we will accept -- can accept verbal comments
23 into the record for this portion of the process.

24 You can complete and submit a comment
25 form. That comment form will be available on our

1 webpage. There is also an online commenting tool on
2 our webpage which is listed there,
3 minnesota.gov/commerce/energyfacilities. Both the
4 forms will be there, that will be up tomorrow
5 morning, and the Internet -- there's a button you
6 can push to submit a comment and a fillable form
7 pops up, and you can submit your comments there.
8 You should get a pop-up window that follows after
9 you hit "submit" that says that you have submitted
10 your comments, and there's an "okay" button there.

11 And you can also mail your comments to me
12 or e-mail your comments directly to me at the
13 address on the screen. That address is also on the
14 comment form. This presentation will be on the
15 webpage, so you'll have that. And then my e-mail is
16 listed there as well, andrew.levi@state.mn.us for
17 those folks who might not have the screen in front
18 of them. Again, that's andrew.levi@state.mn.us.

19 And, lastly, the comment period does
20 close on February 23rd. So we do need your comments
21 sooner than -- on or before that date. If you
22 submit a comment -- or one comment and decide you
23 want to comment again, you certainly can. You can
24 comment as many times as you'd like during the
25 comment period. Again, just please have those

1 comments into us by February 23rd.

2 Next slide, please.

3 So, again, this is -- I'm going to turn
4 the meeting over. If you would like to submit a
5 comment, please either raise your hand by hitting
6 the raise-your-hand button at the bottom of the
7 screen or by hitting *3. The host will call your
8 name, and I believe there's a screen that will pop
9 up on your -- a pop-up that will appear on your
10 screen that you'll follow. And they'll let you know
11 that they've been unmuted. You can please state and
12 spell your name for the court reporter, and then go
13 ahead and provide your question or your comment.

14 You will remain unmuted during that time,
15 but once you're done with your questions and
16 comments, you will be muted again. If you would
17 like to speak again, you most certainly can. You
18 will just have to raise your hand again or dial *3
19 to get back into the queue.

20 Again, you have the opportunity to
21 provide any comment you'd like tonight. Those
22 questions that we spoke about earlier are most
23 useful to us right now: What needs to be clarified,
24 what is missing, and what needs to be added so that
25 the final EIS is complete and accurate.

1 And, again, I just want to remind you
2 that in May there will be an Administrative Law
3 Judge overseeing public hearings where you will have
4 the opportunity to tell the judge -- and thereby
5 tell the Commission -- what you -- you know, what
6 you think about the project. Should it be
7 constructed? Should it not be constructed? What
8 mitigation techniques should be used if it is
9 constructed and so forth.

10 So tonight we're focused on making the
11 best EIS we can, the most complete and accurate EIS
12 we can with your comment on the document as it moves
13 to final so that can be used by both the
14 Administrative Law Judge and the Public Utilities
15 Commission as they make their recommendation and
16 decision respectively.

17 So this slide will remain up for the
18 duration of the meeting so that you -- it's right
19 there with how you can comment.

20 And, I guess, do we have -- anyone raise
21 their hand?

22 MS. SARA RADIL: We are entering the
23 comment period. Currently, we do not have a raised
24 hand. So participants wanting to make a comment,
25 feel free to look at the bottom of your Webex screen

1 for the little hand, and I see a comment hand coming
2 through.

3 All right. Wade Mathiowetz, you are
4 currently being unmuted. Please accept the audio
5 pop-up. State your name for the court reporter and
6 spell your name for the court reporter, and then
7 please provide your comment. Thank you.

8 MR. WADE MATHIOWETZ: You want me to
9 spell it?

10 MS. SARA RADIL: Yes. If you could state
11 your full name and spell it for the court reporter,
12 that would be great, and then go ahead on to your
13 comment.

14 MR. WADE MATHIOWETZ: W-A-D-E, last name,
15 M-A-T-H-I-O-W-E-T-Z.

16 My question was for Dan. Was the
17 modeling done with the windbreak in the summer
18 months or in the winter months when there's no
19 leaves on the trees? And how many miles per hour
20 wind was that modeling done with?

21 MR. DAN PRASCHER: So one of the things
22 that we did was we looked at summer months, winter
23 months. We did the analysis both ways and looked at
24 what was -- what contributed to a worse case, and it
25 was the winter.

1 And we -- the mile an hour that produces
2 the worst amount or the largest amount of impact is
3 about four miles an hour. Anything above that, it
4 gets less, it's less dramatic. And the windbreaks
5 we used, we're looking at things like spruce, things
6 that have -- you know, evergreens, that are
7 typically used in at least one row of windbreaks out
8 there. But, yeah, that's what we used.

9 MR. WADE MATHIOWETZ: So the
10 four-mile-an-hour for wind does the worst in the
11 winter, and so at night the wind dies down, so we
12 could be at more threat during the night in the
13 winter not knowing all this.

14 MR. DAN PRASCHER: At a certain point it
15 just becomes so less that it doesn't really migrate.
16 But the thing to keep in mind is the only way this
17 actually becomes an issue for folks is if there is a
18 major rupture, what's called -- you know, a full
19 rupture, where it releases the maximum amount of
20 product into the air all at once. Anything less
21 than that doesn't release a big enough concentration
22 to be harmful to people.

23 And so it's that initial full release
24 that we were modeling, and we're looking at how does
25 that move, how does that develop into a cloud, how

1 does that move, and --

2 MR. WADE MATHIOWETZ: So you're saying
3 that a certain amount is not harmful to humans on a
4 four- to 24-inch line? And it takes ten to -- and
5 they even say this -- 25 minutes to shut down
6 valves, and you're saying it's not harmful to
7 humans, I beg to differ on that one.

8 MR. DAN PRASCHER: Yeah. Okay. Well,
9 it's not. And this is -- I mean, this is not me
10 saying that, this is the CDC that does tests on
11 this, uses research studies, real-life examples,
12 different releases that have been recorded. They
13 look at the research, they look at the information,
14 and then make a determination of what is harmful to
15 folks.

16 And a lot of times there's a time
17 component associated with that, and the short-term
18 exposure limit as put forth by the NIOSH, which is
19 part of the CDC. It's what they do, and they
20 collect these limits to help people understand
21 what's safe, what's not, what's of concern. But I
22 believe the effects of the short-term exposure limit
23 is possibly having some respiratory issues --
24 possibly. Not permanent -- not permanent health
25 risks to a person, and they put that at 30,000 PPM

1 for CO2.

2 MR. WADE MATHIOWETZ: Okay. You're
3 familiar with the pipeline rupture in Missouri in
4 2020, correct?

5 MR. DAN PRASCHER: In Mississippi, yes, I
6 am.

7 MR. WADE MATHIOWETZ: Or Mississippi, I'm
8 sorry, yes.

9 MR. DAN PRASCHER: Yeah, at Satartia, I
10 am.

11 MR. WADE MATHIOWETZ: I mean, that did
12 some damage there to folks, right?

13 MR. DAN PRASCHER: It made some people
14 sick. It did not --

15 MR. WADE MATHIOWETZ: Some unconscious,
16 some rescue vehicles couldn't make it there; is that
17 right?

18 MR. DAN PRASCHER: Yeah. I believe that
19 some rescue vehicles stalled.

20 MR. WADE MATHIOWETZ: And some people are
21 still dealing with aftereffects of that?

22 MR. DAN PRASCHER: I'm not aware of
23 people still dealing with that. I know that there
24 were people who went to the hospital. I believe it
25 was 40 -- I'd be guessing if I told you, but it was,

1 you know, not an insignificant amount of people.
2 They were sick, no one was hospitalized, no one
3 suffered permanent effects of that.

4 MR. WADE MATHIOWETZ: Well, even if it
5 was one person or two, it's still human lives here
6 we're talking.

7 MR. DAN PRASCHER: It is. It is.

8 MR. WADE MATHIOWETZ: And I think we need
9 to really, really, really not underestimate what's
10 going on here.

11 (Simultaneous cross-talking.)

12 COURT REPORTER: Wait --

13 MR. DAN PRASCHER: And that's -- I
14 appreciate your comment quite a lot, Wade. And
15 that's why we're trying to figure out what the
16 worst-case scenario is. And the thing to keep in
17 mind, too, Satartia was a 24-inch high-pressure
18 pipeline and we're talking about a four-inch.

19 MR. WADE MATHIOWETZ: Okay.

20 MR. DAN PRASCHER: Very, very different.

21 MR. WADE MATHIOWETZ: This says four-inch
22 for this pipeline, and there's -- in this DEIS that
23 was brought up for Wilkin and Otter Tail County, in
24 the drawings it says four to 24. Why is there four
25 to 24, and you're saying it's a four-inch pipeline?

1 MR. DAN PRASCHER: I can't speak to that.
2 Maybe someone else can, but as far as I know it's
3 always been a four-inch.

4 Andrew, do you want to --

5 MR. ANDREW LEVI: Yeah. If it does say a
6 four- to 24-inch, please let us know where. That's
7 a mistake.

8 MR. WADE MATHIOWETZ: It's in the
9 drawing. I went through 1,050 pages of this, so --
10 and there's no way that if it's a four-inch line
11 there should be any wording of 24 in there.

