MINNESOTA PLANNING

is charged with developing a long-range plan for the state, stimulating public participation in Minnesota's future and coordinating public policy with state agencies, the Legislature and other units of government.

Minnesota's Changing Counties: The Next 30 Years was prepared by Martha McMurry with assistance from R. Thomas Gillaspy and David E. Birkholz, staff members of the State Demographer's Office in Minnesota Planning. The Minnesota Center for Health Statistics provided birth and death data. Computer programming was conducted by Peter Olson and report design was furnished by The Design Company.

Upon request, *Minnesota's Changing Counties: The Next 30 Years* will be made available in an alternate format such as Braille, large print or audio tape. For TDD, contact Minnesota Relay Service at 612-297-5353 or 1-800-627-3529.

The Next 30 Years 2
County Projections: 1990 to 2020 13
Regional and Metropolitan Projections 105

MINNESOTA'S CHANGING COUNTIES

Minnesota's Changing Counties contains population projections for Minnesota's counties, regions and metropolitan areas. Prepared by the Demographer's Office at Minnesota Planning, projections are made in five-year intervals for the next 30 years.

The first chapter of *Minnesota's Changing Counties* summarizes and maps future population trends for the state's 87 counties. Projections for the state's total population end the first chapter. Using easy-to-read tables, the second chapter contains future population trends for each of the state's 87 counties. The report concludes with projections for Minnesota's 13 development regions and metropolitan areas.

MINNESOTA'S CHANGING COUNTIES

THE NEXT 30 YEARS

By the year 2020:

- The majority of Minnesota's counties will have fewer people than in 1990.
- Elderly people will outnumber children in most areas of the state.
- Many of Minnesota's rural counties will have experienced at least 40 consecutive years of population decline.
- About 68 percent of Minnesotans will live in the Minneapolis-

St. Paul, Rochester, or St. Cloud metropolitan areas.

These are just a few of the changes projected for Minnesota counties over the next 30 years. Population projections by county are prepared once every 10 years by the Demographer's Office at Minnesota Planning. Based on the 1990 Census, these projections reflect trends that occurred in Minnesota between 1980 and 1990.

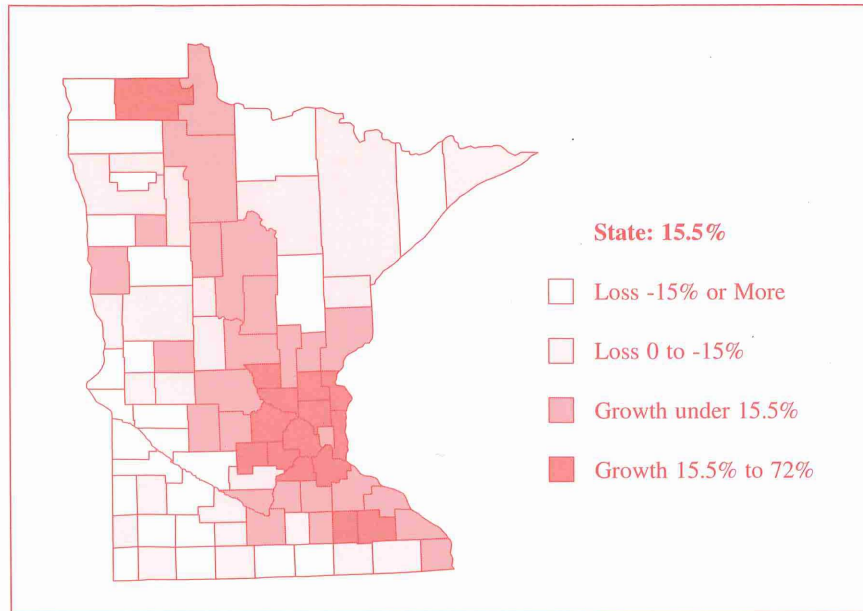

Minnesota's Changing Counties is the second of a four-part series on *The Next 30 Years*. The first publication, *A Changing Population*, dealt with statewide population trends by age, gender, race and ethnic origin. This volume deals with county-level population trends by age and gender. Future publications will include household and labor force projections.

death and migration are true. Accuracy of the projections depends on the accuracy of the underlying assumptions about these future rates.

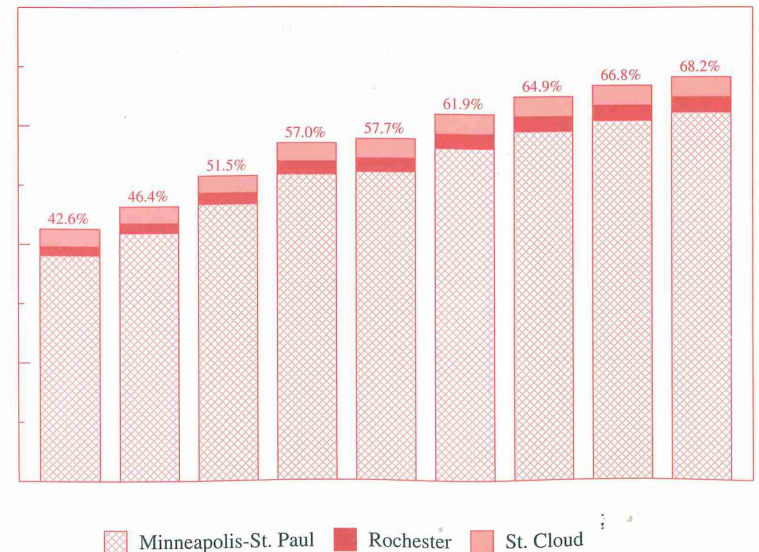

The total population in Minnesota is projected to have moderate growth of 15.5 percent in the next 30 years. Most of this growth will be concentrated in three major metropolitan areas: Minneapolis-St. Paul, St. Cloud, and Rochester. The fastest rates of population growth are projected for suburban counties in the

Population projections tell us what the population will be in the future if assumptions about rates of birth,

PROJECTED POPULATION CHANGE: 1990 TO 2020

PERCENT LIVING IN THREE METROPOLITAN AREAS

1940 to 1990: Census Data
2000 to 2020: Demographer's Office Projections

Twin Cities region. Increases are projected to be the highest in Sherburne (72 percent), Dakota (67 percent), Scott (53 percent) and Carver (51 percent) counties.

