Legislative Update

January, 2001

The Department of Administration, Office of Technology is pleased to submit this status update to the 2001 session of the Minnesota Legislature. This report consists of four sections – each reporting on specific information system initiatives of the state.

Report Contents

1. Small Agency Infrastructure Initiative Progress Report
2. Eliminating Redundant Storage of Data
3. Establishing Information Sales Systems that Utilize Licensing and Royalty Agreements
4. One-Stop Licensing Initiative Report
5. Status of State & Intergovernmental Information & Communication Systems

December 15, 2000

Introduction & Background

The Office of Technology (OT) received an appropriation for the Small Agency Infrastructure Initiative (SAII) from the 1999 legislative session.

Laws of Minnesota 1999, Chapter 250, Article 1, Section 12, Subd. 3(c):

"This appropriation is for a one-time transfer to eligible small agencies for the small agency infrastructure project. The commissioner of administration shall determine priorities for which projects should be funded..."

The purpose of the initiative was to provide small agencies with basic network and desktop infrastructure such as personal computers, printers and servers, and to provide consistent standards for these small agencies. The amount of the appropriation was \$2,128,000.

This progress report summarizes the Small Agency Infrastructure Initiative qualification and assessment process, allocation and funding transfer, benefits, lessons learned, and conclusions. The January 15, 2000 report provides more detail on the Qualification and Assessment Process, Allocation and Funding Transfer, Benefits, Lessons Learned, and Conclusions. A copy of the January 15, 2000 Small Agency Infrastructure Initiative OT report can be obtained from the OT's web site at: <http://www.ot.state.mn.us/reports/>.

Qualification and Assessment Process

Qualification Process

Small agencies were required to address Information Resource Management (IRM) and the Critical Success Factors (CSFs). Agency submissions were evaluated and feedback was given to each agency for future improvement. In addition, OT developed standards for desktop infrastructure. All hardware and software purchases related to this initiative adhered to those standards.

Technical Assessment and Findings

OT staff and a technical advisor conducted a high-level technical assessment of each agency. OT staff found that hardware and software infrastructure in many of these agencies was obsolete and substantially below minimum standards for processing speed and storage capacity.

Allocation and Funding Transfer

Allocation

A work plan and spending plan were created with each small agency to document the approved expenditure plan for the money allocated from this initiative. The work plan and spending plan were prepared using the agency's original spending request, the standard configurations and the technical assessment.

The initiative was not fully funded by the legislature. Therefore, OT calculated a target amount for each agency that represented approximately 71% of the original total request of \$2,723,000. The

December 15, 2000

target levels were used as a starting point to determine the specific amount to be allocated to the agencies. The total amount allocated to the small agencies was \$2,117,000, with a remaining balance of \$11,000.

Funding transfer

The funding transfer was accomplished using a formal inter-agency agreement accompanied by a financial transfer between the Office of Technology and each of the small agencies. The inter-agency agreement listed specific duties for the small agencies as well as for the Office of Technology.

Funding Schedule

- All agencies received a minimum of two payments
- All agencies received the first payment in the Fall 1999
- All agencies received a second payment on July 14, 2000 upon completion and approval of a Strategic Information Resource Plan
- Two agencies were to receive three payments (Public Utilities Commission and Board of Social Work)

Next Steps

- Consult with agencies and monitor agency progress
- Approve agency strategic information resource plans
- Investigate adjusting base budgets

Benefits

Three categories of benefits were realized from the Small Agency Infrastructure Initiative.

- **Deployment of state-of-the-art infrastructure technology** such as providing the infrastructure foundation for operating and supporting business application systems such as case management and licensing systems which are needed to meet citizen expectations for quality and timeliness of service delivery.
- **Business benefits**
 - Managerial business benefits:
 - Information resource management (IRM) and critical success factors were introduced as the framework and best practices for managing technology in these agencies
 - Strategic information resource planning will be established as a critical element in managing and providing a stable, focused IT environment
 - Inter-agency collaboration opportunities were explored
 - Life cycle replacement schedules were established to prevent equipment obsolescence in the future
 - Operational business benefits:
 - Improving quality and timeliness of delivering products and services
 - Improving staff effectiveness and productivity
 - Increasing output volume while maintaining current resource levels
 - Reducing cost of delivering products and services
- **Statewide leadership benefits**, such as identifying strategic direction for desktop and network operating systems and providing managerial and technical advice to the small agencies.

December 15, 2000

Lessons Learned

OT staff discovered common, recurring themes within the small agencies which affected situations, behaviors and attitudes regarding technology. Those themes are listed below as "lessons learned".

- Executives must learn the fundamentals of information technology.
- Strategic planning for information technology is essential.
- Small agencies were receptive to this technology initiative.
- Infrastructure hardware and software standards provide benefits.
- Collocation enables State agencies to share IT resources.
- Continuous funding is needed for technology.

Conclusions

The Small Agency Infrastructure Initiative has been successful. Similar initiatives should be created in the future to leverage and improve management and use of information resources within all state agencies.

- Funding is a strong positive incentive for agency collaboration and for institutionalizing standards.
- Managerial and technical advice offered by the Office of Technology was accepted and appreciated by the small agencies.
- The role of host agencies in providing information technology and office space to associated boards should be clarified.
- Continued exploration of opportunities for co-location and shared resources should be encouraged.

The Final Initiative and Appropriation

Funding for the Small Agency Infrastructure Initiative was appropriated as follows:

Table 1 - Appropriation

Fund Name	Amount
General Fund (100)	\$ 1,700,000
State Government Special Revenue Fund (170)	\$ 168,000
Workers' Compensation Fund (320)	\$ 260,000
Total Appropriated	\$ 2,128,000

Allocation

The initiative was not fully funded by the legislature. Therefore, OT calculated a target amount for each agency that represented approximately 71% of the original total request of \$2,723,000. The target levels were used as a starting point to determine the specific amount to be allocated to the agencies. Agencies reduced the scope of their original requests in order to adjust to the new funding level. As a result, certain elements of original agency requests were not accomplished.

December 15, 2000

The total amount allocated to the small agencies from the initiative appropriation was **\$2,117,000**. After the funding transfers, a balance of \$11,000 remains in the Office of Technology appropriation account that has been set aside for emergency small agency infrastructure needs.

- Agencies using the General Fund were funded at approximately 71% of initial requested amount.
- The Public Utilities Commission was funded at 100% per legislation.
- Administrative Hearings was funded at 100% from Workers' Compensation fund.
- Pharmacy Board & Social Work Board were funded at 100% from the State Government Special Revenue Fund.

The following table shows how the SAIL appropriation was distributed to the participating agencies as per established Interagency Agreements.

Table 2: Allocation Summary Table

Agency Name	Target Amount	Allocated Amount	1 st Yr Transfers (FY 00)	Date Transfer	2 nd Yr Transfers (FY 01)	Date Transfer	3 rd Yr Transfer (FY 02)
Accountancy Board	61,200	55,000	31,766	11/22/99	23,234	11/03/00	
Administrative Hearings	260,000	260,000	189,000	11/02/99	71,000	07/21/00	
Animal Health Board	361,700	340,000	280,176	11/10/99	59,824	07/21/00	
Capitol Area Architecture Board	35,600	34,000	17,200	11/10/99	16,800	10/13/00	
Crime Victim Ombudsman	11,400	25,000	16,900	12/10/99	8,100	07/21/00	
Disability Council	71,200	69,000	62,350	01/11/00	6,650		
Gambling Control Board	178,000	178,000	92,149	11/05/99	85,851	07/21/00	
Human Rights	112,500	112,000	75,796	11/10/99	36,204	07/21/00

Judicial Standards Board FY 00			2,000	06/28/00	0		
Bureau of Mediation Services	65,500	68,000	63,904	11/18/99	4,096	07/21/00	
Ombudsman for Corrections	84,700	60,000	50,340	11/17/99	9,660		
Ombudsman for Mental Health & MR	64,100	64,000	47,121	11/05/99	16,879	09/19/00	
Pharmacy Board	102,000	102,000	53,613	10/28/99	48,387	09/28/00	
Public Utilities Commission	323,000	323,000	86,500	10/28/99	90,470	07/21/00	146,030
Sentencing Guidelines	33,500	49,000	41,255	11/12/99	7,745	07/21/00	
Social Work Board	66,000	66,000	54,675	11/05/99	1,325	09/28/00	
Social Work Board FY 00	0	0	10,000	03/22/00	0		
Tax Court	105,400	105,000	57,540	11/10/99	47,460	07/21/00	
Veterans Affairs	167,300	167,000	140,726	11/12/99	26,274	08/02/00	
Totals	2,128,000	2,117,000	1,403,634		567,336		146,030

Strategic Information Management Resource Planning

To receive SAIL funding, agencies were required to develop a strategic plan on how they would utilize SAIL funds. The legislature approved a request by OT to retain a surplus of Y2K Electronic Government Services (EGS) funds in May of 2000. A portion of these funds were used to distribute grants to agencies for participating in Strategic Information Management Resource

December 15, 2000

Planning (SIRMP) sessions and developing their strategic plans for using SAI funds (as required by the original SAI interagency contract agreement). OT entered directly into contracts with an outside vendor to pay the costs associated with the same training sessions for additional agencies.

Following is a summary of OT reimbursements made to agencies for participating in the SIRMP sessions:

Table 3 - SIRMP Reimbursements

Agency Name	Reimbursements (FY 2000)	Reimbursements (FY 2001)
Animal Health Board	\$3500	
Crime Victim Ombudsman	\$3500	
Human Rights	\$3500	
Bureau of Mediation Services	\$3500	
Sentencing Guidelines	\$3500	
Veterans Affairs	\$3500	
Nursing Board	\$3500	
Emergency Medical Services Regulatory Board (EMSRB)	\$3500	
Public Utilities Commission	\$3500	
Office of Administrative Hearings	\$1500	
Tax Court	\$1500	
Amateur Sports Commission (not an SAI agency)		\$1500
Capitol Area Architectural Board		\$1500
Disability Council		\$1500
Judicial Standards Board		\$1500
Social Work Board		\$1500
Ombudsman for Corrections		\$1500
Accountancy Board		\$1500
Pharmacy Board		\$1500
Totals	\$34,500	\$12,000

The total cost of reimbursements made to SAI agencies for SIRMP sessions was **\$46,500**.

Next Steps and Recommendations

Similar initiatives to the SAI must be developed and funded to help agencies defray the cost of maintaining and updating their technology infrastructure. The SAI was originally intended to be an on-going funding project. However, the SAI appropriation to the OT was a one-time appropriation. The SAI monetary transfers made to state agencies have been tremendously beneficial for participating small agencies and the state technology infrastructure as a whole. However, the costs of maintaining and updating existing infrastructure is substantial for all state agencies. Future initiatives that provide funding for state agencies to maintain and update their technology infrastructure will certainly improve the management of state agencies and the use of information resources across state government.

December 15, 2000

The Office of Technology requests the State Legislature to fund new staff positions, referred to as Technology Analysts, who will work with various government agencies, including the small agencies referred to in this report. On an ongoing basis, these Technology Analysts ("TAs") will provide guidance, support and monitoring of agency information technology initiatives and capabilities to meet critical agency goals. Thus, basic objectives of the SAIL will be met.

Mandated Report and History

Minnesota Statutes 16E.04, Subd. 2(f) states

"the Office of Technology, in consultation with the Intergovernmental Information Systems Advisory Council [IISAC] and the Legislative Reference Library, shall recommend specific standards and guidelines for each state agency within a time period fixed by the office in regard to the following:

"establishing methods and systems directed at reducing and ultimately eliminating redundant storage of data;"

In the fall of 1997, the OT established a task force to formulate a collaborative strategy to examine the issue of redundant data storage. The OT presented that group's recommendations to the Information Policy Council (IPC). Following a structure that was strategically established through the 1998 reorganization of the IPC, an IPC subcommittee, the Data Issues Group – Information Technology (DIG-IT) was created to explore data management issues including redundant storage of data.

The OT provides support and leadership to DIG-IT as the subcommittee examines data management issues and creates opportunities and options for solutions to a myriad of data management issues. IISAC provided input through its membership on the IPC but its funding expired on December 31, 1999. The OT submitted the first data redundancy report, "A Quest for Data Quality – Eliminating Redundant Storage of Data" in January 1998. That report was subsequently updated in January, 1999 and January, 2000. (These reports are available on the Web at <http://www.ot.state.mn.us/reports/archive.html>.)

