Agricultural Placements	15,505	-12.3%
Obtained Employment	16,851	+4.4%

JOB SERVICE COMMENTARY

A review of the Job Service data reveals a gradual decline in activity occurred during a year of good overall economic conditions. This has been the situation since shortly after the recovery from recessionary conditions earlier in the decade.

The point to be made is that Job Service is changing gradually in response to altered conditions in the State's economy. Most of the reasons for the decreased activity levels generated by the area offices have been stated in the monthly publications. First is the aforementioned good economic conditions. Minnesota currently has a very low unemployment rate. High employment means that there are fewer unemployed people filing applications with Job Service. Coupled with this is the ageing of the population. There are fewer youth now to fill entry level positions. Businesses have come to rely upon teenagers as a source of low wage employees and with a decline in the number of youth there is keen competition for these workers. This has pushed up wages for young unskilled workers and made job hunting easier for them. They are not using Job Service facilities. The number of new applications for youth under 22 years of age fell 10.4 percent from the previous year.

Another reason for the decline in new applications is the proliferation of temporary help agencies. In a short period of time these agencies have spread from large metropolitan areas into many of the medium sized communities in Minnesota. Their continued expansion is a measure of their success. Many businesses feel they offer several advantages such as supplying workers with specialized skills, quick response to employers needs, little hassle in removing an unsatisfactory worker, and no problems if cutbacks in production require layoffs. In the latter situation the business using the temporary agency is not charged for unemployment benefits on the workers released.

Drought during 1988 also played a role in the activities during the summer. Conditions became serious towards the end of June and affected placements in agriculture. Job Service has been gradually losing agricultural placements in normal years as many of the short-term jobs such as corn detasseling are eliminated through mechanization, but the very dry summer affected placements even more. Youth placements in agricultural jobs declined by 15.4 percent.

Finally, budget restrictions have forced management to cut staff and consolidate locations. The closing of several small outstate locations in recent years, and attempts to maximize output from staff with such measures as group intake on certain days of the week have caused some difficulties for persons who must travel any distance to reach an area office.

New applications have gradually declined during the 1980's. The highest total was 259,207 new applications in 1980. By 1986 the yearly count had fallen under 200,000 new applications for the first time since 1977, and only the second time since 1972. Since then both 1987 and 1988 have shown

declines. Calendar Year 1988 had the smallest number of new applications since 1959. In contrast to this decline, the labor force in Minnesota has been steadily increasing. Since 1977, the last year with under 200,000 new applications, the labor force has risen by 21.9 percent. Since 1972 the increase has been 36.6 percent.

There are many local variations by area offices from the overall statewide picture. The Minneapolis - St. Paul metropolitan area supplied over a third of the individuals who registered as new applicants during 1988 (37.5 percent), but the decrease from the prior year was greater than in the outstate areas. This was especially true in the East Metro District where St. Paul Central offices' new applications declined by 42.0 percent. This was partially offset by an increase in the Fridley office of 13.8 percent. In reviewing the changing character of the new applications in the East Metro District, the number of registrants who were unemployment insurance claimants rose 2.8 percent despite an overall decline of 9.7 percent in applications. The St. Paul Central office had a 52.2 percent decrease of new applications who were UI claimants, offset by an increase at the Fridley office of 138.6 percent. The increase in new applicants who were UI claimants is unique to the East Metro District. Statewide UI claimants filing new applications declined by 12.3 percent from last year.

In contrast to the subsiding yearly totals of new applications, counts for new partial applications have been relatively stable during the 1980's. The difference between a new application and a new partial application is mainly that the new application is assigned an occupational code whereas the partial applicant registration is not. In 1980 new partial applications totaled 20,837. The highest yearly figure since then was 26,915 in 1984. The lowest total was last year in Calendar Year 1987. This year's figure is in the middle of the range for the 1980's.

New partials are hard to analyze by area office because area office managers differ in opinion as to their value. Some office managers prefer to keep partial new applications to a minimum, recording full applications whenever possible. Other managers make greater use of the partial application. As managers are transferred between locations, partial new applications from an individual office may vary greatly from one year to the next. Examples of differing office policy are Bloomington, where few new partial applications are transacted, and North St. Paul, which uses the activity more broadly. North St. Paul recorded 1,587 partial new applications this year, but only 242 in 1987. In 1986 the North St. Paul office had 1,148 partial new applications. A spokesperson for the office said that last year there was no summer youth activity. Youth are one of the major groups not given occupational codes because they may not have a work history. The other main reason for partial new applications is in cases where applicants wish to apply at only one employer during a mass hiring. These applicants may all be given a partial occupational code for the job classification that the employer is hiring for.

Several of the intake activities such as counseling interviews, referrals to supportive services, and partial new applications are mainly from the Metro districts. For partial new applications 69.8 percent of all transactions were from the Minneapolis - St. Paul metropolitan area, mainly the East Metro District. Almost 84 percent of all counseling

interviews were from the Metro area, and 67 percent of all referrals to supportive services were from there.