12 MR. ANDREW LEVI: Well, yeah, you're
13 exactly right. If there is wording of -- I mean, we
14 did talk about the Satartia release. Perhaps,
15 that's a 24-inch pipeline. But this is a four-inch
16 pipeline, and that's all it ever would be --

17 MR. WADE MATHIOWETZ: Right, but it's --
18 (Simultaneous cross-talking.)

19 COURT REPORTER: Wait, wait --

20 MR. ANDREW LEVI: And if it says that it
21 could be 24 inches, then that's obviously a mistake.

22 MR. WADE MATHIOWETZ: Yeah. In the
23 drawings, it says from four to 24. It's in,
24 probably -- the appendixes, I believe that's where
25 it's at.

1 MR. ANDREW LEVI: Okay. We'll look for
2 that.

3 MR. DAN PRASCHER: You know, one other
4 thing to note in Appendix G is doing these analyses,
5 especially with the CFD analysis, it shows how
6 quickly this dissipates, and worst-case scenario, it
7 would dissipate in just under four minutes. And
8 what I mean by "dissipate," I mean the PPM level,
9 the parts per million level, goes down to safe
10 levels everywhere. Not just at the furthest extent,
11 but everywhere within I think, like, it's
12 3.9 minutes. It's just under four minutes.

13 MR. WADE MATHIOWETZ: How long can you
14 hold your breath for?

15 MR. DAN PRASCHER: Well -- and so also to
16 put this into better perspective, it's -- that limit
17 that -- that's a 30,000-PPM level, and what the CDC
18 says is that a person will not have any sort of
19 permanent health effects if they're exposed to that
20 level up to 15 minutes, and we're saying that it's
21 four minutes.

22 MR. WADE MATHIOWETZ: Okay.

23 MR. DAN PRASCHER: If that makes sense.

24 MR. WADE MATHIOWETZ: I mean, that's for
25 an ordinary human. I'm -- we're not talking elderly

1 or anybody with respiratory problems. I mean, we're
2 doing all average numbers here, but we've got more
3 than just average people living in these places.

4 MR. DAN PRASCHER: Right, and --

5 MR. WADE MATHIOWETZ: It's a very big
6 health risk here, people.

7 MR. DAN PRASCHER: Well, it's -- you
8 know, yeah, it's not. But, those numbers, those
9 limits that are developed with the NIOSH or under
10 the CDC, they take a snapshot of the general
11 population. So we're just not talking, like --
12 well, we'll say like healthy individuals in their
13 20s. You know, it's actually a screenshot, and so
14 what they're saying is worst-case scenario, here's
15 what the level is that we recommend.

16 MR. WADE MATHIOWETZ: I understand that
17 part, but where this pipeline is going to be going
18 in other places, the general population isn't a good
19 feel for it. If you're going by close to a nursing
20 home, throw them numbers into it, and then
21 everything is going to -- the dramatics change a
22 lot.

23 MR. DAN PRASCHER: Yeah.

24 MR. WADE MATHIOWETZ: I mean, the
25 children -- I mean, I don't know, guys. I think

1 you've got to really dig deep on this one.

2 MR. DAN PRASCHER: Well, and from my
3 understanding looking at the right-of-way, it
4 doesn't pass by any places like daycares or schools
5 or retirement homes, any of that stuff. It's
6 very --

7 MR. WADE MATHIOWETZ: Within how many
8 feet, what's a fair setback --

9 (Simultaneous cross-talking.)

10 COURT REPORTER: This is Christine. Can
11 you hear me? Both of you were talking over each
12 other, and so then I can't hear.

13 So, Dan, you were saying that "it doesn't
14 pass by any places like daycares or schools or
15 retirement homes or any of that stuff. It's
16 very," and then I -- both were talking, so I didn't
17 hear what you said.

18 And then, Wade, after Dan's done, if you
19 could repeat what you said, please.

20 MR. DAN PRASCHER: I was just saying it's
21 very rural, very isolated.

22 COURT REPORTER: Thank you.

23 MR. WADE MATHIOWETZ: Okay. So you said
24 there's no schools and nursing homes in close
25 proximity. What is "close," or what is the

1 distance, I guess?

2 MR. DAN PRASCHER: Pick a distance, it's
3 all distances. It's not within any sort of
4 discernable affected distance.

5 MR. WADE MATHIOWETZ: Okay. That really
6 didn't clarify any feet or anything.

7 MR. DAN PRASCHER: So, yeah. So it's not
8 within, what, 2,000 feet, and we're looking at
9 distances that are affected by this pipeline around
10 600 feet.

11 MR. WADE MATHIOWETZ: Okay. So you're
12 saying 600 feet is the closest it will be then?

13 MR. DAN PRASCHER: That's the part where,
14 after 600 feet, the potential rupture would not be
15 concerning by any stretch of the imagination for
16 people, and we looked at further than that.

17 MR. WADE MATHIOWETZ: Okay.

18 MR. DAN PRASCHER: I think, actually, in
19 the study, doesn't it, Andrew, say 1,600 feet?

20 But, still, we're talking about double of
21 what the affected dispersion length would be.

22 MR. WADE MATHIOWETZ: Okay. In the DEIS
23 report it says Summit recommends people have a CO2
24 detector for 1,000 feet. So you're saying 600 feet,
25 anything after that really isn't harmful, but we

1 should have a CO2 detector at 1,000 feet. I'm kind
2 of confused there.

3 MR. DAN PRASCHER: Yeah. Because
4 everyone wants to be prudent about this. We want to
5 be safe. This does have -- as you said, it has, you
6 know, real consequences. It has -- really affects
7 people's actual lives. So we want to be safe, and
8 there's nothing wrong with putting in detectors.
9 It's just trying to do -- trying to do what's right,
10 what's going to protect the general population.

11 MR. WADE MATHIOWETZ: Okay.

12 MR. DAN PRASCHER: And make them feel
13 better, make them feel -- I'm sorry, I spoke over
14 you.

15 MR. WADE MATHIOWETZ: No, that's fine.
16 Just, you recognize there is a problem, then, up to
17 1,000 feet. That's what I was clarifying. Thank
18 you.

19 MR. DAN PRASCHER: No. No, there's not a
20 problem up to 1,000, but what I am saying is we need
21 to be prudent. And there's nothing to say we can't
22 be more conservative, and so we're just being
23 conservative.

24 MR. WADE MATHIOWETZ: That's all I have
25 now.

1 MR. ANDREW LEVI: Thank you.

2 MS. SARA RADIL: All right. Thank you.

3 Next, we have it looks like a screen
4 name, P-F-U-R-S-H-O-N-G. You are being unmuted.
5 Please accept the audio pop-up, state and spell your
6 name for the court reporter, and then provide your
7 comments.

8 And just a reminder, when we are
9 commenting, let's make sure that we're allowing one
10 person to speak at that time so that way Christine,
11 the court reporter, can get a clear record. Thank
12 you.

13 MS. PEG FURSHONG: My name is Peg
14 Furshong, P-E-G, F-U-R-S-H-O-N-G.

15 I would just like to build off of what
16 Wade has said. First of all, respectfully, the CDC
17 generally comes up with their examples related to
18 CO2 in a contained space with a roof and a ceiling
19 and four doors. Typically the humans that they
20 expose to a harmful pollutant like CO2 have two
21 different time exposures: There's a short exposure
22 and a long exposure. Typically, the person or the
23 test subjects are healthy individuals.

24 Dan Zegart, the investigative reporter
25 who reported on Satartia, has done follow-up

1 interviews with the local residents that were
2 exposed to that rupture. People were impacted at a
3 three-mile radius or more from the actual rupture
4 site of that incident.

5 And we're two years after that incident
6 and people still have significant medical issues
7 with COPD, asthma, they're lethargic, they still
8 have headaches, muscle aches, and are unable to
9 return to work. And he's reported that I -- you
10 know, I've watched the interviews of the people from
11 Satartia. They were hospitalized, and some of them
12 were hospitalized. No one died; I wouldn't dispute
13 that. But there have been long-term health effects
14 for those individuals, and they're still struggling.

15 So the setbacks, you know, if it's an
16 actual full-out rupture, there is no safe distance.
17 Unless you're out of the impact zone, which
18 depending on the weather, the time of year, and the
19 season could be up to six miles. So that's
20 concerning.

21 And it seems like, if you look at this
22 route, the ethanol plant is located in Fergus Falls
23 proper. It's going to be going by and near people,
24 a populated area. Definitely would be in a rupture
25 zone if there was a problem, and those people would

1 be impacted.

2 And so I think that that's really
3 important to think about if we're just talking about
4 this particular part of the proposed project and the
5 application for this 28 miles. It originates in a
6 populated area. The carbon-capture is going to be a
7 populated area because they'll be capturing the
8 carbon at the ethanol plant.

