MINNESOTA DEPARTMENT OF

Completion Study for the Class of 1999

Computation of the Four-year Graduation and Dropout Rates for School Districts in Minnesota

September 2000 Data Analysis Team Office of Information Technologies Minnesota Department of Children, Families & Learning

This report and associated data may be found on the Web at http://cfl.state.mn.us

Completion Study for the Class of 1999

Introduction

The Minnesota Department of Children, Families & Learning collects detailed data on students served by Minnesota school districts through the Minnesota Automated Reporting Student System (MARSS). The Department has collected student attendance, demographic, and migration data using the MARSS reporting system since 1992. This study reviewed MARSS data over multiple years tracking the records of ninth grade students from 1995/96 in order to determine their last reported ending status through the 1998/99 school year. Minnesota's four-year Graduation and Dropout rates for 1998/99 were then computed using this detailed student information.

MARSS Data Elements

The MARSS system currently collects 37 different pieces of information on each student including gender, birth date, name, and social security number as well as a unique state reporting number. These pieces of information can be used to follow students from year to year. It also collects each student's start and end dates while served by a school, where the student came from, and why the student left. This information can be used to track the progress of a student while enrolled in Minnesota public schools.

When a student stops attending school, district staff determine the reason and record a specific 'status end' code on the student's MARSS record. These 'status end' codes have been defined by the Department and detail 32 reasons why a student record ended (why the student stopped attending school). The reasons are grouped into five categories:

- The student transferred to another educational program outside Minnesota public schools,
- The student is expected to *continue* education the following year,
- The student graduated,
- The student *dropped out* of school, or
- The student stopped education for reasons of illness, death, or other unusual circumstances.

Students in the Class of 1999

To determine the ending status of students in the Class of 1999, all students who were served by Minnesota schools in grade nine during the 1995/96 school year were first selected. They were then tracked through the 1998/99 school year to determine each student's final ending status as reported by the last Minnesota school district serving the student. The final ending status was allocated to a category and is used in the summary reports for the state and district totals.

The preliminary statewide results of this study are shown in <u>Table A</u>. The detailed analysis of how these students were tracked through the four-year period is described in <u>Appendix A</u>.

TABLE A Preliminary statewide results by category									
Total number of students served	Transferred out of the MN public school system	Continued within the MN public school system	Graduated	Dropped out	Stopped education	Ending status unknown*			
70,445	1,590	6,696 inth grade stud	50,696	6,862	206	4,395			

during the 1995/96 school year and their last reported status after the 1998/99 school year.

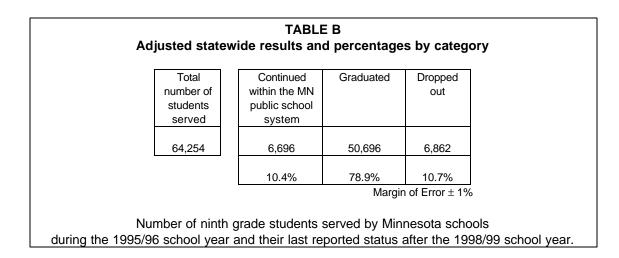

*In some instances, the ending status indicated the student would return to school but no further MARSS records for these particular students could be found in later years. These students were assigned to an 'unknown' category.

Minnesota Department of Children, Families & Learning - Office of Information Technologies - Data Analysis Team

Calculation of Percentages

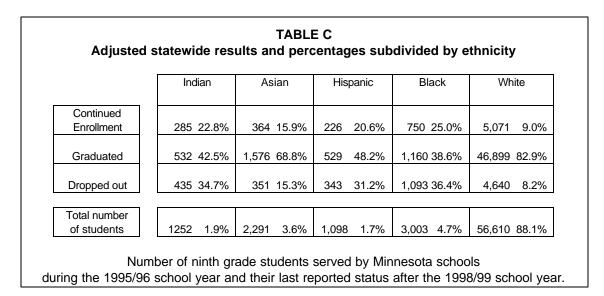

To provide a clearer picture of student achievement within Minnesota, the three main categories of Graduated, Dropped Out, and Continued Enrollment are used. In determining percentages of students served by category, those students who have left the Minnesota public school system and students with ending status unknown are removed from the calculation.

By removing these categories, the total number of students in the sample is reduced and the corresponding percentage for Graduates, Drop Outs, and Continued Enrollments is computed. The adjusted results are illustrated in <u>Table B</u>.

