EXPANSION REPORT

Introduction

Report Number 16 outlines the methodology followed by the Institute of Outdoor Recreation and Tourism to arrive at the figures in the tables included herein. Briefly, the telephone administered questionnaire yielded responses to questions about the respondents and respondents' family's recreation occasions on 31 different activities during one week recall periods spread through the season. The survey tabulated the frequency of occasions by activity type by region of origin and region of occurrence. The task then was to "clean" the data, expand the weekly totals to seasonal totals, then estimate the population parameter from the sample statistic.

Confidence Intervals

Anytime such an expansion is performed, there exists a possibility that the population estimate is not the true value of the population. Confidence intervals are calculated to determine at a particular level of chance the likelihood that the true population parameter lies between some value above the estimate and some value below the estimate. In consultation with representatives from the Minnesota Department of Natural Resources, IORT has calculated the confidence intervals at the 75 percent level. Hence, in the expansion tables which follow, activity occasions are presented in pairs. The upper number is an estimate of the population parameter, the expanded number of activity occasions generated by the residents of a region and occurring in some region. The lower number is the confidence interval for the estimate at the 75 percent level of confidence.

The following numbers should be interpreted as follows:

12,503
4,188

The best estimate of the total activity occasions generated by residents of a given region occurring in a given region based upon our sample expanded to the population level is 12,503. And, we are 75 percent certain that the true population parameter lies between 16,691 and 8,315 or 12,503 plus 4,188 and 12,503 minus 4,188.

Interpreting Tabulated Values

The tables which follow are presented by activity and show the region of residence for the recreator on the horizontal axis. On the vertical axis or reading down the page, the regions where the activity occasions occurred are listed. There are 13 columns across the table excluding the last column of row totals. These 13 columns represent the 13 regions of origin for activity occasions. There are 14 rows excluding the last row for column totals. The first 13 rows represent the 13 regions where activity occasions occur. The 14th row is an out-of-state category. If the following pair of numbers was found in column 1 row 14, it would be interpreted as follows:

6167
167

An estimated 6167 activity occasions generated by region I residents occurred at out-of-state locations. And, we are 75% confident that the true population parameter (number of activity occasions) is somewhere between 6,000 and 6,334.

The column totals are listed below the table and represent an estimate of the total activity occasions generated by a given region's residents. By contrast the row totals found on the right hand margin are listed in pairs. The upper number is, of course, the sum of the activity occasions

occurring in a given region. The lower number is the sum of the confidence intervals about each estimate for activity occasions occurring in a given region regardless of the region of origin of the recreators.

Casual examination of the tables, indeed a quick look at the first table, should elicit a response like, "There are a lot of zeros! What does it mean?" There are a lot of zeros. But first, one should not interpret the lower zero to imply that we are 75 percent certain that the true activity occasions for any given "zero" cell is zero. In point of fact, no confidence interval can be calculated as there are no observations in the sample upon which an estimate can be made, hence, the zero response. If the sample size were to approach the population size, we would undoubtedly find some activity occasions generated by the residents of a given region in many of the other regions. One should correctly interpret the zero response to mean that the frequency of activity occasions was so small that none was included in the sample.

However, the sample size was sufficient to discover the several largest regions of occurrence for a given region of residence. A more subtle review of the tables will show that home region activity occasions are by far the most frequent. As they appear often in the sample, the confidence intervals about the estimates are "tighter" indicating a more precise estimate for home region activity estimates than for activity occasions "exported" to another region.

The tables in this report are presented in pairs. Thus far, our discussion has focused on the first type of table. That type deals with the actual numbers of activity occasions. The second type of table lists the percentage of the total recreation occasions occurring in a given region which were generated by residents of that region. This is the upper of the pair of numbers. For example, one would interpret

the pair of numbers from the second table as follows:

100.0
75.0

If the pair appeared in column two row two, the upper number would indicate that 100% of the participation in activity X taking place in region 2 is by region 2 residents. The lower number would indicate for the same activity that 75% of the total participation occasions generated by region two residents occurred in the home region (region 2). Therefore, 25% of the occasions done by region 2 residents took place in other regions or out-of-state. Hence, for this activity in this region there was a definite home-to-home recreation preference.

The home-to-home recreation preference is perhaps one of the more interesting results of this study. In fact, it is unusual to find an activity in any region, where less than 70% of the region's participation is accounted for by the region's residents. Perhaps the activities and regions in which a high percentage of non-resident recreation exists would warrant additional investigation.

An attempt was made to distribute the activity occasions on a smaller than a region-by-region level. The county-to-county level of aggregation proved meaningless, however, because the sample size was insufficient to provide significant results. We would suggest that for those activities and regions that indicate a very high level of recreation, additional study, perhaps on site data collection, could be warranted.