Objective of This Report

The main objective of this report is to illustrate that technological advances in distributed computing have rendered the issue of redundant data largely moot. Instead, business and industry have developed information strategies such as Enterprise Application Integration, and integration tools such as Application Integration and Middleware Products, open standards and web portals to permit disparate information systems to communicate with each other while maintaining the autonomy of their systems and data.

The other objective of this report is to advise the legislature on some of the new technologies and methodologies, such as Application Middleware and Enterprise Application Integration, that can help the state of Minnesota make the transition to e-government, and help individual agencies become more integrated, efficient, and responsive to citizen needs. The current effort in Minnesota to develop CriMNet, an integrated criminal justice information system is profiled as an example of how the state of Minnesota is already moving towards these new technology models.

December 15, 2000

The Problem

In the Fall of 1997, when the state legislature authorized the Minnesota Office of Technology (OT) to draft this report, the general consensus among the legislature, state agency managers and the technology managers was that the state needed to pursue an effort of reducing and ultimately eliminating the redundant storage of data. The problems facing agencies and the state as a whole that inspired this effort included:

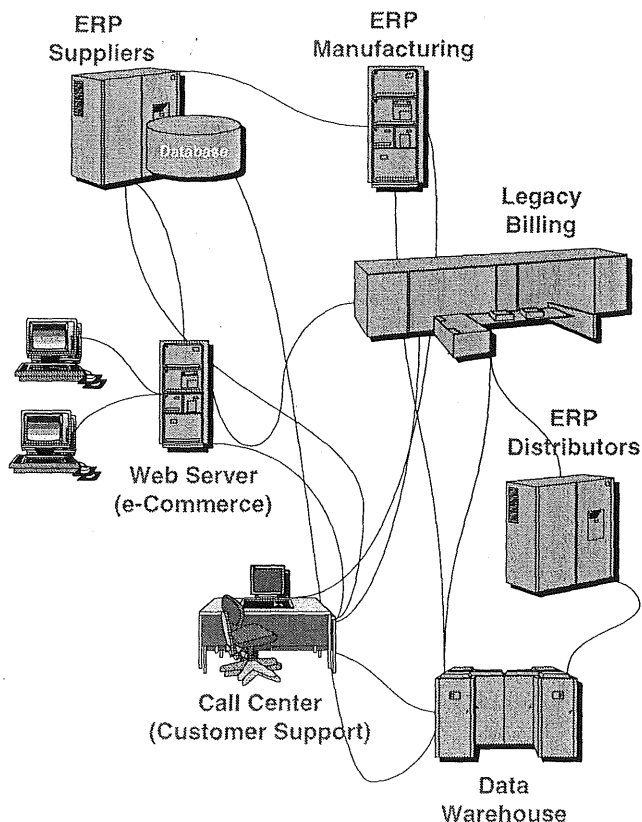

- Duplication of effort
- Inconsistent data definitions and relationships
- Inefficient processes and information flow
- Inaccessibility of data for sharing and reuse
- Reliance on paper forms for exchange of data
- Incompatibility of technical environments (systems don't "talk" with other systems)
- Lack of consolidated information for decision support

All of these issues make it difficult to utilize information efficiently and effectively. In the public sector, information is the "glue" that holds the intentionally separate, yet necessarily integrated business processes and agencies together.

Historically, state agencies have tended to approach development and modification of their computer systems from an individual agency perspective. This approach has been driven by a number of factors, including unique state statutory and federal requirements, state budget and finance policies that are not well-suited to funding community initiatives, and agency risk aversion. This approach continues to be taken by agencies today and will likely continue for the foreseeable future. The needs of agencies are divergent enough and their business rules too complex for a state-wide effort of simply "reducing redundant storage of data" to be successful.

Traditional approaches to achieving integration across multiple applications have involved the coding of multiple interfaces across applications. Figure 1 illustrates the typical approach to integration taken by a commercial enterprise. Sharing of data across these applications requires creation of a "rat's nest" of coded interfaces that are expensive to create, difficult to maintain, and not well-integrated with the business processes that rely on the applications for integration.

Today's Fragmented Environments

December 15, 2000

New Technology Solutions

OT believes that the overall goal of Statute 16E.04, Subd. 2(f) was to help make Minnesota government a better steward of information. To accomplish this goal, the State chose a strategy of reducing or eliminating the redundant storage of data. Although this strategy had merit at the time, the **Internet revolution has brought forward new strategies** for dealing with the problems discussed above. As a result, there has been a major "shift" in thinking in the technology sector on the best strategy for integrating information systems.

Instead of focusing on reducing redundant storage of data, which can be an endless, costly, and non-value-added process, organizations have developed a **new model of distributed computing that permits applications to share data** while retaining their autonomy. This model is widely known as Enterprise Application Integration (EAI).

Enterprise Application Integration (EAI)

The development of new computing tools have created a new technology model called Enterprise Application Integration (EAI). In the EAI model, organizations keep their existing databases, and continue to maintain and update their systems based on their individual needs.

The EAI model helps integrate infrastructure, applications, and government processes, which is the first step towards a successful transition to e-government.

The Benefits of Enterprise Application Integration are many and include:

- Ability to model business processes based on business requirements instead of technology capabilities
- Ability to focus on business logic instead of connectivity and infrastructure logic
- Reduced development cycle
- Faster time to production
- Connection to Enterprise Resource Planning (ERP) systems
- Connection to legacy systems
- other software components and the software applications they power.

Figure 2 illustrates how EAI transforms the traditional integration model illustrated in Figure 1.

December 15, 2000

EAI Tools

Evolution of the EAI model has been driven by the development of integration tools, including:

- **Application Integration and Middleware** products that "glue" and manage highly distributed applications, connecting custom, commercial, and legacy applications
- **Internet Portals**, like North Star, which pull together various data sources under one umbrella so citizens and agencies alike can access a wide range of information through one Web site
- **Open Standards** are published standards that are owned by no one, but used universally. The use of open standards ensures a high degree of interoperability with other software components and the software applications they power.

Government, perhaps more than any other organization, can benefit from the efficiencies and improved service that can be obtained from using these tools. The traditional vertically integrated computing industry created a huge variety of incompatible computers and architectures. A few years ago, most governments were very concerned that within a department or agency there might be a mainframe application, a mini-computer application and numerous PC Local Area Networks (LANs).

But **today's mantra is: integrate and distribute**. Mature IT environments today consist of a variety of distributed applications ranging from legacy applications to open systems applications to Enterprise Resource Planning (ERP) applications. In many cases, data from all of the above types of distributed applications can be accessed from a web-based front-end browser. The following tools make EAI integration possible.

Application Integration and Middleware Products

Application integration and middleware products are making these hybrid systems possible. "Middleware is the glue that coordinates distributed computing," said Richard Schreiber, president of ATB Associates, a firm specializing in middleware technologies. "It's the stuff of interoperability."

In fact, one of middleware's features is its ability to hide the complexity of hard-to-configure distributed applications. Middleware sits between the operating system and the applications, providing developers with a single interface to which applications can be written. Middleware allows computer users to cope in a world of heterogeneous systems, because it helps to insulate users from complexity and change, and cuts down on maintenance. This approach means individual agencies and the state as a whole can move to a new architecture model without throwing away existing investments in systems. This can result in major savings for state governments.

Application Integration and Middleware Products use two common methods for integrating systems or applications: Data-based Integration and Message-based Integration.

In data-based integration, data is sent from one application to another via flat files, file-transfer protocol (FTP), etc. The advantages of data-based integration include:

- Easy to implement
- Ideal for single purpose integration (data migration, system conversion)
- Ideal for legacy-application integration

December 15, 2000

In message-based integration, data is exchanged between applications via messaging. A messaging product is usually used as the transport while an application adapter is utilized as the interface. Enterprises rely on many different applications in the course of running the business.

For example, in the convenience store environment, there are applications for point-of-sale terminals, electronically controlled gas pumps, credit card authorization, inventory control, and so on. To perform a typical transaction in this environment, applications check the customer's credit status, price the merchandise, transfer funds between the customer's bank and the merchant's bank, and manage the store's inventory. Problems arise when applications, running on different system platforms, cannot communicate with each other. Security is an issue, too. Financial institutions do not want retailers viewing the personal records of their customers' bank accounts. These businesses must find a timely, economical way for different applications to communicate with each other. The solution must preserve the security of sensitive customer records and protect the software vendors' intellectual property—that is, the proprietary information that makes up an application. The advantages of message-based integration include:

- Very high degree of scalability
- Ability to get around network/application failures
- Ability to utilize commercial messaging products
- Ability to support multiple clients (many-to-one)
- Ideal for a highly distributed environment

Pulling Data Together through Portals

A long-term goal for the state of Minnesota is a provision of a single "portal" to state government so that citizens and agencies alike can access a wide range of information. This "single face of government" model allows users an easy way to tap into virtually any government service they choose. As stated by Bill Gates, "Governments can use the Web to create a single face to the public, hiding the complexity of internal departmental organization and dramatically improving service."

Nortel Networks refers to this concept as a "unified network," which they feel will usher in an entirely new way for citizens to interact with the public sector. For example, Nortel Networks envisions an integrated network in which a constituent will log onto a government portal to renew their driver's license but will also have the ability to file their state taxes during the same session. And since the portal is tied to a variety of databases, if a citizen has additional questions about a service they need, they will have access to the necessary data.

The State of Minnesota's North Star website represents the beginnings of such a portal. As it evolves, North Star will add transactional services that will permit Minnesota citizens to perform a wide variety of transactions with government. The recent addition of the Department of Public Safety's Online License Renewal function is one such example. It was built using a payment engine contracted through OT and can be deployed to any agency desiring to provide services online that require a payment.

Open Standards

A sound e-government software component exhibits two primary characteristics. First, as with system infrastructure, it should be developed around "open standards." An open standard is a published standard that is owned by no one and is used universally. This will ensure a high

December 15, 2000

degree of interoperability with other software components and the software applications they power. The use of open standards in software components allows a government greater choice and flexibility, as well as quicker implementation, in the types of software applications it chooses to deploy.

An Example of Minnesota's EAI Strategy: CriMNet

Minnesota is already moving towards an EAI model in the criminal justice sector.

Information integration -- the ability to share critical information across systems and agencies -- has long been a significant problem for the Minnesota criminal justice community. In an effort that cut across traditional boundaries, Hennepin County, the City of Minneapolis, the Local Government Information Systems Consortium (LOGIS), the State of Minnesota, Minnesota HEALS, and the Minnesota Business Partnership launched an effort to make statewide sharing of criminal justice information a reality. The initiative has resulted in a set of architectural documents that describe how Minnesota can achieve integration of criminal justice information systems at the state, county, and municipal levels.

By specifying the processes, data and technology that Minnesota criminal justice agencies will use to communicate, the models and forthcoming project plan will provide an "open standard" through which criminal justice agencies will share data. Instead of trying to eliminate redundant data, CriMNet will tie multiple data sources together within a logical framework.

CriMNet's technology model envisions a central State Integration Backbone that will use Integration Middleware to route messages among all integration partners. This message-oriented architecture is consistent with the EAI strategies described in this document.

Next Steps

Rather than focusing on eliminating redundant storage of data, Minnesota should further explore the use of new methodologies and technologies such as Enterprise Application Integration and Application Integration and Middleware Products that can help the state of Minnesota make the transition to e-government and help individual agencies become more integrated, efficient, and responsive to citizen needs. In this way, Minnesota can address the broader issue of data and system integration.

Mandated Report

The 1997 Minnesota State Legislature mandated the establishment of "information sales systems" that are the topic of the following report to the legislature.

Minnesota Statutes 16E.04, Subd 2(f) states

"[T]he office [*Minnesota Office of Technology*], in consultation with the intergovernmental information systems advisory council and the legislative reference library, shall recommend specific standards and guidelines for each state agency within a time period fixed by the office in regard to the following:

(2) establishing information sales systems that utilize licensing and royalty agreements to the greatest extent possible, together with procedures for agency denial of requests for licenses or royalty agreements by commercial users or resellers of the information. Section 3.751 does not apply to those licensing and royalty agreements, and the agreements must include provisions that section 3.751 does not apply and that the state is immune for liability under the agreement."

The first report on this topic to the legislature was issued in December 1998. The OT delivered it as the "first annual report to address the issues of standards and guidelines for state government use and application of intellectual property rights granted under federal and state law."

Background

The statute is specific in its requirement that OT recommend standards and guidelines regarding the establishment of "... information sales systems that utilize license and royalty agreements...[and] procedures for agency denial of requests for licenses or royalty agreements by commercial users or resellers of the information." The "information" referred to by statute is "public government information." In response to public policy concerns, the legislature asked the OT to establish standards and guidelines to direct agencies faced with (1) a request for public data by an entity that plans on reselling that data, and (2) agency initiated selling of data as a new revenue stream.

The 1998 report highlighted several public policy issues and suggested that the concept of government selling information gives rise to several public policy concerns that require further public debate – led by the legislature – prior to establishment of such "systems."

Significant Public Policy Issues

- 1 Controls on use may impact public access to government data
 - ✓ Citizen **access rights** versus citizen **use rights**
 - ✓ Implications of First Amendment (freedom of speech)

December 15, 2000

- 2 Government must define goals for the exercise of licensing and collection of royalties
 - ✓ Revenue generation
 - ✓ State government only or inclusion of local government entities
- 3 Criteria should be established for government's licensing consideration
 - ✓ Public domain issues
 - ✓ Copyright issues
 - ✓ Data integrity issues
- 4 Criteria should be established to assure equal access, equal pricing and equal application of remedies (under the law)
 - ✓ Control of information for partisan objectives
 - ✓ Determination of commercial value to determine royalties
 - ✓ Infringement action criteria

OT's 1998 report concluded that, "Considering all of the above issues, the Office respectfully invites the legislature to provide the forum for public debate on the issues delineated. The outcome of such debate will provide this Office direction for meeting its legislative charge to 'recommend specific standards and guidelines for each state agency to establish information sales systems that utilize licensing and royalty agreements to the greatest extent possible, together with procedures for agency denial of requests for licenses or royalty agreements by commercial users or resellers of the information.'"

The 1999 Minnesota State Legislature did not specifically address the public policy issues related to licensing the sale of government information.

In 1999 the status update blended individual privacy concerns into the array of public policy issues that need to be discussed. The report also cited some specific principles and asked the legislature to incorporate them into the policy debate. Those principles included:

- The Department of Administration supports the principle of open access to public data. Information should be provided in a reasonable amount of time and for marginal cost recovery.
- The Department of Administration also supports the principle that data should be accurately maintained and those providing data to units of government be given a knowing disclosure of the potential use of the data.
- It is appropriate for the government to sell information only if it creates an enhanced product or provides a convenient value-added service. That is currently the case with Minnesota's Bookstore. Many of their name and address lists are sold for commercial purposes, and to out-of-state entities, and it is inappropriate for Minnesota taxpayers to subsidize those services.

The 1999 report again concluded that "Once the current legislative debate regarding data privacy has run its course, the TPB (*now known as OT*) will be in a better position to assess expectations and how it "shall recommend specific standards and guidelines for each state agency ... and(2) establishing information sales systems that utilize licensing and royalty agreements to the greatest extent possible."

December 15, 2000

The 2000 Minnesota State Legislature did not specifically address the public policy issues related to licensing the sale of government information. As such, there is nothing new to report.

It is important to understand that the lack of a "system" does not preclude agencies from exercising their entrepreneurial talent to pursue authorization to sell and market public government data. Under current policy controls, the Department of Administration and the state Attorney General's office may authorize a contract to sell any state services – thus setting a precedent for how to handle similar cases and providing a framework for subsequent policies and guidelines.

Next Steps

The Minnesota Office of Technology respectfully invites the legislature to provide the forum for public debate on the issues delineated. The outcome of such debate could then be used to draft more meaningful legislation that could facilitate standards and guidelines concerning the use of public government data.

Introduction

Minnesota Statutes 16E.08 Business license information

"The office [*Minnesota Office of Technology*] shall coordinate the design, establishment, implementation, and maintenance of an electronic system to allow the public to retrieve by computer information prepared by the department of trade and economic development bureau of business licenses on licenses and their requirements. The office shall establish the format and standards for retrieval consistent with state information and data interchange policies. The system must also be designed to allow the public to apply for and obtain business licenses and permits online. The office shall integrate the system with the North Star online information system. The office shall work in collaboration with the department of trade and economic development bureau of business licenses. The bureau is responsible for creating and operating the system."

Objective of This Report

The principle objective of this report is to describe efforts to coordinate and integrate information technology systems to effectively deliver government services to citizens electronically. It will illustrate that technological advances and the shared use of equipment and systems provide for a practical solution to the State's "One-stop" initiative. Instead of replacing dozens of existing licensing systems with a single system, different strategies employed by agencies will allow them to preserve their original investments (and the local autonomy of systems and data) and still integrate and display a "common face" to internal and external customers. Thus, for these customers, government and citizens alike, there will be a "one-stop" resource for delivery of government services.

Another objective of this report is to inform the legislature about different technologies and approaches, such as the building of an Information Technology Architecture and Enterprise Application Integration, that can help the state of Minnesota make the transformation to e-government, and help agencies become more integrated, efficient, and responsive to citizen needs. The license tab renewal system jointly developed by the Minnesota Office of Technology (OT) and the Department of Public Safety is profiled as an example of how reusable components can facilitate one-stop licensing without creating a "new system."

Background

In 1993, Executive Order 93-9 directed the commissioner of the Department of Trade and Economic Development to conduct a feasibility study of "one stop shopping" for business-related licenses and permits of State of Minnesota agencies. The feasibility study included:

- A survey of the perception of businesses on issues in obtaining licensing;
- Participation by state agencies in identifying current and possible future licensing improvements;
- A review of other states' activities; and
- Development of an electronically accessible one-stop process simulation

A survey was sent to 3,000 Minnesota businesses from industries considered significant to Minnesota's economy regarding how useful a proposed One-stop site would be to them. These businesses were considered likely to experience a substantial amount of government regulation

December 15, 2000

in their business operations. The results of the survey disclosed that licensing is a prevalent and persistent requirement for Minnesota businesses; that there are costs to businesses in securing these licenses; and those businesses favor a one-stop effort.

Additionally, state agencies indicated considerable thought and effort had been given to the one-stop issues by several departments. Many agencies already had in place internal one-stop procedures and cross-agency consolidation of regulatory functions:

- Prior to committing to the development of an automated system, the perspectives of myriad state agencies and businesses were sought (Administration, Commerce, Natural Resources, Pollution Control, Public Safety, Revenue, Transportation, and three Boards of Electricity, Gambling Control, podiatric Medicine, Water and Soil Resources, Attorney General, Turkey Growers Association, Secretary of State, and the Minnesota Racing Commission),
- Several states already had implemented one-stop licensing and permitting efforts (California, Connecticut, Florida, Illinois, Oregon and Virginia). These one-stop efforts were reviewed and found to be limited to providing only information about license and permit requirements.

The legislature provided initial funding of the initiative in fiscal year 1998. The legislature required that OT and Department of Trade and Economic Development (DTED) work cooperatively to develop a database of licenses and permits.

- DTED committed to developing a catalog of business licenses and permits that are required in Minnesota. DTED has completed that catalog, which is housed and maintained on the North Star portal.
- The 1999 legislature amended the original Minnesota Statute 16E.08 to include the requirement that "the system must also be designed to allow the public to apply for and obtain business licenses and permits on-line."

The Problem

In 1998, and when the state legislature authorized the OT to draft this report, the legislature believed that the most expedient and cost effective way of dealing with problems presented by fragmented licensing processes was to build a "one-stop shopping" system on top of the DTED database. The problems facing agencies and the state as a whole that inspired this effort included:

- Reliance on paper forms for collecting and exchanging data
- Inaccessibility of data for sharing and reuse
- Duplication of effort
- Inefficient processes

These issues make it difficult for consumers to research, apply for and purchase permits and licenses.

Historically, state agencies have approached development and modification of their computer systems from an individual agency perspective. This approach was driven by a number of

December 15, 2000

factors, including unique state statutory and federal requirements, and state budget and finance policies that are not well-suited to funding community initiatives. This approach continues to be taken by agencies today and will likely continue for the foreseeable future. The needs of agencies are divergent enough and their business rules too complex for a state-wide effort to combine all of the licensing systems into a single software application to be practical.

It is important to note that **the electronic delivery of services is the responsibility of each agency. OT's responsibility is to lead and facilitate the creation and adoption of an EGS strategic plan, to create a framework of reusable technology components and to integrate those components into state agency infrastructure.** OT is also responsible for identifying collaboration possibilities to achieve the goals of the EGS vision, and where appropriate, take the lead to initiate work efforts.

Thinking Through a Solution

OT and DTED agree that the original DTED licensing description database and web application are not suited to serve as a foundation for a new comprehensive licensing system. That web-based application and architecture simply does not have the capability, because of software constraints, to include functions such as automated workflow, secure financial transactions and inbound/outbound interfaces to or from other agencies, to name a few.

Problems are further exacerbated because some larger agencies already have internal licensing applications that integrate with their existing systems and support processes like license renewal, enrollment, verification and payment processing. Moving licensing functions to DTED would propagate changes throughout their systems – resulting in additional investments and/or fragmented systems. Redesigning their systems will take longer and cost more than using the secure financial transaction (SFT) engine already deployed by OT for the Department of Public Safety.

It is the position of OT and DTED that a comprehensive integrated licensing application not be pursued in the form prescribed in Minnesota Statute 16E.08.

That being said, OT is strongly committed to the goals and benefits of the one-stop initiative. To that end, OT believes that it should help provide the underlying technology for multi-agency, web-based transactions and eliminate the need for individual agencies to develop that functionality on their own. The underlying technology referred to here is a statewide information technology architecture composed of reusable components such as data, applications, technology, and business functions. These components set a standard that all agencies can follow, using their individual databases, thus making them the key enabler to the development of comprehensive statewide efforts.

New Technology Solutions & Approaches

OT believes that the overall objective of Statute 16E.08 was to help streamline the acquisition of permits and licenses for businesses and consumers. To accomplish this goal, the legislature chose a strategy of building a new and comprehensive licensing system. Although this strategy had merit, the **"new economy" has brought forward new strategies** for dealing with the problems discussed above. As a result, there has been a major "shift" in thinking in the technology sector on the best strategy for integrating information systems.

December 15, 2000

Pulling Data Together through Portals

A long-term goal for the state of Minnesota should be a provision of a single "portal" to state government so that citizens and agencies alike can access a wide range of information. This "single face of government" model allows users an easy way to tap into virtually any government service they choose.

As stated by Bill Gates, **"Governments can use the Web to create a single face to the public, hiding the complexity of internal departmental organization and dramatically improving service."**

From a licensing standpoint, it is very realistic to expect that the customer will see the state as one entity even though several agencies actually complete the work.

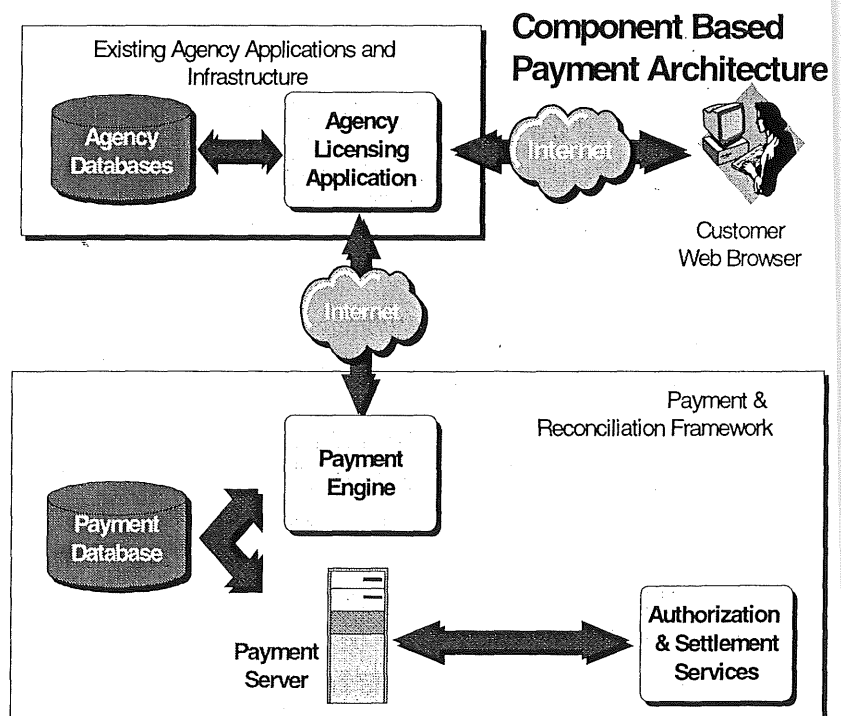

Nortel Networks refers to this concept as a "unified network," which they feel will usher in an entirely new way for citizens to interact with the public sector. For example, Nortel Networks envisions an integrated network in which a constituent will log onto a government portal to renew their driver's license but will also have the ability to file their state taxes during the same session. And since the portal is tied to a variety of databases, if a citizen has additional questions about a service they need, they will have access to the necessary data.

The State of Minnesota's North Star website represents the beginnings of such a portal. As it evolves, North Star will add transactional services that will permit Minnesota citizens to perform a wide variety of transactions with government. The recent addition of the Department of Public Safety's Online License Renewal function using the payment engine deployed by the Office of Technology is one such example.

Architecture in Action – Online Vehicle License Renewal

The single biggest EGS (Electronic Government Services) initiative completed this year was the online vehicle license renewal system, which was launched in July by OT and the Department of Public Safety (DPS). This project was the fulfillment of one of the *technology on target* efforts.

This initiative sets **the cornerstone in the state's EGS enterprise framework** by delivering a set of reusable components that can be quickly adapted by *any agency* interested in incorporating secure online transactions into their business model.

December 15, 2000

In addition to the framework, online tab renewal demonstrates the effectiveness of the Internet for streamlining government while simultaneously improving customer service and the state's image. Online tab renewal is "easy, secure and fast." Renewals may be made for passenger vehicles and customers pay by credit card or a direct transfer of funds from their checking or savings account. The transaction goes directly to the DPS in an encrypted file, which prevents disclosure of financial data to third parties. OT contracted with a private firm, EzGov, to employ software that allows secure payment for services over the Internet. The software uses the highest level of encryption available today.

The initiative is designed to create a foundation of flexible, robust technological capabilities to encourage further growth of electronic government service capabilities. By building one, common infrastructure, Minnesota can provide each state agency with a secure, interactive core infrastructure that, after developing programs and interface applications specific to their unique service goal(s), can be used to provide business licensing and permitting.

Breakdown of Expenditures

The following table shows how the FY 2001 One-stop funds were used to support the EGS Secure Financial Transaction architecture.

Financial Summary			
Expense Category	FY 2000 Actual Expenses & Encumbrances (SFT Prototype)	FY 2001 Budget	FY 2001 Actual Expenses & Encumbrances Through 12-00 (EzGov Contract)
Personnel	\$ 0	\$ 0	\$ 0
Supplies/Software	\$ 16,034	\$ 0	\$ 0
Hardware	\$ 0	\$ 0	\$ 0
Facilities	\$ 0	\$ 0	\$ 0
Training	\$ 1,800	\$ 0	\$ 0
Services	\$ 245,912	\$ 236,254	\$ 117,000
Grants	\$ 0	\$ 0	\$ 0
Total	\$ 263,746	\$ 236,254	\$ 117,000

EGS Steering Committee Formed

An EGS Steering Committee was formed to formalize the approach to EGS delivery. The *Statewide Collaborative EGS Steering Committee's* charge is to identify and sponsor the implementation of policies and technical infrastructure that enable agencies to deliver services electronically consistent with business needs. Policies and technical infrastructure includes the development of data practices, records management, legislation, directory services, security, software/hardware, digital signature (certificates), authentication, encryption and secure financial transactions (SFT) to assist agencies in meeting common statutory requirements.

December 15, 2000

Membership: large, medium and small state agencies, and IPC, OT, ITG and IPA. OT provides staff and support for the committee.

Responsibilities

- 1 Advise and make recommendations to the Assistant Commissioner, OT
- 2 EGS Clearing House: Coordinate with other enterprise-wide EGS architecture and technology efforts; become aware of all EGS projects and encourage strategic alignment among agencies; leverage opportunities and resources; promote agency communication; overcome obstacles
- 3 Build and Promote a Tool Box - Identify and prioritize the tools necessary to complete projects and make recommendation to IPC; legislation, policy, standards, and guidelines
- 4 Identify, prioritize and decide upon projects for implementation and present to IPC - Provide direction and resources to agencies; Project Sponsor – May write and steer an initiative, guided by the project representative, and present that initiative for funding approval

Outcomes and Goals

- 1 Enable/promote collaboration by agencies by offering a Tool Box full of solutions developed by agencies.
- 2 Sponsor projects by offering a Tool Box of solutions and direct practical collaboration efforts between agencies to deliver services electronically. All efforts will be project based.

High-level strategies and recommendations regarding EGS

The following strategies will be considered as EGS initiatives move forward:

- Centralize and stabilize funding for the development of common EGS infrastructure, through a Technology Enterprise Fund, advised by a public/private Technology Enterprise Board.
- Centrally develop, deploy and maintain a statewide framework of common infrastructure components for EGS. This framework includes, but is not limited to security, financial transactions and architecture.
- Promulgate the use of the common infrastructure components throughout all agencies.
- Identify common functions within agencies and encourage collaboration and sharing when EGS application projects are implemented.
- Define infrastructure standards and strongly encourage their use across all agencies, while allowing agencies to prioritize the application of those standards.
- Consider using private sector delivery mechanisms where appropriate – assuming customer satisfaction, service and data quality are not compromised.
- Retain visitor identification and click-stream data only to the extent that it is necessary for official state business e.g., aggregate statistics or transaction based audit trails.

December 15, 2000

Next Steps

- The Minnesota Office of Technology will aggressively move forward with Information Technology Architecture Initiatives.
- Minnesota will further explore the use of new methodologies and technologies such as Enterprise Application Integration and Application Integration and Middleware Products that will help the state of Minnesota make the transition to e-government and help individual agencies become more integrated, efficient, and responsive to citizen needs.
- The Minnesota Office of Technology will continue identifying and developing collaborative efforts for delivery of electronic government services.

MANDATED REPORT

Minnesota Statutes 16E.04, Subd 2(g) states:

"The office [Minnesota Office of Technology] shall conduct a comprehensive review at least every three years of the information systems investments that have been made by state agencies and higher education institutions. The review must include recommendations on any information systems applications that could be provided in a more cost-beneficial manner by an outside source. The office must report the results of its review to the legislature and the governor."

In December 1997, the initial report framed this topic as follows:

"Over the years, Minnesota has made few attempts to ascertain its level of investment in technology. The legislature and the agencies have a notion that the level of investment is "big" but really have no hard facts to substantiate this belief. Because of the lack of fact, **legislators are hampered in their ability to make an informed decision about the appropriateness or magnitude of agencies' requests for funding to build or buy a system.**

The legislative charge to the MN Office of Technology is to review and report to the governor and the legislature on the status of all currently established state agency and intergovernmental information and communications systems that use state funding. With this effort, the state is undertaking the first step in accumulating comprehensive data about the state's Information Technology (IT) investments. The result is the most comprehensive inventory to date of state computer systems. Information provided from 118 organizations identified 963 separate information and communication systems. Each system is identified by purpose and status, whether operational or scheduled for enhancement or retirement.

This data provides an initial look at the systems and applications state agencies use to perform business functions. **With additional information concerning expenditures and performance – coupled with adequate planning and information resource management practices – the state can begin to make more informed, and therefore appropriate decisions about its investment in technology."**

The Office of Technology believes that the intent of M.S. 16E.04, Subd 2(g) is for the Office to assist state agencies and the legislature in maximizing technology investments across the enterprise. **To this end, the Office of Technology serves a vital role developing operational and technical frameworks that are used to manage the enterprise's collective resources.**

Institutionalizing Planning and Management practices

Since 1997, several planning and information resource management practices were institutionalized - providing the legislature with much more information concerning technology investments than ever before.

The majority of this report will illustrate how the Office of Technology has been assisting agencies and the legislature in making technology investment decisions. For reference purposes, a Year 2000 Systems Inventory is also included in Appendix B of this document. This year, over 1,300 information and communication systems were reported by more than 100 state agencies in response to the Office of Technology's request for an updated systems inventory. Combined with SIRMPs and agency budget

December 15, 2000

requests, this data provides the Office with valuable information for recommending technology investments to the legislature.

STATE AGENCY BUDGET MANAGEMENT

The Minnesota Office of Technology (OT) is statutorily charged with reviewing information systems budget proposals and with establishing a methodology and review criteria for evaluating proposals. The purpose of the review is to assist the governor and the legislature in prioritizing requests concerning IT investment strategies.

M.S. 16E.01, Subd.3 Duties. The OT shall...

(2) review state agency and intergovernmental information and communications systems development efforts involving state or intergovernmental funding, provide information to the legislature regarding projects reviewed, and recommend projects for inclusion in the governor's budget under section 16A.11;

OT is responsible for a wide range of budget and contract management activities that are used to make sound enterprise-wide investment decisions. Core activities associated with contract and budget management include:

- manage the review and approval of IT Requests for Proposal (RFP) and Statements of Work (SOW)
- review agency technology budget requests and make recommendations to the governor and legislature about which investments to pursue
- state IT contract management
- coordinate and review state agency IT Strategic Information Resource Management Plans (SIRMP's).

STRATEGIC INFORMATION RESOURCE MANAGEMENT PLANS (SIRMP)

OT requires that agencies possess a Strategic Information Resource Management Plan before receiving funding for new technology initiatives. Agencies are required to complete their plans and submit them to OT, which is responsible for reviewing, prioritizing, and recommending funding. SIRMPs are to be updated at least every two years.

This year, OT received over 60 SIRMPs from agencies which exceeded optimistic expectations by over 100 percent.

The SIRMP is not a bureaucratic requirement that agencies need to jump through to get funding. SIRMPs compel agencies to align technology projects (realization projects) with agency goals through a business plan that links to Big Plan initiatives. OT recognizes that aligning business process with available technologies allows agencies to make the most out of technology investments. Instead of automating business "the way it's always been done", agencies must consider how technology enables them to improve business processes, deliver service to citizens, and facilitate easier business transactions.

SIRMPs assist OT and the legislature in making enterprise decisions about which projects to pursue given funding constraints. SIRMPs provide decision makers with a context for evaluating budget requests and for making tough decisions about which investments provide the state with the greatest value.

December 15, 2000

AGENCY IT BUDGET REVIEWS

Another core function of OT is to review agency IT investment initiatives and to make recommendations to the governor and the legislature about which investments to pursue.

To this end, OT developed tools to assist in the review of agency requests for funding of technology initiatives. These tools provide standard measures of the completeness of the agency's plans for IT investments. Agencies that submit technology requests need to address technology critical success factors and state of Minnesota business drivers – just to make it through the first phase of evaluation.

Realization projects (which are simply implementation plans aimed at realizing strategic business objectives) are the key to accomplishing enterprise-wide objectives, therefore, it is critically important to align technology investments with those objectives. In an effort to achieve greater collaboration among individual projects, four major business drivers were incorporated into the budget review process this year.

Business drivers provide a foundation for funding. This means that agency projects - and their relative value – were evaluated in the context of enterprise business initiatives. The following drivers represent the direction that state government is taking in IT investments:

Statewide and Community-wide collaborative efforts – these projects involve most state agencies or significant local government involvement (for example statewide telecommunications reform or criminal justice data community projects), or otherwise aggregate agency communication and technology service needs with those of the communities throughout Minnesota in which they conduct activities.

The Big Plan – the projects identified in the Governor's big plan that require funding for the project to be completed and implemented, including but not limited to the Big plan initiatives entitled "Electronic Government Services" and "Assuring an Information Highway that Leaves No Community Excluded."

Electronic Government Services (EGS) – these initiatives provide/enhance citizen access to government services electronically from remote locations

Infrastructure – these initiatives maintain and replace existing infrastructure – initiatives that provide new technologies to assist citizen's access to government services; or assure that infrastructure is being made available for remote access from or through Greater Minnesota for government of other purposes; or promote the rapid deployment of technologies with advanced telecommunications capability, such as data speeds in excess of 256 kbps throughout Greater Minnesota; or promote enterprise-wide connectivity with other agency networks or community-based networks.

This year, OT reviewed approximately 100 IT project budget requests valued at over \$190 million. Through the use of tools, evaluation techniques and the application of budget constraint directives, the OT recommended that 62 initiatives representing some \$117 million be presented to the Governor for consideration in his budget submission to the legislature.