9 And so I really think that it's important
10 to be cognizant of that and not dismissive, because
11 this is a test project. We've never seen -- you
12 know, Summit has said, this is a first-of-its-kind
13 pilot project. There's not one of these types of
14 pipelines anywhere in the United States, and
15 certainly not in the Upper Midwest. And so we don't
16 know what is going to happen. We can anticipate
17 what might happen, but we don't know what's going to
18 happen until we have something more tangible to base
19 our decisions off of.

20 Because most of the, you know, dispersion
21 modeling and things like that are done in areas that
22 aren't necessarily in northern climates or cold
23 climates, or have the weather and the geography that
24 we have here. Because there never has been one of
25 these types of pipelines anywhere in this area.

1 So we're just guessing, right? Is that
2 fair to say, Dan? We're guessing as to what's going
3 to happen?

4 MR. DAN PRASCHER: Yeah. I would say
5 that's not necessarily a fair statement, no, and let
6 me give you a little more background. So I model
7 the majority of CO2 pipelines in the continental
8 United States, and I've done that for the last
9 couple of years.

10 There are several pipelines operating,
11 not quite like this is, but the pipeline part of it
12 has been a known quantity for quite some time. It's
13 been in federal regulations as part of 49 CFR 159,
14 which is hazardous materials. Supercritical CO2 is
15 considered one of those, and it's been in Federal
16 Code for, what, the last decade, something like
17 that.

18 It actually is very well known and -- but
19 you do make a point. You do make a point about the
20 cold climate, and the software that we use, the
21 multiphysics engines that we employ, they do account
22 for all of that. They do account for the humidity,
23 temperature. And if you look in the Appendix G, it
24 goes through all of the things that we tried to --
25 that we did use in order to really model what this

1 is going to look like in Minnesota, where it's being
2 proposed.

3 Because we don't -- we don't want to do
4 something that's more akin to, you know, Arizona,
5 and then say, well, if you use your imagination --
6 because, like I said earlier, this is important. We
7 need to get it right, and we did that.

8 One other point I would like to make is
9 the difference between Satartia and where it's being
10 proposed now in Minnesota is that Satartia, yes, it
11 was much, much more CO2 released, and, also, the
12 geology was such that it kind of created a perfect
13 storm. It was up on a mountain, or a very large
14 hill, I guess. But the valley and the terrain made
15 it so that it created a maximum push. It was like a
16 V-like valley that it went right down into.

17 And the reason that's bad is because it
18 kind of shields it from crosswinds. You don't get
19 the mixing that you normally see in flat, open
20 terrains like you do here in Minnesota. And so it
21 had the chance, when it's down in those valleys --
22 and I'm not talking about, you know, like a ditch or
23 something. We're talking about, you know, a 30-,
24 40-foot wall. You know, the V, this height, 30, 40
25 feet. It was really a perfect storm event.

1 And, yes, it did elongate it quite a lot,
2 and we wanted to make sure that we were not modeling
3 that. We were modeling what we're seeing here in
4 Minnesota. They did a realistic look at what we're
5 doing here, and what the study showed is the terrain
6 that's here in Minnesota really doesn't contribute
7 to elongating those -- those impacts like we did see
8 in Mississippi.

9 MS. PEG FURSHONG: Well, I appreciate
10 that, Dan.

11 I would just say two things, and I don't
12 necessarily need a response, but I will say them. I
13 don't -- you make it sound like this is really safe,
14 and it's not. Because PHMSA has issued their
15 concerns, and they're reevaluating their criteria
16 and guidelines because they don't think that CO2 is
17 like other pipelines. While they have been
18 operating, they are foreshadowing more significant
19 concerns as this becomes a popular idea to make
20 money.

21 Second of all, I would say, because the
22 PUC allowed Summit to break this up into, like,
23 segments, maybe the Fergus Falls-to-Breckenridge
24 doesn't have any kind of terrain like you're
25 referring to down in Satartia, but the rest of the

1 proposed footprint does.

2 I live in the Minnesota River Valley, and
3 there are 30- and 40-feet, you know, valleys all
4 in -- you know, in segments of this proposed route.
5 At least, where I live in Renville County. So we're
6 going to have to pay for modeling again. Because
7 the modeling that we're doing for this little
8 segment is not going to be useable anywhere else in
9 the footprint -- the proposed footprint.

10 And I realize that Summit hasn't applied
11 for the rest of the footprint yet, but they fully
12 intend to since they have easements in ten counties.
13 And they have been buying easements, and they've
14 been advertising it. And so we're going to waste
15 taxpayer dollars modeling another round of this as
16 they submit another application and -- or however
17 many they're going to submit.

18 But I'll just leave it at that. I
19 appreciate your comments. I hope you can understand
20 why people are concerned is because there's a lot of
21 information that's not congruent with everything
22 that people have access to to understand this
23 project. Thank you.

24 MR. DAN PRASCHER: Yeah. I do greatly
25 appreciate what you said. Yeah, absolutely. This

1 is serious. That's why we're trying to take it
2 seriously.

3 And maybe, Andrew, you can speak to,
4 maybe better than I can, about there aren't any
5 taxpayer dollars paying for any of this.

6 MR. ANDREW LEVI: Yeah. I just wanted to
7 say, Peg, that I appreciate your comments, and I can
8 tell you that we are very concerned about the safety
9 aspect of it, too. We were asked to do the CFD
10 modeling as part of scoping, and we did that. And
11 we spent a lot of Summit's money doing that.

12 And I think that those -- you know, the
13 results of that study are publicly available, just
14 like folks wanted them to be. So I'm really -- I'm
15 really proud that we were able to do that as we were
16 asked to do.

17 You know, Summit is responsible for the
18 cost of all permitting. So, you know, again, Dan is
19 correct. There would be no -- there is no taxpayer
20 money involved. And I guess when those applications
21 come in, you know -- for the other portions of the
22 project, if they do come in, and if -- you know, if
23 the CFD modeling that's done here isn't applicable
24 to down here, well, then I think that decision gets
25 made at that time.

1 You know, the environmental review for
2 this portion of the project is specific to -- that
3 portion is specific to here, and if another
4 alternative -- another -- excuse me, another segment
5 of the larger project comes in, then we'll take the
6 same hard look at that segment as well. So we
7 wouldn't -- I don't think we would simply say that,
8 yeah, it's completely different terrain, but -- you
9 know, it's completely different, but that counts
10 here. I don't see us doing that at all.

11 But I do appreciate what you're saying,
12 and, you know, we're very concerned about that
13 aspect of it, and that's why we did Chapter 8 the
14 way we did and Appendix G the way we did. So thank
15 you for your comments.

16 MS. SARA RADIL: Thank you.

17 And we have a handful of participants
18 with hands raised, so we'll move on. One inquiry
19 came through the chat, Andrew: Just to -- if you
20 could clarify if there is a public hearing date set
21 at this point?

22 MR. ANDREW LEVI: It's mid-May. It's
23 mid-May. If someone will -- there is a schedule set
24 out by the Administrative Law Judge. That date is
25 probably on there. It escapes me right now. If

1 someone will look that up.

2 Christy looked that up. I saw her pop
3 up, and Christy will let us know what that date is.

4 MS. CHRISTY BRUSVEN: Yeah. Andrew, the
5 schedule for this, the public hearing is set for
6 May 15th and May 16th.

7 MR. ANDREW LEVI: So, yeah, mid-May.

8 MS. SARA RADIL: All right. Thank you.

9 We'll move back to our participant
10 comments now. A couple refresh -- reminders that we
11 are on our first round of comments, so to ensure
12 that we're able to get through all participants,
13 let's attempt to use approximately five to
14 ten minutes for comments. And then what we'll do
15 is, as we wrap up the first round, raise your hand,
16 again, and we'll go back through and open it up for
17 additional comments. I just want to make sure that
18 everyone has an opportunity to comment here.

19 So our next participant, we have Ginny.
20 Please accept the audio pop-up, state your name and
21 spell your name for the court reporter, and then
22 provide your comment. Thank you.

23 MS. GINNY ALLIE: I'm sorry. I missed
24 that. I couldn't hear you, the last part.

25 MS. SARA RADIL: Yes. Go ahead and state

1 and spell your name for the court reporter, and then
2 provide your comment.

3 MS. GINNY ALLIE: My name is G-I-N-N-Y;
4 last name is A-L-L-I-E. And what else was I
5 supposed to say?

6 MS. SARA RADIL: And then feel free to
7 provide your comment or question.

8 MS. GINNY ALLIE: Okay. I just was
9 piggybacking off of Wade Mathiowetz's comments
10 regarding the information being on much of the EIS
11 listing the pipe to be four to 24 inches. And I put
12 something in the comment -- or the chat to indicate
13 a whole bunch of figures, that I saw that, and the
14 response was that it was helpful and that it could
15 be used for editing purposes.

16 But my concern is, well, do we
17 automatically assume that it's not right, or does
18 that need to be looked at more carefully to see if
19 four to 24 inches is really what was intended?