The majority of Minnesota's counties lost population in the 1980s, and this pattern is projected to continue. Between 1990 and 2020, 47 of the state's 87 counties are projected to lose population. This is similar to the 1980s, when 49 counties recorded losses. The highest rates of

population loss are projected for southwestern Minnesota. The largest individual population declines are projected for the counties of Lac Qui Parle and Swift (minus 27 percent), Big Stone (minus 26 percent) and Traverse (minus 25 percent). Northwestern and northeastern Minnesota also are expected to have substantial losses of population.

The counties with growth rates most similar to the state average of 15.5 percent will be McLeod (15.6 per-

cent), Isanti (16.7 percent), and Beltrami (13.6 percent) counties.

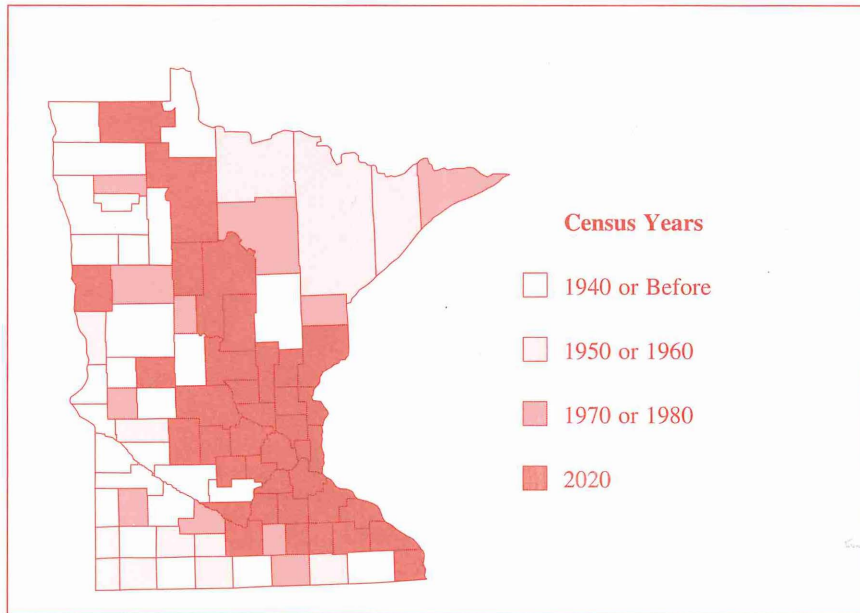

Minnesota's population is projected to become more concentrated in the St. Cloud-Twin Cities-Rochester corridor, with the greatest concentration in the Minneapolis-St. Paul metropolitan area. Over two-thirds of the state's population is expected to live in one of these three metropolitan areas in 2020, up from 56 percent in 1990. About 62 percent will live in the Minnesota portion of the Minnea-

polis-St. Paul metropolitan area. This 11-county area includes Anoka, Carver, Chisago, Dakota, Hennepin, Isanti, Ramsey, Scott, Sherburne, Washington and Wright counties.

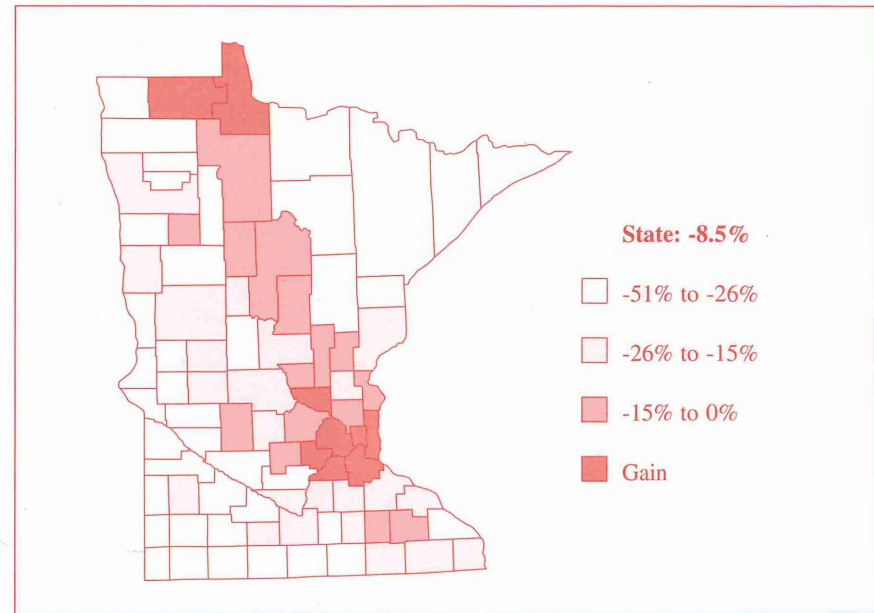

UNDERLYING ASSUMPTIONS

The long-run projections for Minnesota counties reflect underlying assumptions about how the economy will perform in different regions.

PEAK POPULATION YEAR: HISTORICAL AND PROJECTED

CHANGE IN NUMBER OF PEOPLE AGE 5-14: 1990 TO 2020

MINNESOTA'S CHANGING COUNTIES

These assumptions about economic trends affect the projections indirectly, in the form of assumptions about migration. The projections also reflect assumptions about fertility and mortality.

The projections assume that the St. Cloud-Twin Cities-Rochester corridor will remain the major center of economic activity in the state. The past decades have seen an increased centralization of population, income and employment in the Twin Cities.

St. Cloud and Rochester also have experienced strong growth.

In rural agricultural areas, large population losses will be produced by continued farm consolidation, an older population structure, and out-migration of young people.

Moderate population growth in the north central region will be driven partly by expanding industries, such as forest products, and partly by recreation and retirement.

No big economic comeback is foreseen for northeastern Minnesota, although the projections assume that future economic trends will not be as bad as in the 1980s.