Statewide ethnic totals by category

The study also selected each student's ethnicity as reported through MARSS from the last record reported. Statewide totals by category and the corresponding percentage within each ethnic group are shown in <u>Table C</u>.

District totals by category

Individual district totals by category are detailed in <u>Appendix B</u>. District totals by category differ from the state totals by category. The district totals for the number of students served is limited only to those students whose last record reported through the four-year period is from the same district which last served the student in 1995/96.

The difference between the state and district totals can be illustrated in the following example:

A 9th grade student was served by Rochester in 1995/96, moved to Winona in 1996/97, and then graduated from Winona in 1998/99. This student would be included in the graduate counts for the state totals in <u>Tables A, B, and C</u>, but the student would not be included in the graduate counts for either Rochester or Winona in <u>Appendix B</u> (as the student's last reported district was not the same as the student's original district).

Because the district totals are limited to a more stable group of students than the state totals, caution should be used when comparing the district percentages to the state percentages.

ALC Effect

Additionally, district to district comparisons should also be used with caution as certain districts provide instruction in Area Learning Centers (ALCs). ALCs provide an alternative form of instruction for students who may dropout or are significantly behind in their coursework. Students cannot enroll in an ALC unless they fall under a specific definition of a learner 'at risk' of not graduating. Districts that do <u>not</u> host an ALC, but whose students have access to a neighboring ALC, may show a reduced number of dropouts and correspondingly, a reduced number of students served. In some cases, this has the effect of inflating the graduation rate for these districts that neighbor an ALC.

This 'ALC Effect' between neighboring districts can be illustrated in the following two examples:

A 9th grade student is served by Rochester in 1995/96, later qualifies as an 'at risk' student, enrolls in Rochester's ALC in 1997/98, and then drops out in 1998/99. This student is included in the state dropout totals and in the dropout totals for Rochester (as the last district is the same as the original district).

A similar 9th grade student is served in 1995/96 in Pine Island (a neighboring district). This student later qualifies as an 'at risk' student, transfers to Rochester's ALC in 1997/98, and eventually drops out in 1998/99. The student is included in the state totals for dropouts but is <u>not</u> included in the dropout counts for either Rochester or Pine Island (as the last district is not the same as the first district). This example has the effect of removing 1 student from the dropout total and the total of students served for Pine Island as shown in <u>Appendix B</u>.

Because of the reduction of numbers in certain categories, districts which neighbor an ALC may have their dropout percentage slightly deflated and their graduation and continuing percentages slightly inflated due to this 'ALC Effect'.

Margin of Error

This study is based on the ability to track students from one year to the next using the MARSS reporting system. Inconsistencies in recording the state reporting number, student name, birth date, social security number or status end code may reduce the accuracy of the matching process over the four-year period and impact the corresponding result totals by category. Additionally, the methods used to match student records from one year to the next may also have inadvertently increased or decreased the number of students included in the results.

Minnesota Department of Children, Families & Learning - Office of Information Technologies - Data Analysis Team

To determine an overall margin of error to account for inconsistencies in reporting (and erroneous assumptions used in the tracking procedures), separate reviews were conducted to search for different types of errors in the final calculations. These reviews discovered some minor errors in the MARSS reporting process and slight anomalies in the matching logic used over multiple years. The resulting margin of error for the state results appears to be less than 1%. Details of the reviews and errors found are described in <u>Appendix A</u>.

Summary

This study focused on all ninth grade students served in Minnesota during the 1995/96 school year. Of those students who could be reliably tracked in the Minnesota public school system over a fouryear period, <u>Table B</u> illustrates 78.9% graduated from a Minnesota high school. During this same four-year period, 10.7% dropped out and apparently, did not return to the Minnesota public school system.

In comparison to the previous studies of the Class of 1996, 1997 and 1998, there appears to be no significant change in the four-year completion rate for Minnesota high school students. A comparison of the statewide results over the last four years is shown below.

Year	Number of Students	Graduated	Dropped Out	Continued
Class of 1996	56,217	78.5%	11.3%	10.2%
Class of 1997	59,699	78.2%	11.3%	10.5%
Class of 1998	62,822	78.0%	11.0%	11.0%
Class of 1999	64,254	78.9%	10.7%	10.4%

Comparing several years of student activity by using MARSS data exclusively is intended to provide another view of student migration and achievement in addition to the information already reported annually by school districts. The results of this study over multiple years may provide information to measure the success of school districts implementing recent initiatives intended to improve education within the Minnesota public school system.

