Ground Water Observation Well Network Annual Report, Water Year 1992

Introduction

Monitoring of ground water levels has been a cooperative effort of the Department of Natural Resources (DNR) and the U.S. Geological Survey (USGS) since 1947. The DNR Division of Waters maintains the present observation well (obwell) network of 640 wells. In the 1992 water year (WY92), which began October 1991 and ended September 1992, 609 obwells were measured by Soil and Water Conservation Districts (SWCD's) and 31 obwells were measured by the USGS.

The DNR obwell network was developed to record background water levels in areas of present or expected ground water use. These data are used to assess ground water resources, interpret impacts of pumping and climate, plan for water conservation, evaluate local water complaints and otherwise provide for management of the resource.

Aquifers

An aquifer is a geologic formation which is saturated and sufficiently permeable to transmit economic quantities of water to wells and springs. Aquifers may exist under either unconfined or confined conditions (Figure 1).

Unconfined Aquifers - In an unconfined aquifer, the ground water surface that separates the unsaturated and saturated zones is called the water table. The water table is exposed to the

atmosphere through openings in the unsaturated geologic materials. Unconfined aquifers may also be called water table aquifers.

Confined Aquifers - When the aquifer is separated from the ground surface and atmosphere by an impermeable material, the aquifer is confined. The water in a confined aquifer is under pressure. When a well is installed into a confined aquifer, the water level in the well casing rises above the top of the aquifer.

An unconfined aquifer generally responds more quickly to seasonal climatic changes than a confined aquifer since the water table has more direct interaction with the surface. However, the magnitude of change in water levels will usually be more pronounced in a confined aquifer.

Statewide Summary

This section discusses the ground water levels in unconfined aquifers and in confined aquifers during WY92 and compares them with average levels. Figure 2 illustrates the location of the obwells statewide. Figures 3, 4, and 5 illustrate the location of the obwells in each of the three groups discussed in this section: unconfined, buried artesian and bedrock aquifer.

fers. Figures 6-11 indicate the location of obwells in each aquifer type by DNR regions. Index obwells were selected based on length of record and best geographical representation for a region. Water level measurements for the index obwells were averaged for the entire

current water year, then compared to the average water level for the period of record for the well. Table 1 contains the statistics for the index obwells in each aquifer. The statistics included are: the index obwells' WY91 average water level along with the standard deviation, the index obwells' WY92 average water level along with the standard deviation, and the average water levels for the index obwells' period of record along with the standard deviation. Figure 12 contains a graphical representation of Table 1. The representation of ± 1 standard deviation encompasses 2/3 of all water level measurements made on that obwell for the period of record. This gives a statistical representation of the water levels taken on that obwell. No analysis has been done on the possible effects on obwells from nearby pumping wells.

Unconfined Aquifers

Unconfined aquifers are monitored throughout the state (Figure 3). Water levels in the index obwells for unconfined aquifers are generally up from last year but range from below average in the northwest to at or above average in northeast, metro, southwest and central areas. Hydrographs for selected unconfined aquifers are shown in Figure 13.

Approximately half of the index obwells in unconfined aquifers contained in this report have a total period of record in excess of 20 years. Only a few have records less than three years.

Confined Aquifers - Buried Artesian

Figure 4 shows the distribution of buried artesian aquifers in unconsolidated deposits in the state. Hydrographs for selected confined aquifers are shown in Figure 14.

Water levels in index obwells in the buried artesian aquifers are up from last year in the central, southwest, and metro areas and down from last year in the northeast and northwest. When compared to the average water levels of these obwells, index obwells are generally above average in the southwest and below to considerably below average in the rest of the state. The northwest index obwells have the largest deviation from average (7-10 feet below) and from last year (0.5-2 feet below).

Bedrock Aquifers

Bedrock aquifers are monitored only in the central and south-southeast portions of the state where they are the aquifers most often used for water supply (Figure 5). Most of the bedrock aquifers monitored by obwells are confined, although bedrock aquifers may be either confined or unconfined. Figure 14 shows hydrographs for bedrock obwells.