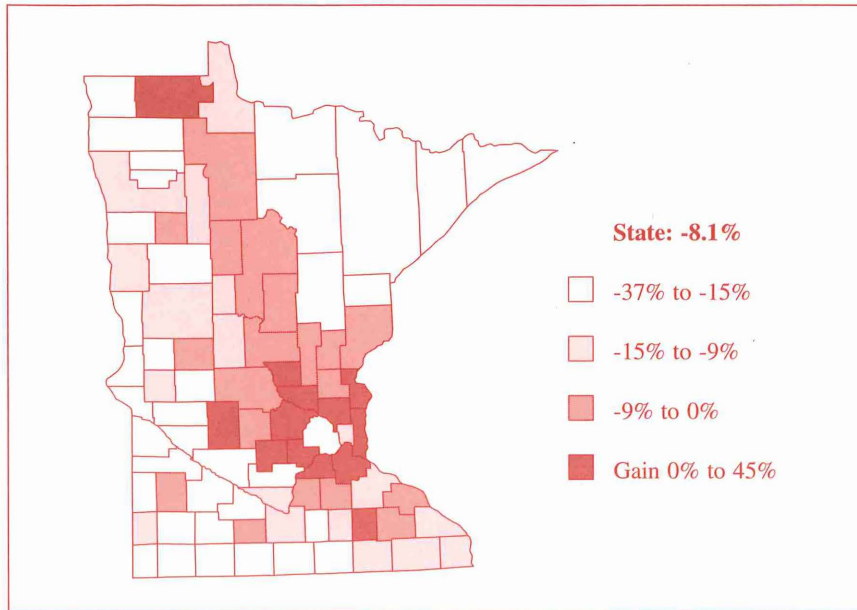

They are located in a band from southeastern Minnesota up through the Twin Cities and the north central part of the state.

The majority of Minnesota's counties, however, have already attained their population peak. Twenty-six counties reached their highest population levels in or before 1940. If the projections are correct, much of rural Minnesota will have seen 40 or more years of continuous population decline by 2020. These counties are

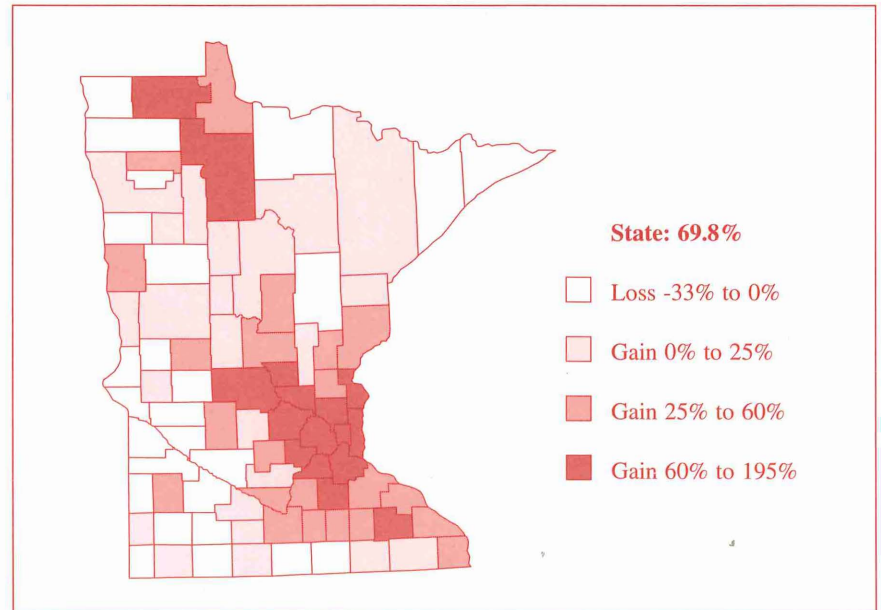

HISTORICAL TRENDS

The projections show that 38 of Minnesota's counties will reach their peak population level in or after the year 2020. These are the counties that are expected to continue to grow between

CHANGE IN NUMBER OF PEOPLE AGE 25-44: 1990 TO 2020

CHANGE IN NUMBER OF PEOPLE AGE 45-64: 1990 TO 2020

mostly located in the western part of the state and are heavily agricultural. The year 1940 was a population peak for many western Minnesota counties. One possible explanation for the population growth between 1930 and 1940 is that many people stayed in or returned to rural areas during the Depression of the 1930s because they were unable to find salaried employment in cities. Greater prosperity after World War II made urban living more attractive again.

Population in much of northeastern Minnesota peaked in the 1960-1980 period. This is partly attributable to fluctuations in the iron ore and taconite industry.

YOUNG AGE GROUPS

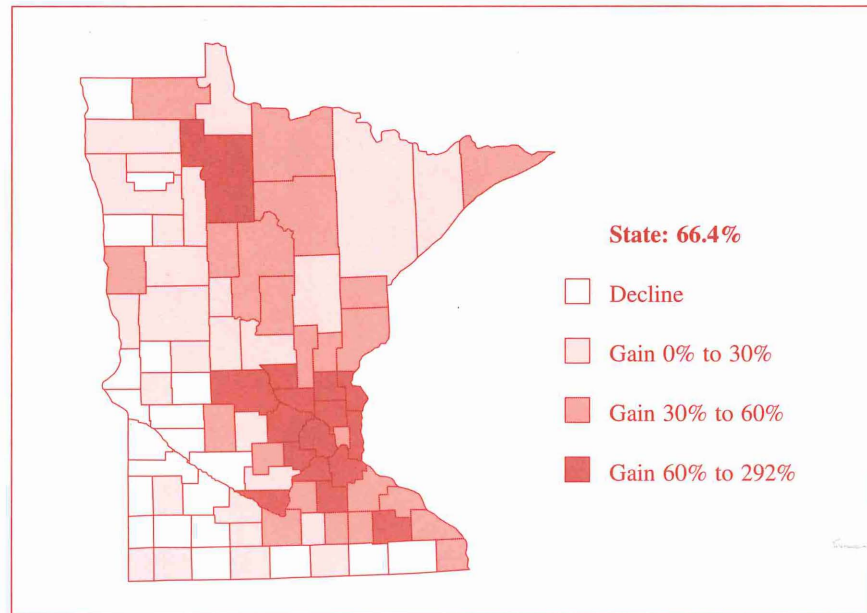

During the next 30 years, Minnesota is projected to have rapid population growth among people age 45 and over. The number of people under

age 45 is projected to decrease. As a rule, the county trends for specific age groups are projected to follow these statewide patterns, but the age trends will be modified by the overall county population trends. Areas with the greatest growth in overall population generally are expected to have the most growth – or the least decline – in each age group. Counties projected to have the greatest population declines also are projected to have the greatest losses –