However, the results as detailed by school district in <u>Appendix B</u> should not be confused with existing graduation and dropout information annually reported by Minnesota schools, nor are they intended to indicate quality of education by school district. Student mobility, cohort characteristics, and individual reporting discrepancies between school districts may also have an impact the detailed district results.

MINNESOTA DEPARTMENT OF

Completion Study for the Class of 1999

September 2000 Data Analysis Team Office of Information Technologies Minnesota Department of Children, Families & Learning

This report and associated data may be found on the Web at http://cfl.state.mn.us

Detailed Methodology

Initial group of students

The study looked at the 1995/96 MARSS End of Year database and selected students served in grade nine on or after September 1, 1995 with the following conditions:

- The record was excluded from the study if the STATE AID CATEGORY^{*} was either 25, (Adult), 16, 17, 18 (Shared-Time), 14 (Residents of other states), 26 & 28 (nonpublic or private alternative programs), or 98 (Summer withdrawals from the previous year).
- The record was excluded from the study if the MARSS STATUS was 1 or 3 (local error or dateoverlap error).
- If the student had more than one record that qualified, the last record (as determined by the STATUS END DATE) was selected. If two records had the same STATUS END DATE for a single student (as occurs with dual enrolled students attending alternative schools) the record with the lower school classification was used. The district serving the student on this last record is referred to as the '1995/96 Serving District' in <u>Appendix B</u>.

Because of reporting discrepancies, some students in this initial group were assigned two different STATE REPORTING NUMBERS. To correct for this, the STUDENT NAME and SOCIAL SECURITY NUMBER (where either was available), DATE OF BIRTH, and GENDER were used to locate duplicate records with different STATE REPORTING NUMBERS. After final corrections, the resulting database contained individual records representing 70,445 unique students that were served as ninth graders during the 1995/96 school year.

Because of this and other reporting discrepancies over multiple years, a separate 'master identification number' was then assigned to each record in the initial group of ninth grade students, independent of the STATE REPORTING NUMBER assigned by each district. Both identifying numbers (as well as several other student demographic elements) were then used to track the records of students through subsequent years.

Subsequent year search

The following year's MARSS database was reviewed using a multi-step procedure to accurately identify subsequent records from the initial group of ninth grade students. The first step was to locate all student records from the 1996/97 MARSS database with matching STATE REPORTING NUMBERS. For the remaining students that could not be found, a special matching routine was developed based on STUDENT NAME, SOCIAL SECURITY NUMBER, BIRTH DATE, GENDER and several other demographic characteristics for the students. This procedure found additional records for students whose STATE REPORTING NUMBER had been changed the following year.

A similar process was then used to identify students from the 1997/98 and 1998/99 school years: The STATE REPORTING NUMBERS were matched and then the special matching procedure was used to find additional records for individual students in the initial group of ninth grade students.

Since there were now several incidences of students with multiple identifiers, the master identification number assigned to the original student from 1995/96 was used to keep records for individual students grouped together.

Results of the matching processes over the four-year period were compiled into a single master database sorted by the newly assigned master identification number and date education service stopped (the STATUS END DATE). In this manner, records were aligned in order of sequence from the earliest to the most recent for each student. After final corrections, the master database contained 320,860 records; a complete history of each student from the initial sample as reported by school districts in Minnesota. The study then selected the last record for each

^{*} All MARSS data elements are represented in a SMALL CAPS font style

Minnesota Department of Children, Families & Learning - Office of Information Technologies - Data Analysis Team

student and copied the corresponding STATUS END CODE and serving district for those records to the final database which contains one record for each of the 70,445 students served in the original sample.

Major categories

Each record in the final database was then evaluated to determine the grouping of the STATUS END CODES. The following codes were assigned to the 7 major categories:

Status End Code	Category	Condition
08, 09, 10	Graduated	Graduated or received a Certificate of Completion
06,14,15,16,17,18,19, 31,32,33,34,35,37	Dropped Out	
01,02,04,20,22,36,40, 41,99	Continued Enrollment	The last record is from the 1998/99 school year and implies the student will continue education into the 1999/00 school year.
03	Transferred to Nonpublic	
05	Left State	
11,12,13	Stopped Education	
01,02,04,20,22,40,99	Ending Status Unknown	The last record is from the 1995/96, 1996/97 or 1997/98 school year. The record implied the student would continue the following year. However, no later student record was matched in any of the following years' databases.

Margin of Error

This analysis is dependent on several factors including the consistent use of the STATE REPORTING NUMBER, valid matching logic used in comparing records from one year to the next, and consistent MARSS reporting practices used by school districts in Minnesota.