ENTERPRISE FOCUS

Beyond the primary objective of aligning agency technology investments with the enterprise and basic budgetary oversight, the Office uses the budget process and agency SIRMPs to further additional enterprise objectives, including:

December 15, 2000

Procurement Policy and Design - as part of the budget review process, the Office looks for opportunities to aggregate hardware and software purchases across all agencies. Proper aggregation will substantially reduce the cost of those purchases through volume discount buying. One estimate projects that the enterprise could potentially save up to \$1.2 million between January and June 2001 through volume discounts if (1) desktop configurations could be narrowed to a predefined set, and (2) a vendor agreement could be reached.

Standardization - as the enterprise continues to discuss the benefits of standards and a common technology framework, the Office will look for opportunities to standardize hardware and software purchases (desktops, tools, training and methodology) to the greatest extent possible so that the benefits of a common architecture are realized.

Enterprise Architecture - An IT architecture provides the technical foundation for an efficient IT strategy. Specifically an IT architecture defines the components or building blocks that make up the overall information system. It provides a blueprint from which systems can be developed and maintained that work together.

ENTERPRISE ARCHITECTURE

An Information Technology Architecture (ITA) is a strategic framework that guides both the **design and implementation** of enterprise information services. An ITA links technical solutions to the enterprise's business requirements in two ways. First, business requirements drive technology through top-down planning and analysis. Second, bottom-up analysis identifies emerging technologies that can further business goals and objectives.

Information Technology Architecture **emphasizes commonality, interoperability, and a significant reduction in the prevalence of stovepipe, stand-alone solutions in favor of an integrated suite of business applications sharing a common data environment.** The state of Minnesota ITA will be accomplished through the adoption and implementation of Information Technology Architecture guiding principles and standards that guide technology decisions and IT procurements.

An Information Technology Architecture focuses on:

secure, reliable, global networking that provides "any-to-any" communication around the world
sophisticated tools and systems for knowledge management geared to key enterprise objectives
exploitation of the Internet, world wide web and other technologies to make information accessible to authorized users when and where they need it
consolidated information management to reduce cost and increase information reliability and accessibility
integrated management of the IT network, systems, and applications to enhance efficiency and reliability
increasing security control over vital corporate information through a more modern security infrastructure, application of "thin clients," and other techniques.

An ITA contains the following architectural layers:

- **Business** -- a model defining current and future enterprise mission, objectives, and business functions in a way that supports identification of information technology solutions.
- **Technical** -- consisting of the following three architectural layers:

December 15, 2000

- o **Information** - providing guidelines on the standardization, modeling, ownership, location, distribution, and access to enterprise information
- o **Applications** - describing the environment in which applications will operate, requirements and conventions to which applications must conform, and services that application developers can expect from the infrastructure
- o **Infrastructure** - describing the network and hardware and system software platforms upon which the IT infrastructure will be based

Additionally, *architecture segments* (segments that cut across the entire technology layer), are developed to address high priority, dynamic technology issues that are vital to state of Minnesota requirements. The architectural segments address such items as the requirements to protect information and system assets (Security), enable network fault management, improved IT configuration management, asset tool procurement, (Enterprise Network Management), and replace existing cable and email systems (Information Exchange). Additional segments will be added as new requirements are identified and analyzed.

The Year 2000 Systems Inventory (see appendix) will help guide ITA planning by allowing the Office of Technology to **identify** widespread business system functionality and **integrate** that targeted functionality into an enterprise Information Technology Architecture. For example, several initiatives – licensing or otherwise – may indicate the need for processing secure financial transactions. **The inventory provides a mechanism for identifying duplicative initiatives that should benefit from a reusable component-based architecture, and provides valuable information for coordinating and communicating opportunities between agencies.**

The inventory is an instrument that assists in the discovery of:

- common business functionality that should benefit from aggregation
- business functions that require the most immediate attention (demand-based)
- previous technology investments that were developed by, or for, a specific agency which can be leveraged as part of the ITA and ported to other agencies for a fraction of the cost
- “quick hit” opportunities (reasonably low-cost opportunities that can be capitalized on quickly)
- EGS initiatives that can benefit from common components (payment engine, security, etc)

An architecture is a prudent management tool that will help ensure that IT is responsive to State business requirements. It will help the enterprise achieve technology goals and objectives cost-effectively by providing the basis for enterprise-wide coordination of IT activities, and a set of standards and common technical services that will foster interoperability and information sharing, while lowering total cost of ownership. In particular, the architecture will promote such benefits as broad access to information, efficient re-use of IT components and solutions, and effective state management of IT support.

ELECTRONIC GOVERNMENT SERVICES (EGS)

The Big Plan EGS Description

“Electronic commerce over the Internet is a centerpiece of the global information revolution. Because citizens are going online at an ever-increasing rate, electronic commerce is at once global, national and local in both scope and impact. Electronic tax filing, and payroll communications, also will be conducted

December 15, 2000

online. Such initiatives will increase government efficiency, provide for a comprehensive and coordinated information management system, and create avenues for citizen communication and participation with their government ... These initiatives will also be utilized to increase service levels, and speed up transactions across state government, while permitting both government and business to maintain a level playing field in commercial transactions."

- *The Big Plan*

EGS Collaborative Planning Committee Formed

The *EGS Collaborative Planning Committee* was formed to formalize the approach to EGS delivery. The Committee's charge is to identify and sponsor the implementation of policies and technical infrastructure that enable agencies to deliver services electronically consistent with business needs. Policies and technical infrastructure includes the development of data practices, records management, legislation, directory services, security, software/hardware, digital signature (certificates), authentication, encryption and secure financial transactions (SFT) to assist agencies in meeting common statutory requirements.

Membership - large, medium and small state agencies, and IPC, OT, ITG and IPA. OT will staff and support the committee.

Responsibilities

1. Inform the IPC and be the community voice for EGS
2. Direct, steer and coordinate the larger Community EGS Collaborative Committee
3. EGS Clearing House: Coordinate with other enterprise-wide EGS architecture and technology efforts; become aware of all EGS projects and encourage strategic alignment among agencies; leverage opportunities and resources; promote agency communication; overcome obstacles
4. Build and promote a Tool Box: Identify and prioritize the tools necessary to complete projects and make recommendations to IPC; recommend legislation, policy, standards, and guidelines
5. Identify, prioritize and decide upon projects for implementation and present to IPC: Provide direction and resources to agencies; project sponsor – may write and steer an initiative, guided by the project representative, and present that initiative for funding approval.

Outcomes and Goals

1. Enable/promote collaboration by agencies by offering a Tool Box full of solutions developed by agencies.
2. Sponsor projects by offering a Tool Box of solutions and direct practical collaboration efforts between agencies to deliver services electronically. All efforts will be project based.

Emerging Technology Management is vital to the success and proliferation of EGS and sound financial and technology management. **Common EGS infrastructure components, leveraged across the enterprise, will provide the state with enormous financial benefits.** Most importantly, a well designed statewide technology infrastructure will give Minnesota's citizenry any-time access to real government service and value.

NEXT STEPS

- The Office of Technology will continue to serve as an enterprise "Gate Keeper" regarding technology investments to maximize the states technology dollars

December 15, 2000

- The Office of Technology will aggressively move forward with Information Technology Architecture initiatives that provide the benefits of reuse, cost-effective maintenance, and extensibility
 - The Office of Technology will continue identifying and developing collaborative efforts for delivery of electronic government services
 - The Office of Technology will promote enterprise development and management through a proposed Technology Enterprise Fund, advised by a public/private Technology Enterprise Board, described in Appendix A to this report.
- 

December 15, 2000

APPENDIX A: TECHNOLOGY ENTERPRISE FUND, TECHNOLOGY ENTERPRISE BOARD

Technology Enterprise Fund (TEF), part of a consolidated funding model; with the **Strategic Information Resource Management Plan (SIRMP)** and **Technology Enterprise Board (TEB)**, provides foundation to prioritize, fund IT initiatives statewide. This proposal has the support of CIO's from across state government.¹

PURPOSE

Fund three specific areas of needed technology development:

1. Enterprise, or interagency, capabilities for data exchange between government entities –
Example: Middleware and web-based services and devices, standards, protocols; MAPS, SEMA4, North Star, CriMNet, IT architecture
2. Pilots, prototypes, projects for EGS, showing breakthrough improvements in government efficiency –
Example: On-line secure voter registration, voting; e-procurement such as "reverse auctions"; Minnesota legal/administrative information archives; citizen electronic "listening post"; personal computer-based video conferencing; document imaging for higher education, health
3. Statewide telecommunications networks in remote locations, to enhance citizen access –
Example: ATM high-speed switches in the MnNet network; CriMNet backbone; Learning Network II; combine state service and community need

NEED

1. "Enterprise" level IT funding does not occur; each entity purchases IT for individual mission needs, resulting in duplicate systems unable to network efficiently.
2. Funding once every two years cannot keep up with technology, or technology pricing, that changes monthly.
3. IT and telecom are among the most expensive, and most strategic, tools in government; they require a credible governance system that assures accountability and effectiveness. Legislative, SIRMP and TEB oversight works, based on statewide strategic plans.

REVENUE SOURCES

TEF derives funding from a continuing revenue stream, throughout the year –

- IT depreciation; Revenues from equipment, IT sales, and IT productivity savings
- Productivity loan funds via MSA §16B.86
- Annual carry forwards, budget roll-over
 - Revenues realized from savings via IT contract renegotiations
- Gifts, contributions, and grants
- Revenue bonds, transportation bonds, general fund appropriations

¹ By unanimous resolution adopted September 21, 2000: "The Information Policy Council supports establishment of a technology enterprise fund to promote fundamental government change, citizen access and efficiency, with funding sources to be determined, for a period of five years, with oversight by a board representing government and industry, and appropriations as provided by law."

December 15, 2000

DISBURSEMENTS

Distribution made per statute, SIRMP rankings and TEB recommendations. Grants and loans pursuant to written agreements, in progress payments against specified productivity, efficiency and/or capacity goals, tracked by established benchmarks. Loans may be forgiven, in whole or in part, based upon performance. Quantifiable benchmarks focus on the following:

- Improve efficiency/productivity of government, or quality and efficient delivery of education;
- Establish statewide or inter-agency implementation (immediate or near future);
- Create jobs and strengthen business opportunities;
- Make communities safer;
- Maximize high-speed digital communications;
- Promote citizen satisfaction and access to EGS;
- Breakthrough improvements in business efficiency (process re-engineering), elimination of redundancies

December 15, 2000

APPENDIX B: YEAR 2000 SYSTEMS INVENTORY UPDATE

Year 2000 Systems Inventory

Academy of Sciences

System Name	Description	Status	Enhancement	Retirement	Comments

Access 97	Ad Law Section scheduling	Operational		2000	Replace by TimeMatters

Agency Name **Agriculture Department**

Food Ins - compl Resume		Retired			
Food Ins - compl Plan Review	State plan review data.	Retired		2000	Replaced by department wide Licensing Information System (LIS).
Food Ins - compl Egg	Egg handler tracking.	Operational			
Food - Food Borne	Tracks complaints of food borne illness.	Operational			
Fert	Fertilizer Sample Tracking	Operational		2001	Replaced by department wide Laboratory Information Management System (LIMS).
Feed	Feed Sample Tracking	Operational		2001	Replaced by department wide Laboratory Information Management System (LIMS).
Farm Security	Farm Loan Tracking	Operational		2002	
Farm Advocates	Assistance data.	Operational	2000		
Farm Advocate	Tracks activities of farm advocates who are working with clients and attempting to resolve the problems that farmers are having.	Operational			

Agriculture Department

System Name	Description	Status	Enhancement	Retirement	Comments
Department Asset Tracking	Identifies state assets	Operational			
Dairy Trade	Dairy Pricing Software	Operational	Operation 1998		
Dairy	Dairy Inspection, etc.	Operational	1998	2001	Replaced by department wide Compliance Information System (CIS).
Apiary	Tracks bees, bee hives, hive owners, hive locations and inspections. Data kept for historical reference.	Retired		2000	Replaced by department wide Licensing Information System (LIS).
County Fair	County Fair Vendor Tracking	Operational			
Cost Accounting	Time & attendance, cost tracking	Operational			
ADaMS - Agronomy Data Management System	Tracks inspections, investigations, permits, companies licensed and locations of all sites that are tied to a single license. Data kept for 10 years.	Operational		2001	Replaced by department wide Compliance Information System (CIS).
Admin Assets	Inventory Control - in house	Operational			
Food inspection - Resume	Inspectors Monthly Accomplishments	Retired			
Ag BMP	Ag Loans	Operational			
AgFin Loans	Accounting Software - vendor other than MDA	Operational			
AGRILIC	Licensing Software	Retired	1998	2000	Replaced by department wide Licensing Information System (LIS).
Animal Damage Control	Tracks wolf damage.	Operational			
Corporate Farm System	Ensures compliance with Corporate Farm laws.	Operational			

Agriculture Department

System Name	Description	Status	Enhancement	Retirement	Comments
Comm - Mailing	Mailing lists	Operational			
Cashiers	Accounting Software - in house cash deposit system	Retired		2000	Replaced by department wide Licensing Information System (LIS).
APPD Cost Accounting	Tracks employee expenses per project.	Operational			
Dairy Drug Screening	Trades results	Operational	2000		
Private Applicators	Private Pesticide Applicator data	Operational			
MN Grown	Tracks MN Grown Companies (TRADIRS)	Operational			
MNPIRS	MN Pesticide Inspection	Retired		2000	Replaced by department wide Licensing Information System (LIS).
Food Inspection - Complaint Desk	Complaint Desk Call Tracking	Operational			
Personnel	Employee list.	Operational			
Food Ins - compliance	Tracks inspection data.	Operational		2002	Replaced by department wide Compliance Information System (CIS).
Media	Media lists	Operational			
Phytosanitary	Phytosanitary Certification Software	Operational			
Nursery	Plant Nursery Tracking & Inspection	Retired		2000	Replaced by department wide Licensing Information System (LIS).
Residue	Residue Sample Tracking	Operational		2001	Replaced by department wide Laboratory Information Management System (LIMS).