20 MR. ANDREW LEVI: No, it was a mistake.
21 It's four inches. It will be four inches on the
22 inside, and then four and a half inches on the
23 outside. So it will have a diameter of about a
24 quarter of an inch all the way around. It's a
25 four-inch pipe with a four-and-a-half inch outside

1 diameter. It is not -- it will not be bigger than
2 that. That's what they have applied for, and that
3 is all the Commission -- if they issue a permit, it
4 says specifically in the permit the size of the pipe
5 they can construct, and Summit Carbon is asking for
6 a four-inch pipeline and not a 24-.

7 That is, obviously, a big mistake.
8 That's my fault, and we'll get it fixed. I'm glad
9 that someone -- I'm glad that it was brought to our
10 attention, but I apologize for that. We will do a
11 search for that and make sure that that's fixed in
12 the final.

13 But Summit is applying for a four-inch
14 pipe. Should the Commission issue a permit, the
15 permit would specify that diameter, and,
16 essentially, if they build something different, then
17 they're violating their permit and it would take get
18 taken away.

19 MS. GINNY ALLIE: All right.

20 MR. ANDREW LEVI: It looks as if Christy
21 hopped on, so, Christy, if you have something to
22 add?

23 MS. CHRISTY BRUSVEN: Andrew, I would
24 just add, you're absolutely correct that the
25 application is for a four-inch pipeline. The

1 figures attached to the environmental control plan,
2 the ECP, which is an attachment, do have "typical."
3 Which are typical practices, showing best-management
4 practices. Some of those show, you know, a four- to
5 24-inch pipe because that practice would apply
6 regardless of the diameter of the pipe, or it shows
7 differences, where necessary. So that may be why
8 folks are seeing some references to 24 inches, but,
9 again, the application here is for the four-inch
10 pipe.

11 MS. GINNY ALLIE: Okay. Thank you for
12 answering that. I just -- because it did say on the
13 bottom of all figures from 2 through 15 on Appendix
14 D, proposed pipeline four to 24 inches. And I think
15 there were other places that said that as well, but
16 thank you for commenting. That's all I have.

17 MR. ANDREW LEVI: No, again, thank you
18 for bringing that to our attention. That is --
19 Minnesota, that's their ECP, it's an environmental
20 construction plan, and it is for the entire State of
21 Minnesota. They would, you know, if they do -- if
22 the applicant does submit an application -- and as
23 Peg alluded to -- talked about, you know, they
24 actively are doing so, I believe that construction
25 plan would also apply to those new portions. So,

1 yeah, that's something that we could look at in the
2 final to try to eliminate that confusion. So we
3 apologize about that. I'm sorry.

4 Do you have anything else?

5 (No response.)

6 MS. SARA RADIL: And if you have anything
7 else, feel free to raise your hand again, and we'll
8 wrap back through the list, as mentioned. So thank
9 you for your comment.

10 Craig, you're being unmuted. Please
11 accept the audio pop-up, and then state and spell
12 your name for the court reporter and provide your
13 comment. It looks like, Craig, you are unmuted.

14 MR. CRAIG WOODWARD: Can you hear me?

15 MS. SARA RADIL: Yes.

16 MR. CRAIG WOODWARD: Okay. Great. My
17 name is spelled Craig, C-R-A-I-G; Woodward,
18 W-O-O-D-W-A-R-D.

19 MS. SARA RADIL: Thank you. Feel free to
20 provide your comment.

21 MR. CRAIG WOODWARD: Okay. And I
22 appreciate the comments that, you know, Dan and the
23 others have made, and also the attendees that are
24 listening in and commenting. Yeah. You know, I'm
25 not unlike them in having some concerns, certainly,

1 about a hazardous liquid CO2 pipeline.

2 And you've mentioned Satartia and that
3 and all, and it kind of brings me around. I circled
4 around to something that I believe Dan hinted on,
5 but I don't know if any information was really
6 provided in terms of plume model that was done by
7 Summit. I thought I had read that they have done
8 that and maybe indicated that it was done, but I'm
9 just wondering, what evidence do you have of that?
10 And what did they say about their plume modeling?

11 You know, I've heard of some that has
12 been done by others, not Summit. But it can be
13 fairly significant because they believe they have --
14 how -- pounds per square inch in that four-inch
15 pipeline, Dan, was it like 2,100 pounds per square
16 inch, does that sound appropriate?

17 MR. DAN PRASCHER: Yeah. It's a little
18 higher than that, but yeah, approximately. It's --

19 MR. CRAIG WOODWARD: A little higher than
20 that, so that's a tremendous amount of pressure to
21 push it, obviously, to where they want to go, which
22 apparently is North Dakota.

23 And, you know, carbon steel pipe, I
24 think, seems there's sometimes an issue. Obviously
25 in Satartia it busted the seam and exploded, and so

1 that is a fear, I'm sure, of residents, you know,
2 those folks in Fergus Falls or wherever they might
3 go in the State of Minnesota. So I can appreciate
4 that.

5 But do you have any hard facts in terms
6 of their plume modeling, Dan?

7 MR. DAN PRASCHER: Yes. Yeah. They did
8 their modeling. And part of our due diligence that
9 we wanted to do is to say, okay, Summit send us your
10 assumptions, the data you used, let us know what
11 kind of modeling software that you used, and we're
12 going to check all of it; and we did.

13 And like I mentioned briefly, I just kind
14 of skipped over it, but I did check what they did.
15 Using their assumptions, using all the data that
16 they collected, I agree with their outcome, what
17 their -- with what they arrived at. I think it's
18 reasonable.

19 And part of -- and when I say
20 "reasonable," what I mean is that our job as
21 pipeline integrity professionals, myself and others,
22 is "reasonable" means we're looking at the worst
23 reasonable case, right? So we're not looking for
24 that one-in-a-gazillion. Like, we're not trying to
25 predict a meteor strike, you know, coming in from --

1 MR. CRAIG WOODWARD: Right.

2 MR. DAN PRASCHER: We're trying to look
3 at, all things considered, what is the worst-case
4 scenario, and that's what we're using, what's
5 reasonably worst-case scenario to do it. And so --
6 and that's -- they did that, and I think they did a
7 pretty good job.

8 I am usually a little more conservative
9 than most, and so I assumed some things more
10 conservatively than they did, and they -- that's
11 what I put in the report. I'm trying to show that,
12 you know.

13 MR. CRAIG WOODWARD: Good for you.

14 MR. DAN PRASCHER: Well, you know --

15 MR. CRAIG WOODWARD: Well, that's -- yes.

16 MR. DAN PRASCHER: We want people to
17 know, yeah.

18 MR. CRAIG WOODWARD: Absolutely.

19 MR. DAN PRASCHER: So yeah.

20 MR. CRAIG WOODWARD: What were their
21 findings? Did you have anything specific that I
22 could learn from?

23 MR. DAN PRASCHER: It's in the report,
24 it's Appendix G.

25 MR. CRAIG WOODWARD: G, got it.

1 MR. DAN PRASCHER: Yeah. And it shows
2 what I came up with, it shows what they came up
3 with.

4 MR. CRAIG WOODWARD: Um-hmm.

5 MR. DAN PRASCHER: And then all the
6 variables that we used --

7 MR. CRAIG WOODWARD: Sure, sure.

8 MR. DAN PRASCHER: -- in that.

9 MR. CRAIG WOODWARD: Okay.

10 MR. DAN PRASCHER: But -- yeah. You
11 know, and -- yeah.

12 MR. CRAIG WOODWARD: Well, I appreciate
13 that, Dan. Thank you.

14 One other question that I have and it --
15 well, a comment, not necessarily a question, but did
16 you speak with them in terms of the conversion
17 process of going to an ethanol plant and then
18 converting that gas to a liquid? And did they
19 discuss that at length with you, or how did they
20 approach that process, Dan?

21 MR. DAN PRASCHER: You mean as far as
22 capturing the carbon --

23 MR. CRAIG WOODWARD: Yes.

24 MR. DAN PRASCHER: -- and liquifying it?

25 MR. CRAIG WOODWARD: Yes.

1 MR. DAN PRASCHER: No, and that really
2 wasn't my purview.

3 MR. CRAIG WOODWARD: Okay.

4 MR. DAN PRASCHER: I'm familiar with that
5 process --

6 MR. CRAIG WOODWARD: Okay.

7 MR. DAN PRASCHER: -- and one thing
8 that -- and one thing that I was going to mention,
9 the pressure, the twenty- -- just shy of
10 2,200 pounds.

11 MR. CRAIG WOODWARD: Um-hmm.

12 MR. DAN PRASCHER: You know, you there
13 are several pipelines that I model in the
14 continental United States, and it's not uncommon to
15 go above 3,000.

16 MR. CRAIG WOODWARD: Um-hmm.

17 MR. DAN PRASCHER: The trick is,
18 regardless of what the pressure is -- and the
19 pressure is really to keep it in that liquid form.
20 It's not to propel it down the pipeline. But the
21 key thing to take away is they must -- regardless of
22 the pressure, they have to construct the pipeline
23 out of materials that are suitable per API 5L
24 standard. That's a standard by American Petroleum
25 Institute. It's been revised and updated over the

1 years. The most current is 5L, and it says, if you
2 are going to create a pipeline, it must adhere to
3 these kinds of things. It has to be appropriate for
4 the kind of material that's being transported. It
5 also has to be appropriate for the pressures, and so
6 that means there's a large factor of safety that's
7 also built into the design of these. So, you know,
8 sometimes these pipelines get up to a half-an-inch
9 or inch thick.