Previous studies have indicated about 1% of the students inadvertently receive a new STATE REPORTING NUMBER within a particular year and 2% of the students have their STATE REPORTING NUMBER inadvertently changed between school years. The <u>Completion Study for the Class of 1996</u> assigned a 1% margin of error in the state-wide percentages due to this factor.

The logic used for the Class of 1997, the Class of 1998, and the Class of 1999 attempts to resolve this problem by using other matching criteria besides the STATE REPORTING NUMBER to accurately locate student records from subsequent years. The logic was also designed to provide a means to match records with the 1996/97 MARSS database where almost all students received new STATE REPORTING NUMBERS due to the planned expanded use of the MARSS reporting system.

This revised logic almost eliminates the previously reported margin of error as combinations of several demographic elements for a single student would now have to change simultaneously for the student record to be missed in subsequent years. However, the revised logic may have introduced other discrepancies (such as student records matched in error).

To determine a percentage of students matched in error, separate reviews were conducted to either correct the error or to assign a 'margin of error' to the results of the study.

Recycled identification numbers / Shared Social Security numbers

The first review compared all BIRTH DATES for students with the same master id number in the master database. It found 988 students where the BIRTH DATE did not match on all the records. Of these, it was determined 242 students were matched in error and their records were removed

from the master database. In many cases, this occurred when a student left a school district and his or her STATE REPORTING NUMBER was assigned to a new student the following year. On other instances, siblings apparently had been assigned each other's SOCIAL SECURITY NUMBER in later years. Errors due to recycling of STATE REPORTING NUMBERS or shared SOCIAL SECURITY NUMBERS have been corrected in the final database.

Students matched incorrectly

The second review attempted to determine how many of the remaining students were matched incorrectly. To determine suspected errors, the student's AVERAGE DAILY MEMBERSHIP (ADM) was totaled in each of the 4 years. Normally, a student would generate about 1.0 ADM if they attended a Minnesota school for the entire year. Student's who had excessive ADM amounts for individual years were selected. There were 806 students whose ADM was excessive for any particular year. The records were then linked to the master database and the student's complete history was then reviewed to determine if all records were matched correctly. Of those, 165 appeared to have been incorrectly matched. Errors due to incorrect matching processes have been corrected in the final database.

Service provided after graduation

The third review looked at all records in the master database and searched for incidences of a graduation STATUS END CODE followed by a later record. It found 261 incidences where a graduation record preceded another record in the master database. All 261 students appeared to be matched correctly. The records were reviewed and it was determined most of the students in the original sample should have the graduation record assigned as the last record for the student. In many cases, this occurred when students were 'dual enrolled' and service did not stop at the same time in both schools. Errors due to service provided after graduation have been corrected in the final database.

Students missed in following years

About 14% of the students in the study could not be found in the 1998/99 MARSS database. The fourth review attempted to find a percentage of these students and then determine margin of error for the entire study by extrapolating the findings. It used a random sample of 902 students from this group (10% of the total not found in the 1998/99 MARSS database). The review matched the records using less restrictive combinations of student characteristics and then confirmed the match manually. These matching methods included using birth date with only the first two letters of the first name, birth date using only the first two letters of the last name and social security numbers without the name or birth date check. This review found 6 students who should have been included in the final database but were not matched because of changes in student demographic elements between school years. Extrapolating the results to the entire study, 60 students have probably been missed in the 1998/99 school year with various ending status results (60 / 70,445 = 0.1%). This type of error could not be corrected in the final database, so a 'margin of error' was assigned to the entire study to account for this type of matching error (rounded up to $\pm 1\%$).

* During 1998/99 school year, these districts hosted an Area Learning Center, Public Alternative Program, or Private Alternative Program.

(P) Paired District - Includes students from the paired district if the students were served by both districts.

Limited to students whose last serving district is the same as their originating district of 1995/96.

The counts represent the adjusted number of ninth grade students served by Minnesota schools during the 1995/96 school year and their last reported status through the 1998/99 school year.

1995/96 Serving District	Adjusted number of ninth grade students served	Number later reported as graduating		Number later reported as dropping out		Number later reported as continuing education the following school year

* During 1998/99 school year, these districts hosted an Area Learning Center, Public Alternative Program, or Private Alternative Program.

(P) Paired District - Includes students from the paired district if the students were served by both districts.

Limited to students whose last serving district is the same as their originating district of 1995/96.

The counts represent the adjusted number of ninth grade students served by Minnesota schools during the 1995/96 school year and their last reported status through the 1998/99 school year.
