State	C-160 to C-162

Preface

This publication has been prepared to serve as a reference source on work force and labor force estimates for the State, the Minneapolis-St. Paul SMSA, the City of Duluth, St. Louis County excluding Duluth, and all remaining counties in Minnesota. Updates of the series are planned as new and revised data become available. These updates will be distributed on pre-punched forms for insert into the loose-leaf binder which is being used to transmit this first set of tabulations. We hope that this reference source will prove useful to those who have a need for a complete set of work force and labor force estimates for Minnesota and its sub-State labor market areas.

Because three different series of estimates are presented for each labor market area, a short note on concepts and methodologies is provided to assist the reader in the use and interpretation of the data. Those who desire a more complete explanation of the concepts and methods that are used in developing work force and labor force estimates should refer to our publication, A Guide to Employment and Unemployment Statistics, which can be obtained by writing to the Director, Research and Statistical Services Office, Minnesota Department of Economic Security, 390 North Robert Street, St. Paul, Minnesota 55101.

It should be noted that a publication of this magnitude could not be produced without the dedication of staff whose efforts extend beyond their normal duties. Therefore it is with great satisfaction and pleasure that I direct the credits for this publication to Wayne Graner, Sue Hamper, Mark Moliter, Mike Casey, Gary Olsen and Craig Shelstad for their computational work, to Charles Cline for supervision and technical guidance, and to Linda Froncak and Sonny Carroccio for their typing.

R. Pinola
Director, Research and Statistical
Services Office

A Note on Concepts and Methods of Estimation

Three different data sets are provided in this publication for each area of the State. Therefore, it is essential that readers are made aware of the conceptual and methodological differences that exist between each data set. In addition, it should be emphasized that, although the Research and Statistical Services Office of the Department of Economic Security is responsible for the major data inputs and the actual preparation of the work force and labor force estimates, the Bureau of Labor Statistics (BLS) of the U.S. Department of Labor prescribes the concepts and methods that are used.1/ The BLS also develops and mandates the use of a number of adjustment factors for estimating selected components of employment and unemployment for which current data is not available, and for making the State and area estimates compatible with national estimates which are developed on a different basis.2/

The sections which follow, briefly explain the concepts and methods that are used in the preparation of the data series presented in this publication. The most recent BLS revision of its methodology has not been included because time and staff constraints did not permit the production of a complete back-series of revisions to 1966. However, the new revisions should be completed within the next six to eight months and updates provided to the readers.

Work Force Estimates

The work force estimates which appear in this publication are those prepared by the Research and Statistical Services Office (formerly Research and Planning Branch) using the 70-Step Handbook Method developed by the Bureau of Employment Security, U.S. Department of Labor in the late 1950's and revised in the early 1960's. When the Bureau of Labor Statistics (BLS) introduced and mandated the use of its new methodology for producing estimates based on the labor force concept, the production of work force estimates at the county level was discontinued. Limited staff time has been used, however, to continue the

---

1/ Prior to 1974, the Research and Statistical Services Office utilized the work force concept and the methodology developed by the Bureau of Employment Security in the U.S. Department of Labor. In 1974, the Bureau of Labor Statistics (BLS) introduced and mandated the use of the labor force concept and a new methodology for estimating State and area employment and unemployment. Since that time, the BLS has made a number of revisions in the methodology, each of which required a complete revision in the labor force estimates.

2/ While State and area estimates are based on the 70-Step Handbook Method using a mixture of administrative statistics and data from State administered statistical programs, national estimates are based on a monthly survey, called the Current Population Survey (CPS), of approximately 47,000 sampled households by the Census Bureau. Those desiring a more detailed explanation of these methods should refer to our publication, A Guide to Employment and Unemployment Statistics.

production of work force estimates for the State in order to provide a continuing series for comparison with the new labor force estimates, and to permit the monitoring of seasonal factors in employment and unemployment.3/

Under the work force concept, employment estimates are based on job counts, by place of work, which are primarily developed from monthly reports provided to the Research and Statistical Services Office by a sample of employer establishments. To these job counts are added estimates of self-employed and non-sampled employment through the use of historical relationships between total employment and selected classes of employed persons. To the extent that a worker is employed by more than one employer (multiple jobholders), the job counts under the work force concept lead to a modest overstatement of employment when compared to those under the labor force concept.