10 MR. CRAIG WOODWARD: Uh-huh.

11 MR. DAN PRASCHER: You know, they need
12 the extra wall to do that. But, yeah, all of that's
13 dictated to all oil and gas operators by PHMSA
14 regulations.

15 MR. CRAIG WOODWARD: Sure. Sure. Well,
16 again, I'm going to come back to the conversion
17 process and just if there were -- I don't think you
18 indicated there was much of a discussion about that
19 process with Summit, but -- whoever would be
20 converting gaseous CO2 to liquid form. But in the
21 research that I've done, I think there is a
22 tremendous amount of heat that is generated in that
23 process. Which leads me to have great concerns for
24 our state of Minnesota in terms of water usage, and
25 that's precisely how they intend to dissipate the

1 extreme heat in that conversion process. And I know
2 this, that they will probably try to get water
3 permits, vis-à-vis working with the DNR, or whoever
4 in Minnesota, in order to provide water.

5 I know this in terms of they're in other
6 states as well. They're in the Midwest trying to
7 get the pipeline up and running. They have -- they
8 have a meeting March 14th in Des Moines, Iowa, in
9 which they will go before that resource commission.
10 And they are going to ask for water permits totaling
11 a half a billion gallons of water in the course of a
12 year. That is 500 million gallons of water in the
13 course of a year.

14 I know that -- I know that Minnesota has
15 aquifers that they pull water from. Iowa does, too,
16 and a lot of states do. The aquifers in Iowa, from
17 what I -- in the research that I have done have
18 indicated that they are depleting because of our
19 droughts. So I am quite concerned over that issue
20 of water usage, and it will take -- if they come to
21 Minnesota, I know POET is here. POET has signed up
22 with Summit. There's going to be a great need for
23 water. I hate to see that depleted knowing that
24 Minnesota as well has been under drought conditions
25 and probably will be next year as well.

1 So, anyway, I don't know if that's been
2 addressed. I don't think it, maybe, has been, but I
3 think maybe it's an environmental study you have
4 done. Maybe that should be brought into it in some
5 facet so that it's recognized. So that's an
6 additional comment I would have.

7 MR. ANDREW LEVI: Thank you for that
8 comment.

9 I just wanted to point out that the EIS
10 does talk about water usage. Sara, I think she's on
11 the meeting, she pointed out that there's a
12 discrepancy between what's in the table and what's
13 in the paragraph. But it looks as if the company
14 would be using about 8.2 gallons of water per minute
15 in the winter to cool and about 40 gallons per
16 minute in the summer months to cool. The EIS
17 currently says though that's an average water usage
18 of about 13 million gallons. I did the math wrong
19 on that. I believe it's a little north of 20
20 million gallons.

21 MR. CRAIG WOODWARD: That's what I
22 thought, yeah.

23 MR. ANDREW LEVI: And we'll get that
24 fixed. But that's currently what it's saying is 8.2
25 in the winter and 40 in the summer, and that's per

1 minute.

2 And you're absolutely correct that water
3 appropriation in the State of Minnesota is done by
4 the Department of Natural Resources. And, you know,
5 I'm expecting the DNR to provide some comments on
6 this particular section of the draft EIS.

7 I'm sorry. I didn't mean to cut you off
8 if you had more. I just wanted to let you know
9 those numbers in case -- just so you know we're
10 aware of the -- it's a lot of water.

11 MR. CRAIG WOODWARD: It is. It is.
12 Thank you, Andrew and Dan, both for your comments,
13 and that's all that I've -- I've eaten up my five
14 minutes, I'm sure. Thank you.

15 MR. ANDREW LEVI: Thank you very much.

16 MS. SARA RADIL: Thank you, Craig.

17 Up next, we have Ed Iverson. You are
18 being unmuted. Please accept the audio pop-up, and
19 then state and spell your name for the court
20 reporter and provide your comments.

21 MR. ED IVERSON: Ed Iverson, E-D,
22 I-V-E-R-S-O-N.

23 I guess you told Wade that the CO2
24 dissipates in three to four minutes. And first of
25 all, I don't think I can hold my breath that long

1 either, but I just want -- you never know when to
2 take that last breath to hold it is the problem.

3 And I guess I've farmed for just about
4 30 years. I've worked with anhydrous ammonia a lot,
5 and had one experience -- I had a really nice mask
6 so I could breathe in it. And I was walking back to
7 the tractor, and I thought that I was out of it. I
8 could not see any anhydrous cloud or anything. I
9 took my mask off. All of a sudden, I could not
10 breathe.

11 And I ended up getting back to the
12 tractor, but I just -- I want -- and I know they're
13 different animals, but I want you to be aware of
14 just how fast that can happen. And if it happens in
15 three to four minutes, your panic has set in, and
16 you're in a lot of trouble, and I just -- this gas
17 stuff that hangs low really, really bothers me. And
18 I guess that's all I really had to say.

19 MR. ANDREW LEVI: Thank you for saying
20 that. I'm glad you're okay, obviously. Yeah. I
21 mean, we're concerned, too. That's why we did it,
22 and that's why we're presenting the information so
23 that it's available so folks know what that distance
24 is, what that time frame is. You know, that's what
25 we're trying to do with the EIS itself.

1 With regards to mitigating that, there
2 are things that can be done in terms of education.
3 I know that, you know, the -- should they be issued
4 a permit for the project, that the company would be
5 conducting an education -- they would -- emergency
6 response plan, which would include an education
7 component. I know that the State would have ideas
8 as to what we think maybe should be included in
9 that, you know. And if you have any ideas, please
10 comment on that and let us know, and that would be
11 appreciated.

12 So, again, yeah, it is a big deal, and I
13 bet that would scare the crap out of me. I'm sure
14 it did you, too. And -- yeah, and it's a serious
15 thing. Thank you.

16 MR. ED IVERSON: Well, the biggest thing
17 is, if you can't see it, you don't know which
18 direction to run. And I just -- to me this seems
19 like a bad idea, but I appreciate you taking my
20 comment. And I guess that's all I have for now.

21 MR. ANDREW LEVI: Thank you.

22 MS. SARA RADIL: Thank you for your
23 comment.

24 Peg, you are up next. You're being
25 unmuted. Please state your name and spell your name

1 for the court reporter, and then provide your
2 comment.

3 MR. ANDREW LEVI: You don't have to spell
4 it again, Peg.

5 MS. SARA RADIL: Okay.

6 MS. PEG FURSHONG: Thanks. Peg Furshong.

7 Just two quick things. When I referenced
8 taxpayer dollars, could you clarify for me, are all
9 the agencies being reimbursed for their time spent
10 on this project? Or are you referring mostly to the
11 modeling that --

12 MR. ANDREW LEVI: I'm referring to the
13 modeling, yes, you're correct.

14 MS. PEG FURSHONG: Yeah.

15 MR. ANDREW LEVI: So any comment on --
16 you know, if MnDOT provides comments or AG, you
17 know, Department -- I should -- okay. The
18 Department of Transportation provides comments or
19 the Department of Agriculture or the Pollution
20 Control Agency provides comments, then, yes.

21 I don't know exactly how they're funded
22 and where their money comes from, but I do know
23 where the money comes from for the EIS, and that's
24 from -- not from taxpayer dollars. But, yes, Peg,
25 you're correct, that I'm sure there's a state

1 employee somewhere looking at this on a, you know,
2 general fund money somewhere.

3 So, yes, I was referring specifically to
4 our role in -- EERA's role in this, and I appreciate
5 that clarification. Sometimes we get into our
6 little boxes and forget it's a big city out there.

7 MS. PEG FURSHONG: I know, and it's not
8 just the state level. The counties, their meetings,
9 there's county commissioner meetings, there's county
10 offices, all sorts of levels of local government
11 that are involved in this process at the expense of
12 taxpayers for this project. So I think that that's
13 just something we should be aware of.

14 I did also want to ask if the EIS
15 requires this process -- if they permit this process
16 to have transparency with the water use. Because we
17 know that sometimes in corporate industries, they
18 will reach out to other businesses who aren't fully
19 using an appropriation of water and try to access
20 that water.

21 And we know that potentially that could
22 happen here with the ethanol plant already having --
23 some of them having appropriations for water may not
24 be using the full amount, and they make
25 arrangements -- because they're partners in this

1 deal, right, ultimately -- to share water
2 permitting.

3 And I just feel like, you know, when
4 we're thinking about climate change and we're
5 thinking about the state suffering from drought and
6 transparency for the public that Summit's usage of
7 water should be separate from the ethanol plant's
8 usage of water.

9 And they both should be transparent to
10 the local communities. Because this is an extremely
11 water-intensive industry, and putting carbon-capture
12 on the ethanol plant is going to double their
13 footprint in every single community.