Agriculture Department

System Name	Description	Status	Enhancement	Retirement	Comments
Risk Management	Allows public access to information.	Operational			
Seed Inspection	Tracks seed and weed samples. Data kept for 7 years □ Installed on network server, run on IBM machines.	Operational		2001	Replaced by department wide Compliance Information System (CIS).
Seed Lab	Seed Lab Results Tracking	Operational		2001	Replaced by department wide Laboratory Information Management System (LIMS).
Service Request	Tracks Service Requests for Information Services.	Operational			
Sustainable Ag Loan	Loan Tracking Software	Operational			
PestMN/Spest/Bio	Pest Field Study	Operational	2000		
Help Desk		Operational			
Grain Certification	Tracks Certification	Operational	1998	2000	Replaced by department wide Licensing Information System (LIS).
Grain Warehouse	Warehouse Inspection Software	Retired	1998	2000	Replaced by department wide Licensing Information System (LIS).
MAX – Minnesota Agricultural eXchange	Helps businesses get in touch with Minnesota food producers.	Operational			
Lab - Sampling	Tracks Samples through the Lab	Operational		2001	Replaced by department wide Laboratory Information Management System (LIMS).
Lab Purchasing	Special purchases (FileMaker Pro)	Operational			
Licensing Information System	Tracks 85 license types.	Operational			

Agriculture Department

System Name	Description	Status	Enhancement	Retirement	Comments
Marketing - Tags	Makes Tags	Operational			
Lime Tonnage Reporting	Posts results.	Operational	2000		
LIMS	Dairy	Operational		2001	Replaced by department wide Laboratory Information Management System (LIMS).
Livestock Price Reporting	Daily prices of hogs & cattle.	Operational			
Manure Testing	Certifies labs.	Operational			
Lime	Lime Sample Tracking	Operational		2001	Replaced by department wide Laboratory Information Management System (LIMS).
Grain Inspection	Field Inspection System from □ from outside vendor. (IBS)	Operational		2001	

Agency Name Amateur Sports Commission

Graphic design systems	Production of promotional materials, programs, and other printed materials.	Operational
Website design and editing systems	In-house creation and editing of websites	Operational
Facility scheduling systems	Facility reservations, invoicing, staff administration	Operational
E-mail	Internal and external e-mail communication	Operational
Staff support and operations	Routine software to support on-going staff functions in writing, spreadsheets, preparation of presentations, etc.	Operational

Amateur Sports Commission

System Name	Description	Status	Enhancement	Retirement	Comments
Financial and accounting systems	Financial management, accounting, etc.	Operational

GroupWise	Email, calendaring, task management system	Operational	1999		Replaced previous email system.
NCSA HTTPD	Web server	Retired		1999	Replaced with new web server.
Apache	Web Server	Operational	1999		Replaced previous web server.
Fast Track Scheduler	Project management system	Operational	2000		Administrative and programs project management system.
QuickMail	Email system	Retired		1999	Replaced with newer, more functional group ware email, calendaring and taks management system.
GradeQuick	Course management System	Operational	1999		Individual course management system for faculty.

Center for Arts Education

System Name	Description	Status	Enhancement	Retirement	Comments
4D Server	Client/Server databases supporting student, resource and image information systems, contract logs, and summer arts course catalog.	Operational			Databases enhancements are ongoing.
Meeting Maker	Calendar and scheduling system for meeting resources.	Operational			

Agency Name Children, Families & Learning

micro/datadict	Maintains the data dictionary for all systems	Operational			
issde	Majority of all database compilation resides here.	Operational			
fiscal	Used to record federal grant awards to local LEA's	Operational		1997	
dads	Replace with Micro/Datadict.	Retired			
ideas	Processes state aid payments to school districts using formulas provided by the legislature.	Operational			
micro/dpsr	Data processing services request system.	Retired		1998	
micro/dvp	Micro system for fiscal grant award system.	Operational			
micro/fees	Fee collections and reporting system for fiscal services section.	Operational			
micro/fisc	Micro fiscal services letter of credit system.	Operational			
itembank		Retired			
micro/cert	Maintains child nutrition certification system.	Operational			

Children, Families & Learning

System Name	Description	Status	Enhancement	Retirement	Comments
micro/foxuser	Maintains micro system security features.	Operational			
micro/honor	Fiscal services honorarium system.	Operational			
micro/levy	Electronic collection of levy data elements.	Operational			
micro/form	Micro system for forms design and data acquisition.	Operational			
CCD	CCD □ Provides data sent to the Department of Education National Center for Education Statistics.	Operational			
VOCAID	Calculates state entitlements for school district vocational handicapped aid	Operational			
Assess	Used to score and report achievement test results.	Retired		1998	
commodity	Orders, allocates, and distributes USDA commodities to school districts and other program recipients within the state	Operational			New web-enabled system developed with KPMG
Census	Collects data on a number of 0□20 year olds in each schools district.	Operational			
ChapterI	Designed to facilitate payment of federal aid	Operational			
child	Assists in distributing state and federal funds to school districts, private schools, etc., which	Retired		1999	New web-enabled system developed with KPMG
micro/bot	Records Board of Teaching complaints.	Operational			
childcount	Produces the annual count of handicapped children receiving special education services from Minnesota Public Schools.	Operational			

Children, Families & Learning

System Name	Description	Status	Enhancement	Retirement	Comments
lep	Was converted into the Sped system.	Retired			
childnut	Maintains application information for school lunch program.	Operational			New web-enabled system developed with KPMG
micro/nwsys	Electronic recording and reporting of help line trouble calls.	Operational			
micro/award	New micro fiscal grant award system.	Operational			
micro/audio	Audio visual inventory system.	Operational			
mdemarrs	Collects detailed data on public school students to supply information to several application systems such as Levy, Mincris, etc.	Operational			
levy	Calculates school district property tax levies based on property value and assessment data.	Operational			
childcare	Used to reimburse public and private daycare centers, family daycare homes and adult daycare.	Operational			New web-enabled system developed with KPMG
TREXIN	Calculates school district training and experience index based on data from teacher employment data. Results are input to the general education aid formula	Operational			
ged	Records test scores of people passing GED tests, produces a certificate and also transcripts.	Operational			
micro/phone	Electronic telephone management system.	Operational			
ABE	Calculated State and Federal adult basic education aids	Operational			

Children, Families & Learning

System Name	Description	Status	Enhancement	Retirement	Comments
PAYS	Processes Federal Aid payments to public and private schools, communities and private educational facilities using formulas provided by congress.	Operational			
vtfin		Retired			
utac		Retired			
transport	Summarizes the number of students transported, number of gallons of gasoline and mileage by school district.	Operational			
TMATRIX	Summarization of teacher license/employment/assignment data to provide flexible reporting in this area.	Operational			
GENED	Calculates state entitlements for school district general education aid (approximately 4 billion dollars per year)	Operational			
COMED	Calculates state entitlements for school district community educational aid	Operational			
CAPEXP	Calculates state entitlements for school district health and safety, and interactive television aids	Operational			
ABATE	Calculates state entitlements of school districts based on amount of school taxes abated during previous fiscal year	Operational			
stateaids	A collection of 10 different systems that calculate school districts' state entitlements.	Operational			
stars	Collects teacher employment and assignment data.	Operational			
micro/requist	Maintains inventory for purchasing of equipment.	Operational			

Children, Families & Learning

System Name	Description	Status	Enhancement	Retirement	Comments
nonpub	Collects data to process and obtain counts of students, staff and graduates of Minnesota nonpublic schools.	Operational			
openenroll	The post secondary enrollment options act enables students to enroll in nonsectarian courses or programs for school credit without cost to the student.	Operational			
orgunit	Maintains current geo-political data on school districts, school buildings, regional computing centers, and other educational organizations.	Operational			
pupil	Replaced with MDEMARRS system	Retired			
sdefin	Financial data on school districts in UFARS format.	Operational			
staff	Establishes, maintains, updates licensing data on teachers and other professional education staff.	Operational			
second	Collects, edits and processes staff, budget, and cost data for vocational programs in secondary schools.	Operational			
sfsp	Used to reimburse schools, governmental agencies and summer camps for food provided to children.	Operational			New web-enabled system developed with KPMG
simideas	Same as IDEAS systems, generates data and Operational reports to the legislature on "what if" situations.	Operational			
LABEL	Produces labels for superintendent, principal, teachers, etc.	Operational			

Children, Families & Learning

System Name	Description	Status	Enhancement	Retirement	Comments
skippy	Provides information about resident and nonresident students. Used in calculating various aid payment systems.	Operational			
PROFILES	Produces report from many systems to show a profile of each school district	Operational			
sped	Calculates state and federal special education aids.	Operational			
mincris	Secures data from each school district to monitor compliance within state and federal law prohibiting discrimination in education/employment.	Operational			

Agency Name	Chiropractic Examiners Board

System Name	Description	Status	Enhancement	Retirement	Comments
HEAT: HelpDesk Expert Automation Tool	An internet-based spatial data acquisition site that allows users to download raw computer-readable data for use in their Geographic Information System, image processing system, or database. The site includes links to extensive and summary level data descriptions (metadata). The web search interface is written in Javascript and Java with system support functions provided by Perl scripts. The spatial display, query, and reporting functions are provided by the University of Minnesota's MapServer software. A variety of integrated data processing support functions are written in Perl and Arc Macro Language (AML). The site is an integrated system of data storage, access, maintenance, documentation, and distribution. The site contains data that is assembled from the DNR GIS Core Database. An update process is executed on a weekly schedule.	Operational			

Natural Resources Department

System Name	Description	Status	Enhancement	Retirement	Comments
GIS Data Deli	The GIS Core Database is an outgrowth of a traditional ARC/INFO database architecture that relies on remotely mounted file systems to access data across various portions of the network. Data are organized in tile-based extent, and are generally only accessible through proprietary software. Spatially continuous data access is provided through ARC LIBRARIAN data structures. Data are redundantly stored at separate key access sites to improve performance of GIS applications, and better support user requirements. Data may also exist in different file formats, particularly in ARC/INFO coverages and Shape files. Data are accessed extensively through both desktop (Windows) and UNIX-based environments. File systems are shared through Samba server processes to desktop clients (the "v" drive), or through the use of NFS networking protocols between UNIX workstations. Portions of the Core Database have found their way into web-based applications, although the data has typically required additional pre-processing.	Operational			
GIS Core Database	Information on forest campgrounds for management purposes. Platform: Access '97.	Operational			
Forest Campgrounds Administrative Database	Application used to develop annual work plans and budgets. Process starts at area offices and rolls up to division work plan and budget. Uses data from Fleet Management System and SEMA4 to calculate equipment costs, staff costs, and resources. Application developed by Rick Nelson, Fisheries Biologist. Potential for use throughout DNR. Modification underway to include Capitol Budget Program (Linda Erickson-Eastwood). Platform: Visual dBase. Projected completion date is July 2001.	Operational			