Changing conditions in parts of Minnesota resulted in large activity shifts between offices. Counseling interviews showed a large decline in the Northeast District. Duluth, Hibbing and Virginia all had declines. These were the offices which last year had shown a fair number of counseling interviews, dealing mainly with mining applicants who were male, caucasian, veterans, 45 or older and claiming unemployment insurance benefits.

Another activity with large changes in individual office activities was referrals to supportive services. The East Metro District had almost half (49.6 percent) of all transactions for the State. Outstate, Detroit Lakes, Fairmont, New Ulm, North Shore and Virginia all had large declines, while Fergus Falls and Willmar rose. Willmar had an increase over last year of 102.8 percent.

Testing has been maintaining a relatively stable level during the 1980's. Area office totals for this activity may vary by year due to employer requests for tested applicants, but statewide the number of tests administered declined only slightly from last year. In the Metro area testing increased by 18.4 percent. Counts rose for North St. Paul, Bloomington, Crystal, and Minnetonka, and declined for Minneapolis. International Falls, working with a large local employer, went from 19 tests given in 1987, to 712 this year.

Of all the intake activities, training enrollments is the smallest. This activity is so minor that it is not published on a monthly basis. Only 806 enrollments in training were made this year, down 27.3 percent from last year. Several offices which did enroll people in training had large changes compared to 1987. Outstate offices in Brainerd, Crookston, St. Cloud, Thief River Falls and Virginia all showed declines. Fridley and the St. Paul Guidance and Training Center had increases.

Levels of placement activities varied as greatly as did the intake activities. This is readily apparent in the activity counts for 1988. The number of job openings received rose by 4.8 percent, nonagricultural referrals rose by 10.2 percent at the same time, yet placements fell from the previous year. The increase in job openings received is all in the nonagricultural sector. Agricultural job openings received declined by 10.2 percent. Much of the decline can be blamed on adverse weather conditions which affected farmers. The drought this summer did affect many crops. However, it did not affect agricultural job openings listed through Job Service as severely as the general farm labor population. The reason that the decrease was not greater than it was, is because many of the jobs that Job Service filled involved crops that were not deeply affected by the drought due to extensive irrigation, or because some job orders for migrant labor were filled before July when the dry weather took control. Declines in agricultural openings were for workers normally used in field crops such as soybeans and corn, and the declines occurred after June.

During 1988 nonagricultural referrals rose in all districts except the East Metro District. Nonagricultural referrals at the St. Paul Midway office fell by 25.7 percent and at the Martin Luther King office by 44.5 percent. Increases at other East Metro offices were not enough to offset these declines and overall nonagricultural referrals fell by 2.8 percent in the East Metro District.

Nonagricultural placements increased in much of the outstate area. The Northeast District had an increase of 14.5 percent, followed by the Central District with 6.6 percent, and the Northwest District with 3.2 percent. However, the South District declined by 2.3 percent and the Metro area declined by 10.3 percent. The East Metro District registered the largest overall decline at 14.1 percent. The St. Paul Midway office had 29.3 percent fewer nonagricultural placements from the prior year, and the Martin Luther King office dropped by 40.4 percent.

Of as much interest as job placements is the quality of those placements. On page 7 is a graph of placements by starting wage. Job Services still fills many entry level or lower paying jobs. Field personnel state that one of the problems faced, and a cause for declining placements, is the poor quality of many of the job openings registered with Job Service. Employers place orders for the jobs they are having trouble filling, for reasons of low pay, split shifts, poor transportation, or bad working conditions. With the ageing of the population a higher percentage of job applicants are older, with families, educated and experienced, who refuse to accept these jobs.

Job service placements by duration show that 46.2 percent of all placements are over 150 days in duration, 31.4 percent are for jobs of 4 to 150 days of work, and 22.4 percent are for less than 4 days of work. This must be broken into agricultural and nonagricultural placements. Nonagricultural placements accounted for 81.8 percent of all Job Service placements during 1988. For these placements, 55.4 percent were long-term duration, 26.7 percent were 4 to 150 days of work and only 17.9 percent were for 4 days or less (such as casual labor for snow shoveling, yard work, etc.). The picture for agricultural placements is different. Long term placements were only 4.1 percent of the total. Summer work of 4 to 150 days was 53.1 percent and short-term duration was 42.8 percent of agricultural placements.

Obtained employment has stabilized with consistent reporting practices over the past two years. This transaction is of applicants finding work on their own within 90 days of receiving some Job Service assistance other than job referrals.

The Work Incentive Program, (WIN), which was to have expired, has received another reprieve. Funding is set at close to Fiscal Year 1988 levels and will run through Fiscal Year 1989, ending September 30, 1989. Tables for WIN activities are on pages 49 - 60.