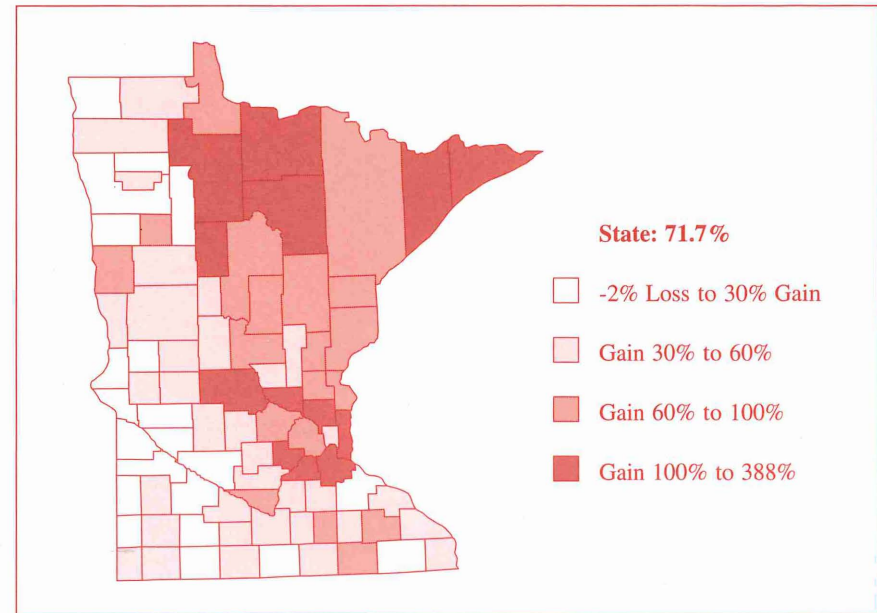

or the smallest gains – in individual age groups.

The number of children under age 5 is projected to decline about 11 percent statewide between 1990 and 2020. Only a few counties in the Twin Cities suburbs and north central Minnesota are projected to have growth in this age group. Especially large losses are anticipated in northeastern and southwestern areas.

CHANGE IN NUMBER OF PEOPLE AGE 65 AND OLDER: 1990 TO 2020

CHANGE IN NUMBER OF PEOPLE AGE 85 AND OLDER: 1990 TO 2020

MINNESOTA'S CHANGING COUNTIES

The number of 5- to 14-year-olds is projected to go down about 9 percent statewide. Only a handful of counties are expected to see an increase in this elementary and junior high age group. The counties with anticipated growth are in the Twin Cities and in Roseau and Lake of the Woods counties.

The number of people 15 to 24 years old will decline about 2 percent from 1990 to 2020. This is an age group with very high migration

rates. Many move to counties with college or university campuses. Most counties will show losses in this age group. Very fast-growing counties will see an increase.

WORKING-AGE POPULATION

Statewide, the number of 25- to 44-year olds is projected to drop 8 percent between the year 1990 and 2020. Only a few counties, mostly

in the Twin Cities area, will have gains. Large losses in this working-age population group will occur in northeastern and western Minnesota.

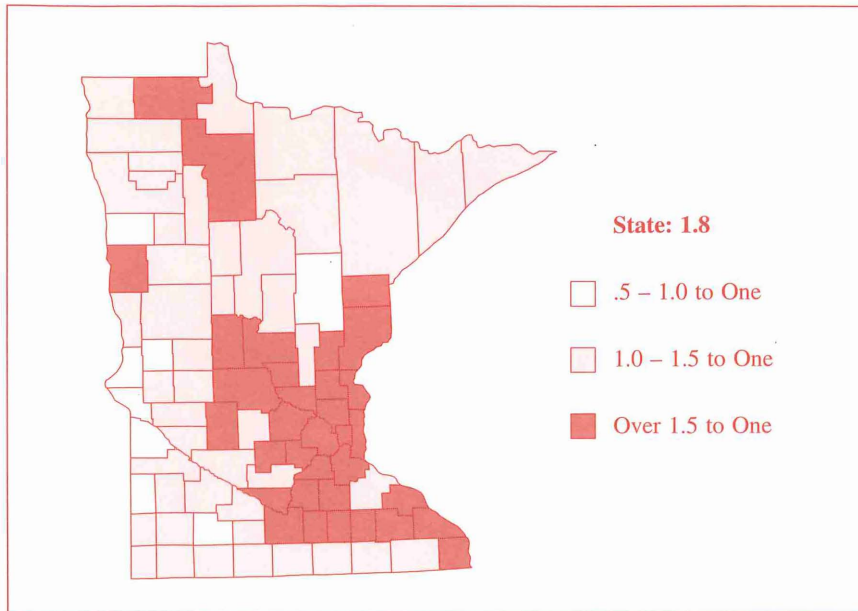

The number of 45- to 64-year-olds will show a huge increase of almost 70 percent during the next 30 years as many of the baby boomers move into this age bracket. The largest increases will occur in the St. Cloud-Twin Cities- Rochester corridor. A substantial minority of counties will have declines. Most of the counties

with declines are in western Minnesota.