14 And while we're just -- I think the other
15 thing about this EIS process that's interesting is,
16 we're just talking about one plant, and there's a
17 proposal right now for a minimum of six in
18 Minnesota, but potentially additional POET plants.
19 And you're talking about 20 million gallons of water
20 annually for one plant, multiply that by six or
21 more, and we're looking at that much more water.
22 And does the State of Minnesota -- I know we're the
23 land of 10,000 lakes, but, honestly, with the
24 drought that we've been experiencing -- and it's
25 only going to get worse as we move forward -- do we

1 have enough water in the State of Minnesota to
2 support infrastructure that is going to be this
3 water intensive and not a public good?

4 That's the question that we face, and we
5 shouldn't go into this naively thinking that we'll
6 let them build the infrastructure and figure out the
7 water later. Because they clearly can't run the
8 infrastructure without the water appropriation, and
9 that, to me, is a real pivotal concern that isn't
10 expressed clearly or doesn't communicate well in the
11 draft EIS. It's not really clear to the -- clear
12 that that's an important part of this to make it
13 work, and I think that that should be addressed.

14 MR. ANDREW LEVI: I'm sorry, Peg. Just
15 to clarify so I know what you're saying and what you
16 want clarified, is you want water use from the
17 ethanol plant and -- but more specifically,
18 acquiring that water -- well, not for the ethanol
19 plant, but for the capture facility, that acquiring
20 that water into the future, you want that discussed
21 more?

22 MS. PEG FURSHONG: I just think -- two
23 things. One, I think the ethanol -- the water
24 that's going to be used for this infrastructure
25 needs to be separate -- accounted for separately

1 than the water from the ethanol plant. It's got to
2 be clear that it can't be muddled.

3 So if an ethanol plant isn't fully using
4 its water appropriation, they don't just slide that
5 water -- because the capture is at the ethanol
6 plant. So it would be easy to let Summit use the
7 water for the carbon-capture very easily. It would
8 be hard to monitor that.

9 So whatever water is used for the ethanol
10 plant, make sure that it's accountable to the
11 appropriation for the ethanol plant, and whatever
12 water that you think that this carbon-capture
13 process needs, it should be publicly transparent how
14 much water that is and that they're accountable for
15 that. I think that really needs to be clear.

16 But, also, the draft EIS doesn't
17 really -- the gentleman, Craig I believe his name
18 was, this is all coming out in Iowa right now, and
19 they're shocked to realize how much water is needed
20 for this project accumulatively. And so that's the
21 problem with us breaking the project up in Minnesota
22 is we're not seeing the cumulative impacts or needs.

23 But, clearly, this is a huge amount of
24 water that this project needs to even run. So if we
25 let them build this infrastructure, do we have the

1 water to make it sustainable? They say this has a
2 25-year life. Do you really think we have that kind
3 of water in Minnesota to support this for 25 years?
4 I mean, we should -- if they're projecting the life
5 of the pipeline, we should be projecting if we have
6 the water to support that. I just think that's
7 really important.

8 And the draft EIS doesn't really
9 articulate the amount of water that's needed or
10 clarify that that is just for this one ethanol
11 plant. So that it's clear that for every ethanol
12 plant the infrastructure is approved for, we need
13 that much more water. That's what I would really
14 like articulated better.

15 MR. ANDREW LEVI: I understand what
16 you're saying, Peg. Thank you.

17 MS. SARA RADIL: Thank you for your
18 comment, Peg.

19 Up next, we have Sharon Leinen. You're
20 being unmuted. Please accept your audio pop-up, and
21 state and spell your name for the court reporter,
22 and then provide your comment.

23 MS. SHARON LEINEN: Okay. My name:
24 Sharon, S-H-A-R-O-N; Leinen, L-E-I-N-E-N.

25 Just to add a little bit to what Craig

1 and Peg were saying. I live in the country. I have
2 a well. I, too, am concerned about how much water
3 this is going to take. I don't want to have to
4 re-drill my well, and I'm wondering if we aren't
5 sacrificing one of our resources just to save
6 another. The water use needs to be looked at,
7 definitely.

8 And the second thing is, I live about a
9 quarter of a mile from the proposed pipeline, and I
10 have no treeline or anything between me and the
11 pipeline to disperse the CO2 if a rupture should
12 happen. I'm just wondering how we are going to be
13 warned if there is a rupture, if we're going to be
14 warned. Because it's kind of scary to think about
15 it.

16 MR. ANDREW LEVI: Thank you for that,
17 and, yes, it is scary.

18 Scott, do you have any comments about a
19 preliminary -- well, do you have any comments,
20 Scott, response further?

21 MR. SCOTT O'KONEK: All right. You've
22 got to give me a second, Andrew. I'm just trying to
23 unmute myself here, if I could figure out the right
24 button to push.

25 MR. ANDREW LEVI: You pushed it.

1 MR. SCOTT O'KONEK: You know, if there --
2 if there was a release or something -- and, you
3 know, Dan can probably back me up on this also,
4 too -- you know, a quarter-mile is quite out of the
5 distance of, you know, what's stated in the draft
6 EIS of a, you know, problematic area.

7 But if there was something that happened,
8 you would hear, you know. I mean, obviously we
9 know -- we talk about the pressure that's in this
10 pipeline. You would be hearing that pressure coming
11 out of the pipeline. You would see the actual cloud
12 coming out of the pipe that -- you know, it's
13 changing back from a liquid to a gas. There's lots
14 of freezing that happens there, and there's actually
15 going to be, you know, frozen water particles coming
16 out of the ground. So if there was something going
17 on, you would hear and see something.

18 MS. SHARON LEINEN: So you're telling me
19 I have to be constantly vigilant in case there's a
20 rupture. What if I'm mowing the lawn and I'm not
21 looking over that way and I can't hear this rupture
22 going on?

23 MR. SCOTT O'KONEK: You know, I can't
24 talk about every hypothetical scenario that we may
25 run across, but those are the things that would be

1 coming from the pipe in that instance. And the
2 distance, you know, that you're talking away from
3 the pipeline is totally safe in any circumstance.

4 MS. SHARON LEINEN: Would you feel safe
5 living that close to the pipeline?

6 MR. SCOTT O'KONEK: Absolutely.

7 MS. SHARON LEINEN: Hmm. Yeah. Okay.
8 Well, I just think that people should be aware.
9 There should be some kind of a warning system in
10 place so that we know if something is going on, and
11 there doesn't seem to be anything planned for that
12 at the moment.

13 MR. SCOTT O'KONEK: And, you know, too --
14 and, Andrew, I just want to touch on, you know,
15 we -- like -- and you've touched on this a little
16 bit, too, public awareness never stops, public
17 training, you know, never stops. Like, we have to
18 work with all local responders, local agencies,
19 continually train, continue to communicate what's
20 out there. What do you do if you see this or hear
21 this? All of that stuff does not stop ever. It's
22 going to continually be updated. We're going to
23 reach back out, and, you know, that education and
24 communication never stop.

25 MR. ANDREW LEVI: I just wanted to point

1 out that the State of Minnesota cannot set safety
2 standards. That said, the State of Minnesota could
3 ask the company if they would like to implement a
4 safety protocol standard, whatever you'd like to
5 call it.

6 And the State has -- the EERA has
7 recommended as a potential mitigation -- something
8 to think about anyway -- is a reverse -- kind of
9 reverse 911 system. To where if something happens
10 along the pipeline, you know, notice would go out
11 via phone to folks along the pipeline.

12 You know, we understand that if the whole
13 rupture takes three to four minutes, not -- you
14 know, not sure if that system would -- could be
15 implemented in time, but it's something that we've
16 at least brought up as something to think about to
17 address that idea of the company being able to get
18 in touch with landowners in a hurry and let them
19 know something's up.

20 MS. SHARON LEINEN: What I'm hearing is
21 those that live along the pipeline route are going
22 to be in a constant state of worry, wondering if
23 there's a rupture going to happen, if somebody's
24 going to let us know. That's not a very nice way to
25 live.

1 MR. ANDREW LEVI: I don't -- I imagine it
2 wouldn't be.

3 MS. SHARON LEINEN: Thank you.

4 MS. SARA RADIL: Thank you for your
5 comment.

6 Tess Dornfeld, you are being unmuted.
7 Please accept your audio pop-up, state and spell
8 your name for the court reporter, and provide your
9 comment. Thank you.

10 MS. TESS DORNFELD: Hi. Tess Dornfeld,
11 T-E-S-S, D-O-R-N-F-E-L-D.

12 I wanted to follow up a little on the
13 discussion about the water use. A 25-year timeline,
14 that's pretty concerning to me. And I don't know,
15 do we have modeling, you know, of the different
16 potential scenarios of what will happen to our
17 state's water resources in the next 25 years? You
18 know, if these -- we could say that we have
19 sufficient water to supply that today, but in
20 20 years things could look a lot different.