Natural Resources Department

System Name	Description	Status	Enhancement	Retirement	Comments
Fisheries Work Planning & Budgeting	Application tracks the stocking of public lakes. Data, including the species, strain, size, and number of fish stocked, is entered and maintained in the Central Office. Platform: dBase IV; release of new web-based application scheduled for January 2001.	Operational			
Fisheries Stocking Database	Application maintains data for the aquatic education program. Goal of the program is to inform the public about life history, habitat requirements, and management of the aquatic species of the state, and to promote understanding of the issues related to balancing social, environmental, and economic demands. Database contains information about the activities of the program, volunteer time, and donations, and is stored in the Central Office. Platform: Visual dBase.	Operational			
Mineral Rights Information System		Operational			
Fisheries MinnAqua Database	Application organizes physical, chemical, and biological data concerning habitat, water quality, and fish populations in Minnesota lakes. Allows Fisheries to develop management plans, evaluate management techniques, and monitor long term changes or trends in aquatic environments. Lake reports generated by the system are very popular with the public and are available in printed form or on the DNR Web Site. Data is maintained at area offices, and combined at Central Office into a statewide database. Platform: dBase IV; will be replaced by a web-based application (interface written in PHP) in 2002.	Operational			

Natural Resources Department

System Name	Description	Status	Enhancement	Retirement	Comments
Fisheries Lake Survey Database	Application to help Fisheries managers reach decisions regarding the best management of lakes, prepare and implement plans, and evaluate results. Platform: dBASE IV; plan to replace the program with a web-based application in 2001. See also under "Development / Testing" in this chapter.	Operational			
Fisheries Lake Management System	Database contains detailed and summary statewide data from Creel, Lake Survey, and Stocking databases. Users connect to the database via LAN, WAN, or dial-in, and use SQL-compliant software (e.g. Microsoft Access, ArcView, Crystal Reports, Quattro Pro) to access the data. Platform: Oracle 8i.	Operational			
Fisheries Data Mart	Application estimates fishing pressure: hours of fishing per time period; catch per unit effort (CPUE = number of fish caught per unit of fishing effort); total catch as identified by anglers surveyed. Developed by Division of Fisheries. Data maintained in fisheries area offices. Platform: dBase IV.	Operational			
Fisheries Creel Survey Database	Project initiated Fall 1996 to integrate four databases and applications: Facilities Management, Fleet Management, Fixed Asset Inventory, and Safety Programs. Application continuing to be developed by Vision Technologies. Platform: AS/400 with VB6.0 client. Y2K investment of \$405,000. Total invested to date is \$785,000. Annual maintenance estimated to be \$80,000. Need migration plan.	Operational			

Natural Resources Department

System Name	Description	Status	Enhancement	Retirement	Comments
Field Services Consolidated Database (CODA)	Consolidated database of environmental review information and a common application for accessing that database by parties involved in the receipt, review, and response to environmental review documents. Developed by Vision Technologies in 1999. Y2K investment was \$42,400. Total investment to date is \$125,000. Platform: Oracle 8i; Visual Basic 5.0 client.	Operational			
Environmental Review Database	Provides status of survey and design projects, both in-house and under contract. Platform: Access 2000. Need network access to database. Contracted with Wendy Nelson in July 1999 to upgrade functionality and reporting options.	Operational			
LandView	System to manage all DNR-owned surface land and mineral rights. Developed by CCSI 1983-85. Accounts receivable, and billings for land sales, gravel, and professional services added 1988-1992. System has been cobbled together over the last ten years and is seriously out-of-date. A Project Definition JDASM was held in March 1999 to begin defining needs for a new system. The FY00/01 budget initiative was not funded. LCMR Proposal FY02/03: \$2,875,000. DNR should set a highest priority on developing an integrated land information system. Platform: AS/400.	Operational			
State Parks Facility Database	DOS-based system developed by The Nature Conservancy for managing SNA biological and conservation data. SNA program budget data is maintained in Lotus. Goal is to integrate components. Met with Carol Pearson 11/24/98 to discuss options for system upgrade. Met with Terry Johns (volunteer) 12/3/98. Platform: Advanced Revelation. Need migration plan.	Operational			

Natural Resources Department

System Name	Description	Status	Enhancement	Retirement	Comments
Engineering Project Management	Mission critical system maintains records of DNR-issued warrants pertaining to fish, game, and recreational vehicle law violations. Developed by CCSI 1985. Platform: AS/400. Major modifications by MIS in 1995 to accept transfer of data from the Total Court Information System (TCIS). Minor fixes by Born Consulting in July 1999. FY00 maintenance: \$25,000. Need migration plan.	Operational			
PlatViewer	Database stores casework the laboratory has handled since 1992, including all testing, recommendations, and reports. Developed by Pathology Lab staff. Application meets user needs at this time. Platform: Access '97.	Operational			
Timber Sales System and Scale Report	Systems will be replaced by FORIST, described under "Development / Testing" in this chapter. Y2K compliance investment of \$189,000 for the two systems.	Operational			Visual Basic on SQL server
Real Estate Management Decision Support System	Graphical interface designed to facilitate access to the Land Information System for viewing project information and status. DSS also tracks employee workload and skill sets. Application developed by Vision Technologies, 1999. Platform: AS/400; Visual Basic 5.0 client. Not currently in use. Estimated investment \$92,000.	Operational			
License, Registration, and Decal Inventory (LRDI)	Tracks inventory of fishing, hunting, and x-country ski licenses that are sold by DNR and license agents. Interface to REVSYS for receipts. Developed by Born Consulting 1995; technology upgrade complete December 1999 at a cost of \$100,000. Current platform is Access 2000 and Visual Basic 6.0 client. ELS will eliminate need for system.	Operational

System Name	Description	Status	Enhancement	Retirement	Comments
License Refund System	System maintains information on issued refunds. Interfaces with MAPS. Developed by License Bureau staff in 1988 and re-written in 1995. Platform: AS/400. Function will become part of Oracle Financials implementation.	Operational			
Boat and Recreational Vehicle Registration	Application tracks boat and recreational vehicle registrations. Developed by CCSI 1985. Platform: AS/400. Electronic Licensing System (ELS) will replace system in May 2001.	Operational			
Watercraft Titling System	Database used by staff for planning, reservation data, and public brochures about park facilities. Contains everything about park facilities from miles of trails to counties that the parks are in. Primary database for the web team to extract data from and to share with others in DNR. Manages watercraft titling transactions. Developed by CCSI 1991. Platform: AS/400. Need migration plan.	Operational			Platform: Access '97.
ArcView Extensions (GIS Tools)	Stream Mode Digitizing Extension (Version 1.05 - 8/15/2000) Provides the functionality to do on-screen stream digitizing of lines and polygons.	Operational			
Revenue Management System (REVSYS)	The PlatViewer program allows users to interactively browse Rockford Plat maps that are stored in digital format. The plat information is created by township and the users can select a township of interest by specifying either a Public Land Survey (PLS) section or by browsing through the townships organized in county folders. The application allows users to view the plat information and create printouts that they can take into the field. Platform: Visual Basic with ESRI MapObjects Light add-ons.	Operational			

Natural Resources Department

System Name	Description	Status	Enhancement	Retirement	Comments
Enforcement Violations, Arrests, and Confiscations System	Point of Sale system manages the sale of hunting and fishing licenses. Developed and operated by Central Bank, Jefferson City, MO. System operational in 1700 locations as of March 2000. See also under "Development / Testing", this chapter. FY00/01 budget is \$2.7 million.	Operational			
LandView	LandView is a program designed for non-GIS users to view a suite of geographic data that would otherwise require learning complex data storage techniques. Basemaps such as Digital Orthophoto Quads (DOQs), Scanned USGS Quadrangle Maps (DRGs), National Wetland Inventory (NWI), Digital Plats Books, and DNR Land Ownership are tiled (stored in many pieces) because of their large size. This program will foster GIS knowledge. Users will become familiar with information available and will be empowered to use spatial data in their work. Some users will want more and will move on to more complex software such as EPIC and ArcView. This software is not a replacement for ArcView or EPIC, but is designed to fill a gap in our information access technologies. Platform: Visual Basic 6.0.	Operational			
Pathology Lab Management	"Campground Manager," a packaged application developed by Mission Management Information Systems Inc., Ontario, Canada is being implemented. Functions include: camp site reservations, customer tracking, revenue tracking, and various accounting functions and reports. Implemented in 19 state parks in 1999, 15 more in 2000. Parks allocated operating funds to implement after FY00/01 initiative failed. Estimated investment to date is \$500,000.	Operational			

Natural Resources Department

System Name	Description	Status	Enhancement	Retirement	Comments
Parks Campground Management	DNR Waters has managed a statewide network of water level observation wells since 1944. About 700 observation wells are monitored currently. Data from these wells are used to assess ground water resources, determine trends, interpret impacts of pumping and climate, plan for water conservation, evaluate water conflicts, and otherwise manage the water resource. Soil and Water Conservation Districts under contract with DNR Waters measure the wells monthly and report the readings. The U.S. Geological Survey also monitors some wells using continuous recorders. Readings are also obtained from volunteers at other locations. Platform: NT network server; FoxPro 2.6; web-enabled access: ASP and Visual Basic.	Operational			
Observation Well Records (OBWELL)	NHIS provides information on Minnesota's rare plants, animals, native plant communities, and other rare features. The database is continually updated as new information becomes available, and is the most complete source of data on rare or otherwise significant species, natural communities, and other natural features. The most commonly-used component of NHIS is the Rare Features Database. It began as a compilation of historical records from museum collections and published information. This has been supplemented with data from years of field work on rare features. Platform: DataFlex / PC-UNIX. System needs to be upgraded. Meetings with Natural Heritage staff May-July 2000 to explore delivery of NHIS data over the web. See also under "Proposed New Applications" in this chapter.	Operational			

Natural Resources Department

System Name	Description	Status	Enhancement	Retirement	Comments
Natural Heritage Information System (NHIS)	Database manages annual work plan proposals and budgets, generates annual spending plans, staff time allocations, and tracks work plan accomplishments for performance reporting. Vision Technologies conducted JAD session March 1999. Perry Canton, Minerals engineer, developed conceptual, logical, and physical data models, and implemented the system in Access '97.	Operational			
Minerals Work Planning Database	An OpenSource development environment for building spatially-enabled Internet applications. The software builds on other freeware systems like Shapelib, FreeType, Proj.4, libTIFF, Perl, and others. MapServer will run on Linux/Apache platforms, is known to compile on most UNIXes, and will run under Windows NT/98/95. MapServer supports MapScript, which allows scripting languages such as Perl, Python, Tk/Tcl, Guile, and Java to access its C API. MapScript provides a rich environment for developing applications that integrate disparate data. If the data has a spatial component and you can get to it via a scripting environment, then you can map it. Originally developed by the University of Minnesota ForNet project (Steve Lime) in cooperation with NASA and the Minnesota DNR. Enhancements made by DNR and the Minnesota Land Management Information Center. Current development is funded by the TerraSIP project, a NASA sponsored project between the University and a consortium of land management interests.	Operational			
MapServer	Maintains information associated with mailing DNR publications. Developed by MIS 1995. Platform: AS/400. Need migration plan.	Operational			

Natural Resources Department

System Name	Description	Status	Enhancement	Retirement	Comments
Map & Brochure Distribution System	System manages sale of hunting and fishing licenses, park permits, and cross-country ski passes at the License Bureau counter. Interface to LRDI, Registrations, Lotteries, and Titling systems. Platform: Visual Basic 6.0.	Operational			
License Point of Sale System	This is an Internet version of the LandView system described above. Both applications are needed due to limited high-speed access to the Internet.	Operational			
Scientific and Natural Areas Database	Processes revenues of over \$100 million per year and makes deposits to 400 distinct account distributions. Majority of transactions and revenues grouped in nine business areas: mining rents and royalties; water permits and pumping fees; timber sales; park permits and merchandise sales; vehicle and boat registrations; arrests and confiscations; real estate sales and leases; and fleet usage. Originally developed by Born Consulting; rewritten by CCSI for MAPS. REVSYS is seriously out-of-date.	Operational			
ArcView Extensions (GIS Tools)	DOQ/DRG Tools Extension (Version 1.3 - 12/21/98) Variety of tools for viewing DOQ's and DRG's. Allows the user to create DOQ Themes straight from a USGS County based DOQ CDROM without having to uncompress.	Operational			
Electronic Licensing System (ELS)	DNRnet is the department's Intranet, introduced in November 1998. The DNR Web Team designed an overall architecture, and business units are contributing content. Site is growing, but needs additional staff support if it is to continue to grow.	Operational			
ArcView Extensions (GIS Tools)	DNR Forestry CSA Utilities (Version 1.0 - 07/12/2000) Written for DNR staff using Cooperative Stand Assessment (CSA) data.	Operational