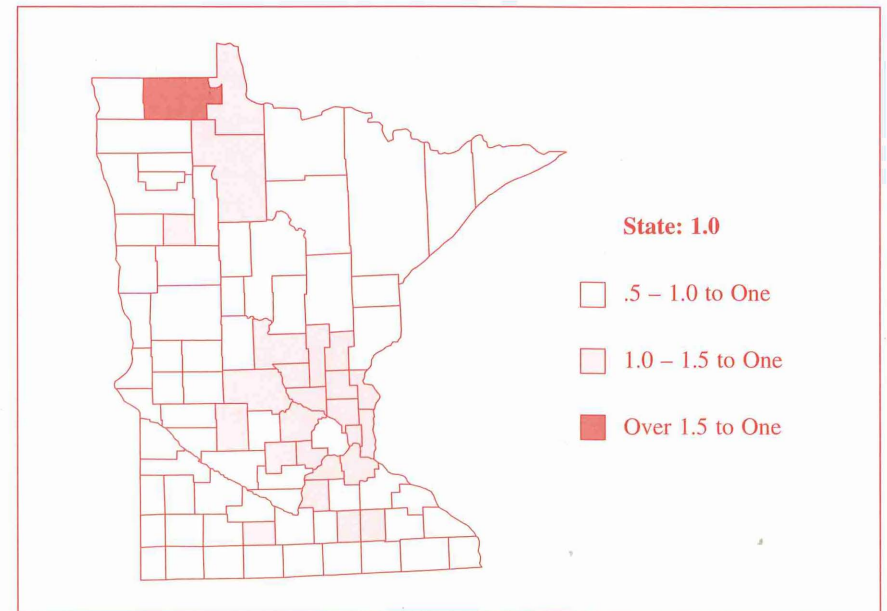

OLDER AGES

The number of people age 65 and older also will dramatically increase between 1990 and 2020. This retirement-age population is projected to grow 66 percent over the next three decades. The eastern half of the state, especially the Twin Cities area, will have the biggest increases.

RATIO OF CHILDREN TO ELDERLY: 1990

RATIO OF CHILDREN TO ELDERLY: 2020

In spite of the rapid statewide growth, many counties in southwestern Minnesota are projected to have declines in the population 65 and over. This reflects the low number of people in their 30s and 40s who are living there now.

The 85 and older population is another age group projected to show a dramatic gain over the coming thirty years. The statewide increase is projected to be 72 percent. The biggest increases are projected for the Twin

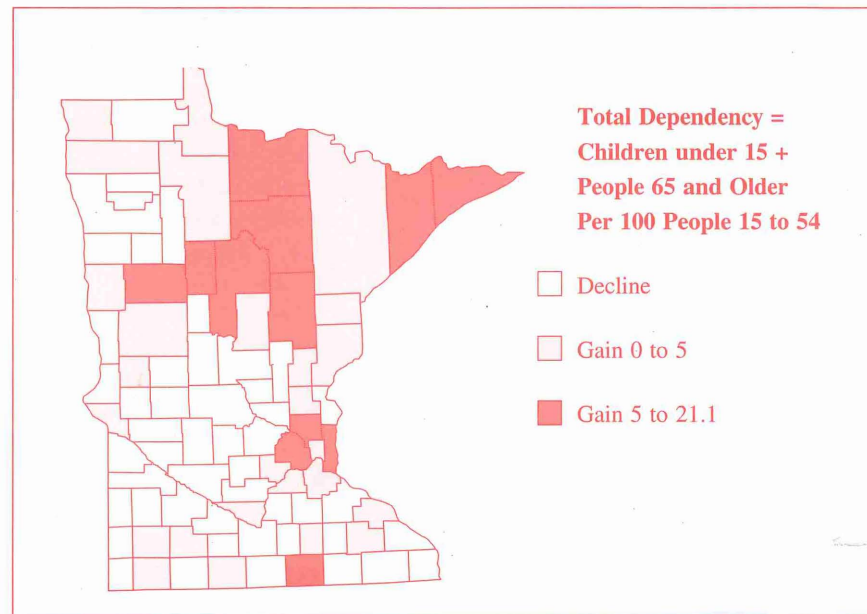

Cities suburbs and parts of northern Minnesota. Anoka County is projected to lead the way, with a gain of 388 percent in the number of people age 85 and older. The huge increase in the number of very old people in Anoka County and other suburban areas reflects the large number of people in their 50s and 60s who are living there now – people who moved to these growing suburban areas when they were in their 20s, 30s, or 40s.

Although the faster-growing metropolitan areas will have the greatest increase in the number of retirees, the highest concentrations of elderly people will continue to be found in rural areas, as they are now. By the year 2020, seven counties are projected to have 5 percent or more of their residents over age 85. A large additional number, principally in southwestern Minnesota, will have between 4 and 5 percent of their population over age 85.

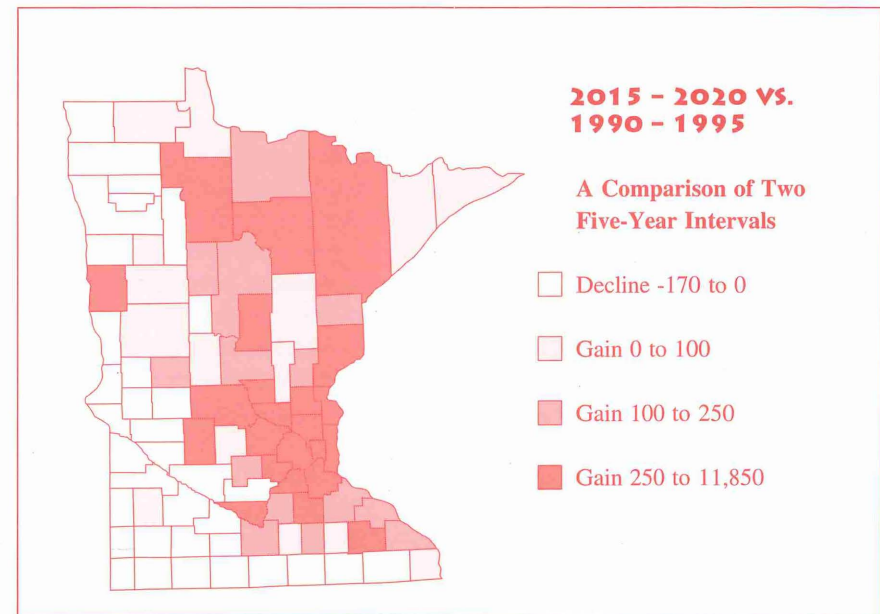

DEPENDENCY RATIOS

As the populations of different age groups change at different rates, the balance among these age groups will shift. One commonly used measure of the relationship between the working-age population and the economically dependent population is the dependency ratio. Higher dependency ratios mean there are large proportions of people who are too young or too old to work and who must be supported by the working

CHANGE IN TOTAL DEPENDENCY RATIO: 1990 TO 2020

PROJECTED CHANGE IN NUMBER OF DEATHS

MINNESOTA'S CHANGING COUNTIES

population. In Minnesota, the dependency burden will decrease until 2010 and then rise as baby boomers retire.