21 There's just been the news out today that
22 we've now passed 1.5 degrees of warming for
23 12 months in a row, and we don't know for sure
24 what's going to happen 20 years from now. And so
25 can we really say that we can reliably commit that

1 amount of water 25 years from now not being sure --
2 or, like, even if we can make our best guess of
3 whether that will still seem reasonable.

4 MR. ANDREW LEVI: I think that -- thank
5 you for that. That's a very good point. I think
6 that -- you know, the Department of Natural
7 Resources is -- appropriates water in the state.
8 It's their job and their responsibility to ensure
9 that they're doing that in a way that, you know,
10 maintains that resource. I think that -- I think
11 I'll start with that and say that, and I don't
12 believe that we looked at long-term forecasts or
13 trends in the draft EIS with regards to water, even
14 the aquifers.

15 I appreciate that comment, and we'll --
16 you know, we'll move -- take a look at all those
17 after the scoping -- this comment period ends. So
18 thank you for that.

19 MS. TESS DORNFELD: Yes. And I did also
20 want to ask then about, when it comes to the DNR,
21 you know, they have their process for the water
22 permits, and you mentioned that you expect they'll
23 be commenting on this. In my understanding, the
24 discussion has been this "13 million" that should
25 really be 20-million-gallons number. That is just

1 for the ongoing operations, but then there's also
2 water that will be impacted during the construction.
3 And that there'll also be permitting needed for that
4 from the DNR, and that that's not outlined in the
5 DEIS.

6 And so I wonder how the DNR can comment
7 on that if they don't actually have the details on
8 what that construction appropriation would be?

9 MR. ANDREW LEVI: Yeah. Well, yeah, they
10 would need water for hydrostatic testing. If they
11 take that from a water body, they would need a
12 permit from DNR for that. That water generally gets
13 discharged back into the -- you know, that's not
14 a -- it's not like cooling. It's not a --
15 destructive is another word, but it doesn't convert
16 the water; it stays as water. So, you know, if they
17 did do that from a water body, they would need a
18 permit from DNR.

19 So and -- and I think other minor
20 watering might be, you know, watering the roads and
21 things. And I thought we did touch on that, and
22 maybe we didn't. We'll go back and take a look for
23 sure, but I believe we did.

24 Cathy, do you have anything to add to
25 that?

1 And then, Christy, we can move over to
2 what it is you have to say.

3 MS. CATHERINE STOREY: Yeah. I just had
4 a note that on page 5-137 of the draft EIS we do
5 talk about the amount of water that would be needed
6 for construction, which is 125,000 gallons, and then
7 that's also where we talk about the amount of water
8 needed for operations.

9 MR. ANDREW LEVI: Thank you, Cathy.

10 MS. CHRISTY BRUSVEN: I have nothing to
11 add. That was the same cite I was going to provide.
12 Thanks.

13 MR. ANDREW LEVI: It turns out I have
14 that page open on my computer screen as Cathy was
15 saying that. No, thank you for that.

16 So, yeah, it looks like 125,000 gallons
17 for construction. Of that, 110,000 gallons would be
18 used for hydrostatic testing.

19 MS. SARA RADIL: Thank you for your
20 comment.

21 Heidi Fossen, you're being unmuted.
22 Please state and spell your name for the court
23 reporter, and then provide your comment. Thank you.

24 MS. HEIDI FOSSEN: Can you hear me?

25 MS. SARA RADIL: Yes, you are on.

1 MS. HEIDI FOSSEN: Okay. Heidi Fossen,
2 H-E-I-D-I, F-O-S-S-E-N.

3 My question is around the energy needed
4 for this project. It's my understanding that the
5 energy needed to actually capture the carbon and
6 turn it into gas is very energy-intensive. I was
7 just wondering if the additional electricity needed
8 to maintain the daily operations of the facility is
9 included in this study.

10 Does the carbon intensity score for the
11 ethanol take into account the additional energy
12 needed to operate the carbon-capture facility? Does
13 the local electricity grid have the capacity to
14 accommodate the daily operations of the capture
15 equipment? And will the local citizens be affected
16 by the increase in energy needed for this project?

17 Sorry. That was like five questions.

18 MR. ANDREW LEVI: I've got four. So
19 we'll try to answer those four, and then let me know
20 what the fifth one was that I missed.

21 So with regards to a number, there is a
22 number in the EIS, and I'm really hoping that Pat or
23 Cathy or Joe right now is looking that up.

24 With regards to the CI score, Will, do
25 you have any insight into electrical use in the

1 capture facility and how that might relate to the CI
2 score in the ethanol produced at the ethanol plant?

3 MR. WILLIAM NEDS: Yeah, I didn't look
4 into --

5 MR. ANDREW LEVI: Will, sorry, if you
6 could state and spell your name for the court
7 reporter.

8 MR. WILLIAM NEDS: Sorry, first time.
9 William Neds, W-I-L-L-I-A-M and N-E-D-S.

10 So I did look at -- I looked at the
11 alternative strategy section rather than what would
12 be constructed or proposed. I do recall coming
13 across the number, so when they bring it up, you can
14 tell me. But I quickly looked at how that would
15 affect the CI score, and it is significantly less
16 than the current energy use for the project.

17 I think it would have made an impact of,
18 maybe, one-point increase, and then when you account
19 for the carbon-capture -- which is an approximately
20 30-point deduction -- maybe would average to about a
21 29-deduction is like a conservative estimate.

22 But I don't think that that was in any of
23 my chapters. I don't know if I can point you to
24 where that done. That was just a quick run-through
25 in my head.

1 MR. ANDREW LEVI: Thanks, Will.

2 And that's something that we could check,
3 and if it's not there, we could go ahead and add
4 that in the final.

5 Cathy, it looks like you have that
6 number?

7 MS. CATHERINE STOREY: Yeah. It's on
8 page 5-51 of the draft EIS. The -- and from the
9 applicant, the project would need 38,501,733
10 kilowatt hours per year, and the Lake Region
11 Electric Cooperative does not anticipate that it
12 would need to add power generation capacity in order
13 to meet that need. So that's what's in the draft
14 EIS now.

15 MR. ANDREW LEVI: And I think that --
16 does that answer your questions? I think that the
17 grid and how it might affect local citizens kind of
18 got combined into one, in that, the electrical co-op
19 doesn't anticipate needing additional generation to
20 supply the ethanol plant. Which I, you know,
21 conclude that that wouldn't affect, you know, their
22 portion of the grid then that they supply.

23 MS. HEIDI FOSSEN: Thank you. That's all
24 I had.

25 MR. ANDREW LEVI: Thank you.

1 MR. WILLIAM NEDS: I can add a little bit
2 more, if you need -- as a comparison now that I have
3 the actual number, if that would be of help.

4 So the current electricity for the site
5 is 38,000 megawatt hours per year, which is
6 equivalent to approximately 2.7 points in the CI
7 score. And I believe the number --

8 (Connection lost.)

9 MR. WILLIAM NEDS: -- kilowatts, so
10 you're still looking at a factor of 10 --

11 COURT REPORTER: William --

12 MR. WILLIAM NEDS: Yes.

13 COURT REPORTER: -- it cut out for just a
14 second. So you were saying that: Equivalent to
15 2.7 points in the CI score, and I believe... And
16 then I think you had another number after that?

17 MR. WILLIAM NEDS: Yeah, the number that
18 Cathy had mentioned. I was saying it was about a
19 factor of ten off of the current energy use.
20 Essentially, the decimal point, so it would be less
21 than one.

22 COURT REPORTER: Thank you.

23 MR. ANDREW LEVI: Thanks.

24 And with -- I'm sorry, it is about 7:50.
25 I know it looks as if Wade has his hand up. I

1 believe we'll move to him next. I'm looking at the
2 person in charge, but after Wade, let's go ahead and
3 take a five-minute break for Christine, for the
4 court reporter. She's been typing vigorously here
5 now for two hours, and as I keep talking she still
6 has to type, so I'll stop. But we'll just take a
7 quick break after Wade's comments.

8 MS. SARA RADIL: Okay. We will move on
9 to Wade, and you have previously provided your
10 information, so please go ahead with your comment.
11 Thank you.

12 MR. WADE MATHIOWETZ: A comment towards
13 Scott. They said they would try and let you know if
14 there's an emergency pertaining to this pipeline,
15 whether it be a rupture or a leak. What if you're
16 handicapped, meaning can't move fast or blind and/or
17 deaf? How are you going to address those issues?
18 How are you going to notify me?

19 And if there was any emergency concerns
20 with this pipeline, why ain't they brought forth
21 before we try and put this pipeline in? It seems
22 like we've got the cart ahead of the horse here. I
23 think safety is one of the utmost concerns of us
24 citizens of this fine state of Minnesota. And yet,
25 as you all know, if we drink water, you're involved

1 in this.

2 So I think everybody needs to know, and
3 they weren't transparent with that. And they wanted
4 just -- landowners just to keep quiet and nobody
5 make any comments on this. I think this is a really
6 big safety concern, and this should be made more
7 public than what it is.