System Name	Description	Status	Enhancement	Retirement	Comments
ArcView Extensions (GIS Tools)	ArcView Tools Extension (Version 1.3) Contains a number of utility tools: Clipping, Mosaic, Buffer, etc.	Operational			
ArcView Extensions (GIS Tools)	Roadway Symbolology Extension (Version 1.4) Creates roadway symbols in ArcView. Supports the automatic generation of four types of road symbols and works off a roads database.	Operational			
ArcView Extensions (GIS Tools)	Garmin GPS Utilities (Version 1.4 - 08/3/2000) Allows users to upload and download Waypoints and Tracks from a Garmin GPS receiver and ArcView GIS.	Operational			
Boat and Water Safety Records	DataAccessTools - Developed for GIS users who need access to spatial data. The software allows users to select a subset of information they need to do the task at hand without knowledge of where the data is and in what format it is stored. Platform: ESRI Arc/Info Arc Macro Language (AML).	Operational			
Commercial Game & Fish Licensing	System used to produce biennial Capital Budget. Developed by Vision Technologies in 1997 at a cost of \$63,000. Platform: Access; Visual Basic 4.0. Need to integrate with facilities management system.	Operational			
Conservation Officer Training	Tracks commercial game and fish licenses issued. Developed by CCSI in 1986. Platform: AS/400. Need migration plan.	Operational			
Division of Enforcement Activity Reporting System (DEARS)	Tracks Conservation Officer training. Developed by CCSI in 1985. Platform: AS/400. Need migration plan.	Operational			

Natural Resources Department

System Name	Description	Status	Enhancement	Retirement	Comments
DNR Web Site	Manages Conservation Officer activity, time, expense, and budget reports. Developed by Vision Technologies 1997-2000. Platform: AS/400; Visual Basic 4.0 client. \$125,000 investment. Enhancements and Oracle 8i migration planned for FY01.	Operational			
DNRnet	An informative, educational and entertaining web site whose purpose is to facilitate citizen access to natural resource and recreation information. Popular applications are the lake survey reports and maps, river level reports, state parks, community forums, and the GameFinder. Platform: SUN E250; Apache Web Server; MYSQL databases; Perl, Java, Javascript.	Operational			
Capital Budget System	Data associated with watercraft accidents. Developed by MIS in 1995. Platform: AS/400. Need migration plan.	Operational			
ArcView Extensions (GIS Tools)	ArcView - EPPL7 Extension (Version 2.04 - 5/7/99) Integrates ArcView with the raster GIS EPPL7 and works with GeoTiff files. Gives the user some raster analysis capabilities including image rectification, clipping and rotation.	Operational

Electronic Bidding	Enhance the efficiency of construction bid processing while streamlining the bidding process for construction contractors	Development			Depends upon authorization of electronic signatures
FANS □ Fixed Asset Network System	A fixed asset system distributed by Fiscal Services in Administration	Operational			
Geopak/Microstation	Design and drafting for civil engineering projects.	Enhancement	2001		
ConLab	Provide direct input of field grading and base testing data to support construction material certification	Development	2001		This is a revision of an existing system that was discontinued
Public Transportation Management System	Inventory and condition information about transit fleets and other public transportation system assets	Operational		2002	Replacement project in planning stage.

Transportation Department

System Name	Description	Status	Enhancement	Retirement	Comments
Traffic Management System	Traffic congestion monitoring, freeway operations, incident response for the metropolitan area.	Enhancement			
Transportation Information System (TIS)	Inventory and analysis of roadway and bridge characteristics, traffic volumes, crashes, rail lines and rail grade crossings.	Enhancement	2001		Platform conversion underway.
TRNS*PRT	Bid analysis (including bid rigging analysis); contract management and partial payments	Operational			Renamed from BAMS by vendor.
Video Log	Record video data on road and roadside conditions on all trunk highways	Enhancement	2001		
Web presence	Web portal for citizens and partners to gain access to Mn/DOT's information and services	Enhancement			
M4-Inventory		Development			

Agency Name Veterans Affairs

Veterans Information Management System	Claims Processing	Operational	2000	2000	Recently upgraded to a Windows version
Benefits 2000	State Soldiers Assistance program	Operational	2000	2000	The old software was discontinued, and is not supported by the manufacturer. Recently converted to a Delphi program.
LibertyNet Image Management System	Provide copies of veterans' discharge papers to appropriate parties.	Operational	2000	2000	The old software was discontinued, and is not supported by the manufacturer. This new imaging system was just installed

Agency Name Veterans Home Board

Veterans Information Manager	Personal veterans information manager	Operational
------------------------------	---------------------------------------	-------------

Veterans Home Board

System Name	Description	Status	Enhancement	Retirement	Comments
Volunteer Services Tracking	Volunteer Services Tracking Database	Operational			
Resident Activity Tracking System	Tracks resident attendance in Rec Therapy activities	Operational			
Premise	MN statutes	Operational			
Long Term Computing Systems	Medical Records/Patient Information	Operational	1998		
Facility Audit	Facility Audit software package	Operational			
EDM Connect	Electronic Data Management connection service to update software for state programs	Retired	1997		
Donations Tracking System	Track Donations Given to MVH Homes	Operational			
Alternate Holiday Tracking System	Tracks Alternate Holidays Used by Employees	Operational		1997	Replaced by SEMA4
Admission Tracking Database	Resident admission, discharge and death tracking database	Operational		1998	Replaced by Long Term Care Systems
License Tracking System	Tracks employee license plates and location Operational of employee	Retired		1998	Replaced by an Excel Spreadsheet
ArchiBus	Facility Management System	Operational	2000		Used to facilitate building maintenance In conjunction with DoA Facility Mgt

Agency Name Veterinary Medicine Board

Licensing System	Database of license veterinarians and candidates.	Operational
------------------	---	-------------

Agency Name Vietnam Veterans Council

Vietnam Veterans Council

System Name	Description	Status	Enhancement	Retirement	Comments
Members	Database	Operational			

Agency Name **Vocational Technical Education Council**

Agency reported it has no systems

Agency Name **Voyagers National Park Commission**

Agency reported it has no systems

Agency Name **Water & Soil Resources Board**

Contact Management	Client/contact database/application	Development			Replaces "Mailing Database", Visual FoxPro
Geographic Information System	Data and software to perform geographic analysis and provide results through maps and reports.	Operational			Work with DNR, MPCA to closely to build on each others data.
Web based business tools. eBWSR	Many different moduls to allow BWSR to conduct much of it's business via the web		2001		Web based Grants tracker, web based reporting. Receive Easement applications via the web. Receive State Cost-Share applications via the web. Many other possibilities. Under consideration Still defining project NOT being developed yet
Wetland Banking	Database/application used to record deposits/withdrawls and sales of wetland credits.	Operational			Visual FoxPro
Timecard	Automated timecard.	Operational	2000		Migrated from Quattro Pro to Excel

Water & Soil Resources Board

System Name	Description	Status	Enhancement	Retirement	Comments
RIM Database	Database of RIM people addresses in state.	Operational	1999		There is a desire to retire this DB and start From scratch. (could be in eBWSR)
Mailing Database	Database for client addresses.	Operational		2001	Replaced with Contact Management
LARS	LGU annual reporting system	Operational		2002	Retirement depends on successful development of a sucesor. (eBWSR)
Grants Tracker	Maintain status information on Annual grants	Operation		2002	Visual FoxPro

Agency Name Workers Compensation Court of Appeals

ZyIndex	Legal Research	Operational
---------	----------------	-------------

Agency Name Zoological Garden

Razor's Edge/Blackbaud	Membership/fundraising	Operational	
ARKS,MEDARKS	Animal records systems	Operational	
TARS	Ticketing, admissions, registration (new system 1998)	Operational	1998
SYS 36	Consumable inventory.	Operational	
Engineering	Utilities, maintenance	Operational	
Retail Pro	Inventory / POS for Gift Store and Stockroom	Operations	
Chief	Maintenance	Operational	
Phone	Switchboard communications, voice mail system	Operational	

Removed from service due to Y2K

Replaced IRIS and System 36

Replace with Siemens phone system 12/99

Zoological Garden

System Name	Description	Status	Enhancement	Retirement	Comments
IRIS	Gift store point of sale and perpetual inventory system.	Operational	2000	36495	Removed from service due to Y2K
Mas 90	Accounting	Operational	2000		
Life Support	MEC/Discovery Bay Life Support systems, pumps. etc	Operational			
Siemens Model 90 Phone Switch	New Phone System	Operational			Replaced old phone system

Agency Name Materials Management Division

Surplus Business Operations System	Macola - Upgrade to version 7.5.102c, completed July, 2000	Operational			
Web/Business Operations Interface	Commerce Connector - Application interface to move web generated orders to internal business software application, completed April, 2000.	Operational			
CStores Web Site	Using fourthchannel's Profit Launch, leased and hosted, site produced and published in April, 2000 with roll out to customers continuing on a daily basis.	Operational			
Database Management Support System		Operational			Upgrade from Btrieve to PSQL for database management for the business software application, completed November, 2000
Stores Business Operations System		Operational			Macola - Upgrade to version 7.5.103c, completed November 13, 2000
File Transfer Services	Novell FTP Server retired October, 2000 with FTP services taken over by upgraded MMD web server.	Operational			

Materials Management Division

System Name	Description	Status	Enhancement	Retirement	Comments
Solicitation Announcements	Created an automated, interfaced process for providing data for new "Solicitation Announcement" pages for MMD's web site. Combined data from MAPS and an active server page into an expanded service and provide Comm.Media with a direct feed of data for support of subscriptions provided by them.	Operational			
Database Management Support System	Upgrade from Btrieve to PSQL for database management for the business software application, completed May, 2000	Operational			
Distributed Access	Citrix MetaFrame 1.8 for Windows 2000 Server implemented as a new application to support classroom G25 in Administration office building.	Operational			Implementation completed June, 2000.
LAN/Desktop FAX services	Unimessage Pro for Windows 2000 replaced HydraFax Gold Version 3.51(51) for managing the Panafax Uf-M500. Supports MMCAP and Voice/FAX customers, in addition to providing desktop FAX capabilities to other staff	Operational			Upgrade by replacement completed November, 2000.
Remote Access	Citrix MetaFrame 1.8 for Terminal Server 4.0 replaced Citrix WinFrame 1.7 for remote access by Administration building personnel	Operational			Upgrade by replacement completed December, 2000.
Vendor Registration System	WebVen, a new application, is a web-based vendor registration system with an automated interface to MN's state accounting and procurement software (MAPS).	Operational			Projected completion date is January, 2001.
Vendor Management System	Vendor Manager running on Windows NT 4.0 and SQL Server 7.0 was converted/rewritten from an IBM OS2, IBM DB2, token-ring system. The new system automatically updates data on the division's web server pages and Voice/Fax System	Operational			Upgrade by replacement completed June, 2000.

Materials Management Division

System Name	Description	Status	Enhancement	Retirement	Comments
Voice/FAX Document Distribution System	Voice/Fax System underwent a major conversion/rewrite from Windows 3.11 platform to Windows NT 4.0 with direct and automated interfaces with the MMD web server	Operational			Upgrade by replacement completed October, 1999.
MN Multistate Contracting Alliance for Pharmacy (MMCAP)	Group Purchasing Systems (GPS) Version 6.0.45 replaced GPS Version 6.0.35 for support of MMCAP.	Operational			Upgrade completed September, 2000.
MMD Web Site	MS IIE 4.0 on a Windows NT 4.0 Server replaced Purveyor/WebDBC on Windows 3.51 Server as the web management platform for the division's web site	Operational			Upgrade by replacement completed November, 2000.