Among Minnesota counties, the Twin Cities area and northeastern Minnesota are projected to see increases in dependency ratios between 1990 and 2020. These increases are related to gains in elderly dependency, reflecting the rapid growth of the elderly population in these areas. Many areas will experience a decline in their depend-

ency ratios, however. Most of southwestern, central, and northwestern Minnesota are projected to have declining dependency ratios. This is mainly due to the projected decline in the number of older people in these areas.

Another way to look at the change in the relative size of different age groups is to look at the ratio of children to elderly people. These two groups have different needs and their political clout may vary based

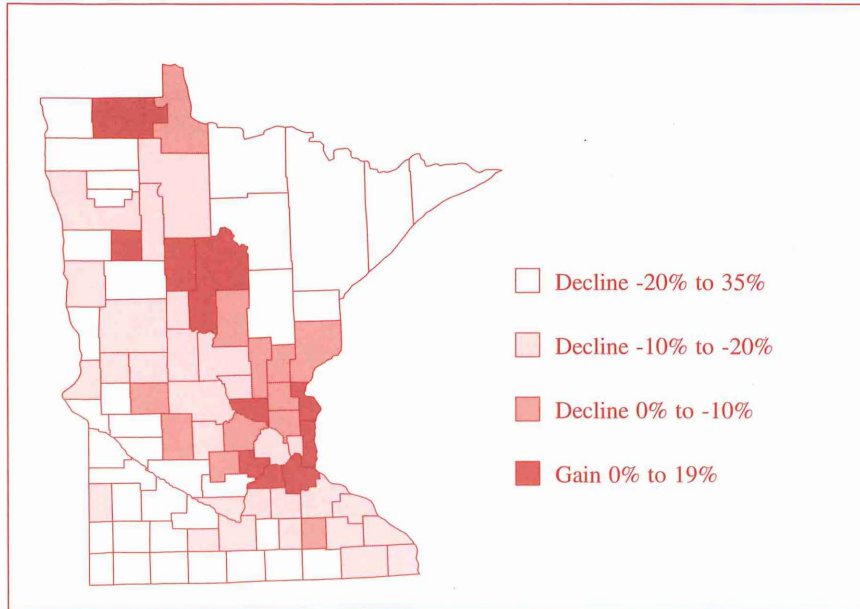

on their respective size. Given the rapid growth of the older population and the projected decline in the number of children, this ratio will change dramatically. In 1990 only a handful of counties had less than one child under age 15 per elderly person. By 2020 the vast majority will have ratios below this level. This could have policy implications for school bonding and other issues that pit the financial interests of elderly people against those of children.

BIRTHS, DEATHS, MIGRATION

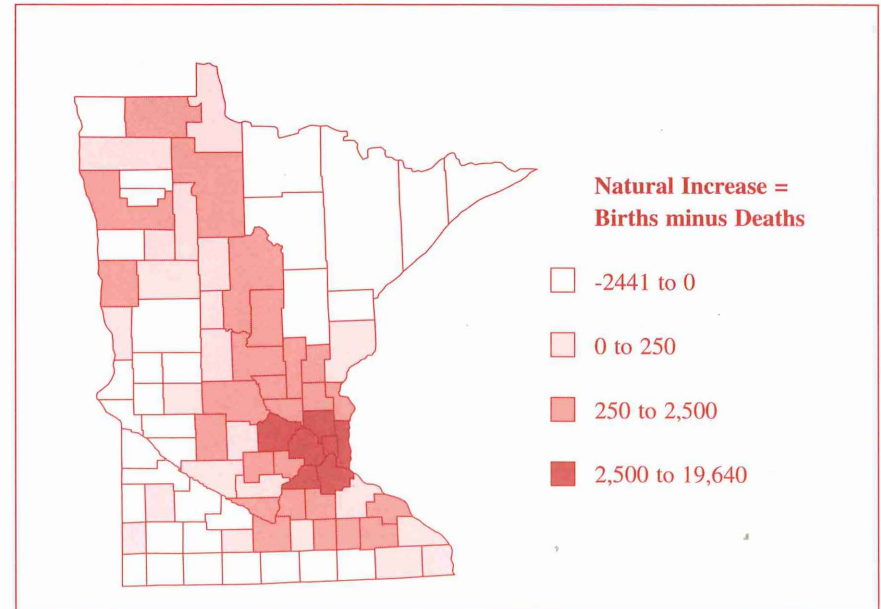

The major reason some counties are projected to grow faster than others is migration. Counties with the highest projected growth are those with the most projected in-migration. Those with the greatest losses are those with the most projected out-migration.

Besides migration, births and deaths are the other factors that produce population change. As Minnesota's

PROJECTED CHANGE IN NUMBER OF BIRTHS: 2019 VS. 1990

PROJECTED NATURAL INCREASE: 2015 TO 2020

population grows older, the number of deaths is expected to increase. Large increases in the number of deaths are projected for the Twin Cities-Rochester-St. Cloud region. The growing number of deaths is a function of the growing number of older people, not higher mortality rates. Mortality rates by age are projected to go down slightly in all parts of the state.

In much of western and southern Minnesota, the number of deaths is projected to go down over the next 30 years. This is because the older population is projected to drop.