8 MR. SCOTT O'KONEK: Did you want me to
9 answer that, Andrew?

10 MR. ANDREW LEVI: Yeah. Sorry, I --
11 yeah.

12 MR. SCOTT O'KONEK: Okay. Thank you,
13 Wade. So, I mean, we'll have plans in place
14 identifying people, you know, in potential impact
15 areas. We'll work with the local emergency
16 responders that, you know -- on, you know, how to,
17 you know -- if there was, you know, something in
18 this area, how to respond? Who do we need to
19 respond for? Is there, you know, people that may be
20 more sensitive than other people?

21 All of those things will actually be
22 taken into account in the emergency response plan.
23 That emergency response plan is always being
24 updated, too, in case of changes. And that plan
25 will actually be shared with everybody once we know

1 exactly what we're crafting to and doing it. That's
2 why we don't have it right now.

3 So that plan, as it discusses in the
4 DEIS, you know, we have to get that to many people
5 out there. And it will be appropriately distributed
6 and trained upon before, you know, operation would
7 ever go into place.

8 MR. WADE MATHIOWETZ: What kind of
9 financial burden is this going to create? I live in
10 a rural area, and our fire and EMS and all our
11 personnel here is mostly volunteer, and we don't
12 have extra funding for all this. You know, this
13 stuff is colorless, odorless, it displaces oxygen.
14 Vehicles don't run. So, now, do we have to equip
15 these people with different kinds of vehicles,
16 different kinds of equipment? You know, nobody out
17 here is even close to -- be prepared for any of
18 this.

19 You know, I think as a big company like
20 you guys are, you should come with the safety stuff
21 first. You know, you're trying to hide behind the
22 horse here on this.

23 MR. SCOTT O'KONEK: Wade, thank you for
24 that. I -- you know, as far as when it comes to
25 emergency response and, you know, I know there's a

1 lot of different people that may need things, all
2 the emergency -- we work through the county
3 emergency managers to figure out what may be needed
4 with different departments, you know.

5 And that stuff, you know, there will be
6 no extra burden or cost if there is additional needs
7 by the forces that you're talking about, our first
8 responders. Someone will actually pay for that.
9 That would be, maybe, a good boost of, you know,
10 stuff that -- equipment or things you guys need for
11 that local area.

12 So that will be actually on Summit's
13 dime, and the things that will be needed will be
14 worked with those departments and with the emergency
15 managers of the areas.

16 MR. WADE MATHIOWETZ: We all can say
17 these things, but will they come to frutation [sic]?
18 It's going to cost a lot of money, and I just -- you
19 know, we wouldn't be talking about this if it wasn't
20 just for the money, right? We all know that. Every
21 one of us listening here tonight and involved with
22 this, it's all about the money. Not about what
23 humans lose or gain, it's always about the money,
24 and that's what's wrong with this whole damn
25 project. It's all about the money. Just follow it.

1 Follow the money, it will lead you where this is
2 going, in somebody else's back pocket at taxpayer's
3 expense.

4 This is not going to solve us -- you guys
5 think the world is warming up from global warming,
6 come on. Go back in history. Read the history,
7 it's not. From what we're going to spend on this
8 whole project, it's going to -- I mean, we could
9 take a 1,000-gallon tank and put one drop of water
10 in it, and this is what we're going to solve.

11 Let's get back to reality here, people.
12 This is a farce, and it's going to cost us our water
13 rights. What's it going to cost for us after
14 20 years when we have no water to get it here? We
15 can't live without water. The plants can survive,
16 and we're surviving now without this CO2 pipeline,
17 period.

18 MR. ANDREW LEVI: Thanks, Wade.

19 It's about 8:00, so let's go ahead and
20 take a break. Come back -- is five minutes enough,
21 Christine?

22 COURT REPORTER: Yes. Thank you.

23 MR. ANDREW LEVI: So let's just come back
24 at 8:05, and we'll pick up -- I guess, we'll see if
25 anyone -- well, yeah. We'll pick back up with Wade

1 in five minutes. Thanks.

2 (Break taken from 8:00 to 8:05.)

3 MR. ANDREW LEVI: We will go back on the
4 record.

5 Sara, go ahead.

6 MS. SARA RADIL: Okay. Thank you.

7 Wade, just confirming if you had any
8 additional comments?

9 MR. WADE MATHIOWETZ: Yes. I think the
10 permit for the project without the safety and
11 equipment and plans in place, it's -- we need to
12 have that first before this permit is issued,
13 preconstruction.

14 MR. ANDREW LEVI: Yeah. I agree with
15 you, Wade. So we have recommended -- so if they get
16 a permit, let's say that. In case I forget to say
17 it again during the rest of what I'm about to
18 explain. If they get a permit, they would need
19 to -- before they can construct, they need to -- the
20 company would need to file several things.

21 One of those things is called a plan and
22 profile, and that's basically -- it's a plan of
23 where the pipeline would go. And we review that
24 plan and make sure that it's going where they said
25 it was going to go and some other things associated

1 with that. But -- and this isn't just for
2 pipelines. This is required for transmission lines.
3 It's required for all these -- you know, this
4 infrastructure.

5 And what we do is with these other plans
6 and these other things that might be required, so,
7 for example, here what we're recommending would
8 happen would be that any emergency response plan be
9 provided to the Commission, developed with the
10 emergency responders, and cover these things that
11 you're talking about. It's written out in Chapter 8
12 as a recommendation by us, EERA, and that be
13 provided 30 days prior to the plan and profile.

14 So we agree. Let's not put the, you
15 know, cart in front of the horse here. We need to
16 look at all of this stuff first. We need to make
17 sure that this safety plan is acceptable to the
18 folks that would be implementing it. That would
19 be -- and we would ask that that be in that plan,
20 you know, a signoff be in that plan. This is what
21 we're asking for.

22 Again, we can't set safety standards.
23 It's just what we're asking of the Commission, and
24 that that plan be filed 30 days prior to them even
25 filing their plan and profile. So that gives us

1 time, the Commission time, the state time to take a
2 look at that and make sure that, you know, the
3 things are lining up.

4 So we -- I hear you. I hear what you're
5 saying, and we've recommended a mitigation to
6 hopefully help with that, to not let construction
7 get out ahead of any of these other very important
8 steps that need to happen. These -- they're not
9 boxes that need to get checked, but I guess, you
10 know, these things that need to happen first before
11 this can be constructed. So I do want to say that,
12 yes, I agree with you on that aspect of things for
13 sure.

14 MR. WADE MATHIOWETZ: Thank you.

15 The Pipeline Hazard [sic] Material Safety
16 Administration, do they have any safety protocol
17 finalized yet for anything like this? I mean,
18 that's our guideline people we go with, right?

19 MR. ANDREW LEVI: Yeah. PHMSA sets the
20 safety standards. Dan touched on that a little bit
21 at the beginning. I'm worried if I asked him to do
22 it again, we'll be here until 10:00.

23 But, Dan, if you can briefly go over
24 those, you know, at a 60,000-foot-level real quick.

25 I mean, the short answer, Wade, is yes.

1 Yes, there is, but Dan can get into that a little
2 bit more.

3 MR. WADE MATHIOWETZ: That's okay. He
4 went through it. I just want to make sure that, you
5 know, their safety standards is up to CO2-standards.
6 That's what I was alluding at, you know.

7 MR. DAN PRASCHER: They are. They are.

8 Yeah. And I didn't touch on, maybe, I
9 don't know, half of what's required. It's extensive
10 and ongoing.

11 MR. WADE MATHIOWETZ: Thank you.

12 MR. ANDREW LEVI: Thank you, Wade.

13 MS. SARA RADIL: Thank you for your
14 comment.

15 Currently I do not see any other hands
16 raised in our participant list. So if you're
17 looking to make a comment, feel free to raise your
18 hand, the small raise-hand button at the bottom of
19 the screen; or if you're joining by phone, dialing
20 *3. Thank you.

21 MR. ANDREW LEVI: While folks are
22 thinking about whether or not they have an
23 additional question or comment -- or a first
24 question or comment -- I just want to, again, thank
25 everyone for coming tonight, participating tonight.

1 We greatly appreciate that.

2 I want to go ahead and remind you about
3 this open comment period. It's open until February
4 23rd. Please do submit comments. We greatly
5 appreciate those. We read them all.

6 (Presentation screen changed.)

7 MR. ANDREW LEVI: And I was going to have
8 to do that. Thank you very much.

9 So, again, these are the different ways
10 you can provide comments. If you have any
11 questions, you know, shoot me an e-mail, send me an
12 e-mail, and we can help answer those. But, again, I
13 just -- while we're waiting, thank you very much for
14 participating this evening.

15 Maybe we'll go ahead and wait about
16 another minute, and if no one wants to speak, we'll
17 call it good, but we don't want to cut anyone off.

18 I don't know if it's been a minute or
19 not, but it sure felt like a minute.

20 Julie just threw my e-mail into the chat.
21 If you'd like to click on that real quick, that
22 should pop-up, in case you have a question later on.

23 But, again, I'm not seeing any hands.
24 So, again, thank you very much for participating
25 this evening, and everyone have a good rest of your

1 night. Thank you.

2 (Public comment concluded.)