While employment estimates are based on place of work under the work force concept, unemployment estimates are based on place of residence. This treatment of unemployment is due to the fact that the base figure for estimation purposes comes from claims records of the unemployment insurance program, which codes claimants by residence. The 70-Step Handbook Method incorporates this data into the estimation procedure and adds to this count estimates of those unemployed who are not claiming benefits, e.g., the self-employed, new and reentrants, delayed and never filers, and other miscellaneous categories of the unemployed.

Once the employment and unemployment estimates have been developed, these are simply added together to secure the estimated work force. The unemployment rate is then computed by taking that fraction which unemployment comprises of the total work force and transforming it into a percentile value. Illustrating, we have:

$$E + U = WF$$

and;

$$\frac{U}{WF} \times 100 = \text{Unemployment Rate}$$

where;

E = Employment
U = Unemployment
WF = Work Force

One of the more severe criticisms that has been directed at the work force estimates is that it constitutes an anachronism because it combines employment by place of work and unemployment by place of residence. While the criticism is valid, the estimates are not devoid of redeeming value for policy formulation. We feel that there are good arguments for their use and, that for certain analytical purposes, they are better than the labor force estimates.4/

3/ The new labor force estimates have not been adequate for developing seasonal adjustment factors and there has also been considerable concern over the reliability of the new series. Therefore, it was considered useful to continue producing the work force series at the State level. Lack of time and resources has prevented extending the estimates to the counties.

4/ See, A Guide to Employment and Unemployment Statistics, Chapter 8, for a discussion of this issue.

A more pointed criticism of the work force estimates is that the counts of unemployment are reflective of State unemployment insurance laws which differ considerably across the Nation with respect to coverage and eligibility for benefits. Because of this factor, there is a lack of compatibility in the estimates between the various States and, also, with respect to estimates developed for the Nation from the Current Population Survey. In addition, the administrative and legal aspects of the unemployment insurance program make it virtually impossible for the claimant count to meet the definitional purity of the conceptual criteria for unemployed status. For example, most States have a forgiveness clause in their law which permits full benefit payments for those whose earnings from work in the claim week fall below a given amount. Strictly speaking, these persons did not meet the conceptual criteria, but were still counted as unemployed in the program statistics.

Finally, the failure to adequately update the factors used to estimate employment and unemployment for categorical groups made the estimation procedure more suspect with the passage of time. In many cases, clearly obsolete historical relationships were still being employed. The only saving grace to the continued use of these factors was that they often applied to small components of employment and unemployment and, therefore, did not carry much weight. However, in the case of some components, such as the new and reentrant class of unemployed, the potential for large errors was present and posed serious problems of estimation which have not been resolved even with the new methodology.

Before passing on to an explanation of the labor force estimates, it should be noted that the 70-Step Handbook Method is still used to develop the base estimates of employment and unemployment, and while some of the factors have been updated by BLS, there remains considerable room for error in some of the components. Moreover, the base estimates of unemployment still hinge on the unemployment insurance program claims data which continues to reflect differences in State laws and the administration of these programs. Thus, the biases that existed in the data base before, are still largely present even after the ostensible cleaning of the claimant records to meet the officially designated conceptual standards.

Labor Force Estimates

As noted earlier, the preparation of employment and unemployment estimates at the State and area level, using the labor force concept and the new BLS methodology, was mandated by the U.S. Department of Labor in late 1973. Beginning in January 1974, the Research and Statistical Services Office began the production of such estimates for the State, the Minneapolis-St. Paul SMSA, the City of Duluth, St. Louis County excluding Duluth, and all remaining counties in the State. In the intervening years, the BLS has required the series to be carried back to 1970. However, since our county work force estimates dated back to 1966, we felt it useful to carry back the labor force estimates to the same year; thus permitting better overall comparisons to be made in the three series presented in this publication.