NOTE: The number of nonagricultural openings received during 1987 has been adjusted downwards. In last year's publication we acknowledged that the figure from the Willmar area (Huthinson office) was too high, but the extent of the adjustment needed was unknown at the end of Calendar Year 1987. Subsequent activities by the Hutchinson office affirmed that the adjustment should decrease job openings in benchwork occupations by 3,500. This is the figure used to reduce the 1987 totals for job openings received and openings unfilled.

UNEMPLOYMENT INSURANCE COMMENTARY

Unemployment insurance activities followed a normal pattern in 1988. There were no drastic events to alter activity levels. Still, due to good economic conditions, virtually all activities declined from last year.

Initial claims are a general indicator of layoffs occurring. Initial claims were 5.6 percent below last year's figure. The graph of monthly initial claims totals on page 66 illustrates the monthly counts in comparison to 1987. By area, all of the outstate districts had declines. The greatest change was in the Northeast District, which had a drop of 14.5 percent from 1987. This was followed by the 11.2 percent decline in the South District. The Metro area was at the same level as last year, declining only 0.5 percent. Most of the West Metro offices showed some decline in initial claims. The addition of the Crystal office has taken some of the activity from the other locations. As with Job Service activities, the UI activity levels have fallen in the St. Paul Midway area. Initial claims in that section of St. Paul are down 37 percent from last year. This had been counterbalanced by increases in the North St. Paul and West St. Paul areas. The West St. Paul office opened a UI office in the latter part of 1987, so the 1988 totals are much higher with twelve months of activities. In the West St. Paul area initial claims increased by 197.1 percent from the 1987 count.

The above comments about the Metro offices initial claims also hold true for all the UI activities. Totals are down in the St. Paul Midway area, compensated for by increases in the North St. Paul and West St. Paul areas. The Crystal office has caused a decline elsewhere in the Metropolitan area by taking some of the activity, as did the opening of the West St. Paul office in 1987. Overall, Metro area figures are close to the 1987 counts.

Calendar Year 1988 is the second year in which breakouts of initial claims by industry are available. The table on page 67 shows totals of initial claims for major industry groups and detailed subsets which had significant numbers of initial claims. The totals show construction and manufacturing to be sources of the largest numbers of initial claims, with 30.7 percent and 26.4 percent of the total respectively. Combined, the two industries accounted for over half of all initial claims, (57.1 percent). The next two industries in size of initial claims were much smaller. Services had 15.3 percent and trade had 14.5 percent of the total. Initial claims from mining were only 0.9 percent of the total, down from 1.5 percent of the State total last year.

A new addition to this year's publication is a table showing weeks claimed by industry. A comparison of weeks claimed to initial claims does not show many shifts, but there are minor differences by industry between the numbers of initial claims and weeks claimed. Trade had 14.4 percent of initial claims with 15.2 percent of weeks claimed. Finance, insurance and real estate had 2.5 percent of initial claims, but 3.8 percent of weeks claimed. On the other hand manufacturing, with 26.4 percent of initial claims, had only 21.4 percent of the weeks claimed.

The seasonality of unemployment insurance activity levels is apparent in the graphics on page 66 concerning initial claims and weeks claimed, and the quarterly totals on the bottoms of the tables on pages 67 and 68. The initial claims are greatest in the fourth quarter of the year, leading to the large number of weeks claimed in the first quarter of the next year. Initial claims in the fourth quarter of 1987 were 31.4 percent of the year's total. Weeks claimed in the first quarter of 1988 were 39.1 percent of this year's count. Now the fourth quarter initial claim figure is 33.2 percent of the current years' total.

New legislation is now in effect concerning unemployment compensation. In the past, the law placed the maximum weekly benefit at 66 2/3 percent of the average weekly wage. Now the percentage of the average weekly wage used to determine the maximum weekly benefit is pegged to the status of the UI fund balance at the end of the previous calendar year. As of December 31, 1988, the balance of the Unemployment Fund was 263.7 million dollars. Because the end-of-year balance exceeded \$250 million, the maximum weekly benefit payment effective July 1, 1989 through June 30, 1990 will be 62 percent of the average weekly wage. The higher the year end UI fund balance, the lower the percentage used to determine the maximum weekly benefit amount.

NOTE: The Minnesota monthly unemployment rates are now being calculated using a new methodology. The new method uses variable coefficient regression models to increase accuracy. This causes more sensitivity in monthly adjustments and less seasonality due to unresponsive estimating techniques than the old building block approach. The first public use of this new methodology is for the January 1989 calculations, but previous monthly rates for Minnesota have been revised backwards to the beginning of 1978.

Substate estimates continue to be calculated using the previous methodology. However, revised Mpls. - St. Paul MSA monthly rates for 1988 based on the total state figures have shown significant changes. This series will also be revised from 1978 to 1989, but only 1988 has so far been completed.

* The MSA has been defined to include St. Croix County in Wisconsin and Isanti County in Minnesota, as well as Anoka, Carver, Chisago, Dakota, Hennepin, Ramsey, Scott, Washington and Wright Counties in Minnesota. This change began with January 1985.