The number of births is projected to decline in almost every county, with the largest declines in southwestern, northwestern and northeastern Minnesota. This reflects the projected decline in the number of women in their childbearing years. Fertility rates also are projected to decline slightly.

Given the projected trends in births and deaths, it is not surprising that the excess of births over deaths will decline between the year 1990 and 2020. The difference between births and deaths is referred to as natural increase. If deaths outnumber births in an area, that area is said to be experiencing natural decrease.

In 1991, 19 of Minnesota's counties experienced natural decrease. Most of these were in the southwestern part of the state. The number of counties with natural decrease is projected to increase substantially during the next 30 years. About 33 counties, mostly in southwestern and northeastern Minnesota, are projected to have more deaths than births by 2020.

FUTURE PROJECTION REPORTS

Minnesota's Changing Counties is the second in a four-part series of population projections. Future reports, to be released winter or spring 1994, will include projections for Minnesota's labor force and households. The size, age and sex of the state's labor force will be provided with the projected size of each county's labor force. Household projections will include information about the number and kind of households in the state and the number of households in each county. Released in August 1993, the first report, *A Changing Population*, contains statewide population projections by age, sex and race.

Copies of projection reports are available from Minnesota's Book-

store at 117 University Avenue, St. Paul, Minnesota 55155, 612-297-3000.

TECHNICAL NOTES: METHODOLOGY

The population projections presented in this publication were prepared using the cohort-component method. The 1990 Census population by county, age and sex was the starting point. Assumptions were made about the rates of mortality, fertility and migration during each five-year period. The population at the end of each time period reflects the expected number of survivors, births during the period, and additions or subtractions attributable to migration. The projected population then becomes the basis for the next cycle of projection calculations. County projections in each age-sex group were controlled to the state totals. Regional and metropolitan area projections were derived by adding up the counties in the region or metropolitan area. Metropolitan area definitions are those established by the federal Office of Management and Budget in 1992.

Statewide fertility, migration and mortality rates are taken from the statewide projections published earlier in *A Changing Population*. In

that publication, projections by race were added together to derive the state population totals. The formulas were then reversed to obtain the statewide rates that would give the same results found by adding the racial groups. Because of the differences in the bottom-up and top-down approach, the state population figures may differ very slightly from those in the previous publication. These differences should not be considered meaningful.

Mortality Assumptions: Survival rates were assumed to be constant across all counties of the state. The projections assume that survival rates will increase slightly between 1990 and 2020. Most of the improvement in survival rates will occur at older ages. Survival rates at younger ages already are extremely high.

Fertility Assumptions: The statewide fertility rate was projected to decline very slightly from 1.89 in 1990 to about 1.85 in 2020. With two exceptions, fertility differences among counties were kept at 1990 levels. County fertility rates were projected to change along with state rates, but fertility differences among counties remain steady.

In the two largest counties, Hennepin and Ramsey, fertility was

projected to remain constant at 1990 levels instead of declining. Although race projections were not done by county, these two counties have the largest nonwhite populations and are likely to see substantial minority population increases in the future. Nonwhite women tend to have somewhat larger families. Although fertility is projected to decline for all racial groups, growing populations of minorities in these two urban counties were projected to offset the general trend to lower fertility.

Migration: Migration rates were assumed to vary by age, sex and county and also over time. The migration rates used are net migration rates, which express the difference between in-migration and out-migration. If more people move into an area than move out, there is net in-migration. If more people move out than move in, there is net out-migration.

The 1980-1990 net migration rates by county, age and gender were used as a starting point. The rates for the 10-year period were halved to estimate the rate for a five-year period. The 1990-1995 migration rates were projected to be 80 percent of the rate during the previous decade. Rates were reduced 10 percent during each subsequent five-year pe-

riod, falling to 30 percent of the 1980-1990 rate by 2015-2020.

For those under age 15, migration rates for males and females were averaged within each five-year age group. The assumption was that among children, differences in migration rates by gender are random. Gender differences in migration among those 15 and older are assumed to represent actual differences in male and female migration behavior.

As a general rule, the result of the migration assumption is that migration and population change tend to taper off gradually over the 30-year projections period. Fast-growing counties continue to grow, but less rapidly. Declining counties continue to decline, but not as fast.

INDIVIDUAL COUNTY ADJUSTMENTS

Individual county adjustments were made where unique factors suggested that the 1980-1990 trends might not be representative of what will happen in the future. These are summarized briefly below:

College counties. Counties where college or university populations

make up a large proportion of the population are difficult to project. Sharp swings in migration rates in the 15- to 34-year-old age groups produce peculiar results at older ages if the method described above is followed. This in turn produces distortions in the projected number of births and the projected population of children. To compensate for this, projections in eight college counties (Beltrami, Blue Earth, Clay, Nicollet, Rice, Stearns, Stevens, and Winona) were adjusted. The 15- to 34-year old age groups were adjusted to reflect projected overall state trends for these age groups.

In addition to the changes in college counties, other adjustments included:

Becker County. Since 1990 a major employer closed a turkey processing facility in Detroit Lakes, resulting in a loss of 500 jobs. The assumption was that this would produce more out-migration during the first part of the decade, with effects dwindling after that. For the 1990-1995 period, 10 points were subtracted from the net migration rates for groups ages 15 to 44. Five points were subtracted from the net migration rates for groups ages birth to 14. In subsequent periods, migration was kept constant at 40 percent of the 1990-1995 levels.

Freeborn County. Since 1990, a major food processing plant in Austin closed, laying off 1,400 workers. Although a new corporation purchased the facility and has hired many workers, a net loss of jobs has occurred. For the 1990-1995 period, migration rates for those age-sex groups experiencing out-migration were kept constant at 1980-1990 levels instead of being reduced to 80 percent of the original level.

Koochiching County. A large wood processing facility was being built in International Falls at the time of the 1990 Census. The census count includes a large number of construction workers who were expected to leave when the plant was finished. The presence of these temporary residents is indicated by a large group quarters population in the census. In addition, males ages 25 to 49 greatly outnumbered women.

For the 1990-1995 period, the male migration rates for ages 25 to 49 were derived by subtracting 10 points from the female migration rates for the same age groups. The female rates had already been set to 80 percent of 1980-1990 levels. The purpose of the adjustment to the male rates was to reduce the number of surplus males by projecting their migration out of the county. In sub-

sequent time periods, the male rates for 25- to 49-year-olds in Koochiching County were set equal to the female rates.

It was assumed the opening of the new plant would not attract large numbers of new residents, since the number of permanent workers will be much smaller than the number of workers needed to build the facility. New jobs can be filled mainly by long-term residents.

Pennington County. A snowmobile factory in Thief River Falls closed during the 1980s. This may have produced an unusually large amount of out-migration. The projections assume that out-migration will be less dramatic in the future. Net migration was set to 40 percent of the 1980-1990 rates for the first five-year period, 50 percent for the second period, 40 percent for the next three periods, and 30 percent for the final five-year period.

Mower County. During the 1980s there was an extended strike at a large meat processing plant in Austin. The plant is still in operation, but more people than usual

may have left the area because of turmoil connected to the strike. For the projections, it was assumed that out-migration in the future would be less dramatic than in the 1980s. Migration rates were projected to be at 40 percent of the 1980-1990 rates between 1990 and 1995, and 30 percent during each subsequent five-year period.

St. Louis County. St. Louis County experienced extraordinary economic problems in the 1980s due to the collapse of taconite mining and a sharp downturn in shipping. The projections assume that the St. Louis County economy has generally bottomed out and future out-migration will be less dramatic. Migration rates were projected to be 40 percent of 1980-1990 rates for the first five-year period. In later five-year periods, migration rates were set to 30 percent of the 1980-1990 rates.

The projections do not assume the proposed airline maintenance base at Hibbing will be built. Although the project has not been canceled, the airline industry continues to be plagued by financial woes and economic upheavals. If the maintenance

base is built, population losses might be less than shown here.

Lake County. Migration rates were also reduced in Lake County. Like adjacent St. Louis County, Lake County endured a dramatic economic downturn during the 1980s. Migration for the 1990-1995 period was set to 50 percent of the 1980-1990 levels. For each five-year period thereafter, migration was assumed to be 30 percent of the 1980-1990 levels.

Roseau County. Roseau County experienced rapid population and employment growth in the 1980s. This was due to expansion in a large window factory and a snowmobile plant.

The projections assume there will be no major expansion in these industries in the 1990s and that in-migration will taper off rapidly. Migration rates were set at 20 percent of previous decade rates for the 1990-1995 period and 10 percent for the 1995-2000 period. After that, migration will be zero except for ages 15 to 34. For these ages, it was assumed that the migration patterns would be similar to those found in

other northern counties. The migration rates for each period after 2000 were minus 2 per 100 for 15- to 19-year-olds, minus 12 for 20- to 24-year-olds, minus 8 for 25- to 29-year-olds, and plus 8 for 30- to 34-year-olds.

Lake of the Woods County. Lake of the Woods County, like neighboring Roseau County, grew faster than anticipated in the 1980s. The projections assume that growth in Lake of the Woods County also will taper off. As in Roseau County, migration was set to 20 percent and 10 percent of 1980-1990 levels in the first two periods and zero thereafter, except for 15- to 34-year-olds. The assumed rates for the post-2000 periods were minus 3 per 100 for 15- to 19-year-olds, minus 15 for 20- to 24-year-olds, minus 10 for 25- to 29-year-olds, and plus 1 for 30- to 34-year-olds.

Waseca County. The closing of the University of Minnesota campus at Waseca was projected to increase out-migration for 15- to 19-year-olds. Their migration rates were set equal to the rates for 20- to 24-year-olds.

COUNTY PROJECTIONS: 1990 TO 2020

MINNESOTA'S CHANGING COUNTIES

COUNTY PROJECTIONS

The following section contains population projections for Minnesota's 87 counties. The counties are shown on the map on the left. The projections are for six time periods: the years 1995, 2000, 2005, 2010, 2015 and 2020. Census data from 1990 is included for comparison.

An introductory table presents the projected total population by county for each year of the projections. There is also a full-page table for each county showing detailed projections by age and sex. In these tables, projections are given separately for males and females by five-year age groups ranging from under age 5 to age 85 and older.

REGIONAL AND METROPOLITAN PROJECTIONS

MINNESOTA'S 13 DEVELOPMENT REGIONS

REGIONAL AND METROPOLITAN AREA PROJECTIONS

The following projections are for Minnesota's development regions, total metropolitan and nonmetropolitan populations, and for the Minneapolis-St. Paul and St. Cloud metropolitan areas.

Minnesota contains all or part of seven metropolitan areas as defined by the U.S. Office of Management and Budget in 1992. This publication presents projections only for the Minnesota portions of these metropolitan areas.

Metropolitan areas are defined on the basis of whole counties. Of Minnesota's metropolitan areas, one (Rochester) includes only one county. Four others (Duluth-Superior, Fargo-Moorhead, Grand Forks, and La Crosse) include two counties, but only one of them is in Minnesota. Data for these five metropolitan areas are not presented separately, since the projections for the Minnesota portions are identical with those for individual counties.

Minnesota's seven metropolitan areas are defined as follows:

- Duluth-Superior, MN-WI (St. Louis County, MN; Douglas County, WI).
- Fargo-Moorhead, ND-MN (Cass County, ND; Clay County, MN).
- Grand Forks, ND-MN (Grand Forks County, ND; Polk County, MN).
- LaCrosse, WI-MN (LaCrosse County, WI; Houston County, MN).
- Minneapolis-St. Paul, MN-WI (Anoka County, MN; Carver County, MN; Chisago County, MN; Dakota County, MN; Hennepin County, MN; Isanti County, MN; Ramsey County, MN; Scott County, MN; Sherburne County, MN; Washington County, MN; Wright County, MN; Pierce County, WI; St. Croix County, WI).
- Rochester, MN (Olmsted County, MN).
- St. Cloud, MN (Benton County, MN; Stearns County, MN).