The two labor force series for which data are provided are the Unadjusted Labor Force Estimates and the Official Labor Force Estimates. As we noted earlier, they are both still tied to the 70-Step Handbook Method, with the differences between the two estimates stemming from the application of further refinements in the derivation of the "Official" estimates. The procedures involved in transforming the work force to labor force estimates are the application of an adjustment factor for eliminating the double counting of multiple jobholders and translating place of work to place of residence employment. Additionally, the BLS has introduced a number of updates of factors for estimating employment and unemployment for selected categorical groups not covered by the statistical programs administered by the Research and Statistical Services Office.

In the case of the Official Labor Force Estimates, two additional adjustments are made in order to: 1) make the State estimates based on the 70-Step Handbook Method compatible with national estimates developed from the Current Population Survey (CPS), and 2) establish internal consistency between State and area estimates. The first adjustment involves making the annual average estimates of employment and unemployment based on the 70-Step Handbook Method identical to the annual average estimates based on the CPS for the State and the Minneapolis-St. Paul SMSA. This adjustment is called "Benchmarking to the CPS" and is usually made in February for the previous year, with the benchmarked results then used to adjust the monthly 70-Step estimates in both the previous and current year. By way of illustration, if the annual average CPS employment estimates were only .80 of the annual average 70-Step employment estimates, this factor will be used to adjust the monthly 70-Step employment estimates for the previous year and those being produced in the current year.5/ A similar procedure is used in adjusting the 70-Step unemployment estimates except that the absolute difference (rather than ratio) in the annual averages is used 6/.

To establish internal consistency between the State and area estimates, the BLS also mandated that the sum of the parts equal the whole. Thus, the independently derived estimates of employment and unemployment for the Minneapolis-St. Paul SMSA and the remaining counties had to equal those of the State. Since the Minneapolis-St. Paul SMSA estimates were already CPS benchmarked, it meant first subtracting these from the State, and then using the residual to adjust each of the county estimates accordingly. For example,

5/ To eliminate sharp discontinuities in the historical data series as a result of these adjustments, the BLS also introduced a procedure for smoothing the month-to-month and annual changes. See, A Guide to Employment and Unemployment Statistics, op cit.

6/ The BLS changed this procedure in December 1977, so that the unemployment adjustment based on the CPS benchmark is now done in the same manner as the employment adjustment, i.e., a multiplicative rather than additive factor. It is interesting to note that we recommended such a change already in 1974.

if the independently derived State estimate of unemployment was 100,000 and that of the Minneapolis-St. Paul SMSA and the remaining counties were 50,000 and 80,000, respectively, the unemployment estimates of the remaining counties would need to be scaled downward by 30,000 to make the combined area estimates equal that of the State. This would actually be done by multiplying each county's unemployment estimate by a factor of 5/8 so that the sum of their adjusted estimates would agree with the difference between the State and Minneapolis-St. Paul SMSA estimate, i.e., 50,000.

A procedure similar to that described above is used to adjust the county employment estimates. Generally, the adjustments for the employment estimates have been less severe than those of the unemployment estimates, which have been very substantial in the past. As a consequence of these adjustments, much debate has taken place over the reliability of the resultant estimates. As producers of the estimates, we have taken issue with regard to certain aspects of the methodology, particularly with some of the factors that are used for estimating the non-covered components of employment and unemployment, as well as the CPS benchmarking and forced additivity adjustments. However, in the absence of a better methodology, the estimates represent the only measures of total employment and unemployment that are currently available that use officially designated concepts.

A Note on the Development of Labor Force Estimates for Counties and the Minneapolis-St. Paul SMSA for 1966-1969

County Estimates

Estimates for the period 1966-1969 were prepared utilizing essentially the same methodology that is currently in use. Nonagricultural self-employed and unpaid family workers, as well as agricultural employment, were developed by working back from 1970 base figures instead of forward from the same base as is being done for the 1970's.

Residency factors, which convert place of work employment counts to place of residence figures (consistent with the labor force concept), were the same for 1966-1969 as the 1970 and later estimates.