The Mt. Simon aquifer in central Minnesota is monitored by a series of obwells stretching from McLeod to Chisago Counties. These obwells have been monitored for periods ranging from 15 to 25 years. The Mt. Simon index obwells water levels were all generally up from last year and at or slightly above average. However, one index obwell in Scott County (70002), with 22 years of record, showed a water level approximately 1 foot below last year's level and 31.06 feet below the average water level. This particular obwell may be affected by nearby pumping.

The Prairie du Chien/Jordan aquifer is monitored in the Metro area and in a few counties southeast of the Twin Cities. In the Southeast, index levels were at or slightly above last

year's levels and at or slightly above the average water level. In the Metro area, index levels were generally down from last year (0.5-13 feet) and slightly to considerably below the average water levels. Since there are relatively few obwells monitored, care should be taken in using these data.

In the Metro area, water levels in bedrock aquifers are strongly influenced by seasonal pumping for air conditioning and irrigation. Levels in obwells decline sharply at the start of the pumping season (May), continue to decline until the end of the pumping season (late August) and then generally recover to pre-pumping levels by mid-autumn. Short-term fluctuations in climate are usually not evident in the water levels of these obwells. The fluctuations are masked by extensive pumping and by the length of time between a change in aquifer recharge and the expression of that change in confined water levels. The lowest levels occur in late summer at the end of the air conditioning season. This is in contrast to unconfined aquifers where drought or precipitation excess can be seen as water level changes in the same year.

The Sioux Quartzite, the Cedar Valley Limestone, the Galena Formation, the Biwabik Iron Formation and other bedrock aquifers are monitored on a limited basis. The data tables presented in this summary should be consulted for these obwells.

Expansion

The observation well network is expanded, when appropriate, by drilling of new obwells or by acquisition of existing obwells. The intent of the program expansion is to place observation wells in areas of present or anticipated high ground water use or where little data exist. New obwells may be drilled into aquifers where suitable existing wells cannot be found. Existing wells can qualify for addition to the network if the following criteria are met:

- An observation well must have a geologic record and well construction data which identifies the aquifer monitored.
- An observation well must not be a multi-aquifer well.

Objectives

- An observation well is not a pumping well. Where irrigation wells are used, measurements are recorded only in non-pumping months.

- An observation well should be less than 25 years old and less than 6" in diameter.

- An observation well must pass a slug test to determine whether it is in hydrologic communication with the aquifer.

Seventeen obwells were added to the network during WY92. New obwells are located in Chisago, Clay, Dakota, Houston, Pipestone, Ramsey, Rock, and Wadena Counties. Of these obwells, 9 were existing wells and 8 were newly drilled.

Ten obwells were removed from the network this water year in Clay, Dakota, Hennepin, Hubbard, Isanti, Jackson, Pine, Swift and Wadena Counties. Of the obwells lost, three were replaced by newly drilled obwells. The others were either sealed or their use discontinued for other reasons.

Therefore, the network gained a total of seven obwells in WY92.

The overall objective of the observation well network is to collect baseline data on ground water level fluctuations and trends. These data are used to assess ground water resources, interpret impacts of pumping and climate, plan for water conservation, evaluate local water complaints and otherwise provide for the management of the resource.

This annual ground water level report is produced by the Division of Waters in the spring of each year. The annual report provides last water year's data. Also available from the Division of Waters is the publication "Understanding Ground Water Level Trends: A Key to Managing Water Use". That report provides an historical overview of ground water level trends throughout Minnesota.

Hydrographs for any obwell(s) can be obtained from the Observation Well Manager (address and telephone number below). Data for observation wells can be supplied on computer disks for use on PC's. These data are compatible with almost all spreadsheet and graphing programs. The combination will allow computer users to create and update their own hydrographs for obwells of interest.

The USGS has conducted many cooperative regional ground water studies in Minnesota. Half of the money for these studies is typically provided by the federal government through the USGS and the rest is paid by the state or local interests. Wells installed as part of the field data collection effort for these studies are often incorporated into the obwell network once the regional study is finalized.

If you have any questions about the ground water observation well network or wish to receive observation well data, please call or write:
