# GROUND WATER OBSERVATION WELL NETWORK ANNUAL REPORT, WATER YEAR 1993

## INTRODUCTION

Monitoring of ground water levels has been a cooperative effort of the Department of Natural Resources (DNR) and the U.S. Geological Survey (USGS) since 1947. The DNR Division of Waters maintains the present observation well (obwell) network of 624 wells. In the 1993 water year (WY93), which began October 1992 and ended September 1993, 610 obwells were measured by Soil and Water Conservation Districts (SWCD's). The USGS measured 14 obwells using continuous recorders. Compared to last water year (WY92), 23 wells were added or re-established in the network. Thirty-seven wells were excluded from the network this year because they either no longer functioned correctly (and were sealed) or financial support was lost. In WY93, the network had a net loss of 14 wells.

The DNR obwell network was developed to record background water levels in areas of present or expected ground water use. These data are used to assess ground water resources, interpret impacts of pumping and climate, plan for water conservation, evaluate local water complaints and otherwise provide for management of the resource.

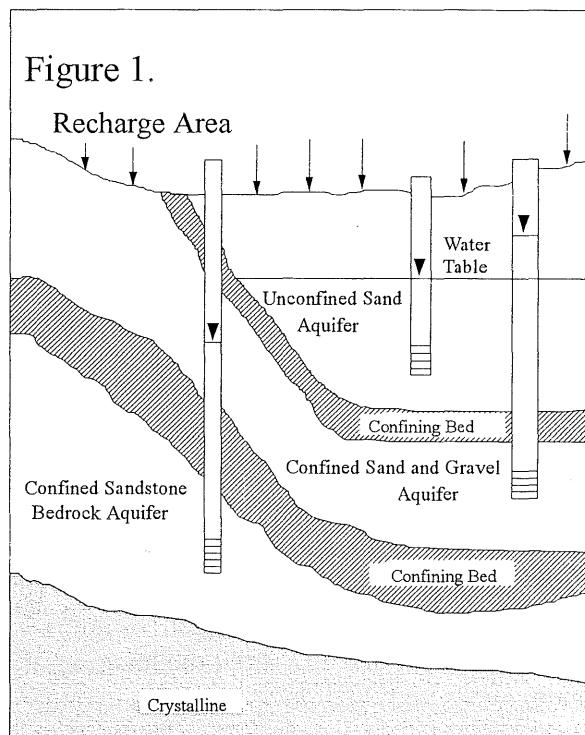

## AQUIFERS

An aquifer is a geologic formation which is saturated and sufficiently permeable to transmit economic quantities of water to wells and springs. Aquifers may exist under either unconfined or confined conditions (Figure 1).

**UNCONFINED AQUIFERS** - In an unconfined aquifer, the ground water surface that separates the unsaturated and saturated zones is called the water table. The water table is exposed to the atmosphere through openings in the unsaturated geologic

materials. Unconfined aquifers can consist of bedrock or of unconsolidated materials and are referred to in this text as Bedrock and Unconfined aquifers, respectively.

**CONFINED AQUIFERS** - When the aquifer is separated from the ground surface and

atmosphere by a material of low permeability, the aquifer is confined. The water in a confined aquifer is under pressure. When a well is installed into a confined aquifer, the water level in the well casing rises above the top of the aquifer. Confined aquifers can consist of bedrock or of unconsolidated materials and are referred to in this text as Bedrock and Buried Artesian aquifers, respectively.

An unconfined aquifer generally responds more quickly to seasonal climatic changes than a confined aquifer since the unconfined has more direct interaction with the surface. However, the magnitude of change in water levels will usually be more pronounced in a confined aquifer.

## **STATEWIDE SUMMARY**

This section discusses the WY93 ground water levels and compares them to the previous water year's levels and with average levels. Figure 2 (page 5) illustrates the location of the obwells statewide. Figures 3, 4, and 5 (page 6, 7 and 8, respectively) illustrate the location of the obwells in each of the three groups discussed in this section: unconfined, buried artesian and bedrock aquifers.

Index obwells were selected based on length of record and geographical representation. Water level measurements for the index obwells were averaged for the entire water year, then compared to the average water level for the period of record for the well. Table 1 (page 9) contains the statistics for the index obwells in each aquifer. The statistics included are: the index obwells' WY92 average water level along with the standard deviation, the index obwells' WY93 average water level along with the standard deviation, and the average water levels for the index obwells' period of record along with the standard deviation. Figures 6 and 7 (page 10 and 11) show the location of index wells and their deviation from average and WY92 levels, respectively. Figure 8 (page 12) contains a graphical representation of Table 1. The representation of  $\pm 1$  standard deviation encompasses two-thirds of all water level measurements made on that obwell for the period of record. This gives a statistical representation of the water levels taken on that obwell. No analysis has been done on the possible effects on obwells from nearby pumping wells.

### **UNCONFINED AQUIFERS**

Unconfined aquifers are monitored throughout the state (Figure 3) except in the southeast.

Water levels in the index obwells for unconfined aquifers in the southwest were strongly affected by flooding and are above last year's levels and average levels. In the rest of the state they are

generally below last year's levels and either within or slightly above average levels. Hydrographs for selected unconfined aquifers are shown in Figure 9 (page 13).