Nine-County Minneapolis-St. Paul SMSA Estimates

Handbook estimates for the 9-county Minneapolis-St. Paul SMSA for the years 1966 through 1969 were obtained by adding handbook estimates for the old 5-county SMSA to residency-adjusted work force estimates for Carver, Chisago, Scott, and Wright Counties. This was done because much of the employment and UI claims data needed for the 70-Step methodology was not available for the four additional counties. It is doubtful that the figures obtained from a 9-county 70-Step estimate would be significantly different from those obtained under the method actually used, since the combined labor force of those four additional counties comprised less than 4 percent of the 9-county labor force.

Much of the data used in the 5-county Handbook estimating procedure was obtained from old work force estimating worksheets. Because the old worksheet had estimated employment for domestics, nonprofit firms, and nonagricultural self-employed and unpaid family members according to the unbenched Current Employment Statistics (CES) program figures, these components had to be recalculated according to benchmarked data. This was done by calculating the ratio of each component to total nonagricultural wage and salary employment using the unbenchmarked figures. Each ratio was then applied to the benchmarked CES data to obtain a new estimate of each component.

The delayed and never filers component for the unemployment insurance program were estimated according to the presently used procedure, but due to low insured unemployment rates, the delayed and never filers estimate was quite high in some months. Some of the figures were so high that we feel it necessary to call this to your attention. However, since the delayed and never filers do not comprise a significant portion of the total count of unemployed, the end result on the unemployment rate estimate will be minor.

OFFICIAL MINNESOTA LABOR FORCE ESTIMATES: 1970-1977
(Revised as of January 1, 1978)

Note:

Labor force estimates count both employment and unemployment on a person (as opposed to position) by place of worker residence basis. This is in contrast to the work force estimates in which employment is a count of positions based on the employer's location.

These estimates are those which were officially sanctioned by the Bureau of Labor Statistics, U.S. Department of Labor, at the time of their calculation, and were used for fund allocation purposes. The official estimates are the result of producing Handbook estimates and then adjusting them to be consistent with the Current Population Survey estimate for the State. The size of these adjustments varies significantly from month to month. Moreover, the official procedure and thereby the official estimates are frequently revised and these revisions apply to extended portions of the historical series. (In fact, this particular set of data will be revised shortly.) The reader should compare the official estimates with the unofficial which follow in the next section. For a more detailed discussion of the estimation process see A Guide to Employment and Unemployment Statistics, soon to be published by the Research and Statistical Services Office, Minnesota Department of Economic Security, 390 N. Robert Street, St. Paul, MN 55101.

UNOFFICIAL (UNADJUSTED) MINNESOTA LABOR FORCE ESTIMATES: 1966-1976

Note:

Labor Force estimates count employment and unemployment on a person (not positions, or jobs) by place of residence basis. This is in distinction to the work force estimate in which employment is a count of jobs based on the employer's location.

These unofficial estimates are those produced using the Handbook method only. The Handbook method is the basis of the official estimates as well, but the adjustments required to produce them are not applied in the unofficial estimates. Furthermore, the unofficial labor force estimates are revised less frequently and hence the historical series shifts less from year to year. Many analysts and planners may therefore find these unofficial estimates to be more useful for trend and comparative analysis.

For further information on the Handbook method which underlies these estimates, see A Guide to Employment and Unemployment Statistics, soon to be published by the Research and Statistical Services Office, Minnesota Department of Economic Security, 390 North Robert Street, St. Paul, MN 55101.

MINNESOTA WORK FORCE ESTIMATES: 1966-1974

Note:

Work force estimates count unemployment on a worker by place of residence basis but employment on a job, or position, basis with location determined by place of employment. This is in contrast to labor force estimates in which both employment and unemployment are based on the number of persons grouped by their place of residence. The work force estimation process predated that of the labor force and was the basis of official estimates prior to 1974.

The process by which these estimates are produced is essentially that of the Handbook method. Readers who wish further information about the Handbook method should read A Guide to Employment and Unemployment Statistics, soon to be published by the Research and Statistical Services Office, Minnesota Department of Economic Security, 390 N. Robert Street, St. Paul, MN 55101.