Approximately half of the index obwells in unconfined aquifers contained in this report have a total period of record in excess of 20 years. Only a few have records less than three years.

### **CONFINED AQUIFERS - BURIED ARTESIAN**

Figure 4 shows the distribution of obwells in buried artesian aquifers in unconsolidated deposits in the state. Hydrographs for selected buried artesian aquifers are shown in Figure 10 (page 14).

Water levels in index obwells in the buried artesian aquifers are generally up from last year in the northeast, central, southwest, and Twin Cities metro areas. The northwest buried artesian wells' water levels are down from last year and from the average levels for those wells close to the Red River Valley. This continues the downward trend seen in the last two water years. The northwest index well which is located further east exhibited levels slightly above last year and within average levels.

### **BEDROCK AQUIFERS**

Bedrock aquifers are monitored primarily in the central and south-southeast portions of the state where they are the aquifers most often used for water supply (Figure 5). Most of the bedrock aquifers monitored by obwells are confined, although bedrock aquifers may be either confined or unconfined. Figure 11 (page 15) shows hydrographs for bedrock obwells. Since there are relatively few bedrock obwells monitored, care should be taken in using these data.

Obwells which monitor the Mt. Simon bedrock aquifer are located throughout the southeast and the Twin Cities metro area. These obwells have been monitored for periods ranging from

16 to 26 years. The Mt. Simon index obwell's water levels ranged from below to slightly above last year's levels in the central area and generally above last year's levels in the remaining obwells. When compared to average levels, two of the state's index wells had levels above average and the rest were within average levels.

The Prairie du Chien/Jordan aquifer is monitored in the Twin Cities metro area and in a few counties southeast of the Twin Cities. All index wells' levels were above last year's levels and, with the exception of one well, were within average levels.

In the Twin Cities metro area, water levels in bedrock aquifers are strongly influenced by seasonal pumping for air conditioning and irrigation. Levels in obwells decline sharply at the start of the pumping season (May), continue to decline until the end of the pumping season (late August) and then generally recover to pre-pumping levels by mid-autumn (Figure 12, page 16). Short-term fluctuations in climate are usually not evident in the water levels of these obwells. The fluctuations are masked by extensive pumping and by the length of time between a change in confined water levels. The lowest levels occur in late summer at the end of the air conditioning season. This is in contrast to unconfined aquifers where drought or precipitation excess can be seen as water level changes in the same year.

The Sioux Quartzite, the Cedar Valley Limestone, the Galena Formation, the Biwabik Iron Formation and other bedrock aquifers are monitored on a limited basis. The data tables presented in the appendix should be consulted for these obwells. Table 2 (page 17) defines the abbreviations used in this appendix.

### **NETWORK DESIGN**

The observation well network is expanded, when appropriate and as funding allows, by drilling of new obwells or by acquisition of

existing obwells. The intent of the program expansion is to place observation obwells in areas of present or anticipated high ground water use or where little data exist. New obwells may be drilled into aquifers where suitable existing wells cannot be found.

Existing wells can qualify for addition to the network if the following criteria are met:

- \* An observation well must have a geologic record and well construction data which identifies the aquifer monitored.
- \* An observation well must not be a multi-aquifer well.
- \* An observation well is not a pumping well. Where irrigation wells are used, measurements are recorded only in non-pumping months.
- \* An observation well should be less than 25 years old and less than 6" in diameter.
- \* An observation well must pass a slug test to determine whether it is in hydrologic communication with the aquifer.

Thirty-seven obwells were lost to the network this year. Of the obwells lost, 1 well in Clay County was sealed; the rest were not monitored due to lack of funding. Four wells were drilled in Wilkin and Yellow Medicine Counties; two in each county. Seven existing wells were incorporated into the network and 12 obwells were reestablished in the network. Therefore, in WY93 the network size decreased by a total of 14 wells.

### **OBJECTIVES**

The overall objective of the observation well network is to collect baseline data on ground water level fluctuations and trends. These data are used to assess ground water resources, interpret impacts of pumping and climate, plan for water conservation, evaluate local water complaints and otherwise provide for the management of the resource.

This annual ground water level report is

produced by the DNR Division of Waters each year. The annual report provides last water year's data. Also available from the Division of Waters is the publication "Understanding Ground Water Level Trends: A Key to Managing Water Use". That report provides an historical overview of ground water level trends throughout Minnesota.

Hydrographs for any obwell(s) can be obtained from the Observation Well Manager (address and telephone number below). Data for observation wells can be supplied on computer disks for use on PC's. These data are compatible with almost all spreadsheet and graphing programs. The combination will allow computer users to create and update their own hydrographs for obwells of interest.

The USGS has conducted many cooperative regional ground water studies in Minnesota. Half of the money for these studies is typically provided by the federal government through the USGS and the remainder is usually paid by the state and by local interests. Wells installed as part of the field data collection effort for these studies are often incorporated into the obwell network once the regional study is finalized.

If you have any questions about the ground water observation well network or wish to receive observation well data, please call or write:
